INTRODUCTION

The Salmon Technical Team (STT) and staff of the Pacific Fishery Management Council (Council) have prepared this postseason review of the 2010 ocean salmon fisheries off the coasts of Washington, Oregon, and California to help assess Council salmon fishery management performance, the status of Council area salmon stocks, and the socioeconomic impacts of salmon fisheries. This postseason report will also provide a detailed description of the salmon fishery portions of the affected environment to be incorporated by reference into an Environmental Assessment (EA) to comply with National Environmental Policy Act (NEPA) requirements for the 2011 ocean salmon management measures. The STT and Council staff will provide three additional reports prior to the beginning of the ocean salmon season to help guide the Council's selection of annual fishery management measures: Preseason Report I, Preseason Report II, and Preseason Report III. These reports will provide forecasts of stock abundance, and will analyze the impacts of the Council's proposed alternatives and adopted fishery management recommendations. Preseason Report I will also constitute the first part of the EA for 2011 ocean salmon fishery management measures, and include a statement of the purpose and need, a description of the affected environment, and a description and analysis of the status quo (no action) alternative. Preseason Report II will constitute the second and final part of the EA, and will include a description and analysis of the alternative management measures considered for 2011 ocean salmon fisheries. The alternatives analyzed in Preseason Report II will provide a reasonable range of environmental effects, which will bound those of the final fishery management measures included in Preseason Report III. Together, these two parts of the EA will provide the necessary components to determine if a finding of no significant impact (FONSI) is warranted.

West Coast fisheries in Council-managed waters (ocean fisheries between the U.S./Canada border and the U.S./Mexico border from 3 to 200 nautical miles offshore) are directed toward and harvest primarily Chinook or king salmon, *Oncorhynchus tshawytscha*, and coho or silver salmon, *Oncorhynchus kisutch*. Small numbers of pink salmon, *Oncorhynchus gorbuscha*, also are harvested, especially in odd numbered years. There are no directed fisheries for other Pacific salmon species, which are rarely caught in Council-managed fisheries.

The Council's annual review of ocean salmon fisheries provides a summary of important biological and socioeconomic data from which to assess the impacts of past management actions, determine how well management objectives are being met, and improve regulations for the future. The Council will formally review this report at its March meeting prior to the development of management alternatives for the approaching fishing season.

Chapter I summarizes ocean salmon fishery regulations and landings within the Council management area and management actions and landings under the jurisdiction of the Pacific Salmon Commission (PSC). Appendix A tables detail historical harvest data by state and by management area. Appendix C summarizes historical ocean fishery regulations.

For Chinook and coho salmon, respectively, Chapters II and III assess, where possible, the achievement of pertinent management objectives by salmon stock (including those listed under the Endangered Species Act [ESA]), outline regulations to achieve the objectives, and summarize inside fisheries catch and spawner escapement data. Appendix B tables detail historical spawning escapement and inside fisheries catch information. Detailed information for other salmon species is not included since Council fisheries have minor impacts on pink salmon escapements and no measurable impacts on sockeye or chum salmon or steelhead trout; however, catch and escapement data and objectives for Puget Sound pink salmon are summarized in Appendix B, Table B-42.

Socioeconomic impacts of the fisheries are discussed in Chapter IV. Appendix D provides historical fishery-related socioeconomic data.

The annual review of ocean salmon fisheries is drafted as early as analyses of landings and escapement data are available. The most recent entries are noted as preliminary and later updated when the data become final. If updated information or error corrections that could substantially affect the development of management measures for the upcoming season are available, an errata sheet will be included as an appendix in one of the subsequent STT preseason planning documents.

COMMON TABLE CONVENTIONS

All 2010 data provided in this report are preliminary. The following conventions apply to all tables in this report:

1. Due to rounding, the total values may not equal the sum of individual values.
2. A single dash indicates there are no data appropriate for a particular table cell, or in the case of fishing effort or landings, that the season was closed.
3. A double dash indicates no records are available, for example, a fishery may not have been sampled due to low and sporadic effort.
4. “NA” indicates data are not available at the time of publication, but are likely to be available at a future date.

CHAPTER I

COASTWIDE OCEAN FISHING SUMMARY

Chapter I contains or references tables summarizing the current and historical ocean salmon fishing regulations and harvest data. In addition, this chapter provides a brief summary of the Council's regulatory objectives, by management area, for the most recent fishing year, reports on the results of the Council's selective fisheries for marked hatchery Chinook and coho, and bycatch mortality of Chinook and coho salmon. The final section in the chapter provides a brief summary of management information and harvests under the authority of the PSC.

COUNCIL-AREA REGULATIONS AND LANDINGS

Summaries of the 2010 regulations for non-Indian commercial troll, treaty Indian commercial troll, and recreational ocean salmon fishing in both the exclusive economic zone (EEZ) (3 to 200 nautical miles from shore) and state territorial waters (0 to 3 nautical miles from shore) are provided in Tables I-1, I-2, and I-3, respectively. Historical summaries of regulations for each of the three West Coast states and for treaty Indian troll fisheries are provided in Appendix C, Tables C-1 through C-7. Table C-9 provides a summary of inseason regulatory actions and events during the 2010 season.

Catch, quota, and fishing effort statistics are presented in the following series of tables:

Table I-4: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by state of landing.

Table I-5: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by management area.

Table I-6: The 2010 coho and Chinook quotas for each fishery compared with actual harvests.

Appendix A Tables A-1 through A-19: Historical monthly ocean salmon harvest data by state and port area.

Tables A-20 through A-28: Historical monthly ocean salmon harvest data by management area.

Appendix B Tables B-1 through B-43: Historical inside harvest and escapement data.

Appendix C Table C-8: Historical record of annual preseason catch quotas for the area north of Cape Falcon, as well as the stocks that were critical for ocean salmon management actions.

REGULATORY OBJECTIVES BY MANAGEMENT AREA

The sections below provide a brief outline of the regulatory objectives that shaped the 2010 ocean salmon fisheries by management area and species. Further details of the conservation and allocation objectives by salmon stock and an assessment of performance are provided in Chapters II and III for Chinook and coho, respectively.

Horse Mountain to U.S./Mexico Border

Chinook Fisheries

Chinook fisheries management in this area is guided by conservation objectives for Sacramento River fall Chinook (SRFC), Klamath River fall Chinook (KRFC), and by NMFS ESA consultation standards for

Sacramento River winter Chinook, California Coastal Chinook, Oregon Coastal Natural (OCN) coho, and Southern Oregon/Northern California Coastal (SONCC) coho. The Council structured 2010 Chinook salmon fisheries south of Horse Mountain (near Shelter Cove, California) to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural area adults (FMP conservation objective). NMFS also provided guidance that management measures for 2010 should target a spawner escapement around the upper end of the FMP conservation objective in response to the stock falling below the lower end of the conservation objective for three consecutive years and to account for scientific uncertainty in the abundance forecast. The Council specified that for 2010, the spawning escapement objective was 180,000 hatchery and natural area adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries. The Council again implemented the 40,700 natural area adult escapement objective for 2010 as a rebuilding strategy after KRFC triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The Sacramento River winter Chinook ESA consultation standard requiring:
 - a. Commercial seasons between Point Arena and the U.S./Mexico border shall open no earlier than May 1 and close no later than September 30, with the exception of a permissible October season conducted Monday through Friday between Point Reyes and Point San Pedro, which shall end no later than October 15; the minimum size limit shall be at least 26 inches total length.
 - b. The recreational season between Point Arena and Pigeon Point shall open no earlier than the first Saturday in April and close no later than the second Sunday in November; the recreational season between Pigeon Point and the U.S./Mexico Border shall open no earlier than the first Saturday in April and close no later than the first Sunday in October; the minimum size limit shall be at least 20 inches total length.

Additional NMFS guidance for 2010 specified that recreational fisheries south of Point Arena must have either a minimum size limit of at least 24 inches total length, or be closed for 61 consecutive days, between the dates of May 1 and August 31.

4. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN coho work group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

Objectives 1, 2, and 3 above were the constraining factors on 2010 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a SRFC spawner escapement of 180,000 adults, a KRFC spawning escapement of 40,700 natural area adults, and a coastwide ocean fishery harvest rate of 12.3 percent on age-4 KRFC.

Coho Fisheries

Coho fishery management for 2010 in this area was guided by the ESA consultation standard for central California coastal (CCC) coho, which prohibits retention of coho in this area. No projection of non-retention fishery impacts on CCC coho was available; projected non-retention exploitation rates on LCN, OCN and RK coho were 0.1, 1.7, and 4.1 percent, respectively, in this area. Retention of coho has been prohibited south of Horse Mountain since 1996. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2010 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

Humbug Mountain to Horse Mountain

Chinook Fisheries

The area between Humbug Mountain (near Port Orford, Oregon) and Horse Mountain (near Shelter Cove, California) is referred to as the Klamath Management Zone (KMZ). Chinook fisheries management in this area is guided by conservation objectives for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2010 Chinook salmon fisheries in the KMZ to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural area adults (FMP conservation objective). NMFS also provided guidance that management measures for 2010 should target a spawner escapement around the upper end of the FMP conservation objective in response to the stock falling below the lower end of the conservation objective for three consecutive years and to account for scientific uncertainty in the abundance forecast. The Council specified that for 2010, the spawning escapement objective was 180,000 hatchery and natural area adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries. The Council again implemented the 40,700 natural area adult escapement objective for 2010 as a rebuilding strategy after KRFC triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
4. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN coho work group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objectives 1 and 2 above were the constraining factors for 2010 Chinook fisheries management in the KMZ. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a SRFC spawner escapement of 180,000 hatchery and natural area adults, a KRFC spawning escapement of 40,700 natural area adults, and a coastwide ocean fishery harvest rate of 12.3 percent on age-4 KRFC.

Coho Fisheries

Coho fisheries management in this area is guided by the ESA consultation standards for LCN, OCN, SONCC and CCC coho, which prohibits retention of coho south of the Oregon/California border. No projection of non-retention fishery impacts on CCC coho was available; projected exploitation rates on LCN, OCN and RK coho in this area were 0.2 percent, 1.3 percent and 5.2 percent, respectively. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2010 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

Cape Falcon to Humbug Mountain

Chinook Fisheries

Chinook fisheries management in this area is guided by conservation objectives for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, LCR natural tule Chinook, SRW Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2010 Chinook salmon fisheries in this area to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural area adults (FMP conservation objective). NMFS also provided guidance that management measures for 2010 should target a spawner escapement around the upper end of the FMP conservation objective in response to the stock falling below the lower end of the conservation objective for three consecutive years and to account for scientific uncertainty in the abundance forecast. The Council specified that for 2010, the spawning escapement objective was 180,000 hatchery and natural area adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries. The Council again implemented the 40,700 natural area adult escapement objective for 2010 as a rebuilding strategy after KRFC triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
4. NMFS consultation standards and annual guidance for ESA listed LCR natural tule Chinook, which required a total exploitation rate not to exceed 38 percent in marine and freshwater fisheries combined.
5. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
6. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
7. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objectives 1, 2, 3, and 4 above were the constraining factors on 2010 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a SRFC spawner escapement of 180,000 hatchery and natural area adults, a KRFC spawning escapement of

40,700 natural area adults, a coastwide ocean fishery harvest rate of 12.3 percent on age-4 KRFC, and a 37.5 percent total exploitation rate on LCR natural tules.

Coho Fisheries

Coho fisheries management in this area is guided by NMFS ESA consultation standards for LCN coho, OCN coho, and SONCC coho. The Council structured 2010 coho salmon fisheries in this area to meet the following objectives:

1. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
2. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group which was accepted by the Council as expert biological advice in November 2000.
3. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

Objective 1 above was the constraining factor on 2010 coho fisheries management in this area. The Council adopted seasons in this area with projected impacts of 2.5 percent, 3.4 percent, and 0.4 percent on LCN natural coho OCN coho and RK coho, respectively. In all relevant fisheries, projected impact rates were 15.0 percent, 11.2 percent, and 10.0 percent, respectively.

The 2010 Oregon recreational coho selective fishery consisted of a June 26 through September 6 fishery from Cape Falcon to the Oregon/California border with a preseason quota of 26,000 marked coho (Table I-3). Under the adopted regulations, the projected harvest impacts and non-retention mortality resulting from these fisheries to be equivalent to exploitation rates of 2.4 percent for OCN coho stocks, 1.6 percent for LCN coho, and 0.3 percent for RK coho.

U.S./Canada Border to Cape Falcon

Chinook Fisheries

Management objectives for Chinook fisheries in this area were to comply with NMFS ESA consultation standards for LCR natural tule, Lower Columbia River Wild (LRW), and Snake River wild (SRW) fall Chinook, meet treaty Indian sharing obligations and the allocation provisions in the Salmon FMP, provisions of the Pacific Salmon Treaty (PST) and, to the extent possible, provide for viable ocean and inriver fisheries while meeting natural stock escapement objectives and hatchery fall Chinook broodstock needs. Columbia lower river hatchery (LRH) and Spring Creek Hatchery (SCH) fall Chinook have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon. The Council structured Chinook salmon fisheries between Cape Falcon, Oregon and the U.S./Canada Border to meet the following objectives:

1. The LCR natural tule Chinook ESA consultation standard requirement for a combined marine and freshwater exploitation rate of no greater than 38.0 percent.
2. The Snake River fall Chinook ESA consultation standard of at least a 30.0 percent reduction in the total ocean age-3 and age-4 AEQ exploitation rate from the 1988-1993 average.
3. For select Chinook stocks of concern to the Pacific Salmon Commission, keep the Individual Stock Based Management (ISBM) index at or below 60.0 percent of the 1979-1982 average.

Objective 1 above was the primary constraint for 2010 ocean fisheries in this area. Under the adopted regulations (Tables I-1, I-2, and I-3), fisheries were projected to have a 37.5 percent total AEQ exploitation rate on LCR natural tules (15.2 percent in Council area fisheries), and a 44.0 percent reduction from the base period AEQ exploitation rate for SRW.

Coho Fisheries

Management objectives for coho fisheries in this area were to comply with NMFS ESA consultation standards for LCN and OCN coho, meet treaty Indian sharing obligations and the allocation provisions in the Salmon FMP, provisions of the PST and, to the extent possible, provide for viable ocean and inriver fisheries while meeting natural stock escapement objectives and hatchery coho brood stock needs. Columbia River early and late hatchery coho have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon.

The Council structured coho salmon fisheries to meet the following objectives:

1. The LCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 15.0 percent.
2. An exploitation rate on Interior Fraser coho of no more than 10.0 percent in southern U.S. fisheries in accordance with the provisions of the southern coho management plan adopted by the PSC in February, 2002.
3. The OCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 15.0 percent.
4. Meet inside/outside and treaty Indian/non-Indian allocation objectives.
5. Meet FMP objectives for allocation of impacts between commercial and recreational ocean fisheries, and among port areas for the recreational fishery.

Objective 1 above was the primary constraint for 2010 ocean fisheries in this area. The adopted regulations (Tables I-1, I-2, and I-3) were projected to have a 15.0 percent total exploitation rate on LCN coho (10.8 percent in Council area fisheries), an exploitation rate in southern U.S. fisheries of 9.8 percent on Interior Fraser (Thompson River) coho (5.3 percent in Council area fisheries), and a total exploitation rate of 11.2 percent on OCN coho (8.3 percent in Council area fisheries).

SELECTIVE FISHERIES AND SALMON BYCATCH

Estimated incidental Chinook and coho mortalities are reported in Tables I-7, I-8, and I-9. Unless otherwise noted, Chinook mortality estimates from north of Cape Falcon and coho mortality estimates coastwide were based on preliminary postseason model runs incorporating final ocean catch numbers and updated Columbia River run-sizes; Chinook mortality estimates south of Humbug Mountain, Oregon are based on expansion of dockside sampling data. Under the Sustainable Fisheries Act, incidental mortality in commercial fisheries constitutes bycatch mortality, but incidental mortality resulting from the non-retention recreational fisheries does not.

The Council assumed a hook-and-release mortality rate of 26 percent in commercial troll fisheries coastwide and 14 percent in recreational fisheries north of Point Arena. In recreational fisheries south of Point Arena, the Council assumed 18 percent based on the proportion of fish caught using mooching versus trolling gear, and the estimated rates of 42.2 and 14 percent for these gear types, respectively. In

addition, the Council assumes drop-off mortality for both Chinook and coho equal to 5 percent of total encounters.

Selective Chinook Fisheries

Recreational fisheries selective for marked Chinook were planned for the four ocean subareas between Cape Falcon, Oregon, and the U.S.-Canada border from June 12 through June 30, 2010. Preseason and inseason assessments of mark rates, catches, numbers of Chinook released, and incidental (bycatch) mortality for Council-area and some mixed-stock inside fisheries are summarized in Table I-8. Fisheries were sampled by a combination of on-water observers and dockside interviews. The observed mark rates were generally slightly lower than predicted preseason. Two Oregon state waters terminal area recreational fisheries also had mark-selective requirements (Table I-3).

In 2010, recreational fisheries in the Strait of Juan de Fuca operated under mark-selective retention restrictions for both Chinook and coho in Area 5 and the portion of Area 6 west of Port Angeles, from July 1 through August 15. As in 2009, the Areas 5 and 6 mark-selective fisheries were managed on season rather than quota-based criteria. After August 15, the fisheries in Areas 5 and 6 remained open for marked coho only (no Chinook retention) through September 15; Area 5 operated under non-mark-selective fishing regulations for coho from September 16 through September 30 while Area 6 remained mark-selective for coho through September 30. Catch and release estimates, derived from creel census programs conducted during the mark-selective fishery in Area 5 from July 1 through September 15 are presented in Table I-8. No inseason estimate was made for Area 6, which was open from July 1 through August 15 for mark-selective Chinook fishing.

Mark-selective Chinook fisheries were also held in Puget Sound Area 9 from July 16 through August 31, in Area 10 from July 16 through August 31, in Area 11 June 1 through September 30, and in Area 13 May 1 through September 30. Winter mark-selective fisheries were held in Area 7 from December 1, 2010 through April 30, 2011. Winter mark-selective Chinook fisheries were held in Areas 8-1 and 8-2 November 1, 2010 through April 30, 2011. Area 9 had mark-selective Chinook opportunity from all of November 2010 and January 16 through April 15, 2011. Area 10 had mark-selective Chinook fisheries from October 1, 2010 through January 31, 2011. Areas 11 and 12 had mark selective Chinook opportunity from February 1 through April 30, 2011.

Selective Coho Fisheries

Recreational fisheries selective for marked coho were planned for the area between Cape Falcon and the Oregon/California border, the four ocean subareas north of Cape Falcon, and the inside fisheries at Buoy 10 and the Strait of Juan de Fuca (Areas 5 and 6). Numerous other Puget Sound, inside, and freshwater recreational fisheries in Washington and Oregon had mark-selective restrictions for coho. Non-Indian commercial mark-selective fisheries for coho were planned for the area between the U.S./Canada border and Cape Falcon. Preseason and inseason assessments of mark rates, catches, numbers of coho released, and incidental (bycatch) mortality for Council-area and some mixed stock inside fisheries are summarized in Table I-9. Fisheries were sampled by a combination of on-water observers and dockside interviews. The observed mark rates both north and south of Cape Falcon were lower than predicted preseason.

PACIFIC SALMON COMMISSION

The PSC was established to implement the 1985 Pacific Salmon Treaty (PST) between the United States and Canada. Because many of the stocks under the jurisdiction of the Council are significantly affected by management actions taken in Canadian and Alaskan waters, considerable interaction between the Council and the PSC occurs at both the policy and technical levels. Actual catches for PSC fisheries of the most relevance to the Council are summarized in Tables I-10 and I-11. Note that these catch statistics do not correspond to provisions of the PST for compliance with aggregate abundance-based management

(AABM; see below); nor do they reflect incidental mortality losses associated with the regulation of these fisheries, except as noted.

Chinook Fisheries

Northern British Columbia (B.C.) and Southeast Alaska (SEAK) fisheries affect far-north migrating Chinook stocks from Washington, Oregon, and Idaho. These include Washington coastal stocks; Columbia and Snake River bright fall and summer stocks; and far-north migrating Oregon coastal Chinook stocks.

The West Coast Vancouver Island (WCVI) troll and Georgia Strait troll and recreational fisheries affect far-north migrating stocks (including LRW) to a lesser degree, but have a major impact on more southerly distributed Columbia River tule and Puget Sound stocks.

In June 1999, the United States and Canada reached agreement on a framework for Chinook fishing regimes for 1999 through 2008. Under this agreement, SEAK (all gear), Northern B.C. (troll and recreational), and WCVI (troll and outside recreational) fisheries were regulated under aggregate AABM regimes. These fishery regimes had catch ceilings derived from indices for total aggregate abundance of stocks contributing to specific components of the fisheries and target fishery harvest rates. For example, the allowable catch for WCVI troll and outside sport fisheries were determined by the abundance index estimated for the WCVI troll fishery. The allowable catch for the WCVI AABM fisheries was designed to reduce harvest rates for the combined troll and outside sport fisheries by approximately 35 percent from levels observed during 1985 through 1996. Provisions of a new agreement, ratified in 2008, took effect January 1, 2009. The 2008 agreement reduces catch ceilings in SEAK and WCVI AABM fisheries by 15 percent and 30 percent respectively, from those in the 1999 agreement. The United States and Canada are developing management regimes for AABM fisheries based on total mortality rather than landed catch.

For fisheries not driven by AABM regimes, including Council area fisheries, the 1999 agreement established conservation obligations to reduce harvest rates on depressed Chinook stocks (those not meeting escapement goals) by 36.5 percent for Canadian fisheries and 40 percent for United States fisheries, relative to levels observed during 1979 through 1982. This individual stock-based management (ISBM) obligation was taken into account during Council and inside fisheries preseason management planning processes.

In 2010, AABM fisheries were conducted in accordance with the obligations set forth in the 2008 PST agreement. SEAK fisheries were constrained by an all-gear catch ceiling of 221,800 "treaty" Chinook in 2010, a small increase from the ceiling of 218,700 in 2009, but 15 percent less than it would have been under the 1999 agreement. "Treaty" Chinook are those fish that are counted against the AABM catch ceiling; they represent total catch minus terminal exclusions (fish taken in terminal net fisheries where escapement goals are achieved) and hatchery add-ons (fish attributed to production from Alaskan hatchery facilities in excess of levels observed prior to the 1985 PST). The preliminary estimate of 2010 total catch of Chinook by SEAK fisheries was 280,600, while the catch of "treaty" Chinook was 227,720 (Table I-10).

The catch ceiling for the Northern B.C. AABM fisheries (Northern B.C. troll plus Queen Charlotte Islands sport) in 2010 was 152,100, compared to a ceiling in 2009 of 143,000 Chinook. The actual catch was estimated at 136,613 (90,213 troll plus 46,400 sport). The entire Northern B.C. troll fishery in 2010 was conducted under a system of individual transferable quotas.

In addition to the overall catch ceiling determined by the PST, Canada's principal management objectives for the 2010 WCVI Chinook fisheries were to meet domestic allocation objectives as well as address

concerns for Lower Strait of Georgia Chinook, WCVI Chinook stocks, spring run upper Fraser River Chinook, and Interior Fraser (Upper Fraser and Thompson) coho. The total allowable catch in 2010 by WCVI AABM fisheries under the 2008 PST Agreement was 143,700 Chinook, while the reported catch was 137,660; 79,123 troll, 5,839 First Nations, and 52,698 recreational (Table I-11).

Since 1999, the WCVI troll fishery has been managed to distribute the catch throughout the year with fisheries in the summer shaped to reduce impacts on coho and WCVI origin Chinook stocks. In accounting year 2010 (October 2009 through September 2010) troll fisheries were open for retention of Chinook in April, May, June, August, and September (Table I-12). During August, gear was restricted to large plugs to reduce coho contacts and the nearshore waters were closed to protect local WCVI Chinook stocks. To protect Interior Fraser coho, coho retention was mark-selective and revival tanks were required for released coho.

The WCVI outside sport fishery (the area where non-local stocks predominate) operated under a 45 cm (17.7 inches) total length minimum size limit, but with the additional restriction that Chinook over 77 cm (30.3 inches) could not be retained in the surf zone corridor (within 1 mile of shore) to protect local-origin stocks. The fishery harvested 52,698 fish, a decrease of about 23 percent from the 2009 catch.

Catch estimates for all Canadian ISBM fisheries in Northern B.C. were incomplete; the reported Chinook catch in 2010 was approximately 2,200 by commercial gillnets. Approximately 4,000 Chinook were caught by anglers from lodges in Rivers Inlet, Hakai Pass, and Bella Bella. Surveys of private angler catch were not conducted, but were believed to be less than the lodge catch. Tidal area sport catch estimates near the mainland coast of Northern B.C. in 2010 were not available. Catches by First Nations were 13,700 Chinook for the North Coast and approximately 100 for the Central Coast.

Southern B.C. ISBM fisheries in 2010 harvested a total of 94,867 Chinook (72,260 sport, 20,872 First Nations, and 1,735 commercial).

No direct management measures for Chinook salmon within the Council management area were specified under the 2008 PST agreement, except for the ISBM commitment. The Council's ocean fisheries and inside fisheries conducted by the state and tribal managers were designed to minimize impacts on spawning escapements of depressed stocks and preseason estimates of impacts were in compliance with terms of the PST agreement. Information necessary to evaluate the postseason impacts of Council area fisheries was not available.

Coho Fisheries

In 2002 the PSC adopted a management plan for coho salmon originating in Washington and Southern B.C. river systems. The plan is directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the United States and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status (low, moderate, and abundant) and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan.

The forecast of 2010 abundance indicated that the status of interior Fraser River coho remained critically low. The lower Fraser, Georgia Basin, and the Johnstone Strait coho management units were all forecast to be at low or moderate status. The PSC coho status categories of low, moderate, and abundant are analogous to the FMP categories of critical, low, and normal.

In 2010, Canada's coho management objective was to constrain the exploitation rate by its fisheries on Thompson coho (a component of the Interior Fraser management unit) to a ceiling of 3 percent. Unmarked coho were released in many Southern B.C. commercial and sport fisheries where Thompson coho were known to be prevalent. Estimated release mortality rates for legal size coho by gear type were: Seine 25 percent; Northern Gillnet 70 percent; Southern Gillnet 60 percent; Troll 26 percent; and Sport 10 percent (Canadian Stock Assessment Secretariat, Research Document 99/128). Only terminal area fisheries along the WCVI and small portions of upper Johnstone Strait and the Queen Charlotte Islands were permitted for a short period to retain unmarked coho. Selective fishing techniques, such as barbless hooks for trollers, seine bunt restrictions, and use of revival tanks, were required. In 2010 a total of 138,757 coho (138,295 troll, 462 net) were retained by commercial fisheries in Northern B.C. and 1,806 coho (1,220 troll, and 586 net) in Southern B.C. fisheries. Coho kept and released by marine commercial fisheries are summarized in Table I-13.

For recreational fisheries, mark-selective coho retention was permitted in mixed stock areas, and barbless hooks were required. Mark-selective fisheries were implemented in most of Southern B.C. (Johnstone Strait, Strait of Georgia, Juan de Fuca Strait, and WCVI). The estimated total retained catch of coho in Southern B.C. marine recreational fisheries in 2010 was 21,531. Coho kept and released by marine recreational fisheries in Southern B.C. are summarized in Table I-14.

First Nations fisheries in Southern B.C. were estimated to have harvested 43,400 coho.

		Chinook	Coho ^{a/}	
U.S./Canada Border to Cape Falcon, OR June 12-30 (19 days)	All except coho	12,000	-	Two fish per day. All Chinook must be marked with a healed adipose fin clip.
U.S./Canada Border to Cape Alava, WA (Neah Bay subarea) Tues.-Sat. July 1-22; seven days per week July 23-Sept. 19 (75 days)	All Salmon		6,990	Two salmon daily; no more than one Chinook prior to July 8. No chum retention beginning August 1.
Cape Alava to Queets River, WA (La Push subarea) Tues.-Sat. July 1-22; seven days per week July 23-Sept. 19 (75 days)	All Salmon	The Chinook quota for all subareas between the	1,700	Two salmon daily; no more than one Chinook prior to July 8.
North of 47°50'00" N. lat. and south of 48°00'00" N. Lat. seven days per week Sept. 25-Oct.10 (16 days)	All Salmon	U.S./Canada border and Cape Falcon, OR combined was 45,000 ^{c/} .	50	Two salmon daily.
Queets River to Leadbetter Pt., WA (Westport subarea) Sun.-Thurs. July 4-22; seven days per week July 23-Sept. 19 (74 days)	All Salmon		24,860	Two salmon daily; no more than one Chinook prior to July 8. Grays Harbor Control Zone closed beginning August 1.
Leadbetter Point, WA to Cape Falcon, OR (Columbia River subarea) Seven days per week July 1-Sept. 30 (92 days)	All salmon		40,600 ^{d/}	Two salmon daily; no more than one Chinook prior to July 8.
Cape Falcon to OR/CA Border May 29-June 25 (28 days)	All except coho	None	-	Two salmon daily. Fishing in the Stonewall Bank groundfish conservation area restricted to trolling only on days the all depth recreational halibut fishery is open. ^{e/}
June 26-Sept. 6 (73 days)	All salmon	None	26,000	Two salmon daily. Fishing in the Stonewall Bank groundfish conservation area restricted to trolling only on days the all depth recreational halibut fishery is open. ^{e/}

TABLE I-3. Summary of actual ocean recreational salmon fishing regulations for 2010. (Page 2 of 2)

Area and Season	Salmon Species	Actual Quota		Daily Limit and Special Restrictions ^{b/}
		Chinook	Coho ^{a/}	
Cape Falcon OR to OR/CA Border (con't.)				
Tillamook Ocean Terminal Area				
Twin Rocks to Pyramid Rock inside 15 fm				
May 29-June 25 (28 days)	Chinook Only	None	-	Chinook must be marked.
June 26-July 31 (36 days)	All Salmon	None	f/	Chinook must be marked.
Twin Rocks to Pyramid Rock inside 3 nm				
Sept. 1-6 (6 days)	All Salmon	None	f/	Barbless hooks required through Sept. 6. Two salmon daily, one of which can be an unmarked Chinook; no more than 10 unmarked Chinook per season.
Sept. 7-Oct. 31 (55 days)	Chinook Only	None	-	
Elk River Ocean Terminal Area				
Inside of a line from Cape Blanco to Black Rock to Best Rock to 42°40'30" N. Lat. 124°29'00" W. Long. to Humbug Mt.				
Oct. 15 - Nov. 30 (47 days)	Chinook only	None	-	Two Chinook daily.
Chetco River Terminal Area				
Twin Rocks to OR/CA border Inside 3 nm				
Oct. 1-12 (12 days)	Chinook only	None	-	One Chinook daily, no more than five per season.
OR/CA Border to Horse Mt., CA				
May 29-Sept. 6 (101 days)	All except coho	None	-	Two salmon daily. 24 inch minimum size limit.
Horse Mt. to Pt. Arena				
Apr. 3-Sept. 6 (157 days)	All except coho	None	-	Two salmon daily. 20 inch minimum size limit prior to May 1; 24 inches thereafter.
Pt. Arena to U.S./Mexico Border				
Apr. 3-Sept. 6 (121 days)	All except coho	None	-	Two salmon daily. Seven days per week and 20 inch minimum size limit prior to May 1; Thurs.-Mon. and 24 inches thereafter.

a/ All coho fisheries and quotas are mark-selective for fish with a healed adipose fin clip.

b/ No more than one rod and single-point, single-shank barbless hooks required north of Pt. Conception, CA. No more than two single-point, single-shank barbless hooks when fishing for salmon or fishing from a boat with salmon on board between Pt. Conception and Cape Falcon, OR. If angling by any means other than trolling between Pt. Conception and Horse Mt., CA, no more than two single-point, single-shank, barbless circle hooks shall be used. The distance between the two hooks must not exceed 5 inches when measured from the top of the eye of the top hook to the inner base of the curve of the lower hook, and both hooks must be permanently tied in place (hard tied). Unless otherwise noted: minimum size limits are (1) 24 inches for Chinook and 16 inches for coho north of Cape Falcon, and (2) 20 inches for Chinook and 16 inches for coho south of Cape Falcon.

c/ 49,000 preseason quota minus impact neutral transfers of 2,500 in August and 1,500 in September to the non-Indian commercial troll fishery in exchange for 7,000 coho in August.

d/ 33,600 preseason quota plus impact neutral transfer of 7,000 from the non-Indian commercial troll fishery in exchange for 2,500 Chinook in August.

e/ The all depth halibut season was open on May 13-15, 20-22, June 17-19, July 1-2, and August 6-7.

f/ Included in the Cape Falcon to OR/CA border recreational mark selective coho quota of 26,000 open June 26 - September 6.

a/ For Washington, commercial effort and landings include: (1) treaty Indian fisheries (ocean and Area 4B only from May 1-Sept. 30) beginning in 1972; (2) prior to 1978, catch off British Columbia landed in Washington; (3) catch off Alaska landed in Washington; and (4) catch off Oregon and California beginning in 1976. Treaty Indian effort is in deliveries. Beginning in 1989, recreational angler trips and catch include state-managed, late-season Area 4B fishery when open (see Table IV-15).

b/ Recreational effort and catch includes Washington-based effort and catch from Oregon state waters (July 26-Aug. 1) and Strait of Juan de Fuca after WDFW and NMFS ocean closures in 1982.

c/ Preliminary.

d/ Oregon commercial troll landings include small numbers of salmon caught in Alaska (prior to 1990), Washington, and California. Oregon recreational effort data are total angler trips prior to 1979 and salmon trips beginning in 1979. Significantly reduced salmon per angler trip in 1994-1998 reflects regulations requiring nonretention of coho in the recreational fishery south of Cape Falcon.

e/ California commercial effort and landings include salmon caught off Oregon and landed in California, which were minor and infrequent until 2004, when 200 days fished and 25,300 Chinook were included.

TABLE I-5. Council area commercial and recreational ocean salmon fishing effort and landings by management area.

a/ Guidelines for Chinook fisheries are marked with an asterisk (*).

b/ Quotas do not match preseason quota/guidelines because inseason actions (i.e., trades and transferring quotas on an impact neutral basis) resulted in increases or decreases to the overall quota.

TABLE I-7. Estimated incidental mortality of Chinook and coho in 2010 ocean salmon fisheries. Observed incidental mortality was calculated by scaling preseason projections of incidental mortality by the ratio of observed to projected catch.

a/ The bycatch mortality reported in this table consists of drop-off mortality (includes predation on hooked fish) plus hook-and-release mortality of Chinook and coho salmon in Council-area fisheries. Drop-off mortality for both Chinook and coho is assumed to be equal to 5% of total encounters. The hook-and-release mortality (HRM) rates used for both Chinook and coho are:

Commercial: 26%.

Recreational, north of Pt. Arena: 14%.

Recreational, south of Pt. Arena: 18% (based on the proportion of fish caught using mooching versus trolling gear, and the HRM rates of 42.2% and 14% for these gear types, respectively).

b/ Bycatch calculated as dropoff mortality plus fish released; commercial troll includes GSI non-retention bycatch and mortality.

c/ Includes Oregon territorial water, late season Chinook fisheries.

d/ Based on reported released Chinook and estimated mortality from non-retention fisheries.

e/ Based on reported released Chinook.

f/ Includes fisheries that allow retention of all legal sized coho.

g/ Calculated from observed mark rates where available; where unavailable, anticipated mark rates were used.

CHAPTER II

CHINOOK SALMON MANAGEMENT

CENTRAL VALLEY CHINOOK STOCKS

Central Valley Chinook stocks include fall, late-fall, winter, and spring stocks of the Sacramento and San Joaquin rivers and their tributaries. Two of these stocks are listed under the ESA: (1) Sacramento River winter Chinook, listed as endangered in January 1994; and (2) Central Valley spring Chinook, listed as threatened in September 1999.

Management Objectives

The following conservation objectives guided Council management of Central Valley Chinook salmon stocks in the 2010 fisheries: (1) for SRFC, an escapement goal of 122,000 to 180,000 hatchery and natural area adults, including additional NMFS guidance to target the upper end of the escapement goal range; and (2) for Sacramento River winter and Central Valley spring Chinook, the ESA consultation standard concerning the duration and timing of the commercial and recreational ocean salmon fisheries south of Point Arena, as well as additional NMFS guidance on recreational size limits directed at reducing mortality of Sacramento River winter Chinook. Harvest impacts on Central Valley Chinook were a primary management concern in fisheries south of Cape Falcon, Oregon

Regulations to Achieve Objectives

Season and size limit details are presented in Tables I-1 and I-3.

Commercial

California commercial fisheries were heavily constrained in 2010, primarily to allow for the projected attainment of the SRFC conservation objective. There were only eight days open to commercial fishing south of Point Arena in 2010. Those eight days and quota fisheries of 18,000 and 9,375 were allowed in the Fort Bragg area, and the California portion of the KMZ was closed. Fisheries between Cape Falcon and the OR/CA border delayed opening until May 1, and the Oregon portion of the KMZ was closed in June.

Recreational

Recreational seasons and size limits were structured to meet the Sacramento River winter and Central Valley spring Chinook ESA consultation standard. In addition to the consultation standard, the minimum size limit for recreational fisheries south Point Arena was 24 inches total length for the period from May 1 through September 6 to comply with 2010 NMFS guidance pertaining to Sacramento River winter Chinook (Chapter I, Regulatory Objectives by Management Area, Horse Mountain to U.S./Mexico Border). The minimum size limit between Point Arena and Horse Mountain was also increased to 24 inches to provide statewide consistency.

Recreational fisheries opened on April 3rd south of Horse Mountain, May 29th (Memorial Day weekend) in the KMZ, and May 1 between Cape Falcon and Humbug Mt. All recreational fisheries south of Cape Falcon continued through September 6 (Labor Day); however, fisheries south of Point Arena were closed Tuesdays and Wednesdays beginning in May to help achieve the 2010 SRFC spawning escapement objective of 180,000 hatchery and natural area adults.

Inside Harvest

Recreational angling for salmon in Central Valley rivers was structured, in part, to result in a harvest of 8,200 adult SRFC; a mosaic of closures in Central Valley rivers were implemented to achieve this catch expectation. An estimate of SRFC harvest in 2010 Central Valley river fisheries was not available at the time of publication.

Since 1990, regulations have closed the mainstem Sacramento River to retention of salmon from January 15 to July 15, a period when winter Chinook adults are thought to be most abundant. Beginning in 2004, the retention closure was enacted earlier, on January 1 from the Carquinez Bridge to Red Bluff, in response to recovery of winter Chinook coded-wire-tags (CWTs) in the sport fishery. Owing to low Chinook escapement to the Stanislaus, Tuolumne, and Merced rivers during the last decade, the majority of the San Joaquin River has been closed to recreational salmon fishing.

Escapement and Management Performance

Chinook catch in all commercial and recreational fisheries south of Cape Falcon were below preseason expectations. Overall, commercial Chinook fisheries caught about 47 percent of preseason expectations and recreational Chinook fisheries caught about 33 percent of preseason expectations (Table I-7).

Sacramento River Fall Chinook

Under the 2010 regulations, the projected spawning escapement in the Sacramento River Basin was 180,000 hatchery and natural area fall Chinook adults. A total of 125,353 hatchery and natural area SRFC adults were estimated to have returned to the Sacramento River basin for spawning in 2010 (Table II-1, Figure II-1). The 2010 adult escapement estimate is slightly higher than the lower bound of the FMP conservation objective of 122,000 to 180,000 hatchery and natural area adults, and comes one year after the lowest escapement estimate on record. In 2009, SRFC failed to meet the lower bound of the conservation objective for the third consecutive year, thereby triggering an Overfishing Concern under the terms of the FMP.

Fall Chinook returns to Sacramento River hatcheries in 2010 totaled 39,702 adults, and escapement to natural areas was 85,651 adults. Available data indicate hatchery-produced fish constitute a large portion of the Sacramento River naturally spawning fall Chinook population. Table II-1 and Figure II-1 display historical natural and hatchery fall spawner escapement estimates. For a more detailed breakdown of the historical escapement see Appendix B, Tables B-1 and B-2.

Sacramento River Winter and Spring Chinook

Spawner escapement of endangered winter Chinook salmon in 2010 was estimated to be 1,555 adults and 41 jacks. This estimate is derived from a carcass survey conducted on the upper Sacramento River and includes winter Chinook captured in the Keswick trap, which provides broodstock to Livingston Stone National Fish Hatchery. Spawner escapement estimates derived from Red Bluff Diversion Dam counts have been made since 1967, and from 1987 to 2008 the estimates were derived by expanding counts made during the period of dam operation (which overlaps with approximately 15 percent of the winter run migration period). In 2009 and 2010 the period of dam operation was delayed by one month which did not allow for a winter run escapement estimate to be made based on Red Bluff Diversion Dam passage (the gates at Red Bluff Diversion Dam were down beginning on June 15, whereas the gates are down typically on May 15). However, even during years with typical Red Bluff Diversion Dam operation timing, the estimates from the carcass survey are considered to better represent winter run spawner escapement owing to the small proportion of the winter run migration sampled during the Red Bluff Diversion Dam operation period.

Escapement of spring Chinook to the Sacramento River system in 2010 totaled 4,612 fish (jacks and adults), most of which (an estimated 2,951 fish) returned to upper Sacramento River tributaries; the remaining 1,661 fish returned to the Feather River Hatchery. No estimate of spring Chinook escapement to the upper mainstem Sacramento River could be made in 2010 due to the changes in Red Bluff Diversion Dam operation described above. The method used to estimate the spring Chinook return to the Feather River Hatchery was modified in 2005. In previous years, the estimate was equal to the number of Chinook that entered the hatchery during the early period of Chinook spawning. From 2005 through 2010, prior to the spring run spawning period, fish that entered the hatchery were tagged and returned to the river; the number of tagged fish that re-entered the hatchery during the spring run spawning period was used as the estimate of spring Chinook escapement in the Feather River. The fish that were tagged at the hatchery and returned to the river but did not re-enter the hatchery during the spawning period were counted in the natural fall run survey and reported as Feather River fall Chinook. The natural area spawner surveys in the Feather River are not currently capable of separating the spring and fall runs.

Historical spawner escapements for Sacramento River winter and spring Chinook salmon are presented in Appendix B, Table B-3.

San Joaquin River Fall Chinook

San Joaquin River spawning areas are used primarily by fall Chinook. The estimated San Joaquin River fall Chinook spawning escapement in 2010 totaled 4,937 jacks and adults in natural areas and 5,422 jacks and adults to hatcheries (Appendix B, Tables B-1 and B-2 provide historical spawner escapements). Salmon production in the San Joaquin River is determined largely by spring outflows three years earlier. Since 1986, spawner returns to the San Joaquin River have constituted less than 10 percent of the total Central Valley escapement for fall run Chinook.

NORTHERN CALIFORNIA COAST CHINOOK STOCKS

Northern California stocks include fall and spring stocks north of the entrance to San Francisco Bay. Primary river systems in this area are (from north to south) the Smith, Klamath, Mad, Eel, Mattole, and Russian rivers. Coastal Chinook stocks south of the Klamath River were listed as threatened under the ESA in September 1999.

Management Objectives

The KRFC conservation objective, and Council guidance for this stock, primarily influenced management of northern California Chinook salmon stocks in the 2010 fisheries. KRFC were managed in accordance with Council guidance calling for a maximum adult natural spawner reduction rate of 67 percent, with a minimum spawner escapement of 40,700 adults in natural areas. The minimum spawner escapement was raised from 35,000 to 40,700 for 2008, 2009, and 2010 in response to the triggering of an Overfishing Concern after failing to meet the 35,000 spawner escapement floor for three consecutive years (2004, 2005, and 2006). The available harvest of KRFC was shared equally between non-tribal and tribal fisheries (tribes with Federally-recognized fishing rights). KRFC also provided the basis for the NMFS ESA consultation standard for California coastal Chinook, which limits the ocean harvest rate on age-4 KRFC to no more than 16.0 percent.

Regulations to Achieve Objectives

To achieve the management objectives for KRFC, the adopted regulations were designed to result in: (1) a Klamath River run of 110,700 fall Chinook adults, resulting in a spawner escapement of 40,700 adults to natural areas, taking into account projected river fishery impacts of 49,800 adults and returns to basin hatcheries; (2) 50 percent (34,600) of the allowable adult harvest for tribal subsistence and commercial fisheries; (3) 34.6 percent (12,000) of the non-tribal harvest to the Klamath River recreational fishery; and (4) 15.2 percent (approximately 3,400 fish) of the ocean harvest to the KMZ recreational

fishery. The age-4 ocean harvest rate resulting from the above configuration was forecast to be 12.3 percent. Season and size limit details are presented in Tables I-1 and I-3.

Commercial

Commercial fisheries south of Cape Falcon were constrained during the spring and summer months primarily to meet the 2010 management objective for SRFC of 180,000 adult spawners and the ESA consultation standard for LCR natural tule Chinook of a total exploitation rate of no more than 38 percent. Limited opportunities in the Oregon KMZ and Fort Bragg were intended to harvest available KRFC when SRFC abundance was relatively low. Fisheries with quotas of 1,500 in July and 1,500 in August occurred in the Oregon KMZ. Fisheries with quotas of 18,000 July (15-29) and 9,375 in August occurred in Fort Bragg.

No fall commercial fisheries (September-December) were established in Council area waters south of Cape Falcon in 2010 due to concern over the status of SRFC and because KRFC remains in a rebuilding plan, which requires restricting fall fisheries opportunity. State waters only terminal commercial fisheries were allowed in three areas in Oregon (Table I-1).

Recreational

Recreational fisheries south of Cape Falcon were permitted in the KMZ from Memorial Day weekend through Labor Day weekend. Fall fisheries were not permitted in Council area waters south of Cape Falcon after September 6 due to concern over the status of SRFC and because KRFC remains in a rebuilding plan. State waters only terminal commercial fisheries were allowed in three areas in Oregon (Table I-3).

Inside Harvest

Yurok and Hoopa tribes shared a federally reserved right of 50 percent (34,600) of the available harvest surplus of adult Klamath fall Chinook. The State of California managed the river recreational fishery under a 12,000 adult fall Chinook quota. Tribal adult harvest was 29,966, which was 87 percent of the quota (Appendix B, Table B-5). The estimated recreational fishery harvest was 3,035 adult fish, which was 25 percent of the quota. Harvest estimates from streams outside the Klamath River Basin were not available.

Escapement and Management Performance

The commercial quota fisheries in the Oregon portion of the KMZ attained only 3 percent and 8 percent of their July and August quotas, respectively, and the Fort Bragg commercial quota fisheries achieved 25 and 66 percent of their July and August quotas, respectively (Table I-6).

Threatened California North Coast Chinook

Historical indices of spawner abundance, or actual spawning escapement estimates, for Chinook salmon in California coastal streams outside of the Klamath River Basin are limited. cursory, nonsystematic surveys are conducted on one tributary of the Mad River and two tributaries of the Eel River. Video counts of Chinook passage at Mirabel Dam on the Russian River have been conducted since 2000 (Appendix B, Table B-7).

The 2010 preseason forecast of the KRFC age-4 ocean harvest rate was 12.3 percent (the ESA consultation standard for California Coastal Chinook is no more than 16.0 percent). The postseason evaluation of the 2010 KRFC age-4 ocean harvest rate was not available in time for this report.

Klamath River Fall Chinook

The 2010 preliminary postseason river run size estimate for KRFC was 90,972 adults compared to the preseason predicted ocean escapement (river run size) of 110,700 adults. The escapement to natural spawning areas was 37,221 adults, which was 91 percent of the preseason prediction of 40,700 adults. The estimated number of hatchery returns was 18,050 adults. Table II-2, Figure II-2, and Appendix B, Table B-4 present historical harvest and escapement data for KRFC.

Spawning escapement to the upper Klamath River tributaries (Salmon, Scott, and Shasta Rivers), where spawning was only minimally affected by hatchery strays, totaled 5,850 adults. The Shasta River has historically been the most important Chinook salmon spawning stream in the upper Klamath River, supporting a spawning escapement of 30,700 adults as recently as 1964, and 63,700 in 1935. The escapement in 2010 to the Shasta River was 1,259 adults, while escapement to the Salmon and Scott Rivers was 2,113 and 2,478 adults, respectively (Appendix B, Table B-6).

OREGON COAST CHINOOK STOCKS

Oregon coast Chinook stocks include all fall and spring stocks from Oregon streams south of the Columbia River. These stocks are categorized into two major subgroups based on ocean migration patterns. Although ocean harvest distributions overlap somewhat, they are categorized as either north or south/local migrating. North migrating Chinook stocks include stocks north of and including the Elk River, with the exception of Umpqua River spring Chinook. South/local migrating Chinook stocks include Rogue River spring and fall Chinook, Umpqua River spring Chinook, and fall Chinook from smaller rivers south of the Elk River.

Based on CWT analysis, the populations from 10 major north Oregon coast (NOC) river systems from the Nehalem through the Siuslaw Rivers are harvested primarily in PSC ocean fisheries off B.C., SEAK and Oregon terminal area fisheries. NOC stocks are harvested to a much lesser degree, in Council area fisheries off Washington and Oregon. Analysis of CWTs indicates the populations from five major mid-Oregon coast (MOC) systems between the Coos and the Elk Rivers are harvested primarily in ocean fisheries off B.C., Washington, Oregon and terminally. Minor catches occur in California fisheries and variable catches in SEAK troll fisheries. South/local stocks are important contributors to ocean fisheries off Oregon and northern California. Another central Oregon stock, Umpqua River spring Chinook, contributes primarily to ocean fisheries off Oregon and California, and to a lesser degree, off Washington, B.C., and SEAK.

Management Objectives

The conservation objective for Oregon coast Chinook was an aggregate of 150,000 to 200,000 natural adult spawners, as indicated by peak spawner counts of 60 to 90 fish per mile in standard index surveys. This stock has been an abundant stock historically, therefore preseason abundance estimates were not developed for this stock, and it has not been of critical management concern. ESA consultation standards for OCN coho, LCN coho, and California Coastal Chinook, and KRFC management objectives generally result in reduced Council-area ocean fishery impacts on Oregon south/local migrating Chinook stocks. Council area Chinook fisheries have minor impacts on most of the stocks originating from the NOC, which have a northerly marine distribution pattern.

Regulations to Achieve Objectives

The areas of primary management concern for ocean fisheries impacting Oregon coast Chinook vary between the north and south/local migrating stocks, although there is some overlap. Preseason abundance estimates were not available for Oregon coast Chinook; however, based on postseason abundance indicators, Council area fisheries impacts on this stock have not significantly affected objective achievement in recent years.

For the 2010 Oregon State-waters terminal area fisheries, conservative regulations were adopted with the intention of reducing impacts on these stocks. These regulations included season quotas, daily and weekly landing limits in commercial fisheries, and reduced daily and season bag limits and partial mark-selective restrictions in recreational fisheries (Tables I-1 and I-3).

Inside Harvest

Inside recreational harvest of fall and spring Chinook occurred in most Oregon coastal estuaries and rivers. For the 2010 fisheries, conservative regulations were adopted with the intention of reducing impacts on many of these stocks. Complete estimates of the 2010 recreational Chinook harvest in freshwater areas were not available. Historical estimates of the recreational harvest of fall and spring Chinook, derived from Oregon Department of Fish and Wildlife (ODFW) salmon and steelhead angler catch record cards are reported in Table II-3.

Escapement and Management Performance

The overall quota for the three fall terminal area commercial fisheries was 2,350 Chinook. The catch estimate for those fisheries was 1,912 Chinook.

Under the 2010 regulations, the STT expected the aggregate conservation objective for this stock would be met with the constraints required for SRFC and LCN coho. Actual escapement was not estimated for the Oregon Coast Chinook stock aggregate; achievement of the aggregate 150,000 to 200,000 naturally spawning adults was assessed through peak spawner index counts of 60 to 90 adults per mile in nine index streams and included both spring and fall Chinook. Peak spawner index counts were based on traditional non-random surveys (e.g., stream surveys, dam counts, etc.). ODFW is developing alternate methodologies for establishing escapement goals for Oregon coastal Chinook stocks, including fall Chinook PSC indicator stocks. Upon completion of this process, the escapement goals and assessments for these stocks will likely change.

North Migrating Chinook

An index of adult spawners (peak count per index mile) in nine standard streams was used to measure natural spawner escapement trends for north migrating fall Chinook. Data have been collected since about 1950 for most systems. Overall peak Chinook adult index spawner counts in 2010 were preliminarily estimated at 87 adults per mile, within the goal range of 60 to 90 adults per mile (Table II-4, Figure II-3).

South/Local Migrating Chinook

Standard fall Chinook spawning index escapement data for the smaller southern Oregon coastal rivers (south of the Elk River) were available for the Winchuck, Chetco, and Pistol Rivers (Appendix B, Table B-8). Rogue River carcass counts were used as an indicator of trends in escapement for naturally produced fall Chinook, but these surveys have not been conducted since 2004 (Table II-4). Therefore, two trend indicators of escapement for naturally produced spring Chinook were utilized: (1) Rogue River counts at Gold Ray Dam, and (2) Umpqua River counts at Winchester Dam (Table II-4). Escapements based on these indicators were an increase for the 2010 returns over recent years' returns (Figures II-3 and II-4). The aggregate Oregon coast goal of 150,000 to 200,000 naturally spawning Chinook adults was probably met in 2010.

COLUMBIA RIVER BASIN CHINOOK STOCKS

Columbia River Basin Chinook salmon stocks include fall, summer, and spring stocks. NMFS has listed five Chinook ESUs within the Columbia Basin under the ESA, (1) Snake River wild (SRW) fall Chinook

listed as threatened April 1992; (2) Snake River spring/summer listed as threatened April 1992; (3) upper Columbia River spring listed as endangered March 1999; (4) lower Columbia River listed as threatened March 1999; and (5) upper Willamette River spring listed as threatened March 1999.

The assessment below covers five major stock groups of Columbia River Basin fall Chinook: lower river hatchery (LRH) tule stock and lower river wild (LRW) bright stock, both of which are part of the ESA-listed lower Columbia River Chinook ESU; Spring Creek Hatchery (SCH) tule stock; upriver bright (URB) stock, which includes the ESA-listed Snake River fall Chinook ESU; and mid-Columbia bright (MCB) hatchery stock. Management details for Columbia River spring and summer Chinook stocks are not discussed, since Council-managed ocean salmon fisheries have very limited impacts on these stocks (less than a 2 percent exploitation rate in base-period fisheries). Appendix B, Tables B-12 through B-19, contain historical harvest and escapement data for fall, summer, and spring stocks. Appendix B, Table B-20 summarizes catch information for all three Chinook runs in the Columbia Basin. Additional information on these stocks can be found in the *Joint Staff Report: stock status and fisheries for spring Chinook, summer Chinook, sockeye, steelhead, and other species and miscellaneous regulations* and the *Joint Staff Report concerning the fall in-river commercial harvest of Columbia River fall Chinook, summer steelhead, coho salmon, chum salmon, and sturgeon* published annually by the joint staffs of ODFW and WDFW.

Management Objectives

Council-area fisheries north of Cape Falcon in 2010 were managed to access SCH and LRH stocks while meeting the NMFS ESA consultation standards for the ESA-listed lower Columbia River Chinook ESU (both LCR natural tules and LRW) and SRW fall Chinook ESU. The standard for ESA-listed lower Columbia River natural tules was a total (ocean plus inriver) AEQ exploitation rate of no more than 38.0 percent. For preseason modeling, the estimated total exploitation rate on a composite of Washougal, Kalama, Cowlitz, and Big Creek hatchery tules was used as a surrogate for natural tules. The NMFS ESA consultation standard for LRW is a North Lewis River fall Chinook spawning escapement of 5,700; the preseason forecast was for an escapement of 10,000. The standard for the SRW ESU was no less than a 30.0 percent reduction in the Snake River Fall Index (SRFI) from the 1988 through 1993 base period exploitation rate for all ocean fisheries combined.

In 2010, allowable catch of Chinook was substantially increased due to the strong abundance of tule Chinook from Spring Creek Hatchery. The NMFS ESA consultation standard for the threatened LCR tule Chinook was the primary constraint on Council-area Chinook fisheries north of Cape Falcon, and to a lesser extent, south of Cape Falcon.

Regulations to Achieve Objective

Fisheries north of Cape Falcon are managed with quotas to help ensure impacts to stocks do not exceed allowable limits and to ensure allocation objectives are met. The overall non-Indian Chinook total allowable catch (TAC) was 117,000, including a 12,000 mark selective Chinook quota for a portion of the recreational fishery; the equivalent non-mark-selective TAC was 110,000. These compare to a 2009 non-Indian TAC of 41,000 Chinook. The 2010 overall TAC was divided into 56,000 commercial and 61,000 recreational. The treaty Indian ocean troll TAC was 55,000 Chinook, and is applicable to the May-September period. This compares to a 2009 treaty Indian TAC of 39,000.

Commercial

Non-Indian commercial fisheries north of Cape Falcon included a Chinook directed fishery in May and June initially open seven days per week with no landing limit. Three-fourths of the overall non-Indian commercial Chinook quota north of Cape Falcon was allotted to the May-June time period to increase opportunity when Chinook were more available to the fishery. The typical allotment is two-thirds of the

total troll quota to the May-June time period. Inseason action was taken to limit the days per week and institute landing and possession limits toward the end of the season to ensure the quota of 42,000 Chinook was not exceeded.

The non-Indian commercial all salmon fishery was scheduled for July 1 through September 14 with preseason quotas of 14,000 Chinook and 11,800 marked coho. Inseason action was taken to transfer 2,700 Chinook remaining from the May-June commercial fishery quota and to transfer 1,650 and 1,000 Chinook from the north of Cape Falcon recreational fishery after adjusting for stock specific impact differences associated with different time periods and incidental mortality rates.(impact neutral basis). The fishery was closed September 7 prior to the scheduled closure of September 14 to ensure the Chinook final quota of 19,350 was not exceeded. The fishery was open Friday through Tuesday most weeks with various landing and possession limits for each open period. In addition, vessels were restricted to fishing and landing catch either north or south of Leadbetter Point during any one open period.

Recreational

The recreational fisheries north of Cape Falcon included a June mark-selective Chinook fishery, the first mark-selective Chinook fishery in Council managed waters. The quota for that fishery was 12,000 marked Chinook, equivalent to a 5,000 non-mark-selective quota.

The summer all-salmon fisheries north of Cape Falcon started with a one Chinook bag limit, but inseason action was taken in July to allow two Chinook to be retained. Inseason action was also taken in July to allow the Westport, La Push, and Neah Bay subareas to open seven days per week; the Columbia River subarea was initially open seven days per week. All four subareas were able to close as scheduled, before exceeding their quotas for Chinook or coho. Inseason action was taken to transfer 2,500 and 1,500 Chinook to the non-Indian commercial fishery on an impact neutral basis in exchange for 7,000 marked coho for the Columbia River subarea recreational fishery.

Treaty Indian

Treaty Indian ocean fisheries were similar in structure to recent years, with a May-June Chinook directed fishery and a July 1 to September 15 all salmon fishery. Chinook quotas were 27,500 in each fishery, and the coho quota in the all-salmon fishery was 41,500. Both fisheries closed as scheduled without exceeding any of their quotas.

Inside Harvest

Since the Columbia River Fishery Management Plan expired on December 31, 1998, fall Chinook in Columbia River fisheries were managed through 2007 under the guidance of annual management agreements among the *U.S. versus Oregon* parties. In 2008, a new 10 year management agreement was negotiated through the *U.S. versus Oregon* process, which included revisions to some inriver objectives. In particular, the "*2008-2017 U.S. v Oregon Management Agreement*" (2008-2017 MA) specified that with run sizes of at least 200,000 URB, including at least 6,000 SRW fall Chinook, the allowable URB impact rate would be 38 percent. NMFS used the URB impact rate as a proxy in the SRW consultation standard.

In 2010, the fall fisheries were managed to achieve the NMFS ESA consultation standards for threatened LCR natural tule and SRW Chinook.

Harvestable surplus was projected for all major fall stocks in 2010. The postseason fall Chinook run reconstruction, however, was not completed in time for this report. The preliminary catch estimate for the non-Indian commercial gillnet fisheries were 39,949 spring, 4,740 summer, and 45,393 fall Chinook, which included 26,142 spring, 20 summer, and 12,712 fall Chinook in Select Area (terminal) fisheries.

The preliminary catch estimates for the treaty Indian fisheries were 37,815 spring, 15,569 summer, and 131,503 fall Chinook. The preliminary catch estimate for the recreational fisheries included 6,393 fall Chinook in the Buoy 10 fishery, and 29,735 spring, 2,738 summer, and 16,600 fall Chinook in mainstem fisheries below Bonneville Dam, 3,512 spring Chinook in mainstem fisheries above Bonneville Dam, and 11,209 fall Chinook in the Hanford Reach fishery above McNary Dam (Appendix B, Table B-20).

Escapement and Management Performance

All Columbia River fall stocks met their escapement objectives (Table II-5). Preliminary estimates of river mouth returns based on inseason run updates were: 86,245 LRH; 9,971 LRW; 123,037 SCH; 255,492 URB; and 68,765 MCB. Estimates for SRW were unavailable. The total ocean escapement of the five stocks was 556,191 fall Chinook (Figure II-5).

The 2010 URB and SRW run sizes were both large enough to allow a 38 percent harvest rate per the 2008-2017 MA. The preliminary URB harvest rate estimate was 36.02 percent. No specific escapement goal was established for the ESA-threatened Snake River wild fall Chinook stock. Because nearly all spawning of this stock occurs upstream from Lower Granite Dam, establishing a spawning escapement goal at Lower Granite Dam would be appropriate. In the *Proposed Recovery Plan for Snake River Salmon*, NMFS has proposed a delisting goal for Snake River fall Chinook that provides for an eight-year (approximately two generation) geometric mean of at least 2,500 natural origin spawners in the mainstem Snake River annually; the eight-year mean through 2009 was 2,494. The total adult fall Chinook count at Lower Granite Dam in 2010 was 41,815 up from 15,167 in 2009. A significant portion of recent year years returns were from supplementation programs. An estimate of SRW fall Chinook spawning escapement in 2010 was not available for this report.

All Council area fisheries north of Cape Falcon were closed before exceeding their final quotas. Postseason estimates of exploitation rate on Columbia River natural tule or SRW for ocean fisheries were unavailable.

WASHINGTON COASTAL CHINOOK STOCKS

Washington coastal Chinook stocks include all fall, summer, and spring stocks from coastal streams north of the Columbia River through the western Strait of Juan de Fuca (west of the Elwha River, inclusive). This complex consists of several natural stocks, generally of small to medium-sized populations, and some hatchery production (primarily Willapa Bay and Quinault River). Coastal stocks are not impacted significantly by Council-area ocean fisheries.

Management Objectives

Willapa Bay natural fall Chinook do not have a conservation objective defined in the Salmon FMP, although WDFW has a spawning escapement objective of 4,350 natural Chinook, which is based on peak density estimates and watershed area.

Spawning escapement goals for natural stocks managed within this complex north of Willapa Bay, established in U.S. District Court by WDFW and the treaty Indian tribes, were recognized in the Council's FMP conservation objectives. Objectives for Grays Harbor and the North Coast river systems were established pursuant to the U.S. District Court order in *Hoh versus Baldrige*. However, annual natural spawning escapement targets may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of *Hoh versus Baldrige* and subsequent U.S. District Court orders. After agreement is reached on the annual targets, ocean fishery escapement objectives are established for each river, or region of origin, which include provisions for treaty Indian allocation and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal Chinook other than those in the FMP were made in 2010.

Regulations to Achieve Objectives

Preseason abundance forecasts for some Washington coastal Chinook stocks were available for the first time in 2008 for the Council preseason management process. However, base period Council area ocean fishery AEQ exploitation rates of 5 percent or less for these stocks were below a management threshold that allows effective Council management of these stocks, and therefore they qualified as exceptions to the Council's overfishing criteria. Because Council area fishery impacts to Washington coastal Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. The only Council area regulation affecting any of these stocks was closing the Grays Harbor Control Zone in August and September for the recreational fishery.

Willapa Bay Chinook

Inside Harvest

Run size, harvest, and escapement data for Willapa Bay fall Chinook are presented in Appendix B, Table B-23.

No Chinook-directed non-Indian gillnet fishery was conducted during July 2010. This fishery is commonly referred to as the "summer dip-in" fishery; it occurs irregularly because historically it was dependent on Columbia River tule abundance, which now include the ESA-listed LCR natural tule stock. This fishery was generally assumed to harvest Columbia River tule stocks in a mix similar to adjacent ocean area catches; however, in light of recent catch composition information (>70 percent local Willapa Bay and Grays Harbor origin stock) this assumption has been questioned.

The 2010 pre-season forecast of Chinook returning to Willapa Bay was 33,157 fish (2,023 natural and 31,134 hatchery). There were two 24 hour Chinook-directed fisheries in August 2010. However, retention of unmarked Chinook was prohibited in August and September. Chinook harvest in coho-targeted gillnet fisheries during 2010 totaled 6,903 fish, based on preliminary data.

Recreational fisheries in the marine waters of Willapa Bay were open from July 4 through July 31, 2010 concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1, 2010 through January 31, 2011, Willapa Bay was open to recreational fishing with no more than three adults allowed to be harvested daily. Barbed hooks were not allowed when fishing for salmon. Retention of chum and unmarked Chinook was prohibited.

Recreational salmon fisheries in tributaries to Willapa Bay varied in duration but were generally open August 1, 2010 through January 31, 2011. Retention of unmarked Chinook was prohibited except in the Naselle River, where two unmarked adult Chinook could be retained. Single-point, barbless hooks were required in all areas except for the Naselle River. Recreational harvest estimates were not available for 2010.

Escapement and Management Performance

During 2009, Chinook returning to hatcheries in the Willapa Bay watershed totaled 20,333 fish. Based on current hatchery production, this return was sufficient to achieve the goal of 9,800 total Chinook escapement to Willapa Bay hatchery facilities. An escapement estimate was unavailable for 2010.

The WDFW escapement goal for naturally spawning Chinook in Willapa Bay was 4,350 adults. An estimate of the 2010 natural spawning escapement was not available (the 2009 natural escapement was 2,251 Chinook). An estimated 1,486 natural Chinook were harvested in commercial and recreational fisheries in 2010, above the preseason expectation of 850.

Grays Harbor Chinook

Inside Harvest

Run size, harvest, and escapement data for Grays Harbor Chinook are presented in Appendix B, Table B-25.

Spring Chinook sales were prohibited in the Chehalis Tribe commercial gillnet fishery. On the Chehalis River and the Humptulips commercial fishing Area 2C, the Quinault Indian Nation conducted a spring/summer commercial gillnet fishery with mesh restrictions to reduce impacts on spring Chinook while targeting white sturgeon. The recreational season was also closed to spring Chinook retention in Grays Harbor. No summer non-Indian gillnet fishery directed at non-local Chinook stocks occurred in 2010.

The non-Indian gillnet fishery in Humptulips commercial Area 2-C had six open periods in September for a total of 15 fishing days. Retention of fall Chinook and marked coho was allowed. Live boxes were required and unmarked coho could not be retained. Catches totaled 1,217 Chinook and 672 coho. The non-Indian gillnet fishery in the Chehalis River commercial Areas 2A and 2D was open for 2 days in October; live boxes were required, and Chinook could not be retained.

The recreational fishery in Marine Area 2-2 was open from September 16 through November 30, with Chinook and chum retention prohibited. The recreational fishery in the Chehalis River was closed to Chinook retention. In the recreational Humptulips River fishery from the mouth to Hwy 101 Bridge, retention of Chinook was allowed from September 16 through January 31. Recreational harvest estimates were not available.

The Quinault Indian Nation fall gillnet fishery harvested a total of 3,403 fall Chinook in two separately scheduled areas: the first in the lower Humptulips River and adjacent Area 2C of Grays Harbor and the second in the lower Chehalis River and adjacent areas of Grays Harbor, Areas 2D, 2A, and 2A-1. Fishing was restricted to east of Stearns Bluff in the Chehalis River, and Areas 2D, 2A, and 2A-1 to limit catches of Chinook, which tend to concentrate in deep areas off the mouths of the Johns and Elk Rivers. The Humptulips area treaty Indian gillnet fishery caught 1,951 fall Chinook, which was 83.9 percent of the preseason expected catch level. The Quinault Tribal gillnet fishery in the Chehalis River caught 1,452 fall Chinook, which was 70.6 percent greater than the preseason expected catch level. The Quinault treaty Indian gillnet fishery in the Chehalis River caught 1,452 fall Chinook which was 70.6 percent over the preseason expected catch level.

Escapement and Management Performance

Chehalis River spring Chinook are of natural origin and managed for an escapement goal of 1,400 adults. The 2010 terminal run forecast for spring Chinook was 909 adult fish; an escapement estimate was not available for the 2010 return. The 2009 final escapement estimate was 1,132.

Grays Harbor fall Chinook were managed for a natural spawning escapement goal of 14,600 adults. The 2010 Grays Harbor fall Chinook forecast was 19,167 natural and 2,404 hatchery adults. Natural and hatchery escapement estimates for 2010 were unavailable. The total spawning ground escapement estimate for 2009 was 7,215, which included some hatchery origin fish. The established hatchery escapement goals for Grays Harbor are 578 for the Chehalis River, which was not achieved in 2009, and 369 for the Humptulips River, which was achieved in 2009.

Quinault River Chinook

Inside Harvest

Historical terminal gillnet harvest data for Quinault River Chinook stocks are presented in Appendix B, Table B-27.

A run of natural spawning spring/summer Chinook enters the river from April through July. The spring/summer Chinook run is typically small and any harvest is taken incidentally during fisheries directed at sockeye and steelhead. Less than 20 spring/summer Chinook were harvested in 2010.

The 2010 harvest of Quinault River fall Chinook was mostly hatchery origin fish taken in September and October. The treaty Indian net catch totaled 4,521 fall Chinook.

Escapement and Management Performance

Quinault fall Chinook were managed for hatchery production. The 2010 fall Chinook spawning escapement estimate was not available. Hatchery fall Chinook egg-take goals for the Quinault River were attained at the Lake Quinault tribal hatchery.

Queets River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Queets River spring/summer and fall Chinook are presented in Appendix B, Tables B-29 and B-30, respectively.

The treaty Indian gillnet harvest of spring/summer Chinook remained closed during the spring/summer period through the last week of August. The non-Indian in-river recreational fishery was closed to retention of Chinook.

Fall Chinook were harvested from August 29 through November 4 by the treaty Indian fall gillnet fishery. The treaty Indian fishery was structured to target hatchery and natural coho while also harvesting Chinook at a total tribal plus non-tribal harvest rate of 40 percent. The treaty Indian gillnet fishery harvested 1,723 fall Chinook in the commercial fishery compared to a preseason expected catch of 1,635. Recreational fisheries targeted coho and Chinook during standard schedules in the Queets and Clearwater Rivers. The on-reservation Salmon River recreational harvest was limited to retention of coho. Only mark-selective Chinook retention was allowed for recreational fisheries within Olympic National Park waters. Catch estimates for recreational fisheries were not available.

Escapement and Management Performance

The 2009 spawning escapement estimate for Queets River spring/summer Chinook was 495 adults, about 70 percent of the minimum escapement goal of 700. The 2010 escapement was not available.

The 2010 fall Chinook spawner survey escapement estimate was not available; however, total fall Chinook escapement is expected to be above the minimum escapement goal of 2,500. High flow conditions during Chinook spawning may adversely affect the quality of escapement estimates based on spawning ground surveys. Catch sampling suggests the proportion of natural and “indicator” Chinook (reared and released from the Salmon River hatchery) may have been close to the preseason prediction. The indicator Chinook originate from wild broodstock taken each year in the river.

Hoh River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River spring/summer and fall Chinook are presented in Appendix B, Tables B-32 and B-33, respectively.

The 2010 Hoh River spring/summer Chinook terminal abundance forecast was 814 fish, 86 fish below the escapement goal of 900. The treaty Indian gillnet fishery occurred between the weeks of May 3 and the week of July 5, and was scheduled for two days per week in weeks 19-23 and one day per week in weeks 24-27, targeting 7.9 percent (including ceremonial and subsistence catch) of the forecasted run. Tribal regulation in 2010 required a minimum of 8 inch stretch mesh during the first four weeks in order to minimize incidental take of steelhead kelts. The treaty Indian gillnet fishery harvested 107 Chinook. Results of mark sampling and scales indicated that 83 of these were of hatchery origin (24 natural). The non-Indian recreational fishery operated from May 16 through August 31, Wednesdays through Sundays, with a bag limit of one marked adult per day from the mouth to Willoughby Creek. A preliminary estimate of Chinook taken in the sport fishery was not available. Retention of un-marked fish was not allowed this year.

Hoh River fisheries for fall Chinook were based on an expected terminal run size of 3,250 adults, allowing for a terminal harvest rate of 40 percent. The spawning escapement was expected to be 1,950 adults.

The treaty Indian fishery targeted 25.5 percent of the terminal run. The treaty Indian gillnet fishery was scheduled for two days per week during weeks 36, 37, and 44-50, and three days per week in weeks 38-43, 51, and 52. The treaty Indian fishery caught approximately 342 Chinook out of an expected catch of 799. Results of mark sampling indicated that 308 of these were of natural origin. Coded-wire tag data were not available.

The non-Indian recreational fishery extended from September 1 through November 30, with the river below Willoughby Creek open and a daily-bag-limit of six salmon, two of which could be adults. The portion of the river between Willoughby Creek and Morgan's Crossing was open October 16 through November 30. The delayed opening was to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan's Crossing was closed to recreational salmon fishing. A catch estimate was not available for the recreational fishery.

Escapement and Management Performance

The 2010 spawning escapement for Hoh River spring/summer Chinook was estimated at 828 adults, approximately 72 fish lower than the 900 fish escapement floor established for this stock. However, this escapement was 78 fish higher than expected preseason.

The preliminary 2010 spawning escapement estimate for Hoh River fall Chinook was 2,347. The escapement goal is the greater of 60 percent of the terminal run or 1,200; for 2010 the goal was 1,950. Tribal catch was below expected harvest rates.

Quillayute River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River spring, summer, and fall Chinook are presented in Appendix B, Tables B-35 and B-36 respectively. Spring and summer Chinook are currently managed separately, but data for both are combined in Table B-35. All hatchery origin fish are considered to be spring Chinook, and all natural spawners and tribal broodstock collections are considered to be summer Chinook. The management of these stocks is currently under review by the WDFW and Quileute Tribal co-managers.

The recreational and tribal fisheries for spring and summer Chinook were established by a preseason management agreement between WDFW and the Quileute Tribe. The total tribal catch for 2010 was 438 spring and 126 summer Chinook and included ceremonial and subsistence use. Estimates of 2010 recreational spring and summer Chinook harvest were unavailable.

The total 2010 Quileute Tribal harvest of fall Chinook was 1,814, and included ceremonial and subsistence use. An estimate of the 2010 recreational catch was unavailable.

As in past years, WDFW required release of unmarked Chinook during July and August to reduce impacts of the recreational fishery on the natural summer Chinook stock. The fall recreational fishery from September through November proceeded with normal bag limits and schedule. The Quileute Tribe did not have a closure in their fishery this year, but as in past years, reduced their fishery to 29 hours per week during July and August to reduce impacts to summer Chinook.

Escapement and Management Performance

The management agreement called for an escapement goal of 200 hatchery spring Chinook. The actual rack return was 880, which exceeded hatchery requirements.

The summer Chinook run was managed to achieve an escapement of 1,200 adults, jacks, and broodstock collection combined. The preliminary estimated natural spawning summer Chinook escapement of 702 was under the escapement goal.

Terminal area fisheries on fall Chinook were managed for a target 40 percent harvest rate, with a minimum escapement level of 3,000 adults. The preliminary escapement estimate of 4,386 fall Chinook was above the escapement goal.

PUGET SOUND CHINOOK STOCKS

Puget Sound Chinook stocks include all fall, summer, and spring stocks originating from U.S. tributaries in Puget Sound and the eastern Strait of Juan de Fuca (east of Salt Creek, inclusive). This stock complex consists of numerous natural Chinook stocks of small to medium sized populations and significant hatchery production. The Puget Sound ESU was listed under the ESA as threatened in March 1999.

Management Objectives

The stocks within this complex and their respective FMP conservation objectives were established in U.S. District Court by WDFW and the treaty Indian tribes. The conservation objectives for stocks managed primarily for natural production were developed by a State/Tribal Management Plan Development Team following the Boldt Decision, and were based on "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The objectives were estimated for the average spawning escapement during periods thought to represent spawner abundances that provided maximum production. The objectives for

stocks managed for artificial production are based on hatchery escapement needs. Annual management targets (expected hatchery returns plus natural escapement) for specific rivers or regions of origin may vary from the FMP conservation objectives by following fixed procedures established in U.S. District Court as outlined in "Memorandum Adopting Salmon Management Plan" (*U.S. versus Washington*, 626 F. Supp. 1405 [1985]).

In 2010, Puget Sound stocks were managed pursuant to the provisions of a WDFW/Tribal management plan approved under an ESA Section 4(d) rule promulgated by NMFS. This plan contains exploitation rate ceilings for ESA-listed Puget Sound stocks that were compared to predicted exploitation rates to assess compliance with ESA consultation standards (Table II-5).

Regulations to Achieve Objectives

Puget Sound stocks contribute to fisheries off B.C., are present to a lesser degree off SEAK, and are impacted to a minor degree by Council-area ocean fisheries. Puget Sound stocks have base period Council-area ocean fishery AEQ exploitation rates of 5 percent or less which are below a management threshold for effective Council management of these stocks, and therefore qualify as exceptions to the Council's overfishing criteria. Because Council area fishery impacts to Puget Sound Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. The only Council area regulation affecting any of these stocks was closing the Cape Flattery Control Zone for the commercial fishery.

Inside Harvest

Commercial inside fishery harvest of Puget Sound Chinook was managed on the basis of six regional stock management units or, in some cases, component stocks within management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest was regulated according to the natural spawning escapement goal or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) is presented in Appendix B, Table B-38. These catches included some fish of non-Puget Sound origin. The total commercial harvest in Puget Sound in 2010 was 937,200 Chinook, compared to 77,052 Chinook caught in 2009. The 2010 non-Indian net catch was 7,922 Chinook, compared to 2,749 Chinook caught in 2009. The 2010 treaty Indian net and troll harvest was 85,278 Chinook, compared to 74,303 Chinook caught in 2009.

Chinook catches in the Puget Sound recreational fishery for years 1971 through 2009 are presented in Appendix B, Table B-39. Catch estimates for the 2010 Puget Sound recreational fishery were unavailable.

Escapement and Management Performance

Puget Sound Chinook management goals for fishery planning processes in 2010 were expressed in terms of constraints on total fishery rebuilding exploitation rates (RER) or on exploitation rates on fisheries south of the Canadian border for those stocks without RERs. Information to evaluate performance against these constraints was unavailable.

Historical hatchery and natural run component escapements and net catches for summer/fall Chinook for each Puget Sound region of origin are presented in Appendix B, Table B-40. Historical spring Chinook escapement data are presented in Appendix B, Table B-43.

Preliminary data suggest most Puget Sound hatcheries met their summer/fall Chinook goals.

Naturally spawning Puget Sound spring and summer/fall Chinook remained depressed in 2010. Preliminary data suggest no Puget Sound spring Chinook natural stocks met their escapement goals. Preliminary information on 2010 natural spawning escapements for summer/fall Chinook stocks indicate escapement goals were met in some areas, but not in many others. Escapement estimates for 2010 were not available for most runs. In many natural spawning areas, hatchery origin Chinook comprise a large component of the natural spawning population.

COASTWIDE GOAL ASSESSMENT SUMMARY

Information to assess conservation objectives was unavailable for LCR natural tule Chinook, SRW fall Chinook, Grays Harbor natural fall Chinook, and all Puget Sound natural Chinook stocks. Conservation objectives for all other Council managed Chinook stocks were met except for Hoh spring/summer, Queets spring/summer, and Quillayute summer Chinook.

A summary of 2010 performance for Chinook salmon stocks in relation to Council conservation objectives is presented in Table II-5.

TABLE II-1. Sacramento River natural and hatchery adult fall Chinook escapement in numbers of fish.

Year	Upper River ^{a/}			Lower River			Total		Grand Total
	Hatchery	Natural ^{b/}	Subtotal	Hatchery	Natural ^{b/}	Subtotal	Hatchery	Natural ^{b/}	
1970	3,010	61,160	64,170	10,266	82,230	92,496	13,275	143,390	156,666

Goal									122,000-180,000

a/ Above the Feather River; 1971-1985 estimates include Tehama-Colusa Spawning Channel.

b/ Fish spawning in natural areas are the result of hatchery and natural production; estimates generally based on carcass surveys.

c/ Estimation methodology was changed due to an extremely high Battle Creek escapement in 2002.

d/ Preliminary.

Goal	≥35,000 ^{c/}										

a/ Inriver run size includes a USFWS estimate of 30,550 fish (19% of the run) that died prior to spawning in September 2002.

b/ Preliminary.

c/ In 2008-2010, fisheries were managed for a natural area spawning escapement of 40,700 adults.

2009 ^{c/}	61	d/	5	5	
2010 ^{c/}	87	d/	10	6	
Goal	60-90				

a/ North migrating peak counts are taken on nine miles of standard index surveys over nine river systems (see Appendix B, Table B-11 for individual system counts). Complete carcass counts are listed in Appendix B, Table B-10. Complete counts for Gold Ray and Winchester dams are listed in Appendix B, Table B-9.

b/ In 2004 one of the standard survey sections was not sampled. In the previous two years this section accounted for 33% of the total adult carcass counts.

c/ Preliminary.

d/ Surveys were not conducted.

TABLE II-5. Performance of Chinook salmon stocks in relation to 2010 conservation objectives (preliminary data). (Page 1 of 2)

System and Stock	2010 Conservation Objective(s)	Achievement
Sacramento River Chinook		
Fall	122,000-180,000 hatchery and natural area adult spawners. 180,000 target for 2010.	125,353 hatchery and natural area adult spawners; 3% above the lower end of the escapement goal range.
Winter (Endangered)	NMFS ESA consultation standard defines specific limits on management measures to protect Sacramento River winter and spring Chinook.	Commercial and recreational seasons south of Point Arena conformed with the consultation standard.
Spring (Threatened)	Same objective as for winter Chinook.	Objective met-see winter Chinook achievement.
California North Coast Chinook		
Klamath River Fall	Minimum escapement of 40,700 natural adult spawners.	37,221 natural area spawners, 106% of FMP conservation objective; 91% of 2010 management objective.
California Coastal (Threatened)	No greater than 16.0% ocean harvest rate on age-4 Klamath River fall Chinook.	Preseason projection of 12.3%; no postseason estimate is currently available.
Oregon Coast Chinook		
North and South/Local Migrating Stocks	150,000-200,000 natural adult spawners (equivalent to peak spawner index counts of 60-90 adults per mile).	79 natural adult spawners per mile, above the lower bound of the aggregate stock index range.
Columbia River Basin Fall Chinook		
LRW (Component of threatened lower Columbia River Chinook ESU)	MSY objective of 5,700 natural North Lewis River adult spawners (no specific NMFS ESA guidance for 2010).	Preliminary estimate of 8,674 is 152% of the conservation objective.
Lower Columbia natural tules (Component of threatened lower Columbia River Chinook ESU)	Total (ocean plus inriver) AEQ exploitation rate on ESA-listed natural tules of no more than 38.0%.	Preseason projection of 37.5%. No postseason estimate is currently available.
LRH	14,100 adult hatchery spawners.	Preliminary projection of 39,943 adult hatchery spawners, 283% of goal.
SCH	7,000 adult hatchery spawners.	30,740 adult hatchery spawners, 439% of target.
MCB	No FMP objective; target of 7,750 hatchery adults.	35,084 adult hatchery spawners, 453% of target.
URB	40-45,000 natural and hatchery adults above McNary Dam, plus meet treaty Indian obligations. <i>U.S. v. Oregon</i> parties agreed to 60,000 in 2010.	138,256 natural and hatchery adults over McNary Dam, 307% of MSY target in FMP.

CHAPTER III

COHO SALMON MANAGEMENT

OREGON PRODUCTION INDEX AREA COHO STOCKS

Oregon Production Index (OPI) area coho stocks include all Washington, Oregon, and California natural and hatchery stocks from streams south of Leadbetter Point, Washington, although stocks produced north of Leadbetter Point are also intercepted in the OPI area. The largest naturally produced coho stock is OCN coho, which includes coho produced from Oregon river and lake systems south of the Columbia River. OCN coho are managed as a stock aggregate with four identified components. NMFS listed three coho ESUs within the OPI area as threatened: CCC coho listed October 1996, SONCC coho listed May 1997, and OCN coho listed August 1998. In 2002, NMFS began an update of all its listing determinations and in January of 2006 concluded that the OCN ESU did not warrant listing under the ESA. That determination was overruled by a U.S. Court decision in 2007, and subsequently relisted by NMFS as threatened in February 2008. Columbia River natural coho were listed as endangered under the Oregon State ESA in 2002, and as threatened under the Federal ESA on June 28, 2005. The primary OPI hatchery stocks include a south migrating Columbia River (early) stock, a north migrating Columbia River (late) stock, public hatchery coho from the Oregon and northern California Coast, and formerly a small cooperative program along the southern Oregon Coast known as the Salmon Trout Enhancement Program (STEP), which was discontinued after the 2004 brood releases.

Management Objectives

In establishing ocean salmon fisheries that impact OPI area coho stocks, the Council was guided by the reasonable and prudent alternatives of NMFS 1999 Supplemental Biological Opinion and Incidental Take Statement for CCC and SONCC coho and the March 2010 NMFS ESA guidance letter for LCN natural and OCN coho, which required:

1. No directed coho fisheries or retention of coho in all commercial and recreational fisheries off California to protect endangered CCC coho.
2. Marine fishery impacts on endangered CCC and threatened SONCC coho must be no more than 13.0 percent as indicated by projected impacts on RK hatchery coho.
3. Fishery impacts on threatened LCN coho must not exceed a coastwide marine and mainstem Columbia River exploitation rate of 15.0 percent.
4. Fishery impacts on threatened OCN coho must not exceed a coastwide marine and freshwater exploitation rate of 15.0 percent.

Based on parent escapement levels and observed OPI smolt-to-jack survival for 2007 brood OPI smolts, the total allowable OCN coho exploitation rate for 2010 fisheries was no greater than 15.0 percent under the Salmon FMP (Amendment 13) and no greater than 15.0 percent under the matrix developed by the OCN work group during their review of Amendment 13. The work group recommendation was accepted by the Council as expert biological advice in November 2000.

The Council was also guided by a treaty Indian/non-Indian sharing agreement for Columbia upriver coho stocks, which required passage of 50 percent of the run destined for areas above Bonneville Dam.

Regulations to Achieve Objectives

Historically, OPI area coho stocks contributed primarily to ocean fisheries off Oregon and northern California and, to a lesser degree, Washington and B.C. The Council prohibited retention of coho in all fisheries south of the Oregon/California border. For the adopted seasons the STT projected exploitation rates of 9.8 percent for RK coho in marine fisheries, 11.2 percent for OCN coho in marine and freshwater fisheries combined, and 11.2 percent for LCN coho in marine fisheries.

The Council adopted a mark-selective recreational fishery quota north of Cape Falcon of 67,200 coho (Table I-3). The Council adopted preseason commercial harvest quotas of 11,800 marked coho for the non-Indian commercial troll mark-selective fishery (Table I-1) and 41,500 coho for the treaty Indian troll fishery (Table I-2), which was not mark-selective. Total allowable harvest set preseason for the non-Indian commercial and recreational fisheries for coho in 2010 was 80,000, compared to 210,000 in 2009. For the treaty Indian fishery, the overall quota of 41,500 coho was a reduction from the 60,000 coho quota in 2009.

Commercial Troll

Commercial troll fisheries had been closed to coho retention south of Cape Falcon since 1993 with the exception of limited fisheries in 2007 and 2009.

Non-Indian commercial troll fisheries from Cape Falcon to the U.S./Canada border in 2010 had an overall quota of 6,100 coho (11,800 preseason minus 5,700 impact neutral transfer to the recreational fishery quota in exchange for 2,500 Chinook in August), (Table I-1). The fisheries were restricted to mark-selective coho retention.

All species treaty Indian fisheries north of Cape Falcon were not restricted to mark-selective retention of coho, and operated on an overall quota of 41,500 coho (Table I-2).

Recreational

Retention of coho has been limited in the recreational fisheries south of Cape Falcon since 1993. Retention of coho has been prohibited off California since 1996 to protect ESA listed CCC coho. All coho directed ocean recreational fisheries in the OPI area have been mark-selective since 1998. Adequate abundance of marked coho in the OPI area has resulted in allowable harvests of marked coho in Oregon and Washington within constraints for OCN and LCN coho.

In 2010, after inseason adjustments, the recreational coho fisheries north of Cape Falcon operated with quotas of 6,990 in the Neah Bay area, 1,750 in the La Push area, 24,860 in the Westport area, and 40,600 in the Columbia River area (Table I-3). The recreational fishery between Cape Falcon and the OR/CA border operated with an overall quota of 26,000 June 26 through September 6 (Table I-3).

Inside Harvest

Coho retention in all California fisheries was prohibited.

The 2010 inside recreational harvest of coho in Oregon coastal streams, as in recent years, was very restricted and generally limited to areas where surplus hatchery coho returns were expected. Estimates of the 2010 inriver recreational coho harvest for most areas were not available. Historical estimates of the recreational harvest of adult coho in Oregon coastal estuaries and rivers, derived from ODFW salmon and steelhead angler catch record cards, are reported in Table III-1.

Limited recreational fisheries for naturally-produced coho were approved in the Siletz and Coquille estuaries in 2010. The catch estimates were 238, and 1,021 respectively.

Limited fisheries for naturally-produced coho were approved in Siltcoos, Tahkenitch, and Tenmile Lakes in 2010. Catch estimates were 400, 287, and 27 respectively.

The 2010 Columbia River non-Indian commercial gillnet fishery harvested 76,300 adult coho, compared to 124,300 coho in 2009. Select Area fisheries in both Oregon and Washington accounted for 57,400 of the total 2010 Columbia River commercial coho catch. The Columbia River treaty Indian mainstem commercial gillnet coho catch was approximately 7,100 fish, compared to the 2009 catch of 8,900 coho. All Columbia River coho commercial fisheries were non-mark-selective. Coho harvest information for Columbia River commercial and recreational fisheries are presented in Appendix B, Table B-21.

The Buoy 10 and mainstem recreational fisheries below Bonneville Dam harvested 7,980 adult coho compared to 48,100 adult coho in 2009. All Columbia River recreational fisheries in 2010 were mark-selective for coho. In 2010, Columbia River managers opened the Buoy 10 fishery August 1 with a daily bag limit allowing two adult salmon in August, no more than one Chinook, and beginning September 1 two salmon with no Chinook retention. The fishery ran through December 31 with the upriver boundary at the Tongue Point, Oregon to Rocky Point, Washington line. The 2010 Buoy 10 harvest and effort totaled 7,980 coho and 52,300 angler trips (Table III-2). Historical Buoy 10 catch and effort data are provided in Appendix B, Table B-22. Recreational coho harvest estimates for Columbia River tributaries were not available.

Escapement and Management Performance

The overall abundance estimate for OPI area stocks in 2010 was 818,100 compared to 1,323,200 in 2009 and to the recent ten-year average of 908,600 (Table III-3; Figure III-1).

Central California Coast and Northern California Coho

For CCC coho, redd counts have been made for the Lagunitas Creek basin since 1995 and are reported in Table B-7. As of January 13, 2011, 78 redds were counted. However, the spawning season for this watershed may not be complete and the final redd count may change. Estimates were available for escapement to Klamath River Basin hatcheries, but not for coho spawning in natural areas. In 2010, a total of 3,868 adult coho returned to Trinity River Hatchery and 428 adult coho returned to Iron Gate Hatchery. These values compare to a combined goal of 2,000 adults.

Oregon Coast Natural Coho

The preliminary estimate of natural spawner escapement in 2010 to Oregon coastal river and lake systems from the Sixes River north (Oregon coast ESU) was 253,800 adult coho. This compares to 262,700 adults in 2009. Historical spawner escapement estimates of naturally produced coho are reported in Table III-1.

Preliminary information, based on random sampling surveys, indicate the second highest total natural spawning population on the Oregon coast since 2002. The estimate of the natural spawning population in 2010 was 256,800, including estimates from the Rogue River, which is part of the SONCC ESU (Table III-4, Figure III-2).

Preliminary postseason estimates of combined marine and freshwater exploitation on OCN coho was 4.8 percent, less than the preseason projection of 11.2 percent, and below the 15.0 percent maximum allowed under the FMP and the OCN work group matrix. Preliminary postseason estimates of marine exploitation on RK coho was 2.2 percent, lower than the preseason projection of 9.8 percent, and below the 13.0 percent maximum ESA consultation standard.

Oregon Coastal Hatchery Coho

The preliminary estimate of total coho returns to Oregon coastal public hatcheries was 7,800 adults (Table III-1). Hatchery egg-take goals were expected to be met at all public hatchery stations.

Columbia River Coho

The 2010 ocean escapement of adult early and late Columbia River coho stocks was 441,000 fish, compared to 729,800 adults in 2009 (Appendix B, Table B-21). The 2010 Columbia River coho abundance was sufficient to meet all hatchery brood stock escapement needs.

Preliminary postseason estimates of marine exploitation on LCN coho was 4.8 percent, less than the preseason projected 11.2 percent.

WASHINGTON COASTAL COHO STOCKS

Washington coastal coho stocks include all natural and hatchery stocks originating in Washington coastal streams north of the Columbia River to the western Strait of Juan de Fuca (west of the Sekiu River). The stocks in this group most pertinent to ocean salmon fishery management were Willapa Bay (hatchery), Grays Harbor, Quinalt (hatchery), Queets, Hoh, and Quillayute coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

Management Objectives

Management goals for Grays Harbor and Olympic Peninsula coho stocks included achieving natural spawning escapement objectives and treaty Indian allocation requirements. The Council's conservation objectives for stocks managed for natural production were based on maximum sustainable yield (MSY) spawner escapements established pursuant to the U.S. District Court order in *Hoh* versus *Baldrige*. The conservation objectives for the Queets, Hoh, and Quillayute rivers were developed as ranges intended to bracket estimates of MSY escapement. The range reflects the degree of uncertainty inherent by using the high estimate of recruits-per-spawner and the low estimate of carrying capacity for the lower bound, and the low estimate of recruits-per-spawner and the high estimate of smolt carrying capacity for the upper end of the range. The ranges were further adjusted upward by 26 to 184 percent for risk aversion and habitat considerations. Annual targets for natural spawning escapement and total escapement were established by WDFW and treaty Indian tribes under the provisions of *U.S. versus Washington* and subsequent U.S. District Court orders. After an annual agreement is reached, ocean fishery escapement objectives are established for each river, or region of origin. Agreements include provisions for treaty Indian allocation requirements and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal coho other than those in the FMP were made in 2010.

Regulations to Achieve Objectives

Washington coastal coho stocks did not play a primary role in 2010 Council area ocean fishery management because of impact constraints on Interior Fraser (Thompson River, B.C.) and LCN coho stocks, and treaty Indian/non-Indian in-river sharing of Columbia upriver coho. Overall harvest quotas were limited to levels well below those of the late 1980s and early 1990s. All non-Indian ocean coho fisheries were mark-selective. Treaty Indian fisheries were not mark-selective.

Willapa Bay Coho

Inside Harvest

Historical terminal run size, harvest and escapement data for Willapa Bay coho are presented in Appendix B, Table B-24. The 2010 gillnet coho harvest in Willapa Bay totaled 28,568 fish. Based on the preseason forecast for a terminal run of 78,050 fish, the scheduled commercial fisheries were expected to

harvest approximately 25,678 total coho. Retention of unmarked coho in the fall 2010 commercial fishery was prohibited.

From July 4, 2010 through July 31, 2010, Willapa Bay (Marine Area 2-1) was open for recreational fishing concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1, 2010 through January 31, 2011, Willapa Bay was open to recreational fishing with a daily-bag-limit of six salmon, no more than three adults. Chum and unmarked coho retention was prohibited. Barbed hooks were prohibited when fishing for salmon. Expected harvest in recreational fisheries based on preseason forecast abundance was 1,805 coho. Marine and freshwater recreational harvest estimates were unavailable for 2010, but for 2009, Marine Area 2-1 and freshwater recreational harvest estimates totaled 6,257 fish.

Freshwater recreational fisheries in the Willapa Bay watersheds varied in duration but were generally open for salmon fishing from August 1, 2010 through January 31, 2011 with a daily-bag-limit of six salmon, and no more than two or three adults. Chum and unmarked coho retention was prohibited. Single-point barbless hooks were required in all areas except for the Naselle River.

Escapement and Management Performance

Willapa Bay coho were managed primarily for natural production. Estimates of natural spawning escapement for 2010 were unavailable. The most recent but still preliminary natural escapement estimate available was 48,774 in 2009, which met the WDFW escapement objective of 13,090 natural spawners. Escapement to Willapa Bay hatcheries in 2009 was estimated at 20,306 coho, which met the WDFW escapement objective of 6,100 spawners.

Grays Harbor Coho

Inside Harvest

Historical terminal run size, harvest and escapement data for Grays Harbor coho are presented in Appendix B, Table B-26. The run size forecast for Grays Harbor coho, after accounting for ocean fishery impacts, was 87,198 fish (60,026 natural and 27,172 hatchery). Treaty Indian and non-Indian gillnet fisheries harvested 31,823 coho (natural, hatchery, and net-pen origin) in 2010. This included 25,314 coho in the Quinault Indian Nation fisheries, 3,990 in the non-Indian gillnet fishery, and an estimated 2,519 in the Chehalis tribal fishery. Recreational harvest estimates for 2010 were not available.

The Quinault Indian Nation operated two separately scheduled gillnet fisheries for Chinook, coho, and chum in the area of the Lower Humptulips and in the area of the Lower Chehalis, as described in Chapter II under the section labeled Grays Harbor Chinook. The expected coho fishery impacts were limited by the expected abundance and harvest of Chinook in the Lower Chehalis side of the fishery and by the expected abundance and harvest of natural coho in the Lower Humptulips side of the fishery. The Humptulips area fishery harvested 8,786 coho, while the Chehalis area fishery harvested 16,528 coho in 2010. Harvest levels on the Humptulips fishery were 74.4 percent over pre-season expected levels while the Chehalis fishery harvest was 88.4 percent over pre-season expected levels.

The non-Indian gillnet fishery in Humptulips commercial Area 2-C had six open periods in September for a total of 15 fishing days. Retention of fall Chinook and marked coho was allowed. Live boxes were required and unmarked coho could not be retained. Catches totaled 1,217 Chinook and 672 coho. The non-Indian gillnet fishery in the Chehalis River commercial Areas 2A and 2D was open for 2 days in October; live boxes were required, and Chinook could not be retained. Catches totaled 3,318 coho.

Estimates of catch in recreational fisheries for 2010 were unavailable. However fisheries were conducted in three general areas: Marine Area 2.2, the Chehalis River and its tributaries, and the Humptulips River.

The recreational fishery in Marine Area 2.2 was open from September 16 through November 30 for two adult salmon daily, with Chinook chum retention prohibited.

The Chehalis River and its tributaries were open for coho fishing on the following dates and areas:

- Downstream of Fuller Bridge: September 16 through October 31, 2010. with a daily limit of 6 salmon, up to 2 adults, and no Chinook or chum retention. November 1, 2010 through January 31, 2011 with a daily limit of 6 salmon, up to 2 adults, with no Chinook, chum, or unmarked coho retention.
- Fuller Bridge to the bridge crossing at the town of Porter: September 16 through November 30, 2010 with a daily limit of 6 salmon, up to 2 adults, and no Chinook or chum retention. December 1 through January 31, 2011 with a daily limit of 6 salmon, up to 2 adults, with no Chinook, chum, or unmarked coho retention.
- From the bridge crossing at the town of Porter to the high bridge on Weyerhaeuser 1000 line approximately 400 yards downstream of Roger Creek: September 16 through November 30, 2010. With a daily limit of 6 salmon, up to 2 adults, with no Chinook or chum retention. December 1 through January 31, 2011 with a daily limit 6 salmon, up to 2 adults, with no Chinook, chum, or unmarked coho retention.

The Humptulips River recreational fishery and its tributaries were open for coho fishing on the following dates and areas, with a bag limit of two adult salmon daily.

- Ocean Beach Road to September 16 -30, 2010 with a daily limit of 6 salmon, up to 2 adults, with no retention of chum or unmarked coho; bait was prohibited.
- From the mouth to the confluence of the East and West forks: October 1, 2010 through January 31, 2011 with a daily limit of 6 salmon, up to 2 adults, no more than one of which could be a Chinook, and no retention of chum or unmarked coho.

Escapement and Management Performance

Grays Harbor coho were managed for natural production with a spawning escapement goal of 35,400. Natural spawning escapement estimates for 2007, 2008, and 2009 were 25,121, 34,054 and 69,733, respectively. An escapement estimate for 2010 Grays Harbor coho was not available.

Quinault River Coho

Inside Harvest

Historical terminal run size, harvest, and escapement for Quinault River coho are presented in Appendix B, Table B-28. The treaty Indian gillnet fishery targeted hatchery Chinook and coho from early September through mid-November. A total of 41,806 coho were harvested by the gillnet fishery during the 2010 season.

Escapement and Management Performance

Quinault River coho were managed for hatchery production. Escapement estimates for Quinault River coho in 2010 were unavailable. The Quinault National Fish Hatchery egg take objectives for 2010 were achieved.

Queets River Coho

Inside Harvest

Historical terminal run size, harvest, and escapement for Queets River coho are presented in Appendix B, Table B-31. Queets River fisheries were managed according to preseason agreement with WDFW based on preseason abundance estimates and planned Council ocean fisheries. The fishery was structured to target returning hatchery and natural coho while also harvesting Chinook at a total tribal and non-tribal harvest rate of 40 percent. The total harvest of coho in the Treaty Indian gillnet fishery was 21,107 commercially landed fish, which was above the expected preseason catch of 8,795. The gillnet harvest was comprised of a mix of early-timed hatchery fish and normal/late-timed natural fish, with the larger than expected catch attributed to a greater hatchery return than expected. A final estimate of the hatchery/natural mix in the catch was unavailable. Recreational fisheries operated with standard bag limits for coho (no mark-selective restriction) and a standard schedule in the Queets, Clearwater, and Salmon Rivers. Recreational fisheries for Chinook operated in a similar manner as coho, except within Olympic National Park waters where only mark-selective Chinook retention was allowed.

Escapement and Management Performance

The 2010 natural escapement estimate was unavailable, but the tribal catch through the season suggested the natural escapement exceeded the escapement floor. The expected natural coho escapement for 2010 based on the preseason effort model was 11,333, with an escapement objective range of 5,800 to 14,500 natural coho. Spawning escapements in 2006, 2007, and 2008 were less than the objective; and therefore triggered an Overfishing Concern, which was addressed during the summer of 2009. That Overfishing Concern was ended because the 2009 escapement exceeded the escapement floor.

Hoh River Coho

Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River coho are presented in Appendix B, Table B-34. The terminal run size of Hoh River natural coho was projected to be 7,608. The tribal fishery targeted 37.4 percent of the terminal run. The treaty Indian gillnet fishery occurred from the week of September 1 to the week of December 31 (which included weeks 49-52 of steelhead management), as described in Chapter II under the section labeled Hoh River Chinook. The tribal fishery harvested approximately 2,638 coho, with 2,170 estimated to be natural origin, including dip-in natural fish. The non-Indian recreational fishery extended from September 1 through November 30, with the area below Willoughby Creek open and a daily-bag-limit of six salmon, two of which could be adults and no mark-selective coho restriction. The portion of the river between Willoughby Creek and Morgan's Crossing opened October 16 to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan's Crossing did not open for recreational salmon fishing. A catch estimate for the 2010 recreational fishery was not available.

Escapement and Management Performance

The preliminary 2010 spawning escapement estimate for coho in the Hoh River was unavailable. Tribal catch and expected harvest rates indicate the fall coho terminal run size may be near the level anticipated preseason. The escapement goal range established for this stock is 2,000 to 5,000.

Quillayute River Coho

Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River summer and fall coho are presented in Appendix B, Table B-37. The recreational and tribal fisheries for coho were established by

preseason agreement between WDFW and the Quileute Tribe. A total of 1,378 (461 natural) summer coho were harvested in the Quileute Tribe's commercial, ceremonial and subsistence fisheries. An estimate of the 2010 recreational catch was unavailable.

The Quileute Tribal harvest of fall coho in 2010 was 26,649 (including ceremonial and subsistence catch). Tribal net fisheries harvested 12,374 natural fall coho out of a total fall coho harvest of 26,649. An estimate of the 2010 recreational catch was unavailable.

WDFW reduced the impacts of the recreational fishery on natural summer and fall coho by requiring mark-selective fisheries for coho through October. The Quileute Tribe did not have a closure in their fishery this year, but as in past years, limited their fishery to 29 hours per week during July and August.

Escapement and Management Performance

The summer coho run in the Quillayute is managed primarily for its hatchery component, which returns in August and September. The summer coho hatchery rack return was 1,644, well above the goal of 300. An additional three natural summer coho were collected as brood stock. The preliminary estimate for natural summer coho escapement was 273. No natural broodstock was collected from the Sol Duc hatchery.

The preliminary 2010 escapement estimate for natural fall coho was 9,322. No natural brood stock was collected from the Sol Duc hatchery. This was above the escapement goal of 6,300 to 15,800.

PUGET SOUND COHO STOCKS

Puget Sound coho salmon stocks include natural and hatchery stocks originating from U.S. tributaries in Puget Sound and the Strait of Juan de Fuca. The primary stocks in this group that are most pertinent to ocean salmon fishery management were Strait of Juan de Fuca, Hood Canal, Skagit, Stillaguamish, Snohomish, and South Puget Sound (hatchery) coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

Management Objectives

The Council's previous conservation objectives were based on the Puget Sound Salmon Management Plan, which defined management objectives and long-term goals for these stocks as developed by representatives from Federal, state, and tribal agencies. Conservation objectives for specific stocks were based on either maximum sustainable production for stocks managed primarily for natural production or on hatchery escapement needs for stocks managed for artificial production. The original conservation objectives were developed by a State/Tribal Management Plan Development Team following the Boldt Decision with the goal for natural spawning stocks defined as "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The methodology used to develop the objectives was based on assessment of the quantity and quality of rearing habitat and the number of adult spawners required to fully seed the habitat. Some objectives were subsequently modified by the U.S. District Court Fisheries Advisory Board and later determinations of the WDFW/Tribal Technical Committee. However, annual natural management objectives may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of *U.S. versus Washington* and subsequent U.S. District Court orders. (see "Memorandum Adopting Salmon Management Plan"; *U.S. versus Washington*, 626 F. Supp. 1405 [1985]).

The PSC adopted a management plan for coho salmon originating in Washington and southern B.C. river systems in 2002. The plan was directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and

nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the United States and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan. Categorical status was employed by the PST under the 2002 Coho Agreement to indicate general ranges of allowable total exploitation rates for U.S. and Canadian coho management units in 2010. Three categories were employed: low (total exploitation rate <20 percent), moderate (total exploitation rate 20-40 percent), and abundant (total exploitation rate >40 percent).

In 2010, the Council adopted management objectives for Puget Sound coho as recommended by WDFW and tribal co-managers under provisions of *U.S. versus Washington*. The annual objectives were based on the Comprehensive Coho Agreement categorical status and associated maximum exploitation rate limits. The Council formally adopted exploitation rate management objectives for Puget Sound coho in November 2009, which were generally consistent with PSC objectives, and replaced the longstanding FMP spawning escapement objectives in 2010. For 2010, the objectives were as follows:

- Strait of Juan de Fuca (East and West): Critical status 20 percent maximum exploitation rate
- Hood Canal: Low status 45 percent maximum exploitation rate
- Skagit: Normal status 60 percent maximum exploitation rate
- Stillaguamish: Normal status 50 percent maximum exploitation rate
- Snohomish: Low status 40 percent maximum exploitation rate

Regulations to Achieve Objectives

Puget Sound coho stocks did not play a primary role in 2010 ocean fishery management considerations, since management of impacts to Interior Fraser (Thompson River, B.C. Canada) and LCN coho were more constraining. Inside fisheries, primarily in Puget Sound, were constrained to meet PSC objectives for Interior Fraser and Hood Canal coho. The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Puget Sound coho, LCN coho, OCN coho, and Interior Fraser coho.

Inside Harvest

Commercial inside harvest of Puget Sound coho was managed on the basis of six regional management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest of coho for each management unit is regulated according to the natural spawning escapement or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) for all coho stocks combined is presented in Appendix B, Table B-38. The 2010 total Puget Sound commercial catch of coho was 171,157 fish, compared to a catch of 218,084 coho in 2009. Non-Indian harvest was 18,220 coho, compared to 20,668 coho in 2009. Treaty Indian net and troll fisheries harvested 152,937 coho, compared to 197,416 coho in 2009.

Historical coho catches in the Puget Sound recreational fishery for the years 1971 through 2009 are listed in Appendix B, Table B-39. Catch estimates for the 2010 Puget Sound recreational fishery were unavailable.

Escapement and Management Performance

No postseason estimates were available for southern U.S. (SUS) inside harvest impacts on coho stocks subject to the PSC coho management plan; therefore the 2010 preseason exploitation rate objectives agreed to by WDFW and tribal co-managers could not be evaluated. Preliminary escapement information indicates natural Puget Sound coho escapements were generally average or below average, but actual escapement numbers were unavailable.

Strait of Juan de Fuca coho (both Eastern and Western stocks) were managed as a unit in 2010 for an exploitation rate provided in the Council-adopted conservation objective described above. However, spawning escapements for the Western stock in 2005, 2006, 2007, and 2008 were less than the FMP conservation objective in place at the time, and therefore triggered an Overfishing Concern, which was addressed under the terms of the Salmon FMP.

BRITISH COLUMBIA COHO STOCKS

Management Objectives

B.C. coho stocks were managed under the PSC management plan as described in the previous section on Puget Sound coho.

Regulations to Achieve Objectives

In 2010, Interior Fraser coho were in the “low” status category, which required the total exploitation rate in SUS fisheries not to exceed 10.0 percent. This requirement constrained both Council area and inside fisheries. The preseason expectation was that the total SUS fishery exploitation rate on Interior Fraser coho would be 9.8 percent (5.3 percent in Council area fisheries). The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Interior Fraser coho.

Inside Harvest

Harvest of coho in inside waters affecting B.C. coho stocks occurred in Puget Sound fisheries, which were described in the previous section of this chapter.

Escapement and Management Performance

Postseason estimates of SUS inside harvest impacts on coho stocks subject to the PSC coho management plan were unavailable. Preseason expectations were for an exploitation rate of 1.0 percent for inside fisheries on Interior Fraser coho.

COASTWIDE GOAL ASSESSMENT SUMMARY

Conservation objective achievement assessments were unavailable for many coho stocks; however, those that were available all met their objectives. Puget Sound FMP conservation objectives have been updated to reflect exploitation rate management objectives adopted by the Council in 2009.

A summary of 2010 performance of coho salmon stocks in relation to the Council’s conservation objectives is presented in Table III-5.

a/ Does not include estimates for the southern OCN component (Rogue River). Spawner escapements to rivers prior to 1990 were estimated by a nonrandom standard index of streams north of the Rogue River. A total coastwide spawner escapement methodology based on stratified random sampling (SRS) was initiated in 1990 and used through 1997 and was implemented concurrently with the standard index methodology. The SRS methodology indicated that actual escapements were less than estimated by the standard rivers index. The spawner index data for years prior to 1990 have been recalibrated in this table to be comparable with the SRS estimates. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used.

b/ Oregon coastal Salmon Trout Enhancement Program (STEP) production from hatchery smolt rearing sites only.

c/ Natural and hatchery fish prior to 1990, unmarked fish only thereafter.

d/ Freshwater sport catch from ODFW salmon/steelhead angler tag information and represents only those fish greater than 24 inches. Includes estimated mortality from hook-and-release.

e/ Preliminary.

TABLE III-2. Estimated weekly effort (in angler trips) and catches of Chinook and coho in the 2010 Buoy 10 recreational fisheries (all data are preliminary).^{a/}

a/ Includes boat-based and shore-based fisheries from the upstream boundary at the Tongue Point/Rocky Point line (2000), downstream to the Buoy 10 line including Clatsop Spit, the South Jetty of the Columbia River, and the North Jetty of the Columbia River after the ocean fishery closed. The fishery was open August 1-31 for Chinook and marked coho, with the daily-bag-limit of two adult salmon, only one of which may be a Chinook. From September 1-December 31 the fishery was open for marked coho with the daily-bag-limit of two adult salmon; Chinook retention was prohibited.

a/ The OPI area includes ocean and inside harvest impacts and escapement to streams and lakes south of Leadbetter Pt., Washington.

b/ Includes estimated nonretention mortality: troll fishery--hook-and-release mortality for 1982-2005 and drop-off mortality for all years; sport fishery--hook-and-release mortality for 1994-2005 and drop-off mortality for all years.

c/ Includes returns from Salmon-Trout Enhancement Program (STEP) smolt releases through the 2007 return year, after which the program was terminated.

d/ Not equal to the sum of previous columns due to stock and fishery accounting north and south of Leadbetter Point.

e/ Ocean fishery impacts on private hatchery stock and returns to private hatcheries are excluded in calculating the OPI area stock aggregate ocean exploitation rate index.

f/ Preliminary.

a/ A spawner escapement methodology study based on SRS had been in effect from 1990 to 1997 in which coho salmon population estimates have been made for Oregon coastal river systems from the Sixes River and north. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used. Spawner population estimates include an adjustment for observation error.

b/ Prior to 1994, the conservation objective was expressed in terms of the total escapement of OCN spawners in index numbers rather than as an exploitation rate. The index escapement objectives from 1981 through 1993 are provided in Table III-2 of the Review of 1998 Ocean Salmon Fisheries and Table 1 of Amendment 11. From 1994 through 1997, Amendment 11 specified that at low stock sizes, only incidental harvest of OCN coho could occur and that impacts could not exceed 20%. Beginning in 1998, the OCN conservation objective has been as specified in Amendment 13 which is also the basis for the NMFS jeopardy standards under the Endangered Species Act listing.

c/ From the coho FRAM, except the estimates prior to 1994 represent the OPI composite exploitation rate for hatchery and natural stocks.

d/ Estimate based on 899 miles of spawner habitat within Nehalem, Tillamook, and Nestucca Rivers and other direct ocean tributaries from Necanicum River through Neskowin Creek.

e/ Estimate based on 1,163 miles of spawner habitat within Siletz, Yaquina, Alsea, and Siuslaw Rivers and other direct ocean tributaries from the Salmon through Siuslaw Rivers.

f/ Estimate based on 1,622 miles of spawner habitat within Umpqua, Coos, and Coquille Rivers. Also includes spawners using tributaries to Siltcoos, Tahkenitch, and Tenmile Lakes.

g/ Estimate based on a mark-recapture methodology and 410 miles of spawner habitat within the Rogue River.

h/ Unreliable estimate.

i/ The Salmon FMP specified an allowable marine and freshwater exploitation rate of 20%, however, the OCN workgroup matrix specified 15% and the Council chose to manage at the more conservative level for 2005 and 2006.

j/ Preliminary.

TABLE III-5. Performance of coho salmon stocks in relation to 2010 conservation objectives (preliminary data). (Page 1 of 2)

System and Stock	2010 FMP Conservation Objective	Achievement
OPI Area Coho		
(Columbia River and coastal stocks south of Leadbetter Point)	Natural spawner escapement objectives as provided below; meet hatchery egg-take goals; meet treaty Indian obligations.	Hatchery egg-take goals achieved. No information available on catch allocation.
Northern California (Threatened) and CCC (Endangered)	No directed coho fisheries or retention of coho south of Humboldt Mt. Marine exploitation rate $\leq 13.0\%$ as indicated by R/K hatchery stocks. Council adopted a projected exploitation rate on R/K hatchery coho of 10.0% .	No fisheries south of the California/Oregon border. Preliminary postseason marine exploitation rate of 2.2%
OCN	Combined marine and freshwater exploitation rate $\leq 15.0\%$. Council adopted a projected exploitation rate on OCN of 11.2% .	Preliminary postseason total exploitation rate estimate was 4.8% .
Columbia River Natural (Threatened)	Combined marine and mainstem Columbia River exploitation rate $\leq 15.0\%$. Council adopted management measures resulted in a projected marine exploitation rate of 11.24% .	A postseason estimate of mainstem Columbia River fishery exploitation was unavailable; preliminary postseason marine exploitation rate estimate was 4.8% .
Washington Coast Coho		
	Natural spawner escapement objectives as provided below and in state/tribal agreements; meet hatchery egg-take goals; meet treaty Indian obligations.	Hatchery egg-take goals achieved. No information available on catch allocation.
Grays Harbor	35,400 natural adult spawners.	Escapement estimate was unavailable; pre-season projection was 61,900 ocean escapement.
Queets	5,800 to 14,500 natural adult spawners.	Escapement estimate was unavailable; pre-season projection was 11,300 ocean escapement
Hoh	2,000 to 5,000 natural adult spawners.	Escapement estimate was unavailable; pre-season projection was 6,500 ocean escapement
Quillayute Fall	6,300 to 15,800 natural adult spawners.	Preliminary postseason escapement estimates was 9,322.

TABLE III-5. Performance of coho salmon stocks in relation to 2010 conservation objectives (preliminary data).
(Page 2 of 2)

System and Stock	2010 FMP Conservation Objective	Achievement
Puget Sound Coho	Stepped exploitation rate objectives; meet hatchery egg-take goals; meet treaty Indian obligations and inside non-Indian fishery needs for six management units.	Data not available for 2010 natural spawner escapements. Hatchery egg-take goals likely will be met.
Strait of Juan de Fuca	≤20% total exploitation rate.	Preseason expectation of an 11% total exploitation rate; postseason estimate unavailable.
Hood Canal	≤45% total exploitation rate.	Preseason expectation of an 43% total exploitation rate; postseason estimate unavailable.
Skagit	≤60% total exploitation rate.	Preseason expectation of an 37% total exploitation rate; postseason estimate unavailable.
Stillaguamish	≤50% total exploitation rate.	Preseason expectation of an 37% total exploitation rate; postseason estimate unavailable.
Snohomish	≤40% total exploitation rate.	Preseason expectation of an 32% total exploitation rate; postseason estimate unavailable.

Figure III-1. Oregon Production Index (OPI) area coho abundance estimates by stratified random surveys (SRS) accounting methods, 1970-2010.

Figure III-2. Oregon coastal natural (OCN) adult coho spawners per habitat mile by coastal region based on SRS accounting methods, 1990-2010.

CHAPTER IV

SOCIOECONOMIC ASSESSMENT OF THE 2010 OCEAN SALMON FISHERIES

SUMMARY: Total 2010 exvessel value of the Council-managed non-Indian commercial salmon fishery was \$7.15 million, which is the fifth lowest on record, but more than four times above its 2009 level of \$1.5 million. California had its first commercial salmon fishery since 2007. The 2010 exvessel value of the commercial fishery was 28 percent below the 2005-2009 inflation-adjusted average of \$10 million and 88 percent below the 1979 through 1990 inflation-adjusted average of \$59.3 million. The coastwide average exvessel price for Chinook in 2010 was \$5.54 per pound. This was four percent below the 2009 level. At \$2.17 per pound, average 2010 West Coast coho prices were six percent higher than in 2009. The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2010 was 182,900 a decrease of three percent from 2009, and 70 percent below the 1979 through 1990 average. Total West Coast income impact associated with recreational and commercial ocean salmon fisheries for all three states combined was estimated at \$25.5 million in 2010. This was 46 percent above the estimated 2009 level of \$17.4 million. 2010 had the third lowest income impacts on record, with 2008 having the lowest on record at \$7.5 million and 2009 the second lowest (adjusted for inflation).

ALLOCATION OF THE SALMON RESOURCE

Salmon management by the Council involves numerous allocation issues including:

- Determining the amount of salmon available for ocean harvest after considering expected abundances, harvests by inside fisheries, and spawning escapement goals.
- Allocating harvest among broad management areas and among port areas within the management areas.
- Allocating harvest between Indian and non-Indian harvesters.
- Allocating the non-Indian harvest between commercial and recreational harvesters.

The amount of salmon available for harvest in Council management areas depends, in part, on harvest in Canada and Alaska. Allocation of harvest between the West Coast, Canada, and Alaska is determined within the constraints of the PST.

In general, the recreational fishery has tended to have a more stable harvest than the commercial fishery (in both absolute and relative terms) (Figures IV-1 and IV-2). The majority of the annual variation in available ocean harvest is usually taken up in the commercial fishery. However, both fisheries have suffered substantial declines relative to harvest levels of the 1980s, the effects of which are amplified within specific geographic areas.

Decisions on allowable harvests for a particular stock often have implicit allocation effects on the geographic distribution of salmon harvest. Seasons may be more restrictive along a particular area of the coast to protect a depressed stock encountered in that area at a higher rate than other areas. The geographic distribution of harvest opportunity along the coast involves balancing the often conflicting objectives of maximizing ocean harvest and fairly distributing the responsibility for resource conservation. A brief outline of the regulatory objectives which shaped the 2010 season is provided in Chapter I; and an assessment of success in meeting the objectives is provided in Chapters II and III.

COMMERCIAL SALMON FISHERIES

West Coast Non-Indian Commercial Ocean Fishery

In-season Price Trends

Monthly exvessel price data provide information on seasonal price trends (Table IV-1). Coastwide average exvessel prices for Chinook and coho in 2010 were \$5.54 and \$2.17 per pound, respectively. California 2010 Chinook prices were at their highest in August, averaging more than \$5.50 per pound. Oregon 2010 Chinook prices were at their highest in October, averaging just under \$6.50 per pound. Washington average Chinook prices were highest in May at \$5.73 per pound. Oregon and Washington average Chinook prices were at their lowest in July and September, respectively. For the season, exvessel Chinook prices in Washington, Oregon and California averaged \$5.61, \$5.49 and \$5.47 per pound, respectively. Coho prices in Washington and Oregon averaged \$2.14 and \$2.23 per pound, respectively.

Annual Trends (Seasons, Value, Prices, and Pounds)

Available information on Chinook and coho exvessel price and value by species, compiled from state fish receiving tickets and expressed both in nominal terms and inflation-adjusted 2010 dollars, is presented in Tables IV-2, IV-3, and IV-4. Data on pink salmon are provided in Table IV-5. The gross domestic product implicit price deflator, developed by the Bureau of Economic Analysis, was used to adjust nominal values for inflation (Appendix D, Table D-22). Weights of landings by species and port for Chinook and coho are presented in Tables IV-6, IV-7, and IV-8. These tables and the following discussion refer to the non-Indian commercial fishery in Council management areas and associated state territorial ocean area waters.

Total 2010 exvessel value of the Council-managed non-Indian commercial salmon fishery was \$7.15 million, which is the fifth lowest on record. Exvessel value was more than four times above its 2009 level (\$1.5 million) and 88 percent below the 1979 through 1990 inflation-adjusted average of \$59.3 million (including pinks), and 28 percent below the 2005-2009 inflation-adjusted average of \$10 million.

In 2010 California had its first commercial salmon fishery since 2007, although it remained heavily constrained by SRFC management objectives. The exvessel value of the California commercial ocean salmon catch in 2010 was \$1.2 million compared with (inflation adjusted) \$8.2 million in 2007 and a 1979-2009 average of \$17.7 million (inflation adjusted). The 2010 exvessel value for the Oregon commercial catch of \$2.8 million was the highest since 2007, although down 13 percent from the 2005-2009 average, and 85 percent below the 1979-1990 average of \$18.7 million, in inflation-adjusted terms. The 2010 exvessel value of the Washington non-Indian ocean commercial catch of \$3.1 million was up 164 percent from the inflation adjusted value in 2009 of \$1.2 million. Exvessel values of Washington landings over the last nine years (2002-2010) have been higher than any period since 1993 when they were \$1.1 million in inflation-adjusted terms. While 2010 Washington exvessel values were higher in inflation adjusted terms than in any year since 1988, they were still 63 percent below the 1979 through 1990 inflation-adjusted average of \$8.4 million.

The 2010 average West Coast ocean harvest Chinook price was \$5.54 per pound, which is the third highest in nominal terms reported since 1979. The last five years (2006 through 2010) all had average Chinook prices over \$5.48 per pound (adjusted for inflation). Chinook prices have not been this high since 1979, when the average inflation-adjusted price was \$6.70 per pound. One of the main reasons prices have been relatively high in recent years is due to the restricted fishing seasons (see Chapter I and Appendix C for details). The 2010 Chinook price was 2 percent above the recent five year (2005-2009) average of \$5.45 in inflation-adjusted terms, and 18 percent above the 1979-1990 average (\$4.70). At

\$2.17 per pound, average 2010 West Coast coho prices were 6 percent higher than in 2009 in inflation-adjusted terms, but 17 percent lower than in 2008 and 28 percent lower than the 1979-1990 average.

In terms of number of fish, the 2010 coastwide, non-Indian commercial Chinook harvest of 99,600 fish increased more than seven fold compared to 2009 (Figure IV-1). Historically, the 2009 harvest of Chinook was the lowest on record. The number of Chinook harvested in 2010 was 86 percent below the 1976-2009 long-term average of 690,600. The coastwide average weight per Chinook (12.7 pounds) was slightly higher than last year (12.6 pounds) and 12 percent higher than in 2008 (11.4 pounds) (Appendix D, Tables D-2, and D-3). The coastwide average weight per Chinook caught in the commercial fishery in 2010 was equal to the previous five years' (2005-2009) average weight.

Coho catch in 2010 was 3,100 fish, a decrease of more than 93 percent from the 2009 coho harvest (42,100), but still 47 percent above the 2008 catch (2,100). The coastwide average weight per coho (7 pounds) was 10 percent higher than the prior year (6.4 pounds) but 17 percent lower than in 2008 (8.4 pounds), which was the second highest average weight recorded since 1980. The highest average weight during that period was 8.5 pounds recorded in 2006. Coastwide coho exvessel value was \$48 thousand in 2010, a decrease of 91 percent from \$543 thousand recorded in 2009, but very close to 2008's value of \$47 thousand, in inflation adjusted terms (Figure IV-4).

West Coast ports with the most Chinook landings (by weight) were Westport (32 percent), Fort Bragg (14.8 percent) and Newport (14.7 percent). By comparison, in 2009, Westport (54 percent), La Push (15 percent) and Neah Bay (18 percent) were the leading ports, indicative of the absence of salmon fishing opportunities in the south. In 2010, areas north of Cape Falcon accounted for about 51 percent of coastwide Chinook harvest by weight, whereas in 2008 and 2009 areas north of Cape Falcon accounted for 84 and 94 percent of the Chinook harvest by weight, respectively. Compared with 2009, Chinook harvest by weight in 2010 was up 33-fold in Oregon and nearly more than three-fold in Washington. In contrast with 2009, the 2010 coho harvest by weight was down by 95 percent in Oregon, and by 89 percent in Washington. Coho harvest in California has been prohibited since 1992.

Ocean Commercial Salmon Harvesters

Based on Pacific Coast Fisheries Information Network (PacFIN) data, a total of 641 vessels participated in the West Coast commercial salmon fishery in 2010. This is more than double the number that participated in 2009 (313), and nearly triple the number in 2008. However the 2010 total was down 36 percent from 2007's total of 1,007 vessels. Note that these coastwide vessel counts are lower than the totals derived from summing Appendix D state-level tables (Tables D-4, D-5, and D-6) because vessels may be counted in more than one state and because of differences in the degree of completeness at the time the data were summarized for this report.

In 2010, 216 vessels made salmon landings in California compared with zero vessels in 2008 and 2009. In 2007, there were 601 vessels active in California, compared with 477 vessels active in 2006 (Table D-4). In Oregon, the active fleet increased by 144 vessels in 2010, with 369 vessels compared to 225 vessels in 2009 (Table D-5). The number of active vessels in Washington increased from 97 vessels in 2009 to 116 vessels in 2010 and 2009 (Table D-6). Coastwide, the number of limited entry salmon permits issued in 2010 decreased by 104 from the previous year to 2,395. Landings were made on 25 percent of all permits in 2010, up from 13 percent in 2009 and from 9 percent in 2008. Years 2008 and 2009 are the two lowest vessel participation years on record (1982-2010). From 1982 to 1993 an average of 5,193 of 7,942 total permits (65 percent) were used on an annual basis. Harvest opportunity began declining substantially after that time, and some permits were purchased in a buyback program.

In 2010, the coastwide average per vessel, inflation-adjusted exvessel value of salmon landings increased 115 percent compared to 2009, to \$10,201 per vessel. Compared to 2009, 2010 average per vessel exvessel revenue was up nearly five-fold in Oregon, and 121 percent in Washington. California harvesters experienced their first commercial salmon fishery in three years. Some caution needs to be exercised in interpreting the per-vessel averages. For example, the averages may be influenced as much by a disproportionate change in the number of small or large harvesters from one year to the next as by a change in the average revenues of those vessels remaining in the fishery.

Additional historical information on landings by vessel size, percentages of the fleet responsible for the majority of harvest, and harvest by residence of those participating in the fishery off each state is provided in Appendix D.

West Coast Treaty Indian Commercial Ocean Fishery

Treaty Indian commercial fisheries off Washington operate under regulations established by the Council. While some of the treaty Indian harvest was for ceremonial and subsistence purposes, the vast majority of the catch was commercial harvest. Commercial treaty Indian fisheries provide food to consumers and generate income in local and state economies through expenditures on harvesting, processing, and marketing of the catch. From May through September 15th 2010, the treaty Indian ocean troll fishery harvested 35,000 Chinook (307,600 pounds) and 11,500 coho (80,500 pounds) compared with 12,811 Chinook (103,700 pounds) and 60,600 coho (347,000 pounds) in 2009 (Tables A-15 and D-3). For all of 2010 the preliminary exvessel value of Chinook and coho landed in the treaty Indian ocean troll fishery was \$1.8 million, compared with the exvessel value in 2009 of \$1.0 million (values based on PacFIN data).

Columbia River Commercial Fishery

Harvest in the ocean salmon fisheries impacts the inriver fisheries by affecting the number of fish available for inside treaty Indian and non-Indian harvest. Table IV-9 shows the exvessel value of Columbia River commercial harvest of Chinook, coho and chum salmon. All prices and values in the table and the following discussion are reported in inflation-adjusted dollars. Exvessel prices for inriver catches of Chinook vary considerably with race (spring versus fall Chinook) and stock (tules versus brights). Spring Chinook generally bring the highest prices, and tule fall Chinook and chum the lowest prices.

Total 2010 exvessel value of commercial salmon harvested in the Columbia River was \$10.0 million. This was 69 percent above the 2009 level (\$5.9 million) and 27 percent above the inflation-adjusted 2008 level (\$7.8 million). Total exvessel value for non-Indian commercial salmon harvested in the Columbia River was \$5.1 million compared with \$3.6 million in both 2008 and 2009 (Table IV-9).

The total 2010 exvessel value of treaty Indian salmon harvested in the Columbia River and sold on fish tickets was \$4.9 million. This is more than double the 2009 value of \$2.2 million and 17 percent above the 2008 value of \$4.2 million. Note that these values include only those sales made to licensed fish buyers. Treaty Indian fisher sales to the public are accounted for in harvest monitoring reports (Table B-20), but estimates of the pounds and value of such sales were not included in Table IV-9.

Puget Sound and Washington Coastal Inside Fisheries

Information on 2010 Puget Sound and Washington coastal inside fisheries is preliminary. Based on PacFIN data, the 2010 exvessel value reported for all salmon species taken in the commercial non-Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) was \$6 million. Of this, \$1.1 million was for Chinook and coho. In 2009, the total inflation-adjusted exvessel value of the commercial non-Indian salmon fisheries in these areas was \$5.8 million for all salmon

species, of which \$1.3 million was Chinook and coho. The 1981 through 2009 inflation-adjusted annual average exvessel value was \$17.3 million, of which on average \$4.4 million was Chinook and coho.

The preliminary 2010 exvessel value reported to PacFIN (as of January 25, 2011) for all salmon species taken in the commercial treaty Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) was \$6.4 million. Of this, \$3 million was Chinook and coho. In previous years, substantial additional landing reports have come in after publication of this review. The updated value for 2009 was \$11.3 million for all salmon species, of which \$6.6 million was Chinook and coho. The 1981 through 2009 inflation-adjusted exvessel value is \$21.7 million, of which on average \$8.2 million was Chinook and coho.

Klamath River Fisheries

Commercial sales in the Yurok and Hoopa Valley Reservation Indian fall gillnet fisheries in the Klamath River occurred in 1987-1989, 1996, 1999-2004, and 2007-2010. Average commercial catch of fall Chinook was about 17,600 in those years, most of which occurred in the estuary. Commercial sales also occurred in spring gillnet fisheries in 1989, 1996, 2000-2004, and 2007-2009, with an average of about 1,300 fish sold. The 1989 harvest of 27,700 Chinook was sold for \$852,000 (unadjusted for inflation, \$1.4 million adjusted to 2010 dollars) and had an average per fish weight of 15.4 pounds. For the 1996 harvest of 3,129 spring Chinook and 40,147 fall Chinook, the value at first sale was estimated at \$525,000 (unadjusted for inflation, \$700,000 adjusted to 2010 dollars). The average weight per fish landed in 1996 was 13.5 pounds. Records were not available for the weight and value of harvests after 1996 as each Indian fisher now markets their fish independently. In recent years the fishery has occurred fairly regularly with the exceptions of 2005 and 2006. The commercial fall Chinook harvest was 15,300 Chinook in 2010, compared to 15,700 Chinook in 2009 (Appendix B, Table B-5).

CEREMONIAL AND SUBSISTENCE SALMON FISHERIES

In addition to the commercial Indian fisheries discussed above, fish are taken in Indian fisheries each year for ceremonial and subsistence purposes. Estimates of the amount of salmon used for ceremonial and subsistence purposes are documented in Appendix B. Discussion of the importance of ceremonial and subsistence fish to Indian communities is presented in Appendix B to Amendment 14 of the salmon FMP.

RECREATIONAL SALMON FISHERIES

Ocean

The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2010 was 182,900, a decrease of three percent from 2009, and 70 percent less than the 1979 through 1990 average. Compared with 2009, preliminary estimates of the number of trips taken in 2010 decreased by 37 percent in Oregon and 18 percent in Washington. California effort was up substantially since the sport fishery was not restricted to a 10-day fishery in the Klamath Management Zone as it was in 2009; however it was still severely depressed compared to historic levels. (Note that Washington effort estimates shown in Tables IV-10 and IV-13 differ from those in Tables I-4 and Appendix A Table A-17 because the former exclude bank effort from the Columbia River north jetty.)

Recreational salmon fishing takes place primarily in two modes, (1) anglers fishing from privately owned pleasure crafts, and (2) anglers employing the services of the charter boat fleet. In general, success rates on charter vessels tend to be higher than success rates on private vessels. Small amounts of shore-based effort directed toward ocean area salmon occur, primarily from jetties and piers. Coastwide, the proportion of angler trips taken on charter vessels in 2010 was relatively stable at 24 percent compared with 23 percent in 2009; however underlying this trend was a decline in the proportion of charter trips in

Oregon and increases in California and Washington. Figure IV-5 and Tables IV-10, IV-11, IV-12, and IV-13 display details of effort and catch by port area and mode for each state.

California

The California recreational salmon fishery was more open in 2010 than it has been any year since 2007. Fishing was recorded in all areas, although compared with 2009 the number of trips in the Crescent City and Eureka areas declined by 81 percent and 5 percent, respectively. Coastwide 14,697 Chinook were caught in California on a total of 48,757 trips, for a success rate of 0.305 fish per trip.

Oregon

Ocean recreational salmon trips in 2010 in Oregon were down 37 percent to 53,319 trips compared with an estimated 84,524 angler trips in 2009 (Tables IV-10 and IV-12). Total trips in 2010 were 22 percent below the most recent five year average (2005-2009). Compared to 2009, effort was down 49 percent in Newport and 16 percent in Astoria. In the other Oregon ports, change in effort was minus 40 percent in Tillamook and Coos Bay and virtually no change in Brookings. The charter industry's share of Oregon recreational salmon trips in 2010 was about 9 percent, which, with the exception of 2008, was well below the trend of the recent past (Figure IV-5 and Table IV-12).

From 1984 to 1993, coho accounted for 87 percent of the annual Oregon recreational ocean salmon catch, on average. From 1994 through 1998 the lack of opportunity to retain coho south of Cape Falcon generally resulted in much lower angler success rates. With the opportunity to retain coho in mark-selective fisheries south of Cape Falcon beginning in 1999, salmon retention rates increased 75 percent, from 0.25 salmon per angler-day in 1998 to 0.43 in 1999. From 2002 through 2009, retention rates ranged between 0.44 and 1.07 salmon per angler-day. The retention rate for 2010 was at the bottom of this range at 0.44. In 2010, coho contributed almost 79 percent of the total Oregon recreational ocean salmon catch.

Washington

In 2010, 80,827 ocean angler trips were taken on vessels on the Washington coast (Tables IV-10 and IV-13), a decrease of 18 percent from the 98,926 trips taken in 2009, but 12 percent above the recent five year (2005-2009) average. About one third of Washington angler trips were taken on charter vessels in 2010, up slightly from 30 percent in 2009, (Figure IV-5 and Table IV-13), but tied with 2004 for the second-lowest charter trip share observed since 1979.

The angler success rate (in terms of retained fish per angler trip) was 0.905 in 2010, down from 1.52 in 2009 and slightly lower than 0.92 recorded in 2008. Between 1979 and 1990, the retention rate averaged 1.49 salmon per trip. Since that period it has averaged 1.26 salmon per trip. Note that these figures do not include angler effort that occurs from the ocean side of the Columbia River jetty, or angler effort in the state managed Area 4B add-on fishery, when open.

In order to increase angler participation in non-salmon recreational fishing (e.g., bottomfish trips) and to extend the length of the salmon season, partial-week closures were instituted in the recreational fishery north of Cape Falcon beginning in 1985. Sunday through Thursday salmon openings were used beginning in 1996 in the Westport and Columbia River port areas. The Neah Bay and La Push areas were generally open seven days a week, until more recently. In 2010 the recreational salmon fishery was open seven-days-per-week in the Columbia River area (south of Leadbetter Point). All open ports north of Leadbetter Point started the year with partial week openings but switched from partial week openings to a seven-day-per-week fishery in late-July. In 2010, north of Cape Falcon there were 39,600 bottomfish trips, an increase from 37,200 trips in 2009 (Table IV-14). All port areas with the exception of Westport experienced an increase in bottomfish trips compared with 2009.

Buoy 10 and Area 4B Add-On Fisheries

In 2010 anglers made a total of 52,000 trips in the Buoy 10 fishery, fishing from private and charter boats. This effort level is down 28 percent from 73,000 trips in 2009. Angler retention rates decreased from 0.75 salmon per angler day in 2009 to 0.29 salmon per angler day in 2010. This is the second-lowest retention rate on record since 2002, Table IV-15).

In 2000, about 3,400 trips were made in the late-season Area 4B add-on fishery. Since that time there have been no late season Area 4B add-on fisheries (Table IV-15), with the exception of 2008, during which there were an estimated 782 private trips and no charter trips. There was no Area 4B add-on fishery in 2010.

There were numerous other inside recreational salmon fishing opportunities in Puget Sound and coastal streams and estuaries that are not discussed in this chapter of the Review. See Appendix B for estimates of harvest in some of those other fisheries.

SALMON FISHERY INCOME IMPACTS AND COMMUNITY DEPENDENCE

Coastal community income impacts provide information on the effects of fluctuations in salmon harvest on local economies and small businesses. Income impacts are estimated per commercial pound and per recreational fishing day, and were generated using the Fishery Economic Assessment Model (FEAM). Information on FEAM is available from the Council on request.

Estimated state and local community income impacts of commercial and recreational ocean salmon fisheries and selected state-managed fisheries are shown in Tables IV-16 through IV-20. These impacts represent estimates of total personal income associated with harvesting, processing and first level distribution activities in the commercial salmon fisheries, and trip-related expenditures made by recreational anglers, aggregated at the local community (county) and state levels. Income impacts are estimated based on several components: reported landings by area, an inventory of the area fleet and processors, estimates of fleet and processor expenditures, surveys of the expenditure patterns of recreational fishers, and local and state level total income coefficients generated by IMPLAN[®] models constructed for each area. In FEAM, most of the benefit of higher than average exvessel prices is assumed to go to the harvesters. Commercial ocean harvest that is landed outside the coastal areas (e.g., landings in Puget Sound ports) is not included in the estimates of coastal community impacts, but is included in the overall estimate of state-level impacts.

The income impacts presented here are estimates of annual trends and are intended to indicate the possible redirection of activity between nonfishing and fishing-dependent sectors. As such they represent likely upper bounds on the local community and state income impacts generated by West Coast salmon fisheries. All income impact estimates in this review are reported in inflation-adjusted 2010 dollars.

West Coast Ocean Fishery Income Impacts

The total West Coast income impacts associated with recreational and commercial ocean salmon fisheries for all three states combined in 2010 were \$25.4 million, the third lowest on record but the highest since 2007. This was 46 percent above the estimated 2009 level of \$17.4 million and 93 percent below the inflation-adjusted value for 1979 (the highest year in the data time series). The 2010 value was 27 percent below the inflation-adjusted average value for the previous five years (2005-2009) of \$34.7 million (Tables IV-16 through IV-18). West Coast income impacts associated with the 2010 non-Indian commercial ocean fishery were \$10.9 million, more than quadruple the estimate for 2009 (\$2.5 million), but 34 percent below the recent five year (2005-2009) average of \$16.5 million, in inflation-adjusted

terms;^{1/} Income impacts related to the 2010 ocean recreational fishery were estimated at \$14.5 million, slightly below last year's level, but two-and-a-half times greater than the 2008 level of \$5.6 million, and 20 percent below the 2005-2009 inflation-adjusted average of \$18.2 million. Note that these coastwide values may mask reductions in particular communities compared with averages during the 1980s. Tables IV-16 through IV-18 provide greater detail on the impacts in individual states and port areas along the West Coast.

Selected Inside Fisheries

Columbia River Commercial Fisheries

Historically the non-Indian and treaty Indian Columbia River commercial fisheries have generated a substantial amount of income for the Oregon and Washington communities on the Columbia River. An average of \$33.0 million (inflation-adjusted) was generated annually from 1986-1990. In 2010, income impacts associated with the Columbia River commercial catch (non-Indian and treaty Indian) were estimated at \$19.6 million. This value is 79 percent above the 2005-2009 average. By comparison, total income impacts of these fisheries in 2008 and 2009 were \$15.2 million and \$12.2 million, respectively (Table IV-19).

Buoy 10 and Area 4B Add-On

The estimated local community income impact associated with the 2010 Buoy 10 recreational fishery was \$1.9 million, down 29 percent from the inflation-adjusted 2009 level, and 73 percent below the 1987-1990 inflation-adjusted average of \$7.2 million, but higher than inflation-adjusted average over 2006-2008 of \$1.4 million (Table IV-20). There was no late-season Area 4B add-on fishery in 2010. The most recent add-on fishery occurred in 2008, which was the first since 2000. The inflation-adjusted local community income impact associated with the area 4B add-on in 2008 was \$30,400. Between 1996 and 2000, the average annual inflation-adjusted total state-level income impact associated with the Area 4B add-on fishery was \$137,500 (Table IV-20).

^{1/} Income impact estimates for the commercial fishery do not include postseason settlement payments fishers may have received from buyers. These postseason settlements may be particularly significant for the California fishery.

a/ These exvessel values do not include the postseason settlement payments some fishers may have received from buyers, and therefore may underestimate the true payments received by fishers for their landings. Beginning circa 1999, these postseason settlements are believed to have grown for the California fishery. For 2002, the exvessel value reported here is believed to be under-reported by roughly 5% to 10%.

b/ Does not include pink salmon landings, if any.

c/ Preliminary.

a/ The major port areas listed may include smaller ports as follows: Crescent City includes only Crescent City; Eureka includes Trinidad and Humboldt Bay; Fort Bragg includes Shelter Cove, Noyo Harbor, Mendocino, and Pt. Arena; San Francisco includes Bodega Bay, Sausalito, Berkeley, and Half Moon Bay; Monterey includes Santa Cruz, Moss Landing, Morro Bay, Avila, and all ports south of Pt. Conception.

b/ Prior to 2005 landings were based on catch area, not port of landing.

c/ Preliminary.

d/ Less than 500 pounds.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.

b/ The major port areas listed may include smaller ports as follows: Neah Bay includes only Neah Bay; La Push also includes Kalaloch; Westport also includes Aberdeen, Bay City, Copalis Beach, Hoquiam, Moclips, Taholah, Bay Center, Grayland Beach, Raymond, South Bend, and Tokeland; Ilwaco also includes Long Beach, Nahcotta, Naselle, and all Columbia River Ports; Puget Sound includes all Puget Sound ports east of Neah Bay.

c/ State total includes landings where port of landing is not specified.

d/ There was no ocean commercial fishery for Chinook north of Cape Falcon in 1994-1996; however, Chinook were caught off Oregon and landed in Washington.

e/ Less than 500 pounds.

a/ Excluding pink, sockeye, and steelhead.

b/ Mainstem below Bonneville and select areas (Youngs Bay, Tongue Point, Blind Slough, and Deep River).

c/ Treaty Indian landings and values do not include direct sales to consumers.

d/ For Washington, this column includes fall brights, tules, and jacks. Price changes may reflect a change in the mix of brights, tules, and jacks rather than annual price changes.

e/ Gillnet exvessel salmon prices are recorded in round weight and therefore are not strictly comparable to exvessel troll prices.

f/ Less than \$500 or 500 pounds.

g/ Preliminary. (All Washington values in this table are based on preliminary information available when each year's Salmon Review is drafted.)

h/ Washington prices for years prior to 2000 are based on a combination of Washington and Oregon value information.

i/ Treaty Indian values are primarily mainstem Columbia set gillnet but also include Klickitat dipnet, Drano Lake (Little White Salmon River mouth), and Priest Rapids Pool fisheries.

a/ Catch numbers may include some illegal harvest.

b/ Fewer than 50 fish.

c/ Preliminary.

d/ Salmon data from surveyed ports only. These generally include Astoria, Garibaldi, Depoe Bay, Newport, Winchester Bay, Coos Bay, and Brookings. Since 1981, Pacific City and Florence have also been included. Gold Beach data are included from 1981-1987. Astoria was not included in 1994.

e/ Numbers do not include angling from the Columbia River jetty.

f/ Numbers do not include angling from the Columbia River jetty or from the late-season state waters Area 4B fishery.

g/ Values for 1982-1985 include some inriver Columbia River fishing after closure of the ocean fishery.

a/ Does not include effort from the late-season state water Area 4B fishery, when open.

b/ Does not include effort from the Columbia River Jetty.

c/ Values for 1984 and 1985 include some Columbia River fishing after closure of the ocean fishery.

d/ Fewer than 50 angler trips.

d/ Preliminary.

a/ Fewer than 50 angler trips.

b/ Preliminary.

c/ Columbia River north jetty was not sampled in 2005 and 2007 due to construction limiting access.

d/ Oregon data is a minimum estimate, as the jetty is not sampled, and bottomfish sampling of vessels only occurs when the ocean is open for salmon.

e/ No Oregon bottomfish trips are included.

f/ Includes tuna trips: Ilwaco - 9 charter, 14 private; Westport - 784 charter, 0 private.

g/ Annual sturgeon angler trips for the lower Columbia River from the western tip of Puget Island to mouth.

a/ Starting in 2000, includes catch upstream from the Astoria-Megler Bridge to the new boundary line from Tongue Point, Oregon to Rocky Point, Washington. Prior to 2000 includes only downstream from the Astoria-Megler Bridge.

b/ Prior to 1987, data on charter and private anglers were combined. Total Buoy 10 catch and effort data prior to 1987 are provided in Table B-21.

c/ Preliminary.

d/ There was no Area 4B add-on fishery prior to 1989.

e/ There was no Area 4B add-on fishery opening because the Area 4 ocean quota was not attained.

f/ There was no Area 4B add-on fishery planned.

a/ Per pound and per day estimates of income impacts provided from output of the Fishery Economic Assessment Model (FEAM). These are the income impacts associated with expenditures in the troll or recreational sectors. There is no differentiation between money new to the area and money which would otherwise have been expended in other sectors. It is assumed that all fish landed at a port is processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 U.S. Forest Service IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 U.S. Forest Service IMPLAN data. Beginning in 2001 values are based on a 2003 run of the FEAM using 1998 U.S. Forest Service IMPLAN data.

b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.

c/ Excluding pink salmon.

d/ Preliminary.

e/ Eureka impacts from fish caught in the Fort Bragg area fishery and landed in Eureka.

a/ Per pound and per day estimates of income impacts provided by the FEAM. These are the income impacts associated with expenditures in the troll or recreational sectors. There is no differentiation between money new to the area and money which would otherwise have been expended in other sectors. It is assumed that all fish landed at a port is processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 U.S. Forest Service IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 U.S. Forest Service IMPLAN data. Beginning in 2001 values are based on a 2003 run of the FEAM using 1998 U.S. Forest Service IMPLAN data.

b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.

c/ Excluding pink salmon.

d/ Preliminary.

TABLE IV-18. Estimates of Washington coastal community and state personal income impacts in thousands of real (inflation adjusted, 2010) dollars of the troll and recreational ocean salmon fishery for major port areas.^{a/}

a/ Per pound and per recreational day estimates of income impacts provided by the FEAM. These are the income impacts associated with expenditures in the troll or recreational sectors. There is no differentiation between money new to the area and money which would otherwise have been expended in other sectors. It is assumed that all fish landed at a port is processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 U.S. Forest Service IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 U.S. Forest Service IMPLAN data. Beginning in 2001 values are based on a 2003 run of the FEAM using 1998 U.S. Forest Service IMPLAN data.

b/ Recreational values exclude recreational shorebased effort from the Columbia River north jetty.

c/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.

d/ Through 1993, commercial values include a very small amount of fish landed in Washington coastal areas not included in the major port groups.

e/ Excluding pink salmon.

f/ All commercial values in this table are based on preliminary information available at the start of each year's Salmon Review.

g/ The non-Indian commercial and recreational fisheries were closed north of Cape Falcon in 1994. Some commercial catch taken south of Cape Falcon was landed in the Puget Sound area.

a/ Includes minor catches made off Oregon and landed in California prior to 2005.

b/ Commercial fishery closed except in August (2002) and September (2002-2004); catch for other months reportedly occurred off Oregon.

c/ Preliminary.

a/ Summary of ODFW fish receiving ticket information. Excludes effort occurring off Alaska, Washington, and California. Days fished data are reported by port of landing prior to 1979 and by area of catch after 1978. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1986 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1986 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

a/ Excludes harvests off Alaska, Washington (north of Leadbetter Point), and California that were landed in Oregon. Landings are reported by port of landing through 1978 and by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1988 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1988 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

b/ Preliminary.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month. The average 1976-1980 effort is from combined salmon/steelhead punch card and sampled port data. Since 1981, data from sampled ports only. Effort since 1979 consists of salmon angler trips only. Data prior to 1979 include combined bottomfish and salmon trips. Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; Newport area includes Depoe Bay and Newport; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only terminal area fisheries.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month and may include illegal catch. The 1976-1980 catch is from combined salmon/steelhead punch card and sampled port data. Since 1981, data is from sampled ports only. Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; Newport area includes Depoe Bay and Newport; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only terminal area fisheries.

b/ October, season, and total catch for the following port areas and years includes the following catch in November: Astoria 1976 - 29 coho; Tillamook 1976 - 38 coho; Newport 1976 - 22 coho; Coos Bay 1976 - 66 coho; Brookings 1976 - 367 coho.

c/ Preliminary.

a/ Neah Bay and La Push statistics do not include estimates of 707 Chinook killed during Chinook nonretention fishery (July 19-August 20, 1987).

b/ Includes catch from the Washington State waters Area 4B fishery in 1991, 1992, 1993, 1996, 1997, 1998, 2000, and 2008.

c/ Preliminary.

d/ Includes catch from the North Jetty when the ocean fishery was open; does not include catch reported as occurring inside the Columbia River mouth (North Jetty catch when the ocean fishery was closed, and Buoy 10 was open).

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month.

b/ Preliminary.

c/ The current KMZ boundaries are Humbug Mt. to Horse Mt. These have changed slightly since the early 1980s.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.

b/ Preliminary.

c/ Treaty troll effort in number of landings, which closely approximates days fished because treaty Indian fishers do not usually make multi-day trips. Season totals do not include January-April, October, or November-December treaty troll effort.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.

b/ Includes minor effort from November in some years.

c/ Includes catch from the Washington State waters Area 4B fishery in 1991, 1992, 1993, 1996, 1997, 1998, 2000, and 2008.

d/ Preliminary.

a/ Most estimates based on carcass surveys with a jack length cut-off. In 2004, CDFG reviewed and updated 1971-2003 escapement estimates to reflect final project reports.

b/ Upper Sacramento mainstem estimates generally based on carcass surveys with a jack length cut-off, however jack estimates from Red Bluff Diversion Dam (RBDD) reports have occasionally been used. Early (pre-2001) mainstem Sacramento River adult and jack estimates based on RBDD passage.

c/ Upper Sacramento River escapement includes Sacramento River mainstem; Battle, Clear, Mill, Deer, Butte, Cottonwood, and Cow creeks; and other small tributaries when surveys were conducted. Specific escapement estimates by tributary can be found at www.calfish.org.

d/ Survey methodology was variable; may not be comparable to other surveys.

e/ Change in estimation methodology due to extremely high Battle Creek escapement.

f/ Preliminary.

a/ In 2004, CDFG reviewed and updated 1971-2003 adult and jack spawner escapements based on final project reports.

b/ Chinook spawning during the fall; may include spring run fish.

c/ Nimbus Hatchery adult and jack counts include fish taken at Nimbus Weir, 1979-current.

d/ Total adults in Sacramento Hatcheries include Tehama-Colusa Fish Facility escapements, 1971-1985.

e/ Preliminary.

f/ Current hatchery-specific goals, not PFMC goals.

a/ Estimated number of jacks and adults based on sampling at Red Bluff Diversion Dam (RBDD) from unpublished CDFG data. Beginning in 1987 for late-fall and winter runs, estimates have been based on historical run patterns and partial counts at RBDD due to raising of dam gates during the last part of the late-fall run and first part of the winter run.

b/ Since 1998, late-fall adult and jack estimates are based on carcass counts of natural spawners plus fish spawned at Coleman Hatchery.

c/ Variable numbers of late-fall and winter run are trapped at Keswick Dam and spawned at Coleman or Livingston Stone Hatcheries.

d/ RBDD and carcass survey estimates represent alternative methods for determining winter run Chinook escapement.

e/ Natural spawning spring run which are isolated from fall run; primarily Mill Creek, Deer Creek, and Butte Creek escapement.

f/ Sacramento River spring run estimates are the total RBDD counts minus the spring run numbers in the upper Sacramento tributaries. If this number is less than or equal to zero, then upper Sacramento River spring run estimates are zero.

g/ Feather River spring run estimates are primarily fish returning to Feather River Hatchery. Spring run are not distinguished from fall run in the natural spawning surveys and are reported in the fall run natural escapement numbers.

h/ Jack proportion could not be determined.

i/ Primarily number of fish spawned at Coleman Hatchery 1991-1997. No data are available for natural spawners, as RBDD gates were raised during the time coinciding with the late-fall run.

j/ Methodology change from using snorkel survey to carcass survey for Butte Creek spring run estimates.

k/ Methodology change for distinguishing spring run Chinook at Feather River Hatchery was implemented in 2005. Fish arriving at the hatchery prior to the spring Chinook spawning period were tagged and returned to the river. The spring Chinook escapement estimate is the number of these tagged fish that subsequently returned to the hatchery during the spring Chinook spawning period.

l/ Preliminary.

m/ RBDD did not go into operation until June 15th, a month later than normal; thus RBDD winter and spring run estimates are unavailable.

a/ Total inriver run includes an estimated 30,550 fish that died prior to spawning in September 2002.

b/ Preliminary.

c/ In 2008 -2010, fisheries were managed for a natural area spawning escapement of 40,700 adults.

a/ From 1930-1937, 1957-1987 and 1991-1995, Shasta counts were made near the river mouth. From 1938-1955, they were made 6.5 miles upstream from the mouth; considerable spawning occurred downstream from the racks in these years. From 1988-1990, escapements were estimated from mark-recapture data (spawning surveys). 1991- 2008 estimates were generated from weir counts.

b/ In 1991, estimates were generated from weir counts. In 1992-2007, estimates were generated from carcass surveys. In 2008, estimates were generated from a combination of video weir counts and carcass surveys

c/ In 2005 and 2007, redd counts were used in lieu of carcass surveys.

d/ Commercial fishing in lower Klamath River closed by the state after the 1933 season.

e/ Gillnetting resumed in lower 20 miles of Klamath River by Hoopa Valley Indian Reservation fishers in 1976.

f/ Shasta adults include 276 females taken to Iron Gate Hatchery in 1981.

g/ Low water conditions appeared to hinder entry into the Shasta River in 1988.

h/ Preliminary.

a/ Survey frequency variable from year to year (between 1 and 10 surveys annually).

b/ Numbers reflect maximum annual counts of live fish and carcasses with adults and jacks combined. Counts are not shown in years where visibility is too poor to conduct surveys.

c/ Survey area was from mouth to falls (2 miles).

d/ Survey area was the mainstem and West Fork (4.5 miles).

e/ Total run size estimate including jacks and adults. Survey methodology changed in 2000-2001 to using index sites, and subsequent estimates are not comparable to previous estimates.

f/ Video counts of combined adults and jacks made at Mirabel Dam. Image quality is affected by turbidity.

g/ Numbers reported are redd counts. Olema Creek is excluded.

h/ Low flows appeared to increase mainstem spawning and decrease tributary spawning for Cañon, Sprowl, and Tomki creeks.

i/ Cañon and Sproul creek totals exclude salmonids that were unidentifiable to species due to poor visibility or advanced decomposition.

j/ Preliminary data.

k/ Redd counts as of January 13, 2011.

a/ Pistol River was subject to several "slope failures" in 1986 resulting in severe short-term alterations in gravel bars and spawning index areas. Considerable debris and siltation severely limited Chinook surveys resulting in "0" counts in Deep Creek index areas through December.

b/ Preliminary.

a/ Includes some upriver origin spring Chinook through 1980. Beginning in 1981, the lower river catch of lower river spring Chinook is based on mark recoveries rather than the timing of the catch, as in previous years. Since 1986, GSI and VSI techniques have been used for stock composition analysis. Commercial catch includes Select Area fisheries. Sport catch is mainstem Columbia River, does not include tributaries. Catch may include small numbers of jacks. Sport fishery closed in 1995 to 1997.

b/ Prior to 1988, the escapement goal at Willamette Falls was 30,000 to 35,000. Beginning in 1988, the goal was dependent on run size under the Willamette Basin Fish Management Plan. Since 2001, hatchery escapement targets are set in the Fisheries Management and Evaluation Plan developed by ODFW. Lower Willamette sport catch may include small numbers of jacks.

c/ Includes hatchery escapement, tributary recreational catch, and natural spawning escapement for 1975 to present. The years 1971-1973 are based on using the 1975-1976 Cowlitz River recreational fishery adult harvest rates.

d/ Includes hatcheries operated by all agencies. Values are included in the totals for the tributary runs.

e/ Preliminary.

a/ Spring Chinook accounting ends on June 15. Chinook formerly managed separately as Snake River summer Chinook are now grouped with all upriver spring Chinook because of overlap in run timing. Snake River summer Chinook have been moved from Table B-14 to this table.

b/ Includes some lower river origin spring Chinook through 1980. Beginning in 1981, the lower river catch of upriver spring Chinook is based on mark recoveries rather than timing of the catch as in previous years. Since 1986, GSI techniques have been used for stock composition analysis. Commercial catch includes estimated miscellaneous fishery-related impacts from test fisheries, commercial shad fisheries, and Select Area commercial gillnet fisheries beginning in 1979 and catch and release mortalities from selective fisheries beginning in 2001. Sport catch includes mainstem fisheries between Buoy 10 and Bonneville Dam.

c/ Spring season fishery closed in 1975, 1976, and from 1978 to 2000. Spring Chinook landed during those years were from the winter season fishery.

d/ Bonneville Dam count minus Zone 6 sport, mainstem commercial and ceremonial/subsistence treaty Indian harvest.

e/ Upper Columbia escapement at Rock Island Dam. Does not include Wenatchee, Entiat, and Methow.

f/ Hatchery rack and trap returns above Lower Granite Dam plus Tucannon and hatchery returns above Priest Rapids Dam (Wenatchee, Entiat, and Methow) plus Ringold. Does not include Leavenworth or East Bank.

g/ Preliminary.

GOAL	29,300 ^{i/}								

a/ Summer Chinook accounting begins on June 16. Chinook managed as Snake River summer Chinook prior to 2004 are now grouped with all upriver spring Chinook because of overlap in run timing. As of 2004, they have been moved from this table to Table B-13.

b/ Includes estimated miscellaneous fishery-related impacts from mainstem recreational fisheries, test fisheries, commercial shad fisheries, and terminal area commercial gillnet fisheries beginning in 1979. Includes catch and release mortality in selective fisheries beginning in 2002.

c/ No directed commercial summer Chinook fishery from 1964 to 2003. Landings during those years are bycatch from commercial shad and sockeye fisheries.

d/ No directed commercial summer Chinook fishery from 1965 to 2003. Landings during those years are bycatch from commercial sockeye fishery.

e/ Bonneville Dam count minus Zone 6 mainstem sport, and treaty Indian commercial, and ceremonial/subsistence harvest.

f/ Priest Rapids Dam count.

g/ Preliminary.

h/ No ceremonial and subsistence permits issued, sales of platform and hook & line subsistence catch allowed and included in commercial catch.

i/ Comanager goal established in 2004 associated with regrouping Snake River summer Chinook with Snake River spring Chinook.

GOAL									40,000 ^{g/}			

a/ Based on Columbia River fall Chinook database, WDFW, unpublished. Does not include hatchery URB Chinook reared and released below McNary Dam.

b/ Includes tributary and mainstem catches between Bonneville and Priest Rapids dams.

c/ Includes Deschutes, Yakima, Upper Columbia, and Snake River escapements.

d/ Entire time series of Deschutes escapement revised in 2010 to match Deschutes River Chinook Spawner Escapement Goal using U.S. v. Oregon Technical Advisory Committee Data (Sharma et al. 2009).

e/ Snake River wild; adjusted for stray hatchery fish. Includes wild fish hauled to Lyons Ferry Hatchery.

f/ Preliminary based on inseason run update.

g/ FMP goal. The U.S. v. Oregon parties managed for a McNary Dam escapement of 45,000 beginning in 1990 to account for increased hatchery brood stock needs and concern for the Snake River wild fall Chinook stock; 46,000 beginning in 1994 to account for the Hanford Reach sport fishery; 60,000 beginning in 2008 for increased production in the Snake basin. However, starting in 1994 inriver fisheries were managed primarily for ESA consultation standards.

TABLE B-19. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult mid-Columbia bright (MCB) stock fall Chinook destined for areas below McNary Dam, not including the Deschutes River.^{a/}

TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River. (Page 3 of 3)

a/ For spring Chinook: includes lower and upper Willamette, Clackamas, Cowlitz, Kalama, Lewis, and Sandy Rivers. Sandy River harvest not available before 1990. Catch estimates may include small numbers of Jacks. Does not include SAFE sport. For summer Chinook: all tributaries are closed. For fall Chinook: all tributaries downstream from Bonneville Dam.

b/ Includes Select Area catch.

c/ Youngs Bay Select Area began in 1992. Tongue Point and Blind Slough began in 1998. Select Area test fisheries began in 1991. Other Select Areas include Knappa in Oregon and Deep River in Washington.

d/ Includes tributaries between Bonneville and McNary Dams, the Snake and Yakima rivers, Icicle and Ringold creeks. For Spring Chinook, this is Ringold creeks and tributaries above Lower Granite Dam. For summer Chinook, this is Wanapum and Hanford Reach.

e/ Primarily mainstem fisheries between Bonneville and McNary dams, but also includes fish caught in miscellaneous commercial Indian fisheries such as Klickitat dip net and mainstem fisheries upstream from McNary Dam. Spring season fishery closed in 1975, 1976, and from 1978 to 2000. Spring Chinook landed during those years were from the winter season fishery. Summer season fishery closed from 1974 to 1982, 1989 to 2000. Summer Chinook landed during those years are bycatch from shad and sockeye fishery.

f/ Primarily mainstem fisheries between Bonneville and McNary dams. Significant subsistence fisheries also occur in tributaries throughout the Columbia and Snake River basin, especially for spring Chinook, which are not included in these estimates.

g/ Upriver spring Chinook accounting ends on June 15 and summer Chinook accounting begins on June 16.

h/ Spring Chinook Buoy 10 area catch is included in mainstem sport.

i/ Preliminary. Fall Chinook estimates are from inseason run updates.

j/ Summer Chinook retention was prohibited for all mainstem non-Indian and treaty Indian fisheries until 2003. Small non-Indian incidental mortalities prior to 2003 are associated with recreational Steelhead fisheries and commercial shad and Sockeye fisheries. A few stray summer Chinook are caught in Select Area (terminal) fisheries that are open for late returning spring Chinook and early returning fall Chinook. Prior to 2003, Treaty Indians could retain summer Chinook for subsistence purposes.

k/ No ceremonial and subsistence permits issued, sales of platform and hook & line subsistence catch allowed and included in commercial catch or non-ticked public sales.

l/ Fall Chinook minimum run size includes LRH, LRW, SCH, URB, MCB, and SAB.

GOAL		Hatchery Production					Hatchery Production			

a/ These numbers match OPI databases. Adjustments were made to the escapement figures and catches.

b/ Mainstem recreational catches listed in this table include tributary catches and catches in the Chinook/Hammond area of 3,195 in 1989, 28 in 1990, and 1,151 in 1991.

c/ Includes hatcheries operated by all agencies.

d/ Willamette Falls, Clackamas River (North Fork Dam) and Sandy River (Marmot Dam).

e/ Includes additional small adults counted as jacks for 1983-1984 and 1986-1989.

f/ Bonneville Dam count minus Zone 6 mainstem commercial treaty Indian harvest.

g/ Preliminary.

TABLE B-22. Estimated catch and effort in the Buoy 10 fishery.^{a/}

2010 ^{e/}	52,300	6,807	7,980	0.28

a/ Prior to 1982, Buoy 10 area catches were not estimated separately and are included in the Columbia River marine area (Cape Falcon to Leadbetter Pt.) recreational catches. Estimates include bank anglers fishing from Clatsop Spit in Oregon and from the North Jetty in Washington. Effort and catch for the North Jetty fishery applied to the ocean quota for the Columbia River area until the ocean fishery closed. Beginning in 2000, includes catch and effort from the Astoria-Megler Bridge upstream to the new boundary from Tongue Point, Oregon to Rocky Point, Washington.

b/ 1989 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 32 and 33. A total of 7,922 angler trips produced catches of 492 Chinook, 3,195 coho, and a catch rate of 0.47 fish per trip. Catches in this fishery were counted against the Buoy 10

c/ 1990 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32. A total of 3,225 angler trips produced catches of 54 Chinook, 28 coho, and a catch rate of 0.03 fish per trip.

d/ 1991 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32. A total of 2,759 angler trips produced catches of 39 Chinook, 1,151 coho, and a catch rate of 0.43 fish per trip.

e/ Preliminary.

GOAL						14,600		

a/ Age-3 and older.

b/ Age-3 and older, including hatchery fish spawning naturally.

c/ Includes naturally spawning fish taken for broodstock.

d/ Minimum estimate due to incomplete estimates of river recreational catch. Does not include non-local catch.

e/ Fewer than 50 fish.

f/ WDFW is not able to differentiate spawning time and believes this includes fall Chinook.

g/ Preliminary.

h/ Recreational catch estimates by WDFW reflect application of catch record card bias correction factor of 0.833. Quinault Indian Nation does not believe this factor is appropriate for this fishery. Unadjusted catch estimates are 1,000 for 1987; 2,400 for 1988; 2,500 for 1989; 2,400 for 1990; 4,500 for 1991; 2,600 for 1992; 4,200 for 1993; 4,300 for 1994; 6,500 for 1995; 6,800 for 1996; 3,400 for 1997; 3,500 for 1998; and 100 for 1999; terminal run sizes would be adjusted accordingly.

GOAL					35,400				

a/ Beginning in 1987, estimates provided by WDFW for recreational catch reflect punch card bias correction factor.

b/ "Natural" includes hatchery fish spawning in wild. "Hatchery" includes wild fish taken for broodstock.

c/ Terminal run size numbers from 1981 to present are under co-manager review.

d/ The combined natural and hatchery run size total may not add to the sum of the catch and escapements due to hatchery total run size including on-station and off-station escapements.

e/ Preliminary.

TABLE B-27. Treaty Indian gillnet catch of Chinook, chum, and sockeye salmon in the Quinault River in numbers of fish.

GOAL				2,500 ^{f/}			

a/ River sport catch of age-3 and older fish. The 2000 sport fishery was closed to retention of unmarked Chinook. The 2002 sport fishery was closed to Chinook retention on October 18 due to unusually low water conditions. The 2008 sport fishery was closed to the retention of Chinook. The 2009 sport fishery was closed to retention of unmarked Chinook in Queets and Salmon Rivers within Olympic National Park.

b/ Includes Indicator Stock. Estimates for years prior to 2001 assume a broodstock take of 150 as a placeholder until individual run reconstructions are complete.

c/ Includes from 100 to 200 wild Chinook captured each season near spawning grounds to be used as Indicator broodstock.

d/ This is an integrated wild/hatchery program. Broodstock are unmarked wild fish collected from river.

e/ Preliminary.

f/ Minimum. Terminal run managed at 40 percent exploitation rate of terminal run size.

TABLE B-31. Estimated terminal run size, catch, and escapement for Queets River coho in numbers of fish.

GOAL				5,800-14,500						

a/ Includes dip-in fish from other river systems.

b/ Recreational catch of adults (coho over 20 inches).

c/ Natural escapement and run size estimates include fish taken for hatchery brood stock.

d/ Queets stock only; does not include non-local, dip-in fish.

e/ 1991 and 1997 supplemental was included in natural escapement and run size.

f/ Poor conditions during the coho spawner survey season precluded conduct of an independent spawner escapement estimate.

g/ Preliminary. In-season effort model used to scale run size to observed catch and effort, natural escapement, and actual hatchery rack escapement.

TABLE B-32. Estimated inriver run size, catch, and escapement for Hoh River spring/summer Chinook in numbers of fish.

2010 ^{f/}	2,638	0	NA	NA	0	NA	468	NA
GOAL				2,000 to 5,000				

a/ Includes dip-in fish from other river systems.

b/ Recreational catch of adults (coho over 20 inches).

c/ Natural escapement and run sizes estimates include fish taken for hatchery brood stock.

d/ Recreational fishermen were limited to Chinook only. Release of adult coho required. Tribal net fishery used large mesh to minimize coho impacts.

e/ Sport and tribal gillnet seasons reduced inseason in response to delayed upriver movement of coho caused by extreme low water conditions in October and early November. Closures were for two weeks.

f/ Preliminary.

TABLE B-35. Estimated inriver run size, catch, and escapement for Quillayute River spring/summer Chinook in numbers of fish.

GOAL				1,200 ^{g/}				

a/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch. Catch during designated ceremonial and subsistence fisheries is listed separately.

b/ Recreational catch of adults; mark selective for adipose fin clipped coho beginning in 2003.

c/ Natural escapement includes hatchery strays and broodstock fish.

d/ Hatchery escapement and terminal run size exclude hatchery strays.

e/ Preliminary.

f/ Terminal run size estimates incomplete because inriver sport catch estimates are unavailable.

g/ FMP goal is adults; WDFW goal of 1,200 includes age-3 males (jacks).

a/ WDFW Statistical Areas 5 through 13, which include the Strait of Juan de Fuca, San Juan Islands, and inner Puget Sound.

b/ Odd-year averages for pink salmon.

c/ 1981-1987: Adjusted all Puget Sound and freshwater estimates by 0.833, due to previous estimates being 20% too high.

d/ 1988: Area 5, no adjustment. Areas 6-13 adjusted by 0.633, due to estimates being 58% too high.

e/ 1989-Present: Area 5, no adjustment. Areas 6-13 adjusted by 0.685, due to estimates being 46% too high.

f/ 1991, 1992, and 1993 catch record card estimates adjusted for results of 1987-1990 WDFW/tribal sports emphasis study.

g/ Preliminary.

GOAL						34,900			

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.

b/ Includes estimated off-station returns.

c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by troll and recreational fisheries inside Puget Sound.

d/ Preliminary.

e/ Since 1999, numbers include Tulalip hatchery returns, which are not added into escapement since no broodstock is taken at the hatchery.

GOAL				52,000					

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.

b/ Includes estimated off-station returns.

c/ Terminal run size is defined as the run to terminal marine areas; spawning escapement plus sport and commercial net catch (inriver and terminal fishery catch). Prior to 1996, estimates are Puget Sound run size, which is defined as the run available to Puget Sound net fisheries; spawning escapement plus commercial net catch (inriver, terminal, and pre-terminal Puget Sound net fishery catch), but not including fish caught in Puget Sound troll and recreational fisheries.

d/ Preliminary.

TABLE B-42. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks.^{a/}
(Page 4 of 4)

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.

b/ Includes estimated off-station returns.

c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by troll and recreational fisheries inside Puget Sound.

d/ Preliminary.

e/ Nisqually escapement estimate incomplete.

f/ Large runs of pinks have returned to Green River in 2001, 2003, 2005, and 2007; however, no formal escapement methodology exists, and Green River pinks are not included in the run reconstruction model. When the model is revised, pre-terminal catch estimates for all stocks will be affected.

GOAL		3,000					

a/ Hatchery escapement estimates include all rack returns (retained and released)

b/ Natural escapement estimates based on carcass counts expanded by a 3.48 multiplier developed from 5 years of redd count based estimates. Most natural spawners are hatchery fish spawning in the wild.

c/ This estimate includes adult Chinook returns to Hupp Springs, White River Hatchery and to the Buckley Trap.

d/ Program has been discontinued.

e/ Preliminary.

TABLE C-6. Summary of actual Washington recreational ocean salmon regulations, 2001-2010.^{a/} (Page 6 of 6)

a/ For earlier years see Review of 2004 Ocean Salmon Fisheries, Appendix C, Table C-6.

b/ Mark selective coho fishery; all retained coho must be marked with a healed adipose fin clip except Aug. 29-Sept. 6, 2004 Queets River to Leadbetter Point.

c/ For detailed regulations see TABLE I-3.

d/ Plus one additional pink salmon.

e/ Plus one additional pink salmon beginning August 1.

f/ Plus two additional pink salmon.

2009	Columbia River natural tules (Coweeman)	39.0	20.5	20.5	Lower Columbia River, Skagit, Stillaguamish, and Interior Fraser Natural	60.0	33.6 ^{g/}	176.4 ^{g/}
2010	Columbia River natural tules (Coweeman)	55.0	56.0	61.0 ^{j/}	Lower Columbia River, Strait of Juan de Fuca, and Interior Fraser Natural	41.5	12.8 ^{g/}	67.2 ^{g/}

a/ Although the Skagit River escapement goal would not be achieved, management was based on meeting WDFW's escapement goal for Hoh River coho and allocation based on aggregation to Washington coastal tribes.

b/ The Council management regime was not expected to meet equitable adjustment requirements for Skagit River coho.

c/ Plus 7,430 hooking mortality for pink fishery.

d/ Plus 3,250 hooking mortality for pink fishery.

e/ Hooking mortality of 2,800 coho for June 1-15 fishery not included.

f/ Plus 1,200 hook-and-release mortality for the Neah Bay all-salmon-except-coho fishery.

g/ Marked hatchery coho only (healed adipose fin clip). Except 2004 non-Indian troll Sept. 1-5 between Queets River and Cape Falcon, and sport Aug. 29-Sept. 6 between Queets River and Leadbetter Point.

h/ Sharing of impacts on ESA listed Puget Sound Chinook also affected the shaping of ocean and inside fisheries.

i/ For 2002, the Council elected to constrain fishing so that the OCN exploitation rate would not exceed 12.5 percent per ODFW's recommendation to provide additional protection for lower Columbia River natural coho, which are listed as endangered under the Oregon State-ESA. The FMP objective for OCN coho was 15 percent.

j/ Included 12,000 mark selective fishery quota (equivalent to 5,000 non-mark selective quota).

TABLE C-9. Sequence of events in ocean salmon fishery management, 2010.^{ai} (Page 1 of 5)

GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES	
Mar. 2	National Marine Fisheries Service (NMFS) provides the Council with a letter outlining the 2010 management guidance for stocks listed under the Endangered Species Act (ESA) and stocks of concern.
Mar. 10	Based on Council recommendations, NMFS takes inseason action to: <ol style="list-style-type: none"> 1) Cancel the opening for the commercial salmon fishery between Cape Falcon, Oregon and the OR/CA border scheduled for March 15 to April 30; 2) Cancel the opening for the recreational salmon fishery between Cape Falcon, Oregon and Humbug Mt., Oregon scheduled for March 15 to April 30. New regulations to take effect May 1, 2010.
Mar. 11	Council adopts three commercial, tribal, and recreational ocean salmon fishery management options for public review.
Mar. 17-18	North of Cape Falcon Salmon Forum meets in Lacey, Washington to initiate consideration of recommendations for treaty Indian and non-Indian salmon management options.
Mar. 29-30	Council holds public hearings on proposed 2010 management options in Westport, Washington; Coos Bay, Oregon; and Eureka, California.
Apr. 6-8	North of Cape Falcon Salmon Forum meets in Lynnwood, Washington to further consider recommendations for treaty Indian and non-Indian salmon management options.
Apr. 15	Council adopts final ocean salmon fishery management recommendations for approval and implementation by the U.S. Secretary of Commerce. The proposed measures comply with the salmon fishery management plan (FMP) and the current biological opinions for listed species.
May 5	Ocean salmon seasons implemented as recommended by the Council and published in the <i>Federal Register</i> on May 5 (75 FR 24482), with an effective date of May 1, 2010.
June 10	NMFS inseason conference number two for the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery results in closing the fishery effective June 12.
June 15	NMFS inseason conference number three results in: <ol style="list-style-type: none"> 1) Reopening the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery June 18 through 22, and June 25 through June 29 with a landing and possession limit of 75 Chinook salmon per vessel per open period; 2) Prohibition retention of Pacific halibut incidentally caught while trolling for salmon in Pacific halibut Area 2A (the coasts of Washington, Oregon, and California) effective Wednesday, June 16, through the remainder of 2010.
June 24	NMFS inseason conference number four results in: <ol style="list-style-type: none"> 1) Changing the landing and possession limit to 25 Chinook for the final June 25 through June 29 open period for the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery; 2) Changing the open period landing and possession limit to 40 Chinook and 30 marked coho per vessel north of Leadbetter Point or 40 Chinook and 30 marked coho south of Leadbetter Point for the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery effective July 1.
July 6	NMFS inseason conference number five for the U.S./Canada border to Cape Falcon, recreational all-salmon fishery results in changing the bag limit to allow retention of two Chinook, effective July 8.
July 15	NMFS inseason conference number six for the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery results in changing the landing and possession limit to 60 Chinook and 50 marked coho per vessel per open period north of Leadbetter Point or 60 Chinook and 50 marked coho per vessel per open period south of Leadbetter Point, effective July 16.

TABLE C-9. Sequence of events in ocean salmon fishery management, 2010.^{a/} (Page 2 of 5)

GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES (continued)	
July 20	NMFS inseason conference number seven for the U.S./Canada border to Leadbetter Point, recreational all-salmon fishery results in opening the fisheries seven days per week effective July 23.
July 29	NMFS inseason conference number eight results in: <ol style="list-style-type: none"> 1) Transferring 4,000 Chinook remaining from the May/June U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery quota resulting in increasing the July-September U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery Chinook quota by 2,700 (impact neutral basis); 2) Changing the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery openings to Friday through Tuesday of each week and changing with open period landing and possession limits to 75 Chinook and 50 marked coho per vessel north of Leadbetter Point or 75 Chinook and 50 marked coho per vessel south of Leadbetter Point, effective July 30.
Aug. 5	NMFS inseason conference number nine results in: <ol style="list-style-type: none"> 1) A trade of 5,700 marked coho from the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery quota resulting in increasing the Leadbetter Point to Cape Falcon recreational all-salmon fishery quota by 7,000 marked coho (impact neutral basis); 2) A trade of 2,500 Chinook from the U.S./Canada border to Cape Falcon recreational all-salmon fishery quota resulting in increasing the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery quota by 1,650 Chinook (impact neutral basis); 3) Changing the landing and possession limit to 30 Chinook and 50 marked coho per vessel per open period north of Leadbetter Point or 30 Chinook and 50 marked coho per vessel per open period south of Leadbetter Point, effective August 6, 2010.
Sept 2.	NMFS inseason conference number ten results in a trade of 1,500 Chinook from the U.S./Canada border to Cape Falcon recreational all-salmon fishery quota resulting in increasing the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery quota by 1,000 Chinook (impact neutral basis).
NON-INDIAN COMMERCIAL TROLL SEASONS	
May 1-June 29	U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery opens May 1 through the earlier of June 30 or a 42,000 Chinook quota. <ol style="list-style-type: none"> 1) May 1-June 12: Seven days per week, no landing and possession limit. 2) June 18-22: landing and possession limit of 75 Chinook per vessel per open period. 3) June 18-22 landing and possession limit of 25 Chinook per vessel per open period.
May 1	Cape Falcon to Humbug Mt. non-Indian commercial all-salmon-except-coho fishery opens May 1-July 6; July 9-13, 16-20, 23-27; and August 1-25.
May 1	Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through May 31.
May 31	Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes.
June 29	U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery closes as quota is approached.

TABLE C-9. Sequence of events in ocean salmon fishery management, 2010.^{a/} (Page 3 of 5)

NON-INDIAN COMMERCIAL TROLL SEASONS (continued)	
July 1	<p>U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery opens through the earlier of September 14 or quotas of 19,350 Chinook (14,000 preseason plus transfers of 2,700 from the May-June commercial fishery, 1,650 and 1,000 from the recreational fishery) and 6,100 marked coho (11,800 preseason minus transfer of 5,700 to the recreational fishery).</p> <ol style="list-style-type: none"> 1) July 1-6, 9-13: landing and possession limit of 40 Chinook and 30 marked coho north of Leadbetter Point or 40 Chinook and 30 marked coho south of Leadbetter Point, per vessel per open period; 2) July 16-27: Friday to Tuesday, with a landing and possession limit of 60 Chinook and 50 marked coho north of Leadbetter Point or 60 Chinook and 50 marked coho south of Leadbetter Point, per vessel per open period; 3) July 30-August 3: landing and possession limit of 75 Chinook and 50 marked coho north of Leadbetter Point or 75 Chinook and 50 marked coho south of Leadbetter Point, per vessel per open period; 4) August 6-September 7: Friday to Tuesday with a landing and possession limit of 30 Chinook and 50 marked coho north of Leadbetter Point or 30 Chinook and 50 marked coho south of Leadbetter Point, per vessel per open period. <p>Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of July 31 or a 1,500 Chinook quota.</p> <p>Horse Mt. to U.S./Mexico border non-Indian commercial all-salmon-except-coho fishery opens July 1-4 and 8-11.</p>
July 11	Horse Mt. to U.S./Mexico border non-Indian commercial all-salmon-except-coho fishery closes.
July 15	Horse Mt. to Pt. Arena non-Indian commercial all-salmon-except-coho fishery opens through the earlier of July 29 or an 18,000 Chinook quota.
July 29	Horse Mt. to Pt. Arena non-Indian commercial all-salmon-except-coho fishery closes as scheduled.
July 31	Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.
Aug. 1	<p>Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of July 31 or a 1,500 Chinook quota.</p> <p>Horse Mt. to Pt. Arena non-Indian commercial all-salmon-except-coho fishery opens through the earlier of August 31 or a 9,375 Chinook quota.</p>
Aug. 25	Cape Falcon to Humbug Mt. non-Indian commercial all-salmon-except-coho fishery closes.
Aug. 31	<p>Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.</p> <p>Horse Mt. to Pt. Arena non-Indian commercial all-salmon-except-coho fishery closes as scheduled.</p>
Sept. 7	U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery closes as the Chinook quota of 19,350 (14,000 preseason plus roll-over of 2,700 from the May-June commercial fishery and transfers of 1,650 and 1,000 from the Recreational fishery) is approached.

TABLE C-9. Sequence of events in ocean salmon fishery management, 2010.^{a/} (Page 4 of 5)

TREATY INDIAN COMMERCIAL TROLL SEASONS	
May 1	All-salmon-except-coho fisheries open through the earlier of June 30 or a 27,500 Chinook quota.
June 30	All-salmon-except-coho fisheries close as scheduled.
July 1	All-salmon fisheries open through the earlier of September 15, a 27,500 Chinook quota, or a 41,500 non-mark-selective coho quota.
Sept. 15	All-salmon fisheries close as scheduled.
RECREATIONAL SEASONS	
Apr. 3	Horse Mt. to U.S./Mexico border all-salmon-except-coho fishery opens through April 30. Fishery is open seven days per week with a 20 inch minimum size limit for Chinook.
Apr. 30	Horse Mt. to U.S./Mexico border all-salmon-except-coho fishery closes.
May 1	Horse Mt. to Pt. Arena all-salmon-except-coho fishery opens through September 6. Fishery is open seven days per week with a 24 inch minimum size limit for Chinook. Pt. Arena to U.S./Mexico border all-salmon-except-coho fishery opens through September 6. Fishery is open Thursday through Monday with a 24 inch minimum size limit for Chinook.
May 29	Cape Falcon to OR/CA border all-salmon-except-coho fishery opens through June 25. Fishery is open seven days per week with a 24 inch minimum size limit for Chinook. OR/CA border to Horse Mt. all-salmon-except-coho fishery opens through September 6. Fishery is open seven days per week with a 24 inch minimum size limit for Chinook.
June 12	U.S./Canada border to Cape Falcon all-salmon-except-coho mark-selective Chinook fishery opens through the earlier of June 30 or a quota of 12,000 marked Chinook. Fishery is open seven days per week with a 24 inch minimum size limit for Chinook.
June 25	Cape Falcon to OR/CA border all-salmon-except-coho fishery closes.
June 26	Cape Falcon to OR/CA border all-salmon mark-selective-coho fishery opens through earlier of September 6 or a 26,000 marked coho quota. Fishery is open seven days per week with a 24 inch minimum size limit for Chinook.
June 30	U.S./Canada border to Cape Falcon all-salmon-except-coho mark-selective Chinook fishery closes as scheduled.
July 1	U.S./Canada border to Cape Alava, all-salmon mark-selective coho fishery opens through the earlier of September 19 or a 6,990 marked coho quota, with a 5,400 Chinook guideline. Fishery is open Tuesday to Saturday through July 23 and seven days per week thereafter. Bag-limit is two fish per day; only one Chinook per day prior to July 8 and no Chinook restriction thereafter. No chum retention in August and September. Cape Alava to Queets River, all-salmon mark-selective coho fishery opens through the earlier of September 19 or a 1,700 marked coho quota, with a 2,450 Chinook guideline. Fishery is open Tuesday to Saturday through July 23 and seven days per week thereafter. Bag-limit is two fish per day; only one Chinook per day prior to July 8 and no Chinook restriction thereafter. Leadbetter Pt. to Cape Falcon, all-salmon mark-selective coho fishery opens through the earlier of September 30 or a 40,600 marked coho quota (33,600 preseason plus 7,000 transfer from the commercial fishery), with a 9,100 Chinook guideline (13,100 preseason minus transfers of 2,500 and 1,500 to the commercial fishery). Fishery is open seven days per week. Bag-limit is two fish per day; only one Chinook per day prior to July 8 and no Chinook restriction thereafter.

TABLE C-9. Sequence of events in ocean salmon fishery management, 2010.^{a/} (Page 5 of 5)

RECREATIONAL SEASONS, (continued)	
July 4	Queets River to Leadbetter Pt., all-salmon mark-selective coho fishery opens though the earlier of September 19 or a 24,860 marked coho quota, with a 28,000 Chinook guideline. Fishery is open Sunday to Thursday through July 23 and seven days per week thereafter. Bag-limit is two fish per day; only one Chinook per day prior to July 8 and no Chinook restriction thereafter. Grays Harbor Control Zone closed beginning August 1.
Sept. 6	Cape Falcon to OR/CA border all-salmon mark-selective-coho fishery closes as scheduled. OR/CA border to Horse Mt. all-salmon-except-coho fishery closes. Horse Mt. to Point Arena all-salmon-except-coho fishery closes. Point Arena to U.S./Mexico border all-salmon-except-coho fishery closes.
Sept. 19	U.S./Canada border to Cape Alava, all-salmon mark-selective coho fishery closes as scheduled. Cape Alava to Queets River, all-salmon mark-selective coho fishery closes as scheduled. Queets River to Leadbetter Point, all-salmon mark-selective coho fishery closes as scheduled.
Sep. 25	La Push area (48 00'00" N. Lat. to 47 50'00" N. Lat.), all-salmon mark-selective coho fishery opens through the earlier of October 11 or a 50 Chinook quota or a 50 coho quota.
Sept 30	Leadbetter Point to Cape Falcon all-salmon mark-selective coho fishery closes as scheduled.
Oct. 10	La Push area, all-salmon mark-selective coho fishery closes as scheduled.

a/ Unless stated otherwise, season openings or modifications of restrictions are effective at 0001 hours of the listed date. Closures are effective at 2359 hours of the listed date.

a/ All values in this table are based on preliminary information available at the start of each year's review. Treaty Indian statistics include landings from Puget Sound.

b/ Season totals include additional winter treaty Indian troll.

c/ In 1994-1996 the non-Indian fishery for Chinook was closed north of Cape Falcon; however, Chinook were caught off Oregon and landed in Washington.

TABLE D-4. California troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings.^{a/}

Year	Dressed Pounds Landed (thousands)	Nominal Exvessel Value (\$ thousands)	Vessels Landing Salmon	Vessels with Permits	Nominal Average Exvessel Value/Vessel (dollars)	Real Average Exvessel Value/Vessel (2010 dollars)

2010	513	2,790	369	1,019	7,560	7,560

a/ Derived from vessel registrations and fish landing tickets.

b/ In 1980, the establishment of a restricted vessel permit system drew a number of historically active vessels back into the fishery.

c/ In 1984, vessels were not required to land at least one salmon to be eligible for a permit in 1985. The Oregon Fish and Wildlife Commission waived this requirement because of the elimination of the coho fishery south of Cape Falcon.

d/ In 1985, vessels traditionally landing salmon south of Cape Blanco and north of Cape Falcon were not required to land at least one salmon to be eligible for a permit in 1986. The Oregon Fish and Wildlife Commission waived this requirement because of the complete closure of the coho season south of Cape Blanco and a limited one-day coho season between the Columbia River and Falcon.

e/ During the 1991 session of the Oregon Legislature, legislation passed waiving the requirement that troll permit holders must buy a 1991 permit to be able to renew for 1992. This was a one-time exemption for 1991 only.

f/ Permits were reissued in a lottery, because the total number of permits had fallen below 1,200.

g/ Preliminary

TABLE D-6. Washington non-Indian troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings.^{a/}

a/ Derived from vessel registrations and fish landing tickets.

b/ Number of boats includes only those recording pounds greater than 0.

c/ Excludes pink salmon landings.

d/ Preliminary.

e/ Fewer than three vessels. Values combined with nearest category to preserve confidentiality.

2010 ^{b/}	369	43	11.7%	139	37.7%

a/ Includes licensed (permitted for 1980 on) and properly identified vessels only. Total poundage on which the numbers are based is not equal to total aggregate troll landings because of landings by unlicensed or misidentified vessels. Percentages of total pounds not credited to licensed (permitted) vessels were: 1974 - 19 percent, 1975 - 19 percent, 1976 - 9.4 percent, 1977 - 8 percent, 1978 - 1.4 percent, 1979 - 0.2 percent, 1980 - 1.7 percent, 1981 - 0.11 percent, 1982-2002 - less than 0.05 percent, 2003 - 0.06 percent, 2004 - 0.15 percent, 2005 - 0.32 percent, 2006 - 0.08 percent, 2007 - 0.7 percent, 2008 - 0.05 percent; 2009 - 0.05 percent and 2010 - 0.05 percent.

b/ Preliminary.

a/ "Home state" refers to the declared state of residence of vessel skipper, who, in most cases, is also the vessel owner.

b/ Includes vessels with home states other than California, Oregon, and Washington.

c/ Includes vessels of unknown lengths.

d/ Length category for 1982 is >36.

e/ Preliminary.

TABLE D-17. Percentages of vessels landing troll salmon in Oregon by license holder's state of residence.

a/ Legislation that created the license requirement expired in 1987. Annual license fees were between \$25 and \$100 from 1980-1987. The license requirement was reinstituted by rule in 1988 and 1989 with a \$10 fee.

b/ In 1990, responsibility for licensing of charter vessels was transferred to the Marine Board and fees for Oregon residents were increased from \$10 to between \$50 and \$100.
