

SALMON ADVISORY SUBPANEL  
REPORT ON SALMON METHODOLOGY REVIEW

The Salmon Advisory Subpanel (SAS) recommends the genetic stock identification study design and experimental fisheries permit be the highest priority for review by the Scientific and Statistical Committee Salmon Subcommittee and the Salmon Technical Team to allow implementation in 2008.

The SAS understands the Klamath River fall Chinook maturity boundary analysis is not ready for review at this time, but requests that when conducted, the analysis include a review of yearling hatchery release strategies and return timing in comparison with other run components.
