</table>

a/ Presumptive Species Category is the initial categorization made by Council staff for consideration by the SSC, GMT, and the Council. Category 1 = relatively data-rich assessed species; category 2 = relatively data-poor assessed or unassessed species; category 3 = relatively data-sparse unassessed species; and EC = ecosystem species that should be monitored but not actively managed in the fishery.

b/ P* is the probability of overfishing a stock due to scientific uncertainty in the assessment. This concept is part of the Amendment 23 framework and a key aspect of deciding the new ABC control rule for category 1 stocks.

c/ Chilipepper rockfish are projected from the 2007 assessment based on the population occurring in waters off CA and OR. They were specified for south of 40°10’ N latitude in 2009-10, but should have been applied for the waters off CA and OR.

d/ Splitnose rockfish specifications in 2009-10 were for south of 40°10’ N latitude. The 2011-12 specifications are projected from the 2009 assessment and apply coastwide.
