

SALMON ADVISORY SUBPANEL REPORT ON SALMON ENDANGERED SPECIES ACT
RECONSULTATION UPDATE

The Salmon Advisory Subpanel (SAS) believes that additional information is necessary to design meaningful management measures under the Endangered Species Act (ESA). The SAS requests updated genetic stock analysis of the fleet's salmon bycatch. Based on this data, the SAS may have specific recommendations on measures that should be adopted. In addition, the SAS believes that adaptive management measures should apply to the trawl fleet's annual Chinook cap. A static number does not reflect annual abundance variations.
