PACIFIC SARDINE HARVEST FRACTION

At its March 2014 meeting, the Council heard a report from the Coastal Pelagic Species Management Team (CPSMT) including recommendations for incorporating best available scientific information on sea surface temperature (SST) into the Pacific sardine harvest control rules (HCR), specifically the harvest guideline (HG) control rule. The current sardine HG control rule includes a harvest fraction parameter that is based on the SST as measured at the Scripps Institution of Oceanography (SIO) pier. However, a 2013 panel of experts made a recommendation, subsequently endorsed by the Scientific and Statistical Committee and the Council, to use the California Cooperative Oceanic Fisheries Investigations (CalCOFI) temperature index as well as a revised F_{msy} relationship, for use in the HCR. The Council adopted the technical change of using the CalCOFI temperature index, rather than the SIO temperature recordings, for the best estimate of a temperature-productivity relationship, used to calculate the annual overfishing limit (OFL) and acceptable biological catch (ABC) for Pacific sardine. The new temperature index and new temperature-productivity relationship was used for establishing the OFL starting with the April 2014 meeting, when the Council established harvest specifications and management measures for the fishing year beginning July 1, 2014.

The HG control rule will continue to use the SIO temperature and temperature-productivity relationship, and a 5-15 percent harvest fraction range, until the Council takes action to change the control rule. Before applying the new (CalCOFI) temperature index and temperature-productivity relationship in the HG control rule, the Council requested evaluation of additional alternatives regarding the bounds on the harvest fraction term, including 0-20 percent and 5-20 percent, in relation to the current policy of allowing relatively higher harvest rates in periods of high biomass and productivity, but constraining harvest rates when biomass and productivity are low. These alternatives are in addition to the options already analyzed by the CPSMT, including their recommended option of a 10-20 percent harvest fraction range. National Marine Fisheries Service (NMFS) staff, Council staff, and the CPSMT prepared a preliminary draft Environmental Assessment (EA) with alternatives for Council consideration, included as Agenda Item C.1.a, Attachment 1.

Under the framework management approach used for CPS, a Fishery Management Plan (FMP) amendment is not necessary in order to develop or modify HCRs. The CPS FMP describes four procedures for making framework changes, depending on the particular situation or action: Automatic Actions, Notice Actions, Abbreviated Rulemaking Actions, and Full Rulemaking Actions. Given the public interest in CPS management and the nature of the changes being considered, staff recommends the Full Rulemaking Action, which requires at least two Council meetings, public notice, and comment.

In order for the Council to use the new harvest fraction parameters for the subsequent fishing year (July 1, 2015 through June 30, 2016), the Council must take final action (selection of a final preferred alternative) at its November 2014 meeting. After final Council action, the process will consist of transmittal of the action to NMFS, regulatory deeming, and proposed and final rulemaking. The Council is scheduled to set Pacific sardine harvest specifications and management measures at its April 2015 meeting.

At this meeting, the Council should consider the draft purpose and need statement, the suite of alternatives, and the analysis. The Council may adopt a preliminary preferred alternative to focus comment in advance of final action at the November 2014 meeting.

Council Action:

1. **Consider the draft purpose and need statement, the list of harvest fraction alternatives, and the preliminary analysis of alternatives.**
2. **Adopt preliminary preferred harvest fraction alternative.**

Reference Materials:

1. Agenda Item C.1.a, Attachment 1: Preliminary Draft Environmental Assessment for incorporating best available science into harvest management control rules for Pacific sardine.
2. Agenda Item C.1.c, Public Comment.

Agenda Order:

a. Agenda Item Overview Kerry Griffin/Lorna Wargo
b. Reports and Comments of Advisory Bodies and Management Entities
c. Public Comment
d. **Council Action**: Adopt Preliminary Preferred Alternative for the Pacific Sardine Harvest Fraction Parameter.

PRELIMINARY DRAFT

ENVIRONMENTAL ASSESSMENT

INCORPORATING THE USE OF A NEW TEMPERATURE INDEX INTO THE CALCULATION OF THE PACIFIC SARDINE HARVEST GUIDELINE FORMULA

REGULATORY IDENTIFIER NUMBER _____

PREPARED BY
THE PACIFIC FISHERY MANAGEMENT COUNCIL
AND
NATIONAL MARINE FISHERIES SERVICE

AUGUST 21, 2014

1.0 INTRODUCTION

1.1 DOCUMENT ORGANIZATION

1.2 PURPOSE AND NEED

The harvest control rules for Pacific sardine include a sea surface temperature (SST) parameter measured off the Scripps Institution of Oceanography (SIO) pier. Recent research indicates that the California Cooperative Oceanic Fisheries Investigations (CalCOFI) temperature index is now a better indicator of California Bight SST and a better predictor of Pacific sardine recruitment and productivity. The purpose of this action is to change the temperature index from SIO to CalCOFI for purposes of calculating the FRACTION component of the Pacific Sardine harvest guideline (HG), while maintaining consistency with the Council's harvest policy approach. This includes the potential for revising the percent bounds currently in place for the FRACTION parameter.

The need for this action is to use the best temperature index in the temperature-productivity relationship in the HG control rule. This action considers improved temperature data and incorporates it into the Pacific sardine harvest control rule.

1.3 PLAN DEVELOPMENT SCHEDULE AND ADVISORY BODY PARTICIPATION

1.4 RELATED DOCUMENTS INCORPORATED BY REFERENCE

This section will incorporate by reference the Hurtado Fmsy analysis, Harvest Parameters Workshop report, and the Coastal Pelagic Species (CPS) Fishery Management Plan (FMP).

2.0 DESCRIPTION OF ALTERNATIVES

Harvest Control Rule Framework

To effectively evaluate the options presented below it is important to recognize the interplay between the set of Pacific sardine harvest control rules (HCRs) under current policy. Prior to Amendment 13, the Harvest Guideline (HG) was the only control rule and it described the overfishing limit, annual harvest policy, and the annual catch limit. To more explicitly define what levels would be considered overfishing, Amendment 13 adopted Overfishing Limit (OFL) and Acceptable Biological Catch (ABC) as additional harvest control rules. The formulas for the three HCRs are displayed below.

Harvest Control Rule (HCR) Formulas
OFL = BIOMASS * E_{MSY} * DISTRIBUTION
$ABC_{P\text{-}star}$ = BIOMASS * $BUFFER_{P\text{-}star}$ * E_{MSY} * DISTRIBUTION
HG = (BIOMASS - CUTOFF) * FRACTION * DISTRIBUTION

All three control rules incorporate E_{MSY}, an estimate of the exploitation rate at maximum sustainable yield. E_{MSY} is dependent upon sea surface temperature (SST) and serves as a proxy for the influence of environmental conditions on stock biomass, so that harvest levels (rates) are adjusted in relation to different conditions. For the OFL and ABC control rules, E_{MSY} is bounded from 0 to 25%. The upper bound of 25% corresponds to the upper quartile of observed temperatures.

In the HG control rule, FRACTION specifies how much of the stock is available to the fishery when biomass exceeds the CUTOFF value set at 150,000 mt. FRACTION is equal to E_{MSY} except it is bounded, currently 5-15%, as a matter of policy to limit the portion of stock available to the fishery depending on environmental conditions (Figure 1).

Analyses conducted during the Amendment 13 scoping process showed that although the HG control rule generally produced harvest levels far lower than necessary to prevent overfishing and protect the stock, there were times when the output of the ABC control rule fell below the HG at some P* (probability of overfishing) values during regimes with lower SSTs. This outcome is in part due to fixing the lower bound for FRACTION in the HG rule. Amendment 13 implemented a control rule policy that specifies the lower of the two be used for annual management. The result was that sardine management post-Amendment 13 became more precautionary, particularly in cooler and low biomass conditions.

The general implementation of this policy in setting maximum allowable catch is demonstrated in Figure 2. Under most SSTs, the HG is the lowest of the HCRs and represents the maximum allowable harvest. As SSTs become relatively cold, the HG and ABC lines converge, and the ABC HCR (illustrated here buffered at P*= 40) produces increasingly lower catch allowances and overrides the HG for annual management. In this example, when biomass (1+) is 500,000 mt, the

HG exceeds OFL and ABC (for P*40) at all temperatures below 14.8 degrees[1]. At these temperatures, the ABC (for P*40) is lowest and therefore sets the maximum harvest allowed. The results are similar for larger biomasses and other values of P*.

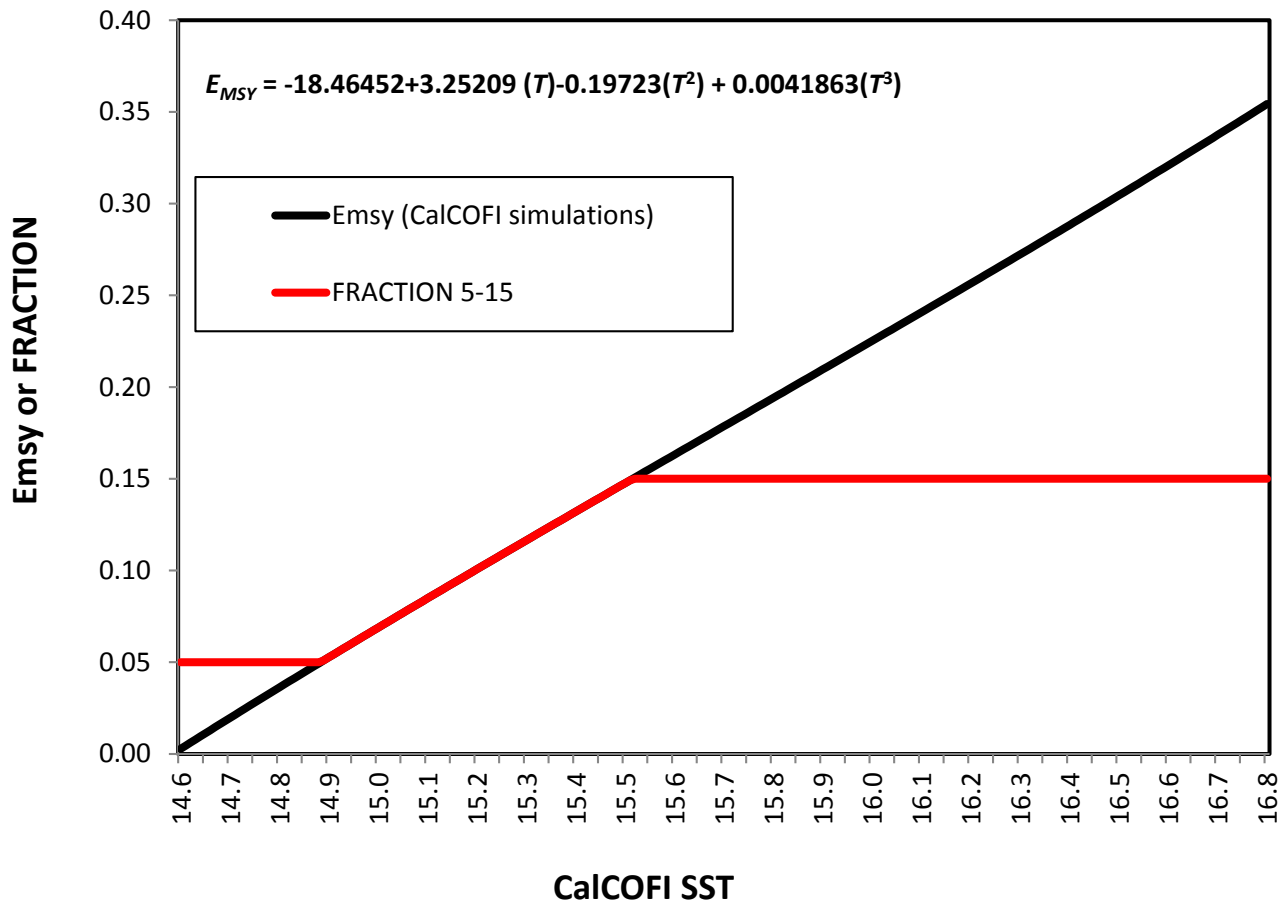

Figure 1. CalCOFI SST and Emsy, FRACTION bounded at 5-15%.

[1] Temperatures below 14.8 degrees have not been observed in the CalCOFI index since 1984 although the recent year trend has been towards cooler temperatures. The recent five year average was 15.4; the lowest recorded temperature was 14.9 in 2002.

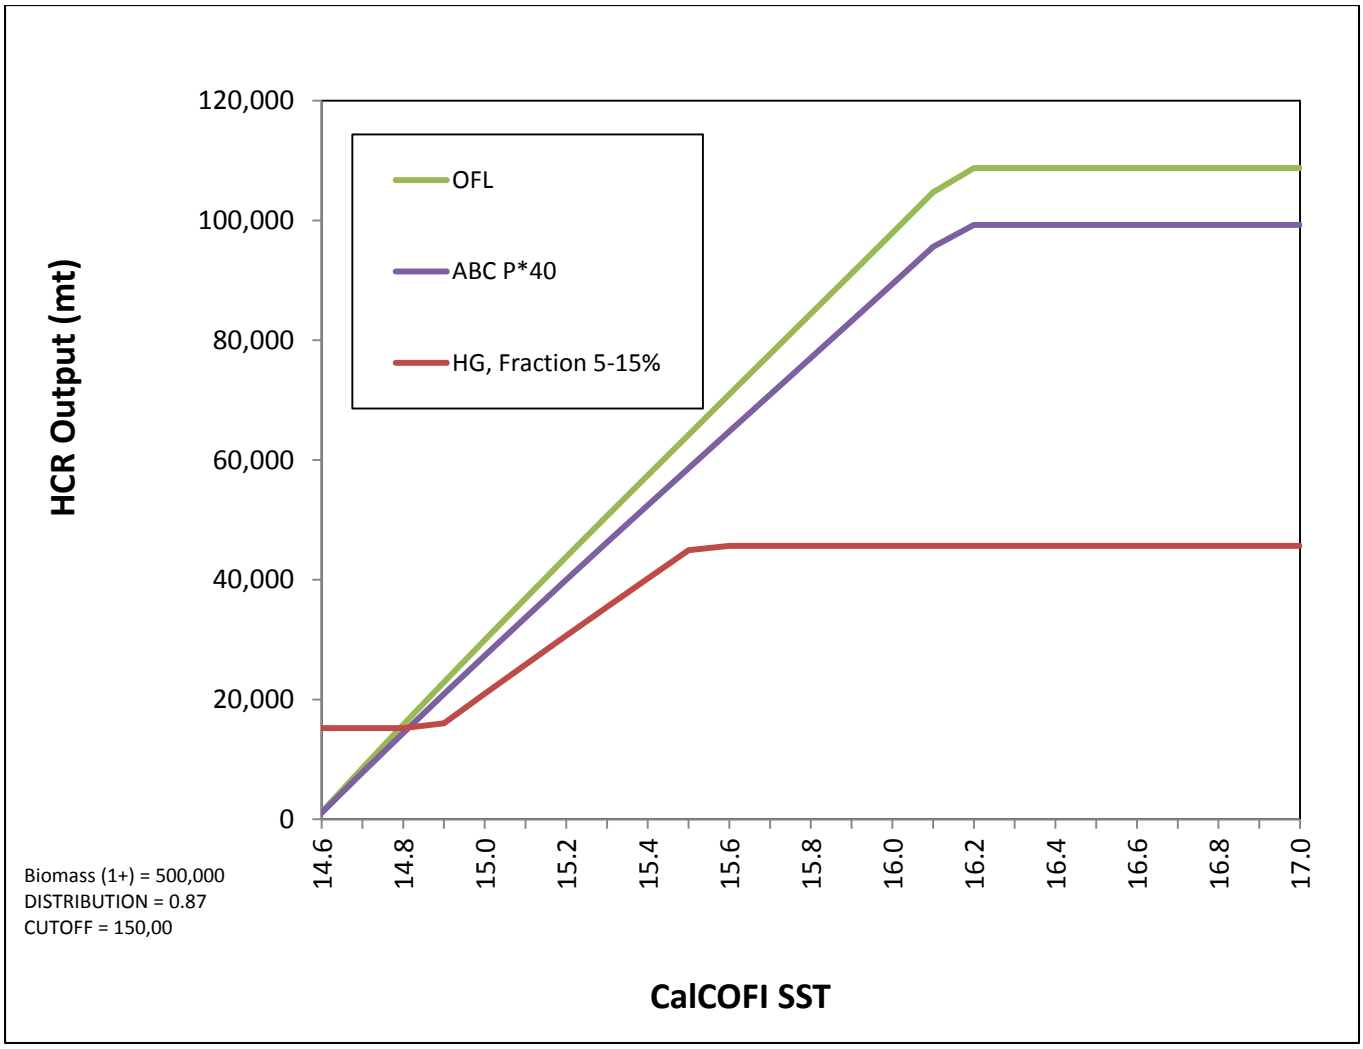

Figure 2. Illustration of the harvest control outputs: OFL, ABC P*40 with HG bounded at 5-15%. By policy annual management follows the lowest HCR.

There are several choices for incorporating an environmental co-variate into harvest policy for Pacific sardine. A hierarchy of decision points is represented in the alternatives below. The first decision point is whether to use Scripps Institution of Oceanography (SIO) (Alternative 1 or No Action) or California Cooperative Oceanic Fisheries Investigations (CalCOFI) as the temperature index (Alternatives 2 and 3). Secondarily, Alternative 2 and the sub-alternatives under Alternative 3 present a range of choices for establishing the FRACTION bounds in the HG.

At the March 2014 Council meeting the CPSMT presented information on the effects of the new index and the revised productivity relationship with environment on the performance of sardine management harvest control rules (HCR). The focus of this evaluation was on whether changing the temperature index that informs FRACTION would maintain or deviate from established policy for sardine management. Based on the information available and this evaluation, the CPSMT concluded that a HCR change to the CalCOFI index did impact current policy and that changing

FRACTION to range of 10-20 provided a better representation of the SST data and new knowledge of stock productivity. This option attempted to preserve current policy by permitting harvest rates to take more advantage of periods when biomass and productivity are higher, while still restricting harvest when biomass and productivity are depressed.

To ensure the analysis of transitioning to CalCOFI and the new Emsy relationship were fully captured, in particular when compared to what was previously in place as well as variations on the lower bound of FRACTION, the Council requested the Coastal Pelagic Species Management Team (CPSMT) also examine FRACTION bounds of 0-20 and 5-20. Those alternatives, along with the general decision points of transitioning from SIO to CalCOFI are presented below.

Alternative 1 – SIO Temp Index; HG FRACTION 5-15 (NO ACTION)
This alternative retains the Scripps Institution of Oceanography (SIO) pier temperature index to describe the relationship between ocean conditions and sardine stock productivity and the bounds around the FRACTION harvest control rule parameter as adopted in Amendment 8 of the CPS FMP. It maintains the OFL and ABC control rules adopted in Amendment 13 of the CPS FMP.

Alternative 2 – New Temp Index (CalCOFI); Maintain existing bounds on FRACTION
This alternative retains the existing HG FRACTION bounds of 5-15% adopted originally in Amendment 8 to implement a temperature-based harvest control rule, but adopts the CalCOFI temperature index.

Alternative 3 – New Temperature Index (CalCOFI); Revise bounds on FRACTION

3a. FRACTION 10-20%
This alternative adjusts the HG FRACTION range in the harvest guideline control rule to 10-20%.

3b. FRACTION 5-20%
Alternative 3b maintains a lower bound of FRACTION at 5% and increases the upper bound to 20%.

3c. FRACTION 0- 20%
Under this alternative the bounds for Fraction in the HG control rule are the broadest of all the options, set at 0-20%.

3.0 AFFECTED ENVIRONMENT

For the purposes of this action, the general action area is the West Coast Exclusive Economic Zone (EEZ) (which is directly affected by the Federal action) and the marine waters, other than internal, of the states of Washington, Oregon, and California (which may be indirectly affected by the federal action).

3.1 SARDINE RESOURCE

Pacific sardine (*Sardinops sagax*) are small schooling fish. When the population of Pacific sardine is large, it is abundant from the tip of Baja California to southeastern Alaska and throughout the Gulf of California. In the north, sardines tend to appear seasonally. Sardines also form three (and possibly four) subpopulations. The northern subpopulation of sardines is most important to U.S. commercial fisheries. Sardines are taken by a wide variety of predators. More information on current Pacific sardine abundance and population trends is contained in the current CPS SAFE Report (DRAFT) (PFMC 2014) and the *Assessment of the Pacific Sardine Resource in 2014 for U.S. Management in 2014-2015* (Hill et al 2014). The Pacific sardine resource is assessed each spring in support of the Council process that recommends an annual OFL, ABC, Annual Catch Limits (ACL) and HG for the U.S. commercial fishery. The primary purpose of the assessment is to provide an estimate of current biomass which is used to calculate HGs for the July 1 to June 30 management cycle.

Sardine, along with other species such as anchovy, hake, jack mackerel, and Pacific mackerel can achieve large populations in the California Current region as well as in other major eastern boundary currents. These populations are important to the trophic dynamics of the entire California Current ecosystem. Anchovy and sardines are key consumers of large quantities of primary production (phytoplankton) in the ecosystem and all five species are significant consumers of zooplankton. Additionally, all five species, and particularly the mackerels, hake, and also squid, are important predators of the early stages of fish. The juvenile stages, and in many cases the adults, of squid and all five species of finfish are important as forage for seabirds, pinnipeds, cetaceans, and other fish.

Trophic interactions between CPS and higher-trophic-level fish are complex, and it is unknown if populations of individual predaceous fish are enhanced or hindered by large populations of CPS. The value of CPS as forage to adult predators versus the negative effects of CPS predation (on larvae and juveniles of predator fish species) and competition (removal of phytoplankton, zooplankton, and other fish) is unknown.

Modeling efforts are underway that may enhance our understanding of these linkages and improve our ecosystem-based management approaches for these species. However, implementing ecosystem-based management requires an understanding of the complex dynamics of marine ecosystems as well as an understanding of how humans fit into the system. A key step toward ecosystem-based management is to better understand how interactions within food webs affect species of commercial and conservation importance. Efforts are underway to provide comprehensive diet information and food web analysis for major taxa within the California Current

ecosystem, including fish, marine mammals, birds, and invertebrates (Dufault et al 2009). Furthermore, robust simulations of the California Current ecosystem that will allow the exploration of potential effects of natural and human-induced perturbations over a range of spatial and temporal scales have been undertaken (Horne et al 2010). Future management tools based on this ongoing work by NOAA will provide a platform for addressing important hypotheses relating to the effects of perturbations (e.g., harvest), characterizing the potential trade-offs of alternate management actions, and testing the utility of ecosystem indicators for long-term monitoring programs (Kaplan et al. 2013). Additionally, these tools will allow consideration of the entire ecosystem such that ecosystem management can maintain multiple ecosystem services as well as system resilience rather than focusing on a single species.

Environmental changes affect all species; however, small coastal pelagic species off the Pacific coast, like those managed by the CPS FMP, show responses that offer dramatic examples of environmental effects. In 1983, the biomass (age 1 +) of Pacific sardine was estimated to be 5,145 mt. By 1999, the biomass was estimated to be around 1 million mt (Conser et al.2001). Pacific mackerel biomass (age 1 +) estimates were atypically high in the early 1980s but began declining steadily from the mid-1980s to the early 2000s. Population estimates increased moderately, with some signs of 'rebuilding' observed in the years 2009-2011 (Crone et al. 2011). More recently, and in historical terms, the population remains at a relatively low abundance level, due primarily to oceanographic conditions. In *El Nino* years, the availability of squid in its typical spawning areas where it is harvested is low, but squid make a dramatic reappearance when the effects of *El Nino* abate.

These types of fluctuations in abundance are common in R-selected species (e.g., pollock, herring, sardine, and mackerel), which generally have higher reproductive rates, are shorter-lived, attain sexual maturity at younger ages, and have faster individual growth rates than K-selected species (e.g., rockfish, many flatfish). As such, predators that utilize R-selected fish species as prey (marine mammals, birds, and other fish) have evolved in an ecosystem in which fluctuations and changes in relative abundances of these species have occurred. Consequently, most of them are generalists who are not dependent on the availability of a single species but rather on a suite of species, any one (or more) of which is likely to be abundant each year.

3.2 HABITAT

In 2011 a five-year review of CPS essential fish habitat (EFH) was completed and can be found in the 2011 Stock Assessment and Fishery Evaluation (SAFE) document (PFMC 2011). Although some new information was gathered during this process, no changes were made to the actual description of CPS EFH. A complete description of EFH for CPS may be found in Appendix D of the CPS FMP (PFMC 1998). In determining EFH for CPS, the estuarine and marine habitat necessary to provide sufficient production to support maximum sustainable yield and a healthy ecosystem were considered. Using presence/absence data, EFH is based on a thermal range bordered within the geographic area where a managed species occurs at any life stage, where the species has occurred historically during periods of similar environmental conditions, or where environmental conditions do not preclude colonization by the species.

The specific description and identification of EFH for CPS finfish accommodates the fact that the geographic range of all species varies widely over time in response to the temperature of the upper mixed layer of the ocean, particularly in the area north of 39° N latitude. For example, an increase in sea surface temperature since the 1970s has led to a northerly expansion of the Pacific sardine resource. CPS EFH is linked to ocean temperatures, which shift temporally and spatially, providing a dynamic definition of EFH. This definition is as follows:

> *The east-west geographic boundary of EFH for each individual CPS finfish and market squid is defined to be all marine and estuarine waters from the shoreline along the coasts of California, Oregon, and Washington offshore to the limits of the exclusive economic zone (EEZ) and above the thermocline where sea surface temperatures range between 10^0C to 26^0C. The southern boundary of the geographic range of all CPS finfish is consistently south of the US-Mexico border, indicating a consistency in SSTs below 26^0C, the upper thermal tolerance of CPS finfish. Therefore, the southern extent of EFH for CPS finfish is the US-Mexico maritime boundary. The northern boundary of the range of CPS finfish is more dynamic and variable due to the seasonal cooling of the SST. The northern EFH boundary is, therefore, the position of the 10^0C isotherm which varies both seasonally and annually.*

3.3 PROTECTED SPECIES

A more thorough description of the affected environment for protected species can be found in the Biological Opinion completed in December 2010 for the Pacific sardine fishery as well as in the Environmental Impact Statement (EIS) prepared for Amendment 8 to the Northern Anchovy FMP, now the CPS FMP (PFMC 1998). While the analysis provided in the EIS focused primarily on the fishery in southern California, most of the species that were identified occur along the entire U.S. West Coast and, thus, the analysis is applicable to fisheries currently managed under the CPS FMP.

The harvesting of Pacific sardines may affect species in two ways, direct take of the animals during the prosecution of the fishery (incidental catch) or indirectly due to reductions in prey base (sardine) that serve as forage. Protected species include species protected by three federal laws, the Endangered Species Act (ESA), the Marine Mammal Protection Act (MMPA), and the Migratory Bird Treaty Act (MBTA).

The following list of endangered or threatened species that may be present in the action area:

Species	**Status**
Marine Mammals	
Blue whale *(Baleaenoptera musculus)*	Endangered
Fin whale *(Baleranoptera physalus)*	Endangered
Humpback whale (*Megaptera novaeangliae*)	Endangered
Sei whale (*Balaenoptera borealis*)	Endangered
Sperm whale (*Physeter macrocephalus*)	Endangered
Killer whales, southern resident DPS (*Orcinus orca*)	Endangered

Northern Right whale (*Eubalaena glacialis*)	Endangered
Steller sea lion, eastern distinct population segment (DPS) (*Eumetopias jubatus*)	Threatened
Southern sea otter (*Enhydra lutris nereis*)	Threatened
Guadalupe fur seal (*Arctocephalus townsendi*)	Threatened
Birds	
Short-tailed albatross (*Phoebastria albatrus*)	Endangered
Marbled murrelet *(Brachyramphus marmoratus marmoratus)*	Threatened
Bald eagle *(Haliaeetus leucocephalus)*	Threatened
California least-tern *(Sternum antillarum browni)*	Endangered
Xantus's murrelet *(Synthliboramphus hypoleucus)*	Candidate
Sea turtles	
Leatherback turtle (*Dermochelys coriacea*)	Endangered
North Pacific Loggerhead turtle (*Caretta caretta*)	Endangered
Olive Ridley (*Lepidochelys olivacea*)	Endangered/Threatened
Green Sea Turtle (*Chelonia mydas*)	Endangered/Threatened
Marine invertebrates	
White abalone (*Haliotis sorenseni*)	Endangered
Black abalone (*Haliotis crachereodii*)	Endangered
Fish	
Green Sturgeon, southern DPS (*Acipenser medirostris*)	Threatened
Pacific eulachon, southern DPS (*Thaleichthys pacificus*)	Threatened
Yelloweye Rockfish (*Sebastes ruberrimus*)	Threatened

Critical Habitat		
Steller sea lion (*Eumetopias jubatus*)	Rogue Reef: Pyramid Rock Oxnard Reef: Long Brown Rock and Seal Rock Ano Nuevo I. Southeast Farrallon I. Sugarloaf I.	Associated aquatic zones 3,000 feet seaward in State and Federally managed waters from the baseline of each rookery
Green Sturgeon, southern DPS (*Acipenser medirostris*)	US coastal marine waters within 60 fathoms from Monterey Bay, CA, to Cape Flattery, WA, the Sacramento River and other select waters within the Sacramento-San Joaquin River-Delta system, and other select coastal bays and estuaries waters within California, Oregon, and Washington.	

Leatherback sea turtle (*Dermochelys coriacea*)	Includes approximately 16,910 square miles (43,798 square km) stretching along the California coast from Point Arena to Point Arguello east of the 3,000 meter depth contour; and 25,004 square miles (64,760 square km) stretching from Cape Flattery, Washington to Cape Blanco, Oregon east of the 2,000 meter depth contour. The designated areas comprise approximately 41,914 square miles (108,558 square km) of marine habitat	Critical habitat extends to a water depth of 80 meters from the ocean surface and is delineated along the shoreline at the line of extreme low water, except in the case of estuaries and bays where COLREGS lines (defined at 33 CFR part 80) shall be used as the shoreward boundary of critical habitat.

A number of non-ESA listed marine mammals may also occur in the affected area, these include the northern fur seal, California sea lion, harbor seal, northern elephant seal, bottlenose dolphin, Pacific white-sided dolphin, common dolphin, harbor porpoise, Dall's porpoise, and minke whale. These species, like all marine mammals, are protected under the MMPA. Section 118 of the MMPA requires NMFS to place all U.S. commercial fisheries into one of three categories (I, II, III) based on the level of incidental serious injury and mortality of marine mammals occurring in each fishery (16 U.S.C. 1387(c)(1)), with Category I being the highest level of interactions and III being the lowest level. The California, Oregon and Washington sardine fisheries are listed as Category III fisheries, meaning that these fisheries have a remote likelihood of/no known incidental mortality or serious injury of marine mammal.

In addition, a number of non-ESA listed sea birds have been identified that forage on sardine and therefore may be affected directly or indirectly by the sardine fishery. These birds include grebes and loons, petrels and albatrosses, pelicans and cormorants, gulls, terns, auks, and some raptors (PFMC 1998).

At-sea observers have witnessed interactions with California sea lions, Pacific white-sided dolphins, and gulls within the California portion of the fishery. Observer records indicate that marine mammals, marine turtles, and steelhead are not encountered in the Pacific sardine purse seine fishery in Oregon and Washington. Fishermen in the southern subarea have not recorded incidental catch of marine turtles, southern green sturgeon, or steelhead in the sardine purse seine fishery. This is supported by preliminary observer information from vessels operating from San Pedro, Moss Landing, Dana Point, and San Diego, California.

Critical habitat for ESA listed cetaceans and most sea turtles has not been designated or proposed within the action area. Critical habitat for listed salmonids does not include marine waters and therefore it is not within the action area. Critical habitat for Steller sea lions in California are the rookeries at Ano Nuevo Island, Sugarloaf Island, and the southeast Farrallon Islands (50 CFR

226.202). Sardine fishermen in California do not fish near these islands therefore, critical habitat for Steller sea lions in California is not part of the affected environment.

3.4 FISHING INDUSTRY

During the 1940s and 1950s, approximately 200 vessels participated in the Pacific sardine fishery. In California, some present day CPS vessels are remnants of that fleet.

In recent history, a fishery for Pacific sardine has operated off Oregon and Washington since 1999. This fishery targets larger sardine, which have typically sold as bait for Asian longline tuna fisheries. Beginning in 2006, this fishery has been expanding into human consumption markets.

Along the West Coast, other vessels target CPS finfish in small quantities, typically selling their catch to specialty markets for relatively high prices. In recent years, these have included:

- Approximately 18 live bait vessels in southern California and two vessels in Oregon and Washington that landed about 4,000 mt per year of CPS finfish (mostly northern anchovy and Pacific sardine) for sale to recreational anglers.
- Roundhaul vessels that take a maximum of 1,000 mt to 3,000 mt per year of northern anchovy that are sold as dead bait to recreational anglers.
- Roundhaul and other mostly small vessels that target CPS finfish (particularly Pacific mackerel and Pacific sardine) for sale in local fresh fish markets or canneries.
- In Washington, albacore tuna vessels using lampara gear that target northern anchovy for use as live bait in the tuna fishery.

The CPS fishery is administratively divided into a federally managed "limited entry" fishery (requiring Federal permits in order to participate in the fishery), south of 39 degrees North latitude (Southern subarea), and an "open access fishery" (not requiring Federal permits to participate in the fishery), north of 39 degrees North latitude (northern subarea). Vessels landing less than five metric tons of CPS per trip in the Southern subarea are exempt from limited entry requirements. However, the states of Oregon and Washington both have specific state restrictions that limit the number of vessels in their respective fisheries. The CPS LE fleet currently consists of 65 permits and 56 vessels. The LE vessels range in age from 4 to 70 years, with an average age of 34 years. The capacity goal and transferability provisions established under Amendment 10 are based on calculated gross tonnage (GT) of individual vessels. Calculated GT serves as a proxy for each vessel's physical capacity and is used to track total fleet capacity. The fleet capacity goal established through Amendment 10 is 5,650.9 GT, and the trigger for restricting transferability is 5,933.5 GT (Goal + 5 percent). The current LE fleet is 4,753 GT, well within the bounds of the capacity goal and not likely substantially different from current capacity. In the northern subarea, fishermen must have individual state harvest permits to fish for Pacific sardine.

The northern subarea fishery operates in an area approximately 45 nm north and 30 nm south of the Columbia River, and extends approximately 35 nm offshore. Fishing depths range from 7 fathoms to over 400 fathoms. There are less specific data available to characterize the geographic range of the southern subarea fishery except that the majority of Pacific sardine are landed in the central California ports of Monterey and Moss Landing and the Southern California port in San

Pedro. The gear type traditionally used in the CPS fishery is a purse seine. Typical purse seine nets measure 185 fathoms long, 22 fathoms wide and 1,600 meshes deep with 1 ¼ inch mesh (Lutz and Pendleton, 2000).

The Pacific sardine fishery in Oregon operates as a day fishery with vessels based primarily in Astoria where processing plants for sardine operate. Many vessels utilize aircraft to assist in locating schools of sardine and setting their nets when weather permits. Weather and tides are major factors in fishing operations and timing of vessels transiting in and out of the Columbia River. The Pacific sardine fishery off Oregon started in 1935, but there are recorded landings of sardine in Oregon dating back to 1928. The catch dropped off in the 1940s with 1948 being the last year of directed fishery landings until 1999 when the fishery was revived. Pacific sardine was managed as a developmental fishery from 1999 to 2005. In 2004, the sardine industry asked ODFW to remove Pacific sardines from the developmental species list and create a LE system for the fishery. ODFW began work with the Developmental Fisheries Board and the industry to develop alternatives for the fishery. In December 2005, the Oregon Fish and Wildlife Commission (OFWC) moved the Pacific sardine fishery from a developing fishery into a state-run LE fishery system. Twenty Oregon permits were initially established and made available to qualifying participants for the 2006 fishery. The OFWC amended an LE permit eligibility rule in August 2006, which resulted in an immediate addition of six permits for a total of 26 LE sardine fishery permits.

In April 2009 the OFWC enacted a number of rule changes for the Pacific sardine fishery. First, the OFWC modified the requirement for minimum landings of sardines into Oregon to qualify for permit renewal (initially enacted in 2006). The minimum landing requirements for permit renewal are now effective only when the federal coastwide maximum HG for the fishing year exceeds 100,000 mt. The minimum landing requirements, either a minimum of ten landings of at least five mt each or landings totaling at least $40,000 ex-vessel price, were not changed. Next, the OFWC eliminated a rule that became effective in 2008, which specified that permit holders must either own or operate a vessel that is permitted. The OFWC also established a lottery system for sardine permits. If the number of permits issued falls below 24 a lottery may be held the following year, but the total number issued shall not exceed 26 LE permits. Finally, a new rule defined catching vessels and limited catch sharing to catching vessels with state LE sardine permits. Of the 25 permits available in 2013, 14 vessels actively fished in the 2013 fishery.

Pacific sardines are the primary coastal pelagic species harvested off the state of Washington. From 2000 through 2009, participation in the sardine fishery was managed under Washington's Emerging Commercial Fishery Act (ECFA), which provides for the harvest of a newly classified species or harvest of a classified species in a new area or by new means. In 2003, to address management needs of the fishery, a formal Sardine Advisory Board (Board) was created, and the WDFW Director, in collaboration with the Board, advanced the sardine fishery designation from trial to experimental as provided for under the ECFA. The number of experimental fishery permits was capped at 25. The experimental fishery program continued through June 2009. Besides limiting participation, WDFW also restricted the amount of sardines sold for reduction to a 15 percent season cumulative total by weight by individual vessel.

Pacific sardines are the targeted catch in the Washington fishery, but anchovy, mackerel, and squid can also be retained and landed. In 2011, 2012, and 2013 mackerel was the only other coastal pelagic species landed, fluctuating from 0.42 mt in 2011 to 636 mt in 2012 to 196 mt in 2013.

During the 2009 Washington State legislative session, WDFW proposed legislation to establish a commercial license limitation program specifically for the harvest and delivery of Pacific sardines into the state. The legislation was passed into rule in July 2009. The new rules established 16 licenses to be issued to holders of a 2008 sardine experimental fishery permit only, with an exception for past participants of the experimental fishery that became ineligible because of loss of their vessel at sea. These newly created sardine licenses can be sold. In addition, the new rule provides criteria for the issuance of temporary annual permits at the discretion of the WDFW Director. In combination, the number of permanent and temporary annual licenses cannot exceed 25. Of the 16 licenses issued in 2011 seven were actively fished in the 2011 fishery. In 2012, 9 of the 16 Washington limited entry licenses were actively fished, as was one temporary annual permit issued for 2012. In 2013, 15 Washington limited entry licenses were issued.

A description of the affected socioeconomic environment and further economic analysis of this action can be found in Section 7.

3.5 TRIBAL FISHERIES

Treaties between the United States and Pacific Northwest Indian Tribes reserve the rights of the Tribes to take fish at usual and accustomed fishing grounds. The Pacific Fishery Management Council's Coastal Pelagic Species Fishery Management Plan (CPS FMP), as amended by Amendment 9 and codified in National Marine Fisheries Service (NMFS) regulations (50 CFR 660.518), outline a process for the Council and NMFS to consider and implement tribal allocation requests for CPS.

The Quinault Indian Nation requested that for the 2014-2015 fishing season NMFS provide the Quinault Indian Nation with the exclusive right to harvest 4,000 mt (2,000 mt less than in 2013) of Pacific sardine in their Usual and Accustomed Fishing Area off the coast of Washington State, pursuant to the 1856 Treaty of Olympia (Treaty with the Quinault). In 2013, through consultation, 6,000 mt of Pacific sardine were set-aside for the Quinault Indian Nation with the expectation that two Quinault fishing vessels would participate in the fishery. In 2013, in part because only one Quinault vessel fished, out of the expected two, the Tribe harvested only 586 mt. For 2013, the Tribe expects that two Quinault vessels will fish actively for sardine. The Quinault usual and accustomed fishing area (U & A) is defined in § 660.50(c)(4) as "That portion of the Fishery Management Area between 47°40.10' N. lat. (Destruction Island) and 46°53.30' N. lat. (Point Chehalis) and east of 125°44' W. long." This represents an area directly off Westport/Gray's Harbor, Washington, and waters to the north of this area. This area is also regularly fished by the non-tribal commercial fishery.

While a large proportion of the sardine stock off the West Coast may pass through the Usual and Accustomed Fishing Area (U&A) of the Quinault in some years, the requested amount for 2014-2015, as in 2013, was not based on a scientific determination of their precise treaty share under

current conditions. In future years, the precise amount provided under the treaty will have to be more fully examined.

4.0 ANALYSIS OF ALTERNATIVES

This chapter describes anticipated impacts of the alternatives on fish resources, habitat, protected resources, and the socio-economic environment. Table 1 below depicts fishery performance measures of the action alternatives.

Table 1. Fishery performance measures of action alternatives.

Alternative	**2**	**3a**	**3b**	**3c**
HG FRACTION (%)	5-15	10-20	5-20	0-20
OFL E_{MSY} (%)	0-25	0-25	0-25	0-25
CUTOFF	150	150	150	150
MAXCAT	200	200	200	200
Performance Measures				
Biological				
Mean B1+ (SD)	1220 (888)	1182 (883)	1186 (882)	1187 (881)
Mean SSB (SD)	945 (757)	911 (753)	915 (752)	916 (751)
%B1+>400	92	91	92	92

Median catch	97	107	107	107
Mean catch all (SD)	106 (73)	112 (75)	111 (75)	111 (76)

4.1 EFFECT ON PACIFIC SARDINE FISH RESOURCES

4.1.1 ALTERNATIVE 1 – NO ACTION

This Alternative is based on the Scripps Institution of Oceanography (SIO) Temperature Index and an HG FRACTION range of 5-15%. Amendment 8 of the CPS FMP adopted a harvest policy for Pacific sardine that included a SST temperature-dependent exploitation factor as a biological indicator of stock status/productivity. The SIO temperature time series has provided SST for use in the HCRs. In 2013 an evaluation of SST indexes found that the 1984-2008 CalCOFI SST time series provides the best fit for the sardine recruitment – environment relationship (PFMC 2013). This temperature index was found to track more closely with other SST time series and is more geographically representative of the sardine recruitment environment than the current SIO pier index. This finding was subsequently endorsed by the PFMC SSC.

Under the No Action alternative, FRACTION in the HG would continue to rely on SIO which has been deemed less representative of current ocean conditions. The effect on fish resources is difficult to calculate because impacts to the resource will vary with biomass and temperature. In general, the effect of the No Action alternative, by relying on a weaker indicator of stock productivity, may be to increase management uncertainty.

4.1.2 ALTERNATIVE 2 – NEW TEMPERATURE INDEX AND MAINTAIN EXISTING BOUNDS ON FRACTION (5-15%)

This alternative replaces the temperature index from SIO with CalCOFI but maintains the existing bounds on FRACTION. Noteworthy is the high depletion value of 78% (Table 1). [2] By comparison, depletion under Amendment 8 was 64%. Unlike the FRACTION bounds adopted under Amendment 8, FRACTION bounded at 5-15% based on CalCOFI does not bracket the mid-range of temperatures vs E_{MSY}. Nor does it encompass stochastic E_{MSY} which was 0.12 under Amendment 8 analyses compared to the more-recently computed stochastic E_{MSY} 0.18 (Hurtado-Ferro and A. E. Punt. 2014). As a consequence, Alternative 2 is a very conservative harvest policy under all conditions. For example, with biomass (1+) at 370,000 mt and CalCOFI SST at 15.3 (2014-2015 estimates, rounded) the effective harvest rate is approximately 6%. In comparison, with a biomass of 700,000 and the same CalCOFI temperature, the harvest rate increases to 8%. The harvest rate with this latter biomass and SST of 16.7 degrees (representing warmer conditions) is 10%.

4.1.3 ALTERNATIVE 3 – NEW TEMPERATURE INDEX AND REVISE BOUNDS ON FRACTION

This alternative describes the effect of changing the bounds on FRACTION. Like Alternative 2, this alternative also is based on the recommended CalCOFI temperature index. Overall, the effects of the various FRACTION bounds on fish resources are not markedly different because at a given biomass and E_{MSY} between 10 and 20 percent, each alternative will produce the same result. The biological performance measures presented in Table 1 illustrates the similarity among and between the different bounds for FRACTION.

Alternative 3a - FRACTION 10-20%

Adjusting the HG FRACTION from 5-15% to 10-20% mirrors the increase from stochastic Emsy of 0.12 in Amendment 8 to 0.18 based on the updated analysis and new operating model (Hurtado-Ferro and A. E. Punt. 2014). This increase in E_{MSY} reflects a statistically identified increased productivity and therefore the ability of the stock to withstand a higher average fishing rate. Additionally, a FRACTION that ranges from 10-20% also better reflects the mid-range of actual measured temperatures and aligns with CalCOFI temperatures and the temperature vs E_{MSY} relationship in a manner similar to the where the 5-15% range fell relative to SIO temperatures. Bounding Fraction at 10-20% permits higher harvest rates to take advantage of periods when

[2] Depletion refers to the portion of the population remaining after harvest (i.e., the percentage of fish left in the ocean after harvest). Thus, higher depletion values are considered desirable from a fishery resource perspective.

biomass and productivity are high and restricts harvest when biomass and productivity are low, in a manner similar to the No Action Alternative, thereby preserving current harvest policy. Additionally, although the lower bound in this scenario would increase from 5% to 10% compared to alternative 2, during low biomass and presumably less productive conditions, this lower bound still limits fishing to only a 5% effective harvest rate (Figure 3).

Alternative 3b - FRACTION 5-20%

This alternative blends Alternative 2 and Alternative 3a by maintaining a lower bound of FRACTION at 5% and increasing the upper bound from 15% to 20%. By increasing the FRACTION term up to 20%, this alternative also accommodates the increase in stochastic E_{MSY} from 0.12 to 0.18. By extending the range of FRACTION to 20%, this alternative is similar in effect to the No Action Alternative but increases harvest opportunity compared to Alternative 2 when environmental conditions are favorable. In maintaining the lower FRACTION bound at 5% the effect of this alternative under cooler regimes is more similar to Alternative 2 than the No Action Alternative.

Alternative 3c - FRACTION 0-20%

Under Alternative 3c, the bounds for Fraction in the HG control rule are the broadest of all the options, 0-20%. The upper bound of 20% captures the adjustment for the change from the SIO to the CalCOFI temperature index described previously, so like alternatives 3a and 3b, it allows increased harvest rates to take advantage of years when environmental conditions are favorable and biomasses are high. However, the lower bound of 0% is more conservative and restricts harvests to a greater degree under unfavorable environmental conditions and low biomasses above CUTOFF than any of the other alternatives. A FRACTION of 0-20% means the HG will always be lower than the OFL and ABC control rules at all P* values (Figure 4). The HG, therefore, represents the maximum allowable harvest at all stock sizes and temperature conditions.

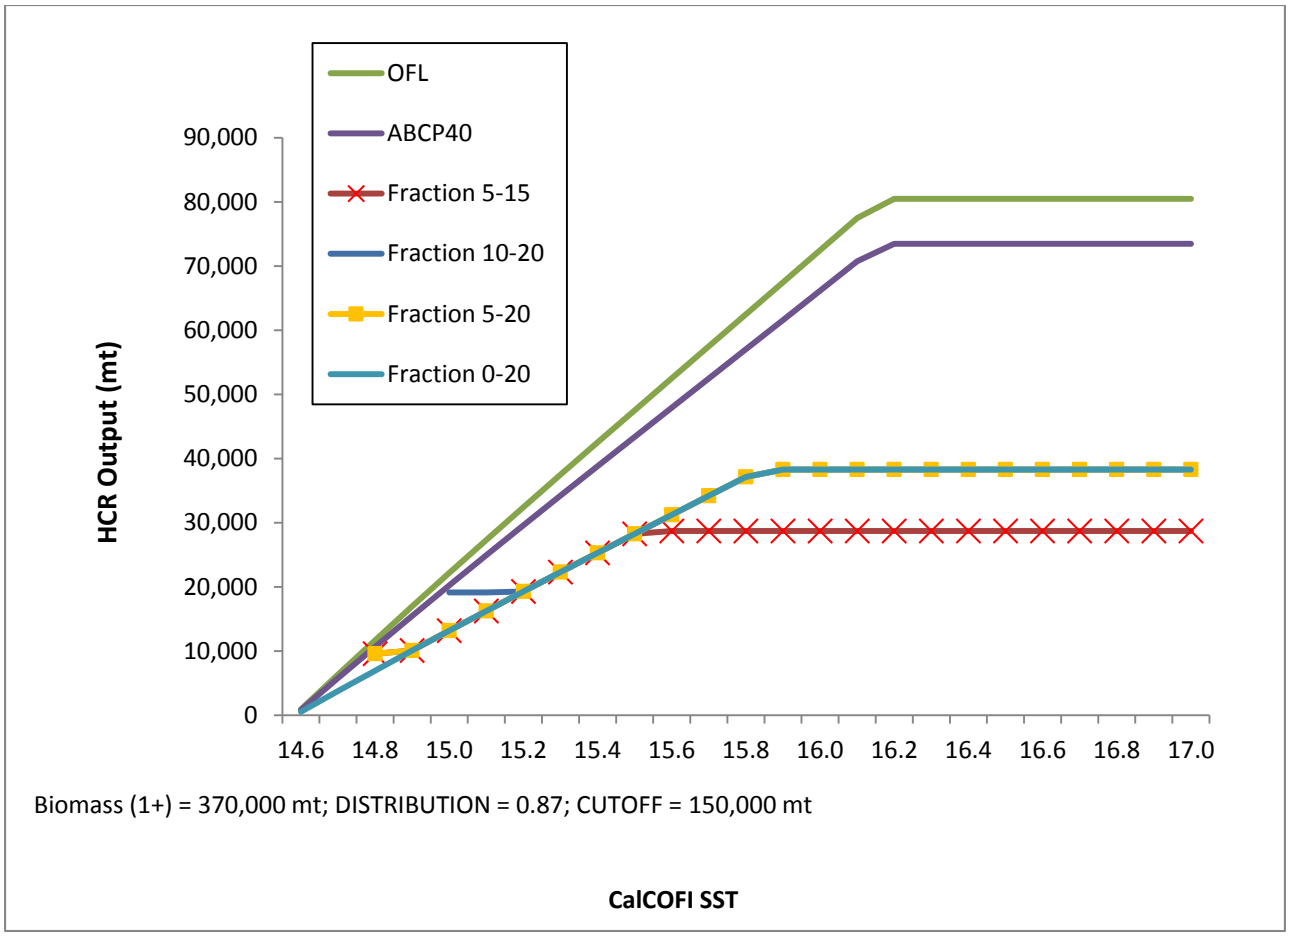

Figure 3. An illustration of harvest control outputs: OFL, ABC P*40 and HG with varying FRACTION bounds.

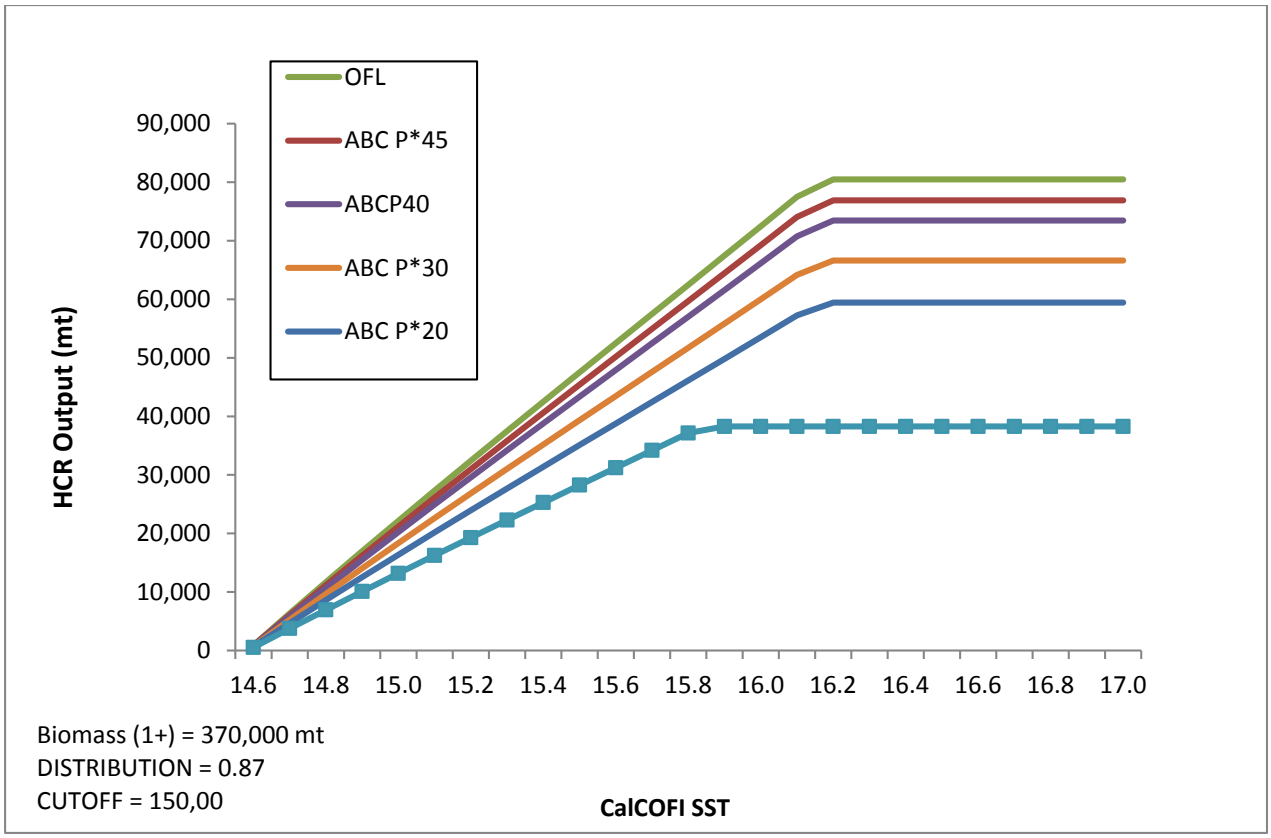

Figure 4. An illustration of harvest control rule outputs: OFL, ABC at various P* values and the HG when FRACTION is bounded 0-20%.

**Note: Sections 4.2 (Effects on Habitat and Ecosystem Resources), 4.3 (Effects on Protected Species), 4.4 (Effects on Socio-economics), 4.5 (Cumulative Effects), and other relevant information to be added later.*

COASTAL PELAGIC SPECIES ADVISORY SUBPANEL REPORT ON PACIFIC SARDINE HARVEST FRACTION

The Coastal Pelagic Species Advisory Subpanel (CPSAS), in joint session with the Coastal Pelagic Species Management Team (CPSMT), received a briefing from Ms. Lorna Wargo on CPSMT analyses regarding sardine harvest fraction. The CPSAS commends the CPSMT for their work in producing a preliminary draft Environmental Assessment (EA), *Incorporating the Use of a New Temperature Index into the Calculation of the Pacific Sardine Harvest Guideline Formula*.

The CPSAS continues to support the harvest Fraction range of 10-20 percent using the new California Cooperative Oceanic Fisheries Investigations (CalCOFI) temperature index, as first recommended by the CPSMT in March. This is represented by Alternative 3a in the preliminary draft EA.

We support Alternative 3a for the following reasons, as set forth in the draft EA (direct excerpts highlighted with quotation marks):

- "sardine management post-Amendment 13 became more precautionary, particularly in cooler and low biomass conditions."
- This added precaution is also illustrated by depletion levels. The policy initially approved by the Council under Amendment 8 produced a depletion of 64 percent. All the alternatives shown in Section 4, Table 1 of the draft EA (page 18) provide depletion rates ranging from 75 to 78 percent.
- "…a FRACTION that ranges from 10-20 percent also better reflects the mid-range of actual measured temperatures, and aligns with CalCOFI temperatures and the temperature vs. Emsy relationship." This is comparable to the 5-15 percent relationship using the SIO temperature index. The 10-20 percent fraction range provides for more harvest opportunity when biomass and productivity are high, and still restricts harvest when biomass is low, "…thereby preserving current harvest policy."
- There is no significant difference in biological performance measures among all the alternatives in Table 1.
- The lower bound [at 10 percent fraction] "still limits fishing to only a 5% effective harvest rate (Figure 3)."

It is important to consider CUTOFF in the harvest control rule, which effectively accelerates reduction of the fishing rate as biomass declines. In addition, the overlay of the acceptable biological catch (ABC) rule on the harvest guideline (HG) control rule during low temperature/low biomass years would further constrain harvest opportunity to protect the stock.

As the CPSAS noted in our March 2014 supplemental report to the Council, decisions regarding fisheries management require a balance. Alternative 3a achieves the goals and objectives of the CPS Fishery Management Plan, namely to:

- Prevent overfishing
- Achieve optimum yield
- Promote efficiency and profitability in the fishery, including stability of catch
- Provide adequate forage for dependent species

In conclusion, the CPSAS supports the CPSMT recommendation of Alternative 3a as the best option to preserve balance between fishing opportunity and ecosystem needs. The CPSAS recommends that the Council adopt alternative 3a as the preliminary preferred alternative.

Environmental Assessment Incorporating the Use of a New Temperature Index into the Calculation of the Pacific Sardine Harvest Guideline Formula

CPSMT, NMFS, PFMC

September 12, 2014
Spokane, Washington

Background

- Sardine harvest control rules (HCR) include a temperature-dependent parameter
- CalCOFI temperature index recommended; endorsed by SSC and Council
- Hurtado-Ferro and Punt: New simulation model, management scenarios
- March 2014: CPSMT Harvest Parameter Report; Council requested additional scenarios for modeling FRACTION
- April 2014: CalCOFI temperature index used to calculate OFL for 2014-2015 fishing year

Purpose and Need

Purpose – The purpose of this action is to change the temperature index from SIO to CalCOFI for purposes of calculating the FRACTION component of the Pacific Sardine harvest guideline (HG), while maintaining consistency with the Council's harvest policy approach.

Need – The need for this action is to use the best temperature index in the temperature- productivity relationship in the HG control rule.

Harvest Control Rule Framework

- OFL = Biomass * E_{MSY} * DISTRIBUTION

- ABC = Biomass * E_{MSY} * DISTRIBUTION * BUFFER

- Harvest Guideline
  (HG) = (BIOMASS – CUTOFF) * FRACTION * DISTRIBUTION
  HG FRACTION bounded at 5 – 15% of E_{MSY}

By policy
- ACT = HG or ABC, whichever is lower

Alternative 3 – New Temperature Index (CalCOFI); Revise bounds on FRACTION

3a. FRACTION 10-20%

- Mirrors increase from stochastic Emsy of 0.12 in Amend 8 to current 0.18
- Better reflects mid-range of actual measured temperatures

3b. FRACTION 5-20%

- Blends Alt 2 and Alt 3a
- Accommodates the increase in stochastic Emsy
- More restrictive harvest at lower temperatures

3c. FRACTION 0- 20%

- Captures current stochastic Emsy
- Lower bound restricts harvest more than other alternatives at low temperature and biomass

Questions?

COASTAL PELAGIC SPECIES MANAGEMENT TEAM REPORT ON PACIFIC SARDINE HARVEST FRACTION

In March 2014, the Coastal Pelagic Species Management Team (CPSMT) presented a report that considered how use of a new sea surface temperature (SST) index for Pacific sardine management would maintain or deviate from existing policy. In addition to recommending use of the California Cooperative Oceanic Fisheries Investigations (CalCOFI) temperature index to replace the Scripps Institution of Oceanography (SIO) pier index, the CPSMT recommended modifying the FRACTION bounds for the harvest guideline (HG) harvest control rule (HCR) from 5-15 percent to 10-20 percent as consistent with the current harvest policy and control rule.

At the March 2014 meeting, the Council adopted the new CalCOFI index and temperature-productivity relationship to calculate the annual overfishing limit (OFL) and acceptable biological catch (ABC) for implementation in April 2014, when management for sardine was determined for the fishing year beginning July 1, 2014. To accommodate regulatory timelines, the harvest guideline (HG) FRACTION continued to include the SIO index for the 2014-2015 fishing season.

The March report analyzed two options for FRACTION: 5-15 percent and 10-20 percent. The Council also requested analyses of alternate HG FRACTION bounds of 5-20 percent and 0-20 percent, to consider in addition to the recommended 10-20 percent option. The CPSMT submitted a preliminary draft Environmental Assessment (EA) for this meeting that examines all of these alternatives (Agenda Item C.1.a, Attachment 1).

Additional analyses of the alternatives in the EA show very little difference among Alternatives 2 and 3a-c (Table 1 of the EA, below). Results for biological and economic performance measures are very similar, reflecting little influence of low-bounding the HG FRACTION at 0 or 5 percent on long-term results compared to 10 percent. This is due to the precautionary effect of the ABC and HG control rule interaction under lower temperatures and biomass.

At the March 2014 Council meeting, the CPSMT report (March Agenda Item I.1.c), the CPSMT recommended HG FRACTION bounds of 10-20 percent to better reflect both the increased productivity of the sardine stock (stochastic E_{msy} increased from 12 percent under Amendment 8 to 18 percent in the new model), and to more closely align with observed temperature ranges as seen with the 5-15 percent range under SIO temperatures (see Figures 1 and 2 from the March 2014 report, below). For these reasons, and the similarity of simulation results for the alternatives, the CPSMT continues to support Alternative 3a as consistent with existing harvest policy.

The HG is but one control rule used for management, interacting with the others to conservatively manage the Pacific sardine stock. Based on analyses to date, the CPSMT believes the change in temperature index to CalCOFI and the team's recommendation of Alternative 3a will maintain the Council's precautionary approach in adopting the suite of HCRs (OFL, ABC, HG) under Amendments 8 and 13 of the Coastal Pelagic Species Fishery Management Plan, including accounting for scientific and management uncertainty.

The CPSMT recognizes the importance of regular evaluation of the SST index. Reviews of the index should be periodically conducted to ensure best available science is used in determining sardine HCRs.

The CPSMT understands that the SSC has recommended additional analyses. The CPSMT is willing to consider these SSC recommendations; however, the team does not believe additional simulation model runs are necessary for Council action on this issue.

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON THE PACIFIC SARDINE HARVEST FRACTION

Ms. Lorna Wargo of the Coastal Pelagic Species Management Team (CPSMT) presented the preliminary draft of the Environmental Assessment (EA) and additional analyses conducted by the CPSMT. Mr. Josh Lindsay was present for the discussion as well.

The Scientific and Statistical Committee (SSC) supports the change to using the 3-year moving average of the CalCOFI temperature index for the harvest guideline (HG), as was done for the overfishing limit (OFL) control rule adopted by the Council in March 2014. In order to fully evaluate the impact of this change and the Alternatives presented, however, Table 1 in the EA should include a column for Alternative 1 (the No Action Alternative). To produce this column, a simulation needs to be conducted using the current harvest control rules (including OFL, acceptable biological catch [ABC] and HG rules), including the temperature data from Scripps Institute of Oceanography (for the HG) as well as that from CalCOFI (for the OFL, ABC, and to drive the biological simulation) for the same time period used as the basis for simulations of the other Alternatives. The SSC expects that the results of this analysis will be generally similar to Scenario New8 (=Variant 22) in the "Revised Analyses Related to Sardine Harvest Parameters" (Agenda Item I.1.b, Revised Analyses, March 2014).

The analyses in the EA are based upon a single combination of P* and sigma. Alternative values of these parameters should be considered to expand the range of ABC control rules that are analyzed. For example, a P* of 0.25 with a sigma of 0.72 could be considered.

The table of species listed as endangered or threatened under the ESA should be revised. For example, the eastern distinct population segment of Steller sea lions is no longer listed as threatened under the ESA; and yelloweye rockfish is listed only in Puget Sound.

RE: Agenda Item C.1. Pacific Sardine Harvest Fraction

Dear Ms. Lowman and Council members,

As Executive Director of the California Wetfish Producers Association (CWPA), representing the majority of coastal pelagic species 'wetfish' fishermen and processors in California, I appreciate your consideration of the following points in the continuing discussion regarding modifications to the sardine harvest control rule (HCR). This letter reprises highlights of earlier CWPA comments, and those of Dr. Richard Parrish, submitted in March 2014 (Agenda Item I.1.d.) and April 2014 (Agenda Item H.1.d.).

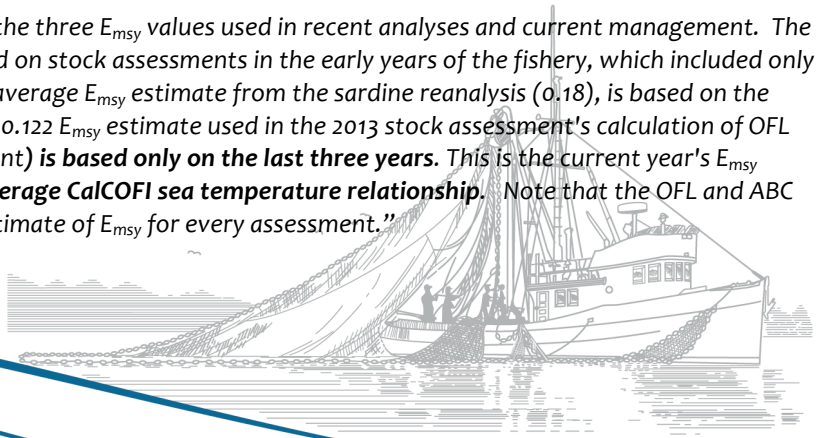
Council action at this meeting is to adopt a preliminary preferred alternative for the Pacific sardine harvest fraction. At the March meeting the CPS Management Team and Advisory Subpanel supported a 10-20% range of harvest fractions, as consistent with Amendment 8 policy, bracketing the new E_{msy} of 18% produced in the reanalysis conducted by Felipe Hurtado.

I appreciate the Council's consideration of the following information specific to the reanalysis of the Amendment 8 HCR provided by Dr. Richard Parrish, an architect of the original sardine HCR who attended both the sardine harvest parameters workshop and subsequent CPSMT meetings, including the January 2014 Management Team meeting.

In summary, I highlight these points from Dr. Parrish's March 2014 statement:
"*…, I note that the CPS management team attempted to strike a balance by recommending the harvest fraction range in Scenario L (10-20%) to account for higher productivity.*"

"The bottom line is that all of the scenarios in the CPSMT's Table 2 are much more conservative than HG J in Amendment 8; median catch levels are far lower and average depletion levels are considerably higher."

And here is a comment from his April 2014 statement:
" *There is likely to be considerable misunderstanding of the three E_{msy} values used in recent analyses and current management. The Amendment 8 estimate of average Emsy (0.12) was based on stock assessments in the early years of the fishery, which included only the first few years of the rebuilding period. The revised average E_{msy} estimate from the sardine reanalysis (0.18), is based on the recent years of increased stock productivity. Finally, the 0.122 E_{msy} estimate used in the 2013 stock assessment's calculation of OFL and ABC (page 12 of the most recent assessment document)* ***is based only on the last three years****. This is the current year's E_{msy} estimate and it is* ***calculated from the new three-year average CalCOFI sea temperature relationship****. Note that the OFL and ABC calculations will have a different, temperature-based, estimate of E_{msy} for every assessment."*



One further point, analysis of the 0-20% and 5-20% fraction range requested by the Council vs. the CPSMT recommended 10-20% fraction showed no significant improvement in ecosystem benefits if the F range were changed either to 0-20% or 5-20%, but there would be an obvious impact on harvest potential over time.

Again, we ask the Council to consider that achieving **Optimum Yield requires balance: considering both fishery opportunity and economic stability as well as forage needs.**

Following are selected excerpts from Dr. Parrish, submitted in March 2014 (I.1.d, Public Comment, March 2014), as well as CWPA comments also submitted in March, both provided in reference to the full discussion of the future of Pacific sardine fishery management:

EXCERPTS
Comments on the Sardine Re-Analysis
Richard Parrish
(Please note that direct quotes are highlighted in italics. Emphasis added.)

Results from January 2014 CPSMT Meeting:

- *"There has been little discussion in any of the recent sardine analyses regarding the optimum depletion level for sardine – one that balances ecosystem values with socio-economic values.* ***The revised analysis shows that the sardine population is considerably more productive than earlier thought, as seen in the large increase in average depletion with HG J [Amendment 8] (i.e. Scenario B Base Case; 64% to 78%.) …"***

- *"The scenarios in the CPSMT's Table 2 have a very narrow range of options with no change in either CUTOFF or MAXCAT. The average depletion in these scenarios range from 73% (Scenario O) to 78% (Scenario B). The median catch for these scenarios range from 97-110 TMT; all well below the 182 TMT predicted in Amendment 8. There was no attempt to develop a policy with higher median catch; this would require reductions in MAXCAT and possibly CUTOFF. Therefore I would not personally recommend any of the proposed policies.* ***However, I note that the CPS management team attempted to strike a balance by recommending the harvest fraction range in Scenario L (10-20%) to account for higher productivity."***

"The bottom line is that all of the scenarios in the CPSMT's Table 2 are much more conservative than HG J in Amendment 8; median catch levels are far lower and average depletion levels are considerably higher."

Predictions for the Future of the Sardine Fishery

" There have been numerous predictions made by several NGOs, and others, that the sardine population is going to collapse in a manner similar to the collapse that occurred in the mid-1900s. In addition, it has been suggested that the Scripps Pier sea temperatures are no longer a predictor of reproductive success in sardine. This report is an attempt to place the present situation in context with what is known about the northern population of sardine in the California Current. "

Stock Structure:

"It has been generally accepted that the California Current sardine stock can be divided into three fishery stocks (Clark 1947, Felix-Uraga et al 2005). Recent evidence (Felix-Uraga et al. In Press) confirms that there are three fishery stocks; two in the California Current (i.e. the northern or 'cold' stock and the southern or 'temperate' stock) and one in the Gulf of California (i.e 'warm" stock)."

Distribution:

"During the period of 1981-2012 sardine landings totaled 8,833,602 mt; 18.3% from the 'cold' stock, 16.0% from the 'temperate' stock and 65.7% from the 'warm' stock (Felix-Uraga et al. In Press). The dividing line between the northern and southern stocks is in the Southern California Bight and it moves seasonally in association with the 17 C isotherm. The 1981-2012 landings data in the above study suggest that 65.3% of the Ensenada, Mexico landings and 35.1% of the landings in Southern California were from the 'temperate' (i.e. southern) stock."

History of Exploitation and Collapse of the Northern Sardine Stock:

"The maximum observed sardine biomass, 3.894 million tons, occurred at the start of the 1931-32 fishing season (MacCall 2013) and the peak fishery occurred in the 1936-7 season when 791,334 tons were landed in the US and Canadian fisheries (Murphy 1966).

The second peak in sardine landings occurred in the 1941-2 season with an age 2+ biomass of 2.458 million tons. ***Over the two decades there was no regulation of either total catch or effort and by the end of the 1962-3 season the biomass fell to 0.021 million tons (Figure 1). The exploitation rate over this period averaged 43% with a maximum of 87% in the 1961-2 season****. MacCall (1979) used a simple, but logical, population analysis to show that the sardine population would not have gone below about 1 million tons if it had been fished at a constant fishing mortality rate of F=0.25 (i.e. an exploitation rate of 22.1%) or a constant annual catch of 300,000 tons. "*

"Hill (2013) reported that the total exploitation rate of age 0+ sardines ranged from 10.43% to 24.98% during calendar years 2000-12; and the average for these years was 13.63%; the corresponding values for the US portion of the fishery was 5.57% to 14.85% and 7.84%. ***A moderate portion of the 200-2012 landings were southern stock sardine so the actual average coastwise exploitation rate is undoubtedly somewhere between the 7.84% and 13.63% values.***

It therefore appears that the exploitation rate on the northern stock during the 2000-12 period was less than one quarter of the rate observed during the historical collapse of the sardine. "

Management:

"*The historical collapse of the Pacific sardine fishery occurred during a period when there was no regulation of annual landings or fishing effort. The present US fishery is regulated with both limited entry and an annual catch quota that automatically reduces the exploitation rate when the biomass decreases or cold environmental conditions in the southern nearshore area (i.e. Scripps Pier).* *The Canadian fishery is managed with an annual quota based on in-year biomass surveys and the Mexican fishery is primarily based on the southern (temperate) and Gulf of California (warm) stocks. "*

Environmental Conditions:

"Has time invalidated the original (Jacobson and MacCall 1995) temperature-dependent spawner-recruit model? MacCalls (2013) R- non-linear and linear fits to the ln(R/S) model with SIO SST T3 both have an R-squared of 0.39 with 61 years of data. The same model with the ERSST time series has an R-squared of 0.27. The original linear fit to the ln(R/S) model had an R-squared of 0.27 with 34 years of data (Jacobson and MacCall 1995). Clearly the new Scripps Pier time series is a better descriptor of sardine recruitment than either the original, shorter time series, or ERSST the other long-term SST time series examined. "

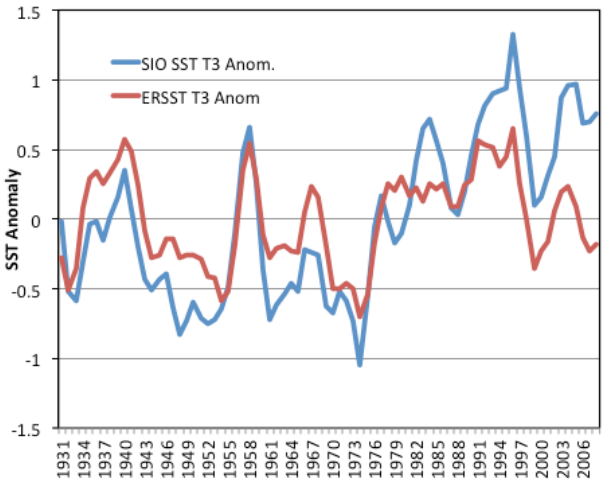


Figure 2. SST anomalies for 3 year average Scripps Pier and Extended Reconstructed sea surface temperatures (1931-2008. (Data from MacCall 2013)

"Obviously the claims that the original model has been 'debunked' are not valid and in fact the statistical fit with the new, and much longer time series, is considerably better than the original.

It is also clear that the SST at Scripps Pier was considerably colder during the collapse of the sardine that occurred in the late 1940s and early 1950s than it is at present and the ERSST had a more extensive negative SST anomaly during the 1943-56 period when the stock collapsed. "

* * *

Dr. Parrish's comments reemphasize a comment acknowledged (albeit quietly) at the sardine harvest parameters workshop – when the historical as well as recent-year sardine fishery data are considered, the long 61-year SIO time series is the better fit.

The use of a truncated time series for sardine to resolve modeling issues has created its own set of problems. The 2011 sardine STAR panel report noted, " *...dropping the early data means that it is no longer possible to assess the state of the stock prior to 1993, which adds to uncertainty about the dynamics of this population and current biomass levels.*

The scarcity of old and large sardines in the data relative to model estimates is a fundamental tension in the assessment that may be due to assumptions about, for example, growth, selectivity, natural mortality, and data weighting."

As I also noted in June 2013, setting the context for this discussion:

- Under the current harvest control rule (HCR), according to the 2012 stock assessment **the US sardine fishery harvested only 5 percent of a VERY conservative biomass estimate, and coast-wide exploitation was slightly over 15 percent**, while **E_{msy} for sardine is currently 18%.** Recent ecosystem modeling efforts (Horne et al 2010, Kaplan et al 2012) estimate **the entire CPS fishery harvest, sardines included, accounts for less than 4 percent of the <u>planktivorous</u> forage pool**, which is only part of the forage available overall. This harvest level is decidedly NOT overfishing, nor harming the ecosystem.

- **Variability characterizes all the indices** used to measure sardine. Survey timing is crucial, and <u>each survey measures only a spot in time</u>. **It is important to maintain multiple surveys, rather than relying on only one**. Industry continues to voice concern that acoustic methods largely miss the upper 10 meters of the water column; the vessel avoidance issue has not been resolved. Nor do current acoustic surveys capture the full extent of the nearshore area, i.e., the beach, where sardines congregate in California.

In conclusion, we recommend the following:

- Adopt the Management Team recommendation of 10-20% as the preferred alternative for the Pacific Sardine Harvest Fraction Parameter
- We reiterate the request to the Council to support the workshop recommendation to review environmental proxies frequently – and in particular, review indices using a 3-year average.
- Now that we're managing the fishery based on the "northern" stock, future work should include reanalysis that incorporates only the northern stock.

Finally, please understand that achieving **OY requires balancing both fishery opportunity and economic stability and forage needs.** We would appreciate the Council's recognition of the continuing importance of the sardine resource to California's historic wetfish industry.

Thank you for your attention to these comments.

Best regards,

Diane Pleschner-Steele

RE: Agenda Item C.1: Pacific Sardine Harvest Fraction

Dear Chair Lowman, Mr. Stelle, and Council members:

Oceana remains deeply concerned about the current collapse of the Pacific sardine population in the California Current as confirmed by the recent 2014 stock assessment. What is more, the reduced availability of this critically important forage species is resulting in a lack of prey for dependent predators. We commend the Council's recent precautionary actions to set 2014-15 catch levels below that specified in the Pacific sardine harvest control rule. These were steps in the right direction. We are writing now to support the proposal to use the CalCOFI 3-year temperature index to set FRACTION in the Pacific sardine harvest control rule. However, we do not support any increase in the harvest FRACTION as recommended by your Coastal Pelagic Species Management Team (CPSMT) March 2014 Report (Scenario K, Table 3).[1] Increasing the FRACTION range would be a step in the wrong direction, and a serious mistake for the future of the Pacific sardine stock, the fishery, and the many animals that rely on sardines as food.

As you know, the sardine harvest control rule is established in the Coastal Pelagic Species Fishery Management Plan (CPS FMP). The harvest level is determined by the following formula:

$$HG = (BIOMASS - CUTOFF) \bullet FRACTION \bullet DISTRIBUTION$$

HG = Harvest Guideline, BIOMASS = estimated 1+ sardine biomass (from the stock assessment), CUTOFF = 150,000 metric tons (mt), FRACTION = 5-15% depending on sea surface temperatures, and DISTRIBUTION = 87% (estimated distribution in U.S. waters). FRACTION is a proxy for F_{MSY} and varies with temperature; a measure of the productivity of the stock during cooler or warmer ocean conditions. The March 2014 CPSMT recommendation proposes to increase the FRACTION range from 5-15% to 10- 20%.

As we have previously brought to the Council's attention, there are serious flaws in the current sardine harvest parameters. These parameters include the use of Scripps Institute of Oceanography Pier (SIO) temperatures as a basis for FRACTION, an excessively high DISTRIBUTION that fails to account for

[1] PFMC CPSMT, at: http://www.pcouncil.org/wp-content/uploads/I1c_CPSMT_RPT_MAR2014BB.pdf

actual sardine catch in Mexico and Canada, a CUTOFF that is far too low to protect the stock from overfishing during periods of low abundance, and a Minimum Stock Size Threshold (MSST) that is inconsistent with the National Standard 1 Guidelines.[2]

As a result, these parameters are failing to prevent overfishing, failing to provide sufficient forage to dependent species, and failing to achieve Optimum Yield (OY). The hundreds of starving sea lions, brown pelican nesting failures, and the lowest sardine landings in decades all provide direct evidence of this management failure.

Our position remains that the Pacific sardine harvest control rule should be modified in the following ways:

1. Use the CalCOFI 3-year temperature index to set FRACTION levels not to exceed 15%.
2. Increase the CUTOFF to 640,000 mt or greater to provide adequate forage, prevent overfishing, and ensure sustainable fisheries when sardines are abundant.
3. Address the fact that neither Mexico nor Canada follow the U.S. harvest control rule by correcting the distribution parameter, accounting for foreign catch in CUTOFF, and/or developing a tri-national agreement governing catch to ensure coastwide target catch levels are not exceeded.
4. Set MSST at one half of average B_{MSY} levels as per the National Standard 1 guidelines[3], using best available scientific models.

We would only support an increase in the upper range of FRACTION to 20%, provided that CUTOFF is concurrently increased to 500,000 mt or greater. This combination would result in a more conservative harvest rule that would allow greater precaution in years of low abundance when fishing pressure has the greatest impacts to the Pacific sardine population, while maintaining high catch levels when the stock is more abundant and robust to fishing pressure. However, in the absence of a CUTOFF greater than 500,000 mt, we adamantly oppose any increase in the FRACTION range from status quo levels, as this would constitute a more aggressive harvest policy.

We appreciate the Council convening a Sardine Parameters workshop in February 2013, which provided a key scientific conclusion that the CalCOFI 3-year average temperature is the best available proxy for sardine productivity. As such, we wholeheartedly support replacing the SIO index with the CalCOFI 3-year average as the appropriate index to determine where in the range between 5-15% to set FRACTION. There is no reason, however, that the adoption of the CalCOFI 3-year average temperature index necessitates a change in the FRACTION range. In fact, the March 2014 CPSMT report (Figures 1 and 2) indicates that under the CalCOFI index, the FRACTION would be set at the higher end of this range more often than under the SIO index.[4] Without a significant increase in CUTOFF, any increase in the upper bound of FRACTION is a more aggressive, less precautionary management regime than the status quo.

---

[2] 50 C.F.R. § 600.310(e)(2)(ii)(B). MSSTs must be expressed in terms of spawning biomass or other measure of reproductive potential and should equal *whichever is greater*: one-half the MSY stock size, or the minimum stock size at which rebuilding to the MSY level would be expected to occur within 10 years.
[3] Id.
[4] PFMC CPSMT, at: http://www.pcouncil.org/wp-content/uploads/I1c_CPSMT_RPT_MAR2014BB.pdf

While we understand the CPSMT's argument that the addition of more recent data results in a new understanding of the productivity of the stock, considering the current dire status of the sardine stock, now is not the time to be making the harvest policy more aggressive by increasing the upper bound of FRACTION. According to the most recent stock assessment, the Pacific sardine population has declined by 74% over the last 7-year period, and fishery removals account for the bulk of this decline as recruitment is the lowest it has been in decades.[5]

Recent scientific findings by NOAA scientists indicate that the California sea lion Unusual Mortality Event of 2013, where over a thousand pups were stranded on Southern California beaches, was caused by the lack of sardines. According to NOAA's Office of Protected Resources:

> *"Our findings to date indicate that a likely contributor to the large number of stranded, malnourished pups was a change in the availability of sea lion prey, especially sardines, a high value food source for nursing mothers…. while other prey were available (market squid and rockfish), these may not have provided adequate nutrition in the milk of sea lion mothers supporting pups or for newly-weaned pups foraging on their own. Although the pups showed signs of some viruses and infections, findings indicate that this event was not caused by disease rather by the lack of high quality, close-by food sources for nursing mothers."*[6]

In addition, California brown pelicans breeding in the Channel Islands have undergone a decline in reproductive success since 2010, culminating in major nesting failures in 2012 and 2013.[7] Moreover, unusual adult brown pelican stranding events during the non-breeding season on the California and Oregon coasts were observed in 2009-2010. These unusual events were attributed to the lack of prey availability during the breeding season and attributed primarily to starvation.[8] This situation appears to have worsened with complete range-wide breeding failure for the first time ever, reported in 2014.[9] Although sardines comprised 25%-67% of the diets of breeding pelicans in six years of surveys that took place at the Channel Islands between 1991 and 2005, they have been absent from the diets of breeding pelicans in recent years.[10] Biologists have noted that in the absence of contaminant, disease, or disturbance effects, local prey availability during the breeding season is most likely the primary driver of these reproductive failures.[11]

It is the responsibility of the Pacific Fishery Management Council to ensure a forage reserve for brown pelicans. The Federal Register notice of removal of the brown pelican from the Endangered Species List notes that:

> *The Coastal Pelagic Species Fishery Management Plan (CPSFMP) will continue to ensure that adequate forage is available to pelicans if economic conditions change and northern anchovies become more intensively fished. The CPSFMP will also ensure that other forage fishes used by pelicans, such as Pacific sardines and Pacific mackerel, are also managed to preserve adequate forage reserves….*[12]

Ultimately, the harvest control rule established in the CPS FMP governs the long-term yield from the sardine stock. As such the harvest control rule is the mathematical mechanism through which NMFS and the Council should achieve Optimum Yield (OY). The FMP states that FRACTION builds in OY considerations by accounting for changes in sardine productivity with changing oceanographic conditions.[13] Any policy decision to modify FRACTION then, is a reconsideration of OY, and would require an FMP amendment that assesses and specifies OY. If the Council choses to modify the sardine harvest control rule beyond simply the adoption of the CalCOFI index, we expect that OY specification will be an integral component of such an FMP amendment, including a thorough examination of the ecological, social, and economic factors to be considered and incorporated into the harvest guideline.

To summarize, we request the Council adopt the CalCOFI 3-year average as the index to set FRACTION, without increasing the FRACTION range. This would remedy a scientifically identified deficiency. Any other changes to the harvest control rule would constitute a reconsideration of the harvest policy and a reconsideration of OY. Should the Council make any policy changes to the harvest control rule, we ask that you make the rule more conservative, and remedy the deficiencies in the existing harvest control rule that we have identified above. Such changes would greatly benefit California fisheries and wildlife for generations to come.

Sincerely,

Geoffrey Shester, Ph.D.
California Campaign Director

cc. Chuck Bonham, Director, California Dept. of Fish and Wildlife

---

[12] 74 Fed Reg. (November 17, 2009). Rules and Regulations. 50 CFR 17 Endangered and Threatened Wildlife and Plants; Removal of the Brown Pelican (*Pelecanus occidentalis*) From the Federal List of Endangered and Threatened Wildlife; Final Rule.

RE: Item C.1: Pacific Sardine Harvest Fraction

Dear Chair Lowman, Pacific Fishery Management Council members and California Department of Fish and Wildlife Director Bonham:

The Pacific sardine population found in waters off the United States West Coast is in crisis. In March 2014, the National Oceanic and Atmospheric Administration released the latest Pacific sardine stock assessment concluding that the Pacific sardine population has precipitously crashed 74 percent since 2007 with no signs of recovery. While ocean conditions are a contributor to the population collapse, the directed commercial fishery for Pacific sardines accelerates the rate of this decline and impedes the ability of the population to recover. I am concerned about the current collapse of the Pacific sardine population and the subsequent effect the lack of this important forage fish is having on other marine animals that rely on this small, but important fish as a critical part of their diet. As sardine populations have plummeted, I am also concerned about recent increases in Northern anchovy fishing off California, which may place increasing pressure on this important forage fish, and which is currently not actively managed. The last thing we need is for Northern anchovy to be overfished before it has a chance to recover. Therefore, I am writing to request that you do not allow for any increases to the current harvest rate framework for sardines, and that you begin actively managing Northern anchovy by establishing appropriate safeguards to protect this important forage species.

While I commend the Council for reducing sardine catch levels in response to the decline, these actions have not gone far enough. I urge you to take a more precautionary approach to the management of this critical food source by leaving more sardines in the ocean and immediately closing the sardine fishery until the population recovers to healthy levels.

Ocean wildlife like sea lions, whales, dolphins, and seabirds rely heavily on Pacific sardines and Northern anchovies as a critical part of their diets. Yet some species of ocean wildlife are being severely impacted by a lack of prey. In 2013, more than 1,600 California sea lions were found stranded and malnourished along the Southern California coastline. These sea lion pups were admitted to rehabilitation facilities, emaciated, dehydrated and very underweight for their age because nursing California sea lion pups were not getting the necessary nutrition and fats from their mothers, due to a lack of sardines and anchovies. Also, California brown pelican nesting failures at the Channel Islands and Baja California have been documented, and the nesting failures are occurring because of a lack of Pacific sardines and anchovies. Scientists completed a survey of breeding colonies in Mexico's Gulf of California and found that this year areas that typically host hundreds or thousands of nesting pairs held only a few hundred at most, and in some cases zero nesting pairs. Not only do our oceans need enough Pacific sardines to prevent crises like these, but abundant sardine populations are critical to the recovery of key commercial and recreational fish populations.

I strongly urge your leadership to ensure we leave more sardines in the water to allow the population to recover and prevent increases in anchovy harvest until appropriate management safeguards are in place and the stock is assessed. Sardine management needs to be more conservative, not more aggressive, than it currently is, and there should not be any sardine fishing at this time given the dire status of the Pacific sardine population. Please take precautionary and proactive action for the benefit of ocean wildlife and healthy fisheries.

Sincerely,

The following 4,604 California residents, 620 Oregon residents, 891 Washington residents, and 94 Idaho residents.

Agenda Item, C.1.c
Supplemental Public Comment 3
September 2014

Comments on Pacific Sardine Harvest Parameters

Geoff Shester, Ph.D.

September 12, 2014
Presentation to Pacific Fishery Management Council, Agenda Item C.1

OCEANA

Sardine FRACTION Alternatives

- We support **Alternative 2**: Use CalCOFI index; do not change FRACTION bounds (5-15%)
  - Alternative 2 best reflects current harvest policy
  - Alternatives 3a,b,c ***more aggressive*** than the status quo
- Now is not the time to move to more aggressive harvest FRACTION
  - Premature without addressing other aspects of HCR: DISTRIBUTION, OY specification, MSST, CUTOFF
  - Sardine population decline
  - Predator reproductive failures: evidence of insufficient forage

The Need to Fix Temperature-based FRACTION

- Purpose of temperature-based FRACTION:
  - fish harder during booms (15%)
  - ease off during periods of low recruitment / declines (5%)
- SIO index originally selected in 1998
- During last 7 years, sardine have been in steep decline with low recruitment, yet FRACTION remained at 15%
- McClatchie et al. 2010: SIO index failed, should be removed
- PFMC Sardine Harvest Parameters Workshop: 2013: Replace SIO index with CalCOFI index in the HCR
- 2014: SSC adopted CalCOFI for OFL

Alternative 2 is Closest to Status Quo HCR

	Status quo*	Alt 2	Alt 3a	Alt 3b	Alt 3c
Fraction	15%	5-15%	10-20%	5-20%	0-20%
Mean B1+ (tmt)	1208	1220	1182	1186	1187
Depletion	77%	78%	75%	75%	76%
Mean catch (tmt)	107	106	112	111	111

Data from Prelim. Draft EA. Agenda Item C.1.a, Table 1

Alternatives 3 a,b,c are **MORE AGGRESSIVE** than status quo:
Higher catch and lower biomass

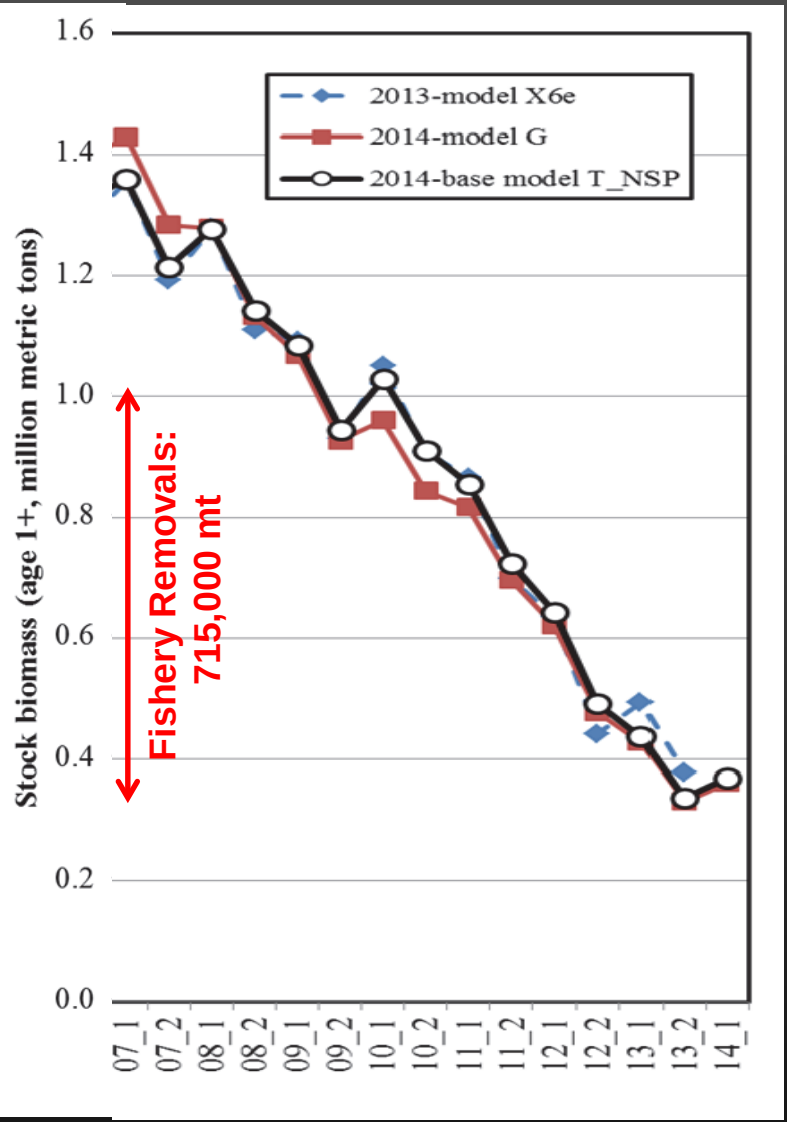
HMS MT Presentation: At low biomass (370,000 mt), Alts 3a,b,c result in substantially higher harvest than Alt 2 or status quo at median and upper quartile temperatures

**Status quo data from Scenario code 22, Table 4, Hurtado-Ferro & Punt 2014 (March 2014), as per SSC recommendation of closest approximation*

Harvest control rules must achieve Optimum Yield and prevent overfishing

- CPS FMP has not specified or assessed Optimum Yield
- Must analyze and account for ecological, economic, social factors:
  - Effects of fishery on dependent predators
  - Effects of prey depletion on other fisheries (e.g., salmon)
  - Assessing whether there are sufficient other prey sources for predators (e.g., anchovies) when sardine stock is low
- CUTOFF is not high enough to provide adequate forage
- Minimum Stock Size Threshold (MSST = 50,000 mt) for sardine is far below follow NS1 Guidelines (1/2 Bmsy)

Sardine Collapse: The Role of Fishing



- Decline (2007-2014):
  - 1,050,000 mt (74%) drop
- Fishery removals:
  - 715,000 mt
- No “surplus” production, low recruitment

Evidence of Inadequate Forage

Specifically Sardine and Anchovy

- **California Sea Lions**
  - 2013: Unusual Mortality Event
    - *(Melin et al., NOAA, 2014)*
  - 2014: Double average pup mortality

Ingrid Overgard/TMMC

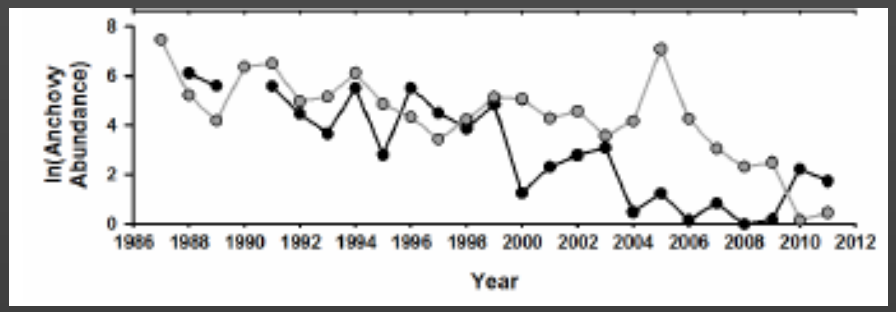
- **Brown Pelicans**
  - 5 consecutive years of nesting failures (Harvey 2013)
  - 2014: First range-wide nesting failure in 25 years of monitoring

Ingrid Taylar

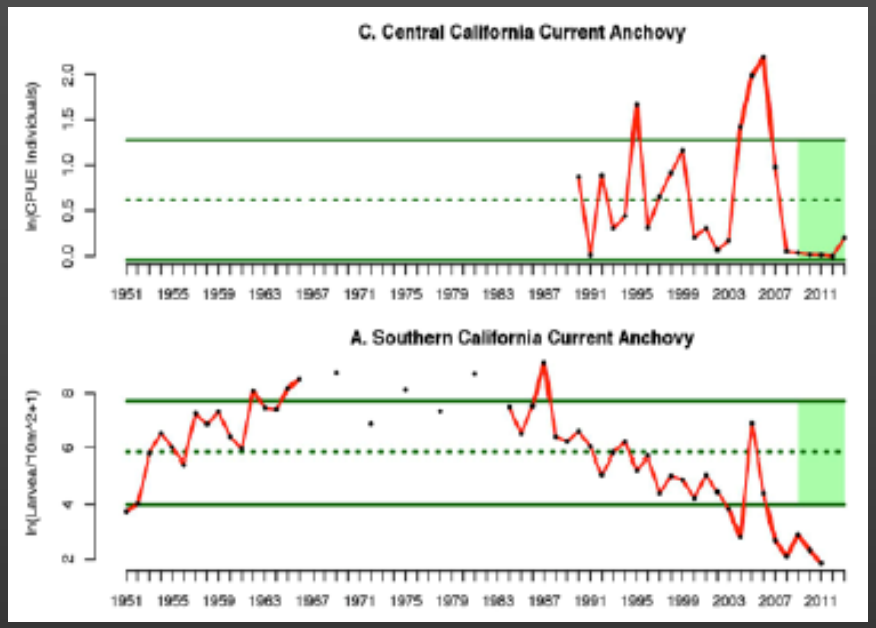
Primary forage: sardines & anchovies

Geoff Shester/Oceana

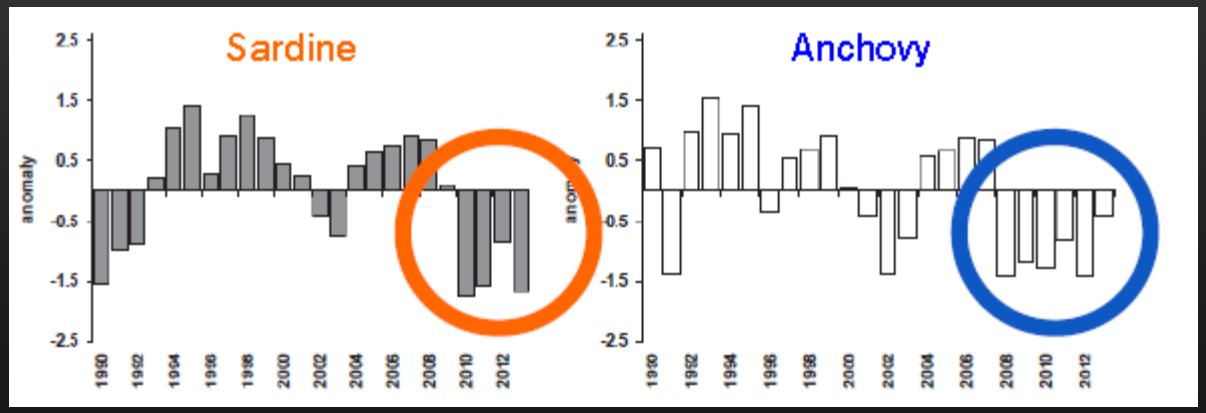
Available Indices: Anchovies Low



CalCOFI (Sydeman et al. in press)



CC IEA, March 2014



CC IEA, March 2014

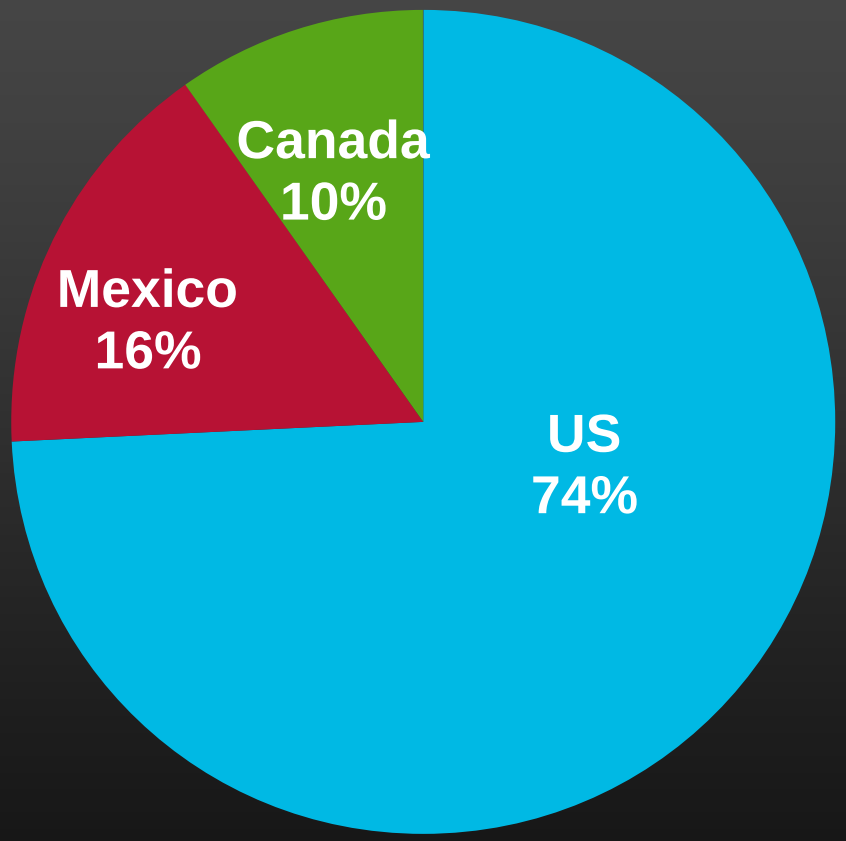
Sydeman et al. Climate-ecosystem change off southern California: time-dependent seabird predator-prey numberical responses. CCIEA from March 2014, Agenda Item C.1.b

OCEANA

DISTRIBUTION still needs to be fixed

(DISTRIBUTION currently set at constant 87%)

Distribution of Pacific Sardine Landings attributed to N. Subpopn. (2004-2013)



Ramifications of assessing and managing only the Northern Subpopulation have not been addressed in the CPS FMP

Optimizing fishing quotas to meet target fishing fractions of an internationally exploited stock of Pacific sardine (Sardinops sagax)

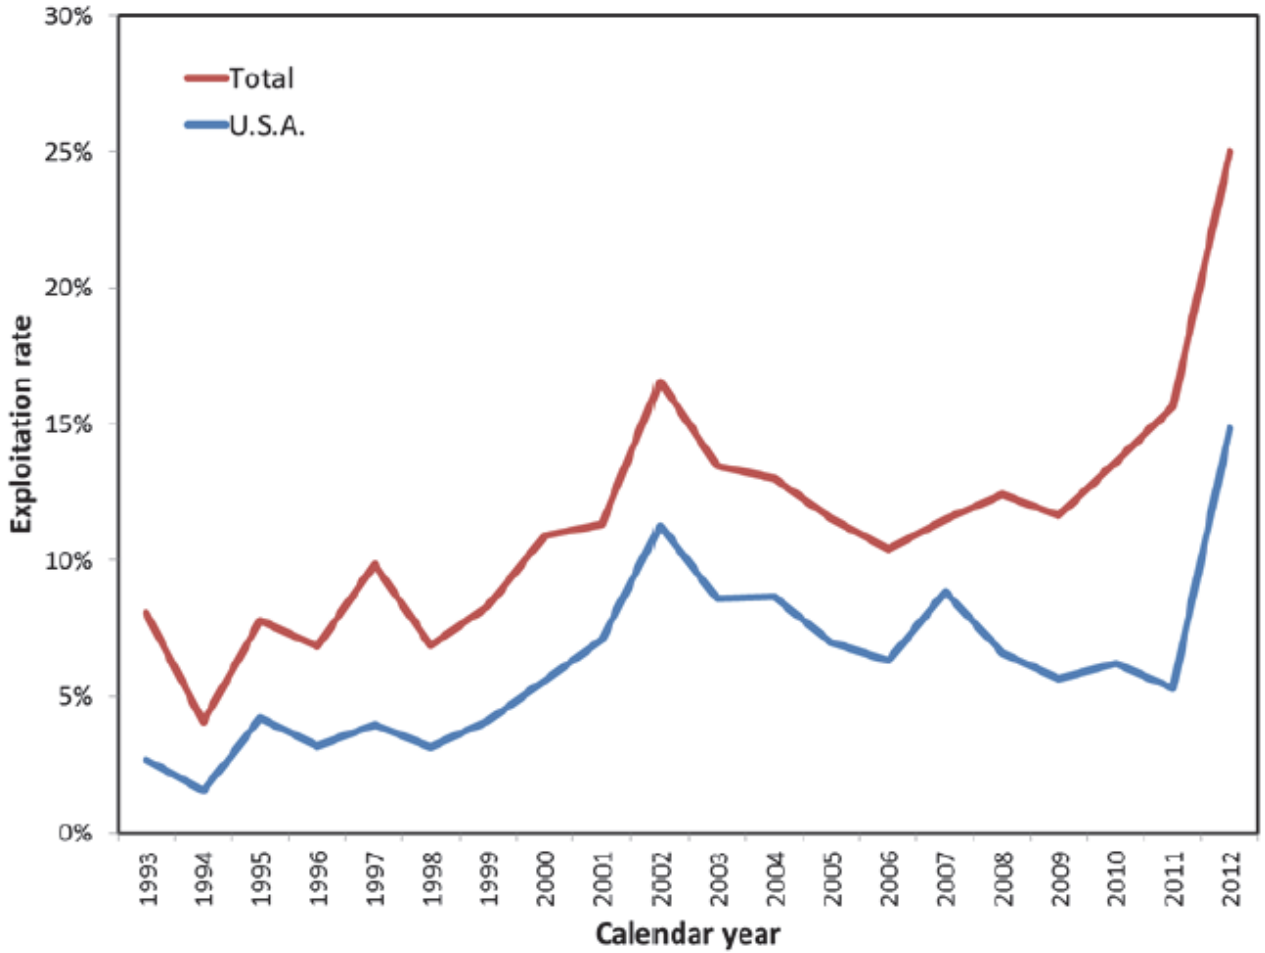
***North American Journal of Fisheries Management*, 2014**

D. A. Demer and J. P. Zwolinski (NMFS/SWFSC)

- "…the current harvest control rule for sardine has not consistently maintained a total fishing fraction below the US target value because the 'distribution' parameter, which is intended to account for the proportion of the stock in the US exclusive economic zone (EEZ), has **not adequately accounted for landings** of the stock at **Mexico and Canada**."

- "The authors propose a **refinement to the harvest control rule**, which gives explicit consideration to the summed landings at Mexico and Canada, to more optimally set the annual US quota"

Recent Assessments Indicate Coastwide Sardine Overfishing Occurred



Calendar year	U.S.A.	Total
2000	5.57%	10.91%
2001	7.07%	11.34%
2002	11.26%	16.55%
2003	8.59%	13.46%
2004	8.68%	13.02%
2005	6.99%	11.53%
2006	6.33%	10.43%
2007	8.85%	11.50%
2008	6.59%	12.43%
2009	5.64%	11.64%
2010	6.23%	13.59%
2011	5.30%	15.63%
2012	14.85%	24.98%

(Overfishing Limit Set at 18%)

Source: Hill et al. 2013. Pacific sardine biomass projection in 2013; November 2013, E.5.b

OCEANA

Performance measures are dramatically worse if Mexico and Canada don't follow U.S. HCR:

	Status quo*	Alt 2	Alt 3a	MF*
Fraction	15%	5-15%	10-20%	5-15%
Mean B1+ (tmt)	1208	1220	1182	**716**
Depletion	77%	78%	75%	**46%**
Mean catch (tmt)	107	106	112	**57**

*Sensitivity Run Table 6, S14, Hurtado-Ferro & Punt 2014

In summary:

- Increasing FRACTION without fixing DISTRIBUTION or addressing needs of predators

  …at time when sardine population just plumetted by 74% while recruitment and biomass are at 20-year lows…

  …after overestimating productivity in the HG for the last 7 years

  - **Fails to prevent overfishing**
  - **Fails to achieve OY**
  - **Violates common sense responsible fishery management**

- Please select **Alternative 2** as your PPA
