

SEABIRD AVOIDANCE REGULATIONS

In 2012, the U.S. Fish and Wildlife Service (USFWS) published a biological opinion considering the effects of West Coast groundfish fisheries to Endangered Species Act (ESA) listed marine species, including seabirds (see <http://tinyurl.com/nl4ye3u>). The opinion includes reasonable and prudent measures (RPMs), terms and conditions, and conservation recommendations¹ to minimize take of seabirds, particularly the endangered short-tailed albatross. The RPMs stipulate that the National Marine Fisheries Service (NMFS) shall 1) minimize the risk of short-tailed albatross interactions with commercial hook and line gear, 2) establish a work group as an advisory body to NMFS and USFWS for the purposes of reducing risk to short-tailed albatross (and other ESA-listed species), 3) monitor and report all observed, reported, and estimated short-tailed albatross take as well as report on the efficacy of avoidance and minimization measures, and 4) facilitate the salvage of short-tailed albatross carcasses taken by longline gear.

In June 2013, NMFS prepared a preliminary draft Environmental Assessment (EA) and associated regulations, in response to the RPMs, for Council consideration. In addition to No Action (labeled Alternative 1 in the draft EA), the Council adopted two alternatives for public review. Alternative 2 would require that streamer lines be deployed during setting operations on commercial longline vessels 55 feet or greater in length with a safety exemption in the event of rough weather, which is defined as 35 knot winds or Beaufort 9 conditions. Proposed regulations would also minimize offal discharge and require that baited hooks sink as soon as they are put in the water to minimize seabird interactions. Procedures for reporting and salvaging short-tailed albatross carcasses taken by longline gear are also proposed. Alternative 3 is the same as Alternative 2, except that it would not provide for a rough weather exception.

The NMFS revised the draft EA and associated regulations (see Appendix A of the EA), in response to Council action at the June meeting (Agenda Item H.1.b, Preliminary Draft EA, November 2013). NMFS also added a new alternative (Alternative 4), which would include a rough weather exemption with the exact threshold to be determined through outreach and the rule-making process. Alternative 4 also removes the offal and sink rate provisions from the regulations relying on public outreach to accomplish the underlying objectives. The Council should review the draft EA and regulations, provide guidance, and select a final preferred alternative.

Council Action:

Adopt final seabird avoidance regulations for groundfish fisheries.

¹ Reasonable and prudent measures are non-discretionary measures to minimize the amount or extent of incidental take. Terms and conditions are non-discretionary terms to implement the reasonable and prudent measures. Conservation recommendations are suggestions regarding discretionary measures to minimize or avoid adverse effects on listed species or critical habitat or regarding the development of information.

• 1.0 INTRODUCTION

This Environmental Assessment (EA) analyzes the implementation of a Seabird Avoidance Program in the Pacific Coast Groundfish Fishery. It specifically addresses proposed regulations to minimize the take of ESA-listed short-tailed albatross (*Phoebastria albatrus*). The proposed provisions are pursuant to a U.S. Fish and Wildlife Service Biological Opinion (B.O.) that requires NMFS to implement regulations mandating the use of seabird avoidance measures by vessels greater than or equal to 55 feet length overall (LOA) using bottom longline gear to harvest groundfish. The seabird avoidance measures are modeled after a similar regulatory program in effect for the Alaskan groundfish fishery.

1.1 PURPOSE AND NEED FOR ACTION

The purpose of the proposed action is to reduce interactions between seabirds and groundfish longline gear. Many seabirds attack baited hooks as the longline is being set and become lethally hooked and drowned (USFWS 2008, p. 20). The proposed action would amend the regulations governing the Pacific Coast groundfish fishery to require seabird avoidance measures – specifically the use of streamer lines and related provisions currently mandated in the Alaskan groundfish fishery – by vessels 55 ft LOA or greater in the bottom longline fishery.

The proposed action is needed to minimize takes of endangered short-tailed albatross and comply with a 2012 B.O. issued by the U.S. Fish and Wildlife Service. The 2012 B.O. evaluated the risks of continued operation of the Pacific Coast groundfish fishery on ESA-listed seabirds, including short-tailed albatross. The 2012 B.O. included a Term and Condition requiring NMFS to promulgate regulations mandating the use of streamer lines by longline vessels 55 feet LOA or greater, patterned on the Alaska streamer line regulations. Accordingly, for the fishery to be exempt from the ESA Section 9 restrictions regarding take of a listed species, streamer line regulations must be in effect by November 21, 2014. The 2012 B.O. anticipates the yearly average take of one short-tailed albatross killed from longline hooks or trawl cables. As the short-tailed albatross population is expanding, it is expected to result in more interactions with the Pacific Coast Groundfish Fisheries. This action would implement one of the terms and conditions of the 2012 B.O. and reduce the risk of exceeding the take limits of short-tailed albatross, which in turn would reduce the risk of economic harm to the fishing industry that could result from the incidental take limit being exceeded.

1.2 PROPOSED ACTION

The proposed action would require streamer lines, sometimes referred to as tori or bird-scaring lines, to be deployed as the longline gear is being set. A streamer line effectively fences off the longline from seabird interactions. The streamer line is a line (typically 50-fathom or 90-meter) that extends from a high point near the stern of the vessel to a drogue (usually a buoy with a weight). As the vessel moves forward the drogue creates tension in the line producing a span from the stern where the streamer line is aloft. The aloft section includes streamers made of UV protected, brightly colored tubing spaced every 16 feet (5 meters). Streamers must be heavy enough to maintain a near-vertical fence in moderate to high winds. Individual streamers should extend to the water, to prevent aggressive birds from

getting to the groundline. When deployed in pairs – one from each side of the stern – streamer lines create a moving fence around the sinking groundline reducing or eliminating bird interactions (see Figure 1) (Melvin 2000). Streamer lines have been effective at reducing seabird bycatch in fisheries throughout the world including Alaskan fisheries that are similar to West Coast groundfish fisheries (USFWS 2008; Ed Melvin, personal communication; Bob Alverson, personal communication).

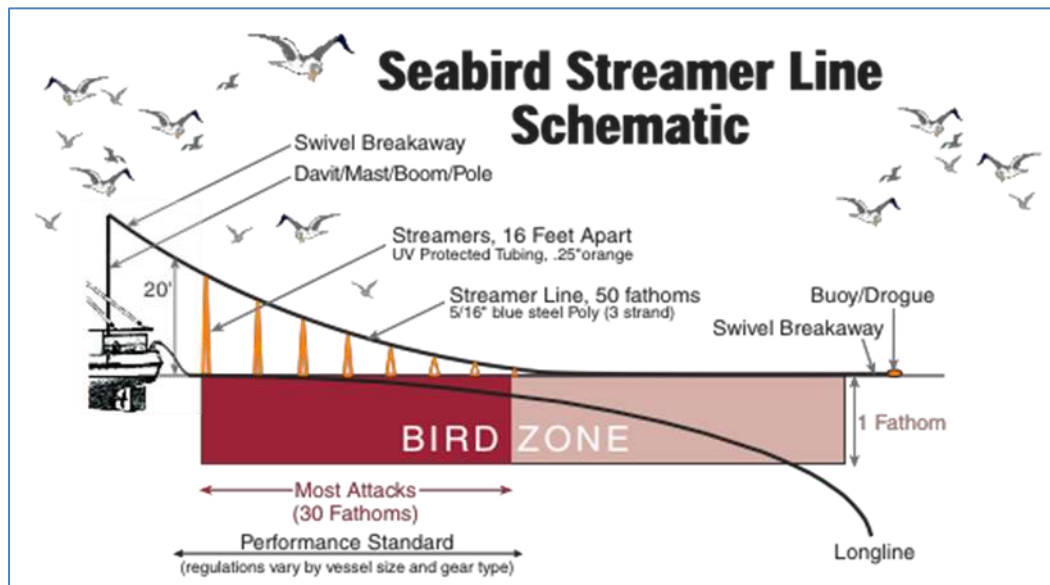

Figure 1: Schematic of streamer lines to reduce seabird bycatch (modified from Melvin 2000).

1.3 ACTION AREA

The action area is the area off the Pacific coast where West Coast groundfish vessels using bottom longline gear operate, defined by regulation at 50 CFR 660.11 subpart C as: "the Exclusive Economic Zone off the coasts of Washington, Oregon, and California between 3 and 200 nm offshore, and bounded on the north by the Provisional International Boundary between the U.S. and Canada, and bounded on the south by the International Boundary between the U.S. and Mexico (see Figure 2). The inner boundary of the fishery management area is a line coterminous with the seaward boundaries of the States of Washington, Oregon, and California (the "3-mile limit"). The outer boundary of the fishery management area is a line drawn in such a manner that each point on it is 200 nm from the baseline from which the territorial sea is measured, or is a provisional or permanent international boundary between the U.S. and Canada or Mexico."

Figure 2: The action area, showing major coastal communities and groundfish management areas.

1.4 BACKGROUND OF RELATED NON-REGULATORY ACTIONS

In addition to the regulatory action analyzed in this EA, NMFS has worked in collaboration with academia, NGOs, the fishing industry, coastal tribes, and Washington Sea Grant to develop a multi-dimensional seabird conservation initiative for the West Coast groundfish fishery. The initiative includes research, industry outreach, and subsidies to encourage voluntary use of the seabird avoidance measures described below. The initiative was catalyzed in 2011 by the take of a short-tailed albatross in the groundfish longline fishery off Oregon (see Section 3.1).

1.4.1 Research

Washington Sea Grant and Oregon State University are leading a research program in collaboration with the fishing industry to develop effective and practical tools to reduce the mortality of albatrosses and other seabirds in the West Coast longline fishery targeting sablefish. Industry partners currently include the Fishing Vessel Owners Association, Washington coastal tribes, and others. NMFS, the Packard Foundation, and the National Fish and Wildlife Foundation are funding this project. A specific goal is to develop streamer lines suited to the diversity of longline gear used in this fishery and to promote their voluntary use.

At the conclusion of this research effort, recommendations for seabird bycatch avoidance will be provided to the Pacific Fishery Management Council for its consideration based on results and consultation with the fishing industry and other stakeholders. Research protocol is provided in Appendix C. The research program is pursuant to the 2012 B.O. requirement for an adaptive management process to revise the regulatory provisions considered in this EA as needed. The B.O. provides:

“It is expected that new information and research shall reveal new or improved methods of reducing bycatch of short-tailed albatross that are safe and effective for the Fishery to use . . . (USFWS 2012, p. 35)“

1.4.2 Industry Outreach

The purpose of the outreach program is to raise awareness of the need for albatross bycatch mitigation, share solutions developed for Alaskan fisheries and other demersal fisheries around the world, encourage voluntary use of streamer lines, and foster innovation. The project is:

- developing and distributing outreach materials on seabird bycatch prevention strategies;
- raising industry awareness on the availability of free streamer lines;
- serving as the point of contact on technical aspects of seabird bycatch mitigation measures to stakeholders; and,
- conducting targeted outreach to fishery stakeholders.

Appendix B contains a 2011 outreach summary.

1.4.3 Subsidy

NMFS has provided funding to the Pacific States Marine Fisheries Commission (PSMFC) to build (or procure) streamer lines and distribute them free of charge to any bottom longline vessel fishing on the West Coast. The program has resulted in the distribution of 221 streamer lines since 2009 that have been deployed on a voluntary basis. It is expected that the outreach efforts described above will result in increased interest by the fleet and the distribution of additional free streamer lines.

• 2.0 ALTERNATIVES

This section presents alternatives for analysis as well as a summary of NMFS' scoping process, including alternatives that were considered but rejected from further analysis.

2.1 ALTERNATIVE 1 – NO ACTION

The No Action alternative would maintain the current regulations that do not include seabird avoidance measures. The non-regulatory actions described in Section 1.4 would continue as long as funding is available.

2.2 ALTERNATIVE 2 – REGULATORY SEABIRD AVOIDANCE PROGRAM

Alternative 2 would amend the regulations governing the Pacific Coast groundfish fishery to require seabird avoidance measures – specifically the use of streamer lines and related provisions currently mandated in the Alaskan groundfish fishery (50 CFR 679.24(e)) – by vessels 55 ft LOA or greater using bottom longline gear pursuant to the Pacific Coast Groundfish Fishery Management Plan (FMP). In sum, the regulation would:

- Require the use of streamer lines in the commercial longline fishery of the Pacific Coast Groundfish Fishery for non-tribal vessels 55 feet in length or greater;
- Require vessels to deploy one or two streamer lines depending on the type of longline gear being set;
- Require that streamer lines meet technical specifications and be available for inspection;
- Allow for a rough weather exemption from using streamer lines for safety purposes; and,
- Require that vessels take additional measures to avoid seabird interactions including:
 - Ensuring that baited hooks sink quickly; and,
 - Discharging offal in a manner that distracts birds from hooks.

Details associated with Alternative 2 are presented as draft regulatory language in Appendix A.

The non-regulatory actions described in Section 1.4 would continue as long as funding is available.

2.3 ALTERNATIVE 3 – PFMC ALTERNATIVE

The Council, at their June 2013 meeting, approved alternatives 1 and 2 above and directed NMFS to develop a third alternative that is identical to alternative 2 except that the rough weather exemption is removed.

Pursuant to Council direction, Alternative 3 would amend the regulations governing the Pacific Coast groundfish fishery to require seabird avoidance measures – specifically the use of streamer lines and related provisions currently mandated in the Alaskan groundfish fishery (50 CFR 679.24(e)) – by vessels 55 ft LOA or greater using bottom longline gear pursuant to the Pacific Coast Groundfish FMP. In sum, the regulation would:

- Require the use of streamer lines in the commercial longline fishery of the Pacific Coast Groundfish Fishery for non-tribal vessels 55 feet in length or greater;
- Require vessels to deploy one or two streamer lines depending on the type of longline gear being set;
- Require that streamer lines meet technical specifications and be available for inspection;
- ~~Allow for a rough weather exemption from using streamer lines for safety purposes;~~ and,
- Require that vessels take additional measures to avoid seabird interactions including:
 - Ensuring that baited hooks sink quickly; and,
 - Discharging offal in a manner that distracts birds from hooks.

Details associated with Alternative 3 are presented as draft regulatory language in Appendix A.

The non-regulatory actions described in Section 1.4 would continue as long as funding is available.

2.4 ALTERNATIVE 4 – NMFS ALTERNATIVE

Alternative 4 has been added since the preliminary draft of this EA was made available for public review in the Council’s June 2013 Briefing Book. This alternative is designed to be consistent with the requirements of the B.O. and responsive to issues raised through the public process and consultation with experts.

Feedback on the June 2013 draft EA falls primarily into two categories: (1) enforceability of the regulation; and (2) the rough-weather exemption.

To characterize enforceability challenges, NMFS consulted with the Council’s Enforcement Consultants, CDFW, and NMFS Office of Law Enforcement, Alaska Division. Based on those discussions, the mandatory use of streamer lines and the technical specifications of those lines do not present a unique or difficult enforcement problem. Provisions to sink baited hooks quickly and discharge offal in a manner that distracts birds from baited hooks do present enforcement challenges (M. Brown, W. Giles, M. Killary, D. Matthews, August 2013 pers comm). Upon consultation with WA Sea Grant, it was determined that such provisions are better addressed through outreach than regulation. USFWS confirmed that removal of those provisions from the regulation is consistent with the terms of the B.O. provided NMFS were to conduct outreach and education with the longline fleet on the importance of those elements to seabird avoidance (E. Melvin, July 2013 & B. Tuerler, July 2013 pers comm).

NMFS is committed to proposing a rough-weather exemption to the streamer line regulations to address safety-at-sea but recognizes that the Alaska exemption may not be transferrable to the West Coast due to differences in fleet characteristics and the geophysical environment. To address this concern, NMFS consulted with the longline industry to attempt to identify a weather threshold where the deployment of streamer lines becomes hazardous. Because this consultation has occurred during the busy part of the fishing year for the affected industry, a specific threshold has not yet been identified (R. Alverson August 2013, pers comm). Under this alternative, NMFS will continue to work with the industry to develop an appropriate rough-weather exemption that will be published in the Proposed Rule. NMFS recognizes that this is a relatively subjective determination and will encourage broad public comment on the proposed rule.

Alternative 4 would amend the regulations governing the Pacific Coast groundfish fishery to require seabird avoidance measures – specifically the use of streamer lines and related provisions currently mandated in the Alaskan groundfish fishery (50 CFR 679.24(e)) – by vessels 55 ft LOA or greater using bottom longline gear pursuant to the Pacific Coast Groundfish Fishery Management Plan (FMP). In sum, the regulation would:

- Require the use of streamer lines in the commercial longline fishery of the Pacific Coast Groundfish Fishery for non-tribal vessels 55 feet in length or greater;
- Require vessels to deploy one or two streamer lines depending on the type of longline gear being set;
- Require that streamer lines meet technical specifications and be available for inspection; and,
- Allow for a rough weather exemption from using streamer lines for safety purposes. The threshold for a rough weather exemption will be determined through the proposed rule process.
- ~~• Require that vessels take additional measures to avoid seabird interactions including:~~
 - ~~○ Ensuring that baited hooks sink quickly; and,~~
 - ~~○ Discharging offal in a manner that distracts birds from hooks.~~

Details associated with Alternative 4 are presented as draft regulatory language in Appendix A.

The non-regulatory actions described in Section 1.4 would continue as long as funding is available.

2.5 SUMMARY OF THE ALTERNATIVES

The following is a plain-language summary of the alternatives.

Alternative 1 – No Action

Alternative 2 – Regulatory Seabird Avoidance Program

- “Alaska style” seabird avoidance regulations for non-tribal commercial longline vessels 55 feet in length or greater.

Alternative 3 – PFMC Alternative

- Alternative 2 minus the rough weather exemption.

Alternative 4 – NMFS Alternative

- Alternative 2 minus provisions to sink baited hooks quickly and control offal discharge. The exact threshold for a rough-weather exemption would be determined through the rulemaking process.

2.6 SCOPING SUMMARY

Scoping is the process for determining the scope of issues to be addressed and for identifying issues related to a proposed action for in-depth analysis (40 CFR 1501.7). Scoping of the proposed action was as follows:

- Summer 2012 – USFWS engaged NMFS NWR and NMFS NWFSC to learn about ongoing conservation measures for seabirds, scope reasonable reporting requirements, and identify potential seabird avoidance measures for incorporation in the Terms and Conditions of the B.O.
- September 2012 Council Meeting - USFWS engaged the Council and appropriate committees to identify issues related to seabird avoidance measures. Pursuant to that interaction, and in the context of ongoing non-regulatory recovery efforts described in Section 1.4, USFWS determined that a Reasonable and Prudent Measure to require seabird avoidance measures for only vessels 55 ft or longer would achieve ESA goals for the recovery of short-tailed albatross while alleviating safety and practicability concerns. Further, research activities on smaller boats (Section 1.4) would proceed and may lead to adaptive management decisions in the future.
- May 6, 2013 - Pursuant to the NMFS Policy Directive 30-131, NMFS convened an Internal Scoping Meeting with subject matter experts to scope alternatives, identify issues or resources for analysis, and make preliminary determinations regarding the context and intensity of likely effects of the proposed action on the human environment.
- June 2013 Council Meeting – NMFS presented a Preliminary Draft Environmental Assessment to the Council and appropriate committees to get feedback on the range of alternatives and issues. The Council requested the addition of alternative 3 (see above).
- June-August 2013 – NMFS Northwest Region staff consulted with CDFW, WA Sea Grant, the Fishing Vessel Owners Association, USFWS, and the NMFS Office of Law Enforcement, Alaska Division to scope issues associated with implementation of seabird avoidance measures including the rough-weather exemption, enforceability, and non-regulatory outreach strategies.
- Ongoing – formal and informal interactions with the seabird conservation experts, the affected industry, fishery managers, and others to identify alternatives and issues associated with the proposed action.

As a result of scoping, it was determined that an EA is the appropriate level of analysis for the proposed action. Further, the following narrow range of issues has been identified for further analysis and carried forward to Chapters 3 and 4 of this EA:

- Seabirds (ESA-listed and other);
- Socioeconomic issues specific to fixed-gear fishermen;
- Safety-at-sea; and,
- Enforcement.

While the proposed action is expected to affect a narrow range of issues, it is within the context of the groundfish fishery. Other issues within the scope of the groundfish fishery are not expected to be affected by the proposed action but are important considerations for the groundfish fishery as a whole. Therefore, analyses of the following issues in the Environmental Impact Statement for the 2013-2014 Groundfish Harvest Specifications and Management Measures¹ are incorporated by reference and not considered further in this EA: groundfish species (including overfished species), non-groundfish fish species, listed species (other than seabirds), the marine ecosystem and habitat, tourism and recreation, environmental justice, human health, cultural resources, and climate change.

2.7 ALTERNATIVES CONSIDERED BUT REJECTED FROM FURTHER ANALYSIS

The following alternatives were considered but rejected from further analysis:

- An alternative to require seabird avoidance measures on all vessels using longline gear;
- Alternatives to pattern seabird avoidance measures on other fishery management programs (e.g., Hawaii longline); and,
- An alternative to make seabird avoidance measures voluntary guidelines rather than required provisions.

The alternative to require seabird avoidance measures on all vessels using longline gear was considered during scoping and rejected from further analysis due to ongoing research that makes such an alternative premature. As described in Section 1.4, WA Sea Grant is conducting research to develop streamer lines suited to the diversity of longline gear used in the Pacific Coast Groundfish Fishery. While the research may influence streamer line design for all vessel sizes, smaller vessels may be subject to the risk of safety problems arising from the streamer lines becoming entangled during gear-setting (Guy 2013, pers comm). Designing safe gear for smaller vessels is a priority of the research. Pending the completion of that research, it would be premature to consider regulations on vessels smaller than 55 ft LOA.

Alternatives to pattern seabird avoidance measures on other fishery management programs (e.g., Hawaii longline) were considered and rejected for further analysis because the B.O. specifically requires the measures to be patterned after the program for the Alaskan groundfish fishery.

An alternative to make seabird avoidance measures voluntary guidelines rather than required provisions was considered but rejected from further analysis because it would not be consistent with the mandatory requirements of the B.O.

¹ PFMC (Pacific Fishery Management Council) and NMFS (National Marine Fisheries Service). 2012. Proposed Harvest Specifications and Management Measures for the 2013-2014 Pacific Coast Groundfish Fishery and Amendment 21-2 to the Pacific Coast Fishery Management Plan, Final Environmental Impact Statement. Pacific Fishery Management Council, Portland, OR. September 2012.

• 3.0 AFFECTED ENVIRONMENT

This section describes the affected environment of those resources within the action area.

3.1 GROUND FISH STOCKS²

More than 90 species are managed under the Groundfish FMP. These species include: 60-plus rockfish, including all genera and species from the family *Scorpaenidae* (*Sebastes*, *Scorpaena*, *Sebastolobus*, and *Scorpaenodes*); 12 flatfish species; 6 roundfish species; and 6 miscellaneous fish species that include sharks, skates, grenadiers, rattails, and morids. Rockfish vary in their morphological and behavioral traits, with some species being semi-pelagic and found in mid-water schools, and others leading solitary, sedentary, bottom-dwelling lives (Love, *et al.* 2002). Rockfish inhabit varied depths, from nearshore kelp forests and rock outcroppings to deepwater (> 150 fm) habitats on the continental slope. Despite the range of behaviors and habitats, most rockfish share general life history characteristics, including slow growth rates, bearing live young, and large infrequent recruitment events. These life history characteristics contribute to relatively low average productivity that may reduce their ability to withstand heavy exploitation (Parker, *et al.* 2000), especially during periods of unfavorable environmental conditions.

Table 1: Latitudinal and depth distributions of groundfish species (adults) managed under the FMP.

Common Name	Scientific Name	Latitudinal Distribution		Depth Distribution (fm)

a/ Data from (Casillas, *et al.* 1998; Eschmeyer, *et al.* 1983; Hart 1988; Love, *et al.* 2002; Miller and Lea 1972), and NMFS survey data. Depth distributions refer to offshore distributions, not vertical distributions in the water column.

b/ The category “rockfish” includes all genera and species of the family *Scorpaenidae*, even if not listed, that occur in the Washington, Oregon, and California area.

c/ Only the southern stock of bocaccio south of 40°10' N. lat. is listed as depleted.

d/ Only two occurrences of harlequin rockfish south of 51° N. lat. (off Newport, OR and La Push, WA; (Casillas, *et al.* 1998)).

3.1.1 Overfished Stocks³

Overfished stocks are those with spawning biomasses that have dropped below the MSST. The Groundfish FMP requires overfished stock to be rebuilt to B_{MSY} through harvest restrictions and conservation measures. Furthermore, the MSA requires the rebuilding periods to be the shortest time possible while taking into account the status and biology of the depleted stock, the needs of fishing communities, and the interaction of the depleted stock

³ Adapted from Section 3.1.1.2 of PPMC 2012.

within the marine ecosystem. A rebuilding analysis that considers alternate harvest levels and rebuilding times is prepared for each overfished species.

Common name	Scientific name
Bocaccio ^{a/}	<i>Sebastes paucispinis</i>
Canary rockfish	<i>Sebastes pinniger</i>
Cowcod	<i>Sebastes levis</i>
Darkblotched rockfish	<i>Sebastes crameri</i>
Pacific ocean perch	<i>Sebastes alutus</i>
Petrale sole	<i>Eopsetta jordani</i>
Widow rockfish	<i>Sebastes entomelas</i>
Yelloweye rockfish	<i>Sebastes ruberrimus</i>

As described in Section 2.6, groundfish stocks, including overfished stocks, are not expected to be affected by the proposed action but are important considerations for the groundfish fishery as a whole. Therefore, analyses of groundfish stocks in the Environmental Impact Statement for the 2013-2014 Groundfish Harvest Specifications and Management Measures are incorporated by reference and not considered further in this EA.

3.2 NON-GROUNDFISH FISH SPECIES⁴

Non-groundfish fish species affected by implementation of the Groundfish FMP include:

- Pacific Halibut
- California Halibut
- Coastal Pelagic Species
- Dungeness Crab
- Greenlings (other than kelp greenling), ocean whitefish, and California sheephead
- Highly Migratory Species
- Pink Shrimp
- Salmon
- Sea Cucumber
- Ridgeback and Spot Prawns
- Miscellaneous Nongroundfish Flatfish, Skates, and Tanner Crab

As described in Section 2.6, non-groundfish fish stocks are not expected to be affected by the proposed action but are important considerations for the groundfish fishery as a whole. Therefore, analyses of non-groundfish fish stocks in the Environmental Impact Statement for the 2013-2014 Groundfish Harvest Specifications and Management Measures are incorporated by reference and not considered further in this EA.

3.3 PROTECTED SPECIES (OTHER THAN SEABIRDS)⁵

Protected species are species listed under the ESA, the Marine Mammal Protection Act (MMPA), the Migratory Bird Treaty Act (MBTA), and EO 13186.

⁴ Adapted from Section 3.1.3 of PFMC 2012.

⁵ This section adapted from Section 3.1.4 of PFMC 2012.

- The ESA protects species in danger of extinction throughout all or a significant part of their range, and mandates the conservation of critical habitat. The ESA defines “species” as a species, a subspecies, or for vertebrates a distinct population. A species is listed as “endangered” if it is in danger of extinction throughout a significant portion of its range and “threatened” if it is likely to become an endangered species within the foreseeable future throughout all, or a significant part, of its range.
- The MMPA guides marine mammal protection and conservation. Stock assessments are conducted annually for strategic stocks and every three years for non-strategic stocks. “Strategic stocks” are those with a human-caused mortality and injury level that exceeds the potential biological removal level (defined as “the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population...”) Marine mammal populations with an abundance that falls below its optimum sustainable level are listed as “depleted.” All marine mammal species are protected under the MMPA, regardless of species or stock listings under the ESA.
- The MBTA implements treaties and conventions between the U.S. and Canada, Japan, Mexico, and the former Soviet Union for the protection of migratory birds. Under the MBTA, it is unlawful to take, kill, or possess migratory birds. In addition, Executive Order 13186, *Responsibilities of Federal Agencies to Protect Migratory Birds*, directs Federal agencies to negotiate Memoranda of Understanding with the United States Fish and Wildlife Service (USFWS) that would obligate agencies to evaluate the impact on migratory birds as part of any NEPA process. All migratory seabird species are protected under the MBTA and EO 13186, regardless of species or stock listings under the ESA.

ESA-listed Salmon and Steelhead

Salmon caught in West Coast groundfish fisheries are anadromous, spending part of their life in fresh water streams and rivers from Central California to Alaska and part of their life in marine waters. During their marine phase they occur along the U.S. and Canada seaward into the north central Pacific Ocean, including Canadian territorial waters and the high seas. Critical portions of these ranges include the freshwater spawning grounds and migration routes. There are 31 West Coast salmon and Steelhead Evolutionarily Significant Units (ESUs) or distinct population segments (DPSs) in the action area (**Error! Reference source not found.**). The concept of ESUs and DPSs are used by MFS in applying the ESA to salmon and steelhead. Of the ESA-listed species, Chinook are most likely to be encountered. The Chinook ESUs that NMFS has concluded to be affected by the groundfish fisheries are: Snake River fall Chinook, Upper Willamette River Chinook, Lower Columbia River Chinook, Puget Sound Chinook, Sacramento River winter-run Chinook, California coastal Chinook, and Central Valley spring-run Chinook (NMFS 2006b))

Table 2: Endangered Species Act Status of West Coast Salmon & Steelhead (highlighted ESUs are those most likely to be encountered in the groundfish fisheries).

Species/ESU		Status
Sockeye	Snake river	Endangered
	Ozette Lake	Threatened
Chinook	Sacramento River Winter-run	Endangered
	Upper Columbia River Spring-run	Endangered
	Snake River Spring/Summer -run	Threatened
	Snake River Fall-run	Threatened
	Puget Sound	Threatened
	Lower Columbia River	Threatened
	Upper Willamette River	Threatened
	Central Valley Spring-run	Threatened
	California Coastal	Threatened
	Central Valley Fall and Late Fall-run	Species of Concern
Coho	Central California Coast	Endangered
	Southern Oregon/Northern California	Threatened
	Lower Columbia River	Threatened
	Oregon Coast	Threatened
	Puget Sound/Strait of Georgia	Species of Concern
Chum	Hood Canal Summer-run	Threatened
	Columbia River	Threatened
Steelhead	Southern California	Endangered
	Upper Columbia River	Threatened
	Central California Coast	Threatened
	South Central California Coast	Threatened
	Snake River Basin	Threatened
	Lower Columbia River	Threatened
	California Central Valley	Threatened
	Upper Willamette River	Threatened
	Middle Columbia River	Threatened
	Northern California	Threatened
	Puget Sound	Threatened
	Oregon Coast	Species of Concern

Sacramento River Winter-run Chinook

The Sacramento River winter-run Chinook ESU is represented by a single naturally-spawning population that has been completely displaced from its historical spawning habitat by the construction of Shasta and Keswick Dams. Having only one population in the ESU is a risk due to the lack of genetic diversity.

Snake River Fall-run Chinook

The Snake River Spring-Summer Chinook ESU includes all naturally-spawned populations of spring/summer-run Chinook salmon in the main stem of the Snake River, the Tucannon River, Grande Ronde River, Imnaha River, and Salmon River sub-basins, as well as 15 artificial propagation programs. Although recent natural spawning abundance estimates have increased, all populations remain below minimum natural origin abundance thresholds (Ford, *et al.* 2010).

Puget Sound Chinook

The ESU includes all naturally-spawned populations of Chinook salmon from rivers and streams flowing into Puget Sound including the Strait of Juan De Fuca from the Elwha River, eastward, including rivers and streams flowing into Hood Canal, South Sound, North Sound and the Strait of Georgia in Washington, as well as 26 artificial propagation programs. Most Puget Sound populations have consistently been below the spawner recruit levels that were identified as being consistent with

recovery (Ford, *et al.* 2010). Risk factors for the ESU include high fractions of hatchery fish in many populations and widespread loss and degradation of habitat (Ford, *et al.* 2010).

Lower Columbia River Chinook

The Lower Columbia River Chinook ESU includes all naturally-spawned populations of Chinook salmon from the Columbia River and its tributaries from the Pacific to a transitional point between Washington and Oregon east of the Hood River and the White Salmon River. The ESU includes the Willamette River to Willamette Falls, exclusive of spring-run Chinook salmon in the Clackamas River. Seventeen hatchery programs are considered to be part of the ESU. Lower Columbia River Chinook salmon includes three distinct components: spring run Chinook, tule fall Chinook, and bright fall Chinook. A recent 5-year review by Ford *et al.* (2010) concluded that the ESU is at very high risk of extinction with 28 of the 32 historical populations in the ESU considered to be extirpated or at very high risk; however, the overall biological risk category remains as threatened.

Upper Willamette River Chinook

The Upper Willamette River Chinook ESU includes all naturally-spawned populations of spring-run Chinook salmon in the Clackamas River and in the Willamette River and its tributaries, above Willamette Falls. Seven hatchery programs are also considered to be part of the ESU. Ford *et al.* (2010) verified the high fraction of hatchery fish in all of the populations in the ESU and highlighted the substantial risks associated with pre-spawning mortality.

Central Valley Spring-run Chinook

Central Valley Chinook stocks include spring stocks of the Sacramento and San Joaquin rivers and their tributaries. From the early 1990s through 2001 there was an improving trend in the population, as well as major habitat improvements in the watersheds and reduced ocean catch; however, since 2005 there have been declines in the abundance in the Central Valley, including spring-run Chinook salmon (NMFS 2011). Major concerns with the ESU have been loss of diversity caused by the extirpation of spring-run Chinook salmon populations from most of the Central Valley, the small number and close proximity of extant spring-run Chinook salmon populations (only three streams) which are vulnerable to catastrophic events, and interactions with hatchery fish from populations outside the ESU (Good *et al.* 2005).

California Coastal Chinook

The ESU includes all naturally-spawned populations of Chinook salmon from rivers and streams south of the Klamath River to the Russian River, California, as well as seven artificial propagation programs: the Humboldt Fish Action Council (Freshwater Creek), Yager Creek, Redwood Creek, Hollow Tree, Van Arsdale Fish Station, Mattole Salmon Group, and Mad River Hatchery fall-run Chinook hatchery programs. Currently there is no evidence to suggest any substantial improvement in the status of this ESU since 2005 (NMFS 2011). Concern relative to the ESU's ability to recover include the low population size relative to historical abundance, mixed trends in the time series of abundance indices, and the low abundances and potential extirpations of populations in the southern part of the ESU (Good, *et al.* 2005).

Salmon Interactions in the Whiting Fishery

Table 0-3 shows the estimated annual catch of salmonids in all sectors of the Pacific whiting fishery from 2005 to 2010, and Table 3-18 shows salmon catch by sector for 2008 and 2009. On an annual basis there is temporal and spatial variation in the catch of salmon that is associated with the behavior and biology of Chinook salmon and Pacific whiting. Bycatch rates tend to be higher closer to shore and earlier in the season. This may explain, the higher bycatch rate for the tribal mothership sector,

since these vessels fish within the tribal usual and accustomed areas (U/As), and have less flexibility to make spatial adjustments in response to salmon bycatch. The shorebased sector, for cost and operational reasons, tends to fish closer to shore. However, no such factors adequately account for inter-annual variation in bycatch. Previous work found no “obvious or consistent correlation” between annual Chinook abundance and bycatch (page 19 in NMFS 2006b). Ocean conditions may play a role, but specific causative factors, at least any that can be used predicatively, cannot be identified.

Table 0-3. Estimated Annual Catch of Salmonids in the Pacific Whiting Fishery, All Sectors, 2005-2010.

Information gathered from coded-wire-tag (CWT) recoveries in Chinook salmon in recent years (2006-2009) shows which hatchery stocks have been encountered in the fishery in recent years (Figure 0-1). Consistent with the most recent biological opinion, the Puget Sound ESU, Snake River Summer/Fall, Lower Columbia were most frequently encountered.

Figure 0-1. Pacific Whiting At-sea Fisheries, Number of Coded Wire Tags 2006-2009, by ESU (Source: Pacific States Marine Fisheries Commission, Regional Mark Processing Center 205 SE Spokane Street, Suite 100, Portland, Oregon 97202).

Salmon Interactions in the Nonwhiting Groundfish Fisheries

Data from the WCGOP were used to estimate the number of salmon caught in the nonwhiting groundfish fisheries. Table 3-19 shows the annual estimates bycatch by species from 2005 to 2009. Table 3-20 provides the estimated catch by species and fishery for 2008 and 2009.

Most salmon bycatch in the nonwhiting fisheries is Chinook salmon and is taken by the limited entry bottom trawl fishery. Estimates of Chinook bycatch from 2006 through 2009 remained considerably lower than 2005 (Table 3-19). Coho salmon bycatch has shown an increasing trend since 2005 with bycatch occurring in the fixed gear nearshore groundfish fishery (Table 3-20). Coho bycatch observations were all made North of Cape Mendocino, except an estimate of 19 individuals in 2006 that were taken in the limited entry trawl fishery (Bellman and Hastie 2008). Pink salmon bycatch was first observed in the limited entry bottom trawl fishery during 2009. One individual pink salmon was observed during the summer season in depths shallower than 125 fm south of Cape Mendocino. Chum and sockeye salmon were not observed as bycatch from 2005 to 2009 (Table 0-5).

Table 0-5. Estimated Annual Catch of Salmonids in the Nonwhiting Groundfish Fishery, All fisheries. (Bellman and Hastie 2008; Bellman, *et al.* 2010c; Bellman, *et al.* 2011b)

a/ LE bottom trawl vessels that hold a California halibut bottom trawl permit may participate in the state permitted California halibut fishery. California halibut tows can occur on the same trip as tows targeting groundfish and were identified in logbook and observer data based on the following criteria: 1) the reported tow target was California halibut or 2) the tow target was nearshore mix, sand sole, or other flatfish, and the tow took place in less than 30 fm and south of 40°10' N. latitude.

Green Sturgeon

The southern distinct population segment (DPS) of North American green sturgeon was listed as threatened under the ESA in 2006 (71 FR 17757), and critical habitat was designated in 2009 (74 FR 52300). The North American green sturgeon southern DPS is defined as coastal and Central Valley populations, south of the Eel River in California. Green sturgeon critical habitat is designated from 0 to 60 fm (74 FR 52300). The depth distribution of all observed tows encountering green sturgeon bycatch was similar, with 60 percent of tows in the depth range of 5-15 fm and 75 percent from 5-20 fm (Al-Humaidhi, *et al.* 2011). Since 2007, the WCGOP has collected lengths, general condition, photographs, and tissue samples from all green sturgeon observed. All but one green sturgeon observed and measured as bycatch between 2007 and 2010 appeared to be less than 20 years of age (< 145 cm fork length) (Al-Humaidhi, *et al.* 2011). Green sturgeon age at first maturity in the Klamath River is approximately 14 years for males and 16-20 years for females. The majority of green sturgeons encountered by the west coast groundfish fishery are believed to be from the southern DPS (Al-Humaidhi, *et al.* 2011).

Eulachon

Eulachon are found in the eastern north Pacific Ocean from northern California to southwest Alaska and into the southeastern Bering Sea. The southern DPS of eulachon was listed as threatened under the ESA in 2010 (75 FR 13012). The eulachon southern DPS is defined from the Mad River in northern California, north to the Skeena River in British Columbia. Eulachon are an anadromous fish. Adults migrate from the ocean to freshwater creeks and rivers where they spawn from late winter through early summer. The offspring hatch and migrate back to the ocean to forage until maturity. Once juvenile eulachon enter the ocean, they move from shallow nearshore areas to deeper areas over the continental shelf. There is little information available about eulachon movements in nearshore marine areas and the open ocean.

Eulachon are incidentally caught in the groundfish trawl fisheries. **Error! Reference source not found.** shows estimates of the number of eulachon caught by trawl fisheries. Eulachon appears to be encountered in the at-sea hake fishery as bycatch with more occurring in the catcher-processor sector of the fishery than the other sectors (**Error! Reference source not found.**). The highest eulachon ycatch in this mid-water trawl fishery was in the summer of 2006 with 145 individuals being caught. In contrast, no eulachon were observed as bycatch in the bottom trawl fishery during 2006. The depth distribution of all observed tows encountering eulachon bycatch from 2002-2010, inclusive, indicates that 86 percent of tows that encountered eulachon, as well as 86 percent of the eulachon encountered, were in the depth range of 60-90 fm. The shallowest observed tow that encountered eulachon was at 19.5 fm and the deepest observed tow was at 118.5 fm. Collection of eulachon length data began in 2009.

Marine Mammals

U.S. west coast waters support a variety of marine mammals. Approximately 30 species, including seals, sea lions, sea otters, whales, dolphins, and porpoise, occur within the EEZ. Many species seasonally migrate through west coast waters, while others are year-round residents. Species in the action area that are listed under the ESA are shown in **Error! Reference source not found.**

Table 7: ESA listed marine mammals that occur in the action area. (Highlighted species are those most likely to be encountered in the groundfish fisheries)

	Species	ESA listing
Whales	Humpback (<i>Megaptera novaeangliae</i>)	Endangered
	Sei (<i>Balaenoptera borealis</i>)	Endangered
	North Pacific Right (<i>Eubalaena japonica</i>)	Endangered
	Blue whales (<i>Balaenoptera musculus</i>)	Endangered
	Fin whales (<i>Balaenoptera physalus</i>)	Endangered
	Sperm whales (<i>Physeter macrocephalus</i>)	Endangered
	Southern Resident Killer whales (<i>Orcinus orca</i>)	Endangered
Pinnipeds	Stellar Sea lions	Threatened
	Guadalupe Fur Seals (<i>Arctocephalus townsendi</i>)	Threatened

The information on marine mammal interactions in this paragraph and **Error! Reference source not found.** is summarized from the NWFSC report titled “*Estimated bycatch of marine mammals, seabirds, and sea turtles in the U.S. west coast commercial groundfish fishery, 2002-2009*” (Jannot, *et al.* 2011). **Error! Reference source not found.** provides a summary of marine mammal interactions ocumented by groundfish observers. All but one cetacean species (whales, dolphins, and porpoises) recorded as a take by groundfish observers were considered to have been killed by the fishing gear. In 2007, a sperm whale collided with a limited entry fixed gear vessel in the sablefish primary fishery off northern Washington when the vessel was moving at idle speed. Although the animal did not appear

injured, it was considered a take under the ESA. A single bottlenose dolphin take occurred ~9 km offshore when it became entangled in a buoy line from a limited entry fixed gear sablefish (non-endorsed) vessel. The dolphin was release alive, but with injuries. Cetaceans with only a single observed takes include: a Pacific white-sided dolphin caught in 2003 by a limited entry bottom trawl vessel fishing at a mean depth of 300 fm off California; a harbor porpoise caught by a federally-permitted California halibut trawl vessel fishing off California at a mean depth of 8 fm; and, a Risso's dolphin caught by a federally-permitted bottom trawler fishing targeting thornyheads and flatfish at a mean depth of approximately 160 fm. Because there was only a single observed take recorded, they cannot be used for fleetwide bycatch estimations. Two cetacean specimens, a Pacific white-sided dolphin and a Dall's porpoise were caught by at-sea hake vessels off Washington, but were not within the observers' sample. Because they were recorded outside the observer samples they cannot be used for fleetwide bycatch estimations. The remaining observed takes are summarized in **Error! eference source not found..** In addition to observed takes, there have been 28 reported entanglements of humpback whales in fishing gear off the West Coast since 2000 (Southwest Region and Northwest Region stranding network). Of these, 15 were pot gear, 6 were net gear, and 7 were of unknown gear type. In most of these cases, the final status of the entangled animal was unknown.

Among the marine mammals, bycatch estimates were highest for California sea lions, which were caught primarily in trawl nets in the limited entry trawl (bottom and whiting) and California halibut trawl fisheries. Steller sea lions were the next highest, which were also caught in trawl nets in the at-sea whiting sectors, the limited entry trawl (bottom trawl and whiting) and California halibut trawl fisheries. Stellar sea lions taken on the west coast are believed to be primarily from the eastern stock (east of 140° west longitude). The majority of elephant seals were taken in the at-sea whiting fisheries.

Sea Turtles

Major threats to sea turtles in the U.S. include, but are not limited to, destruction and alteration of nesting and foraging habitats; incidental capture in commercial and recreational fisheries; entanglement in marine debris; and vessel strikes. All six species occurring in U.S. waters are listed under the ESA. The west coast groundfish fisheries have only one documented sea turtle interaction between 2002 and 2009. In 2008, WCGOP observers recorded a single fishery interaction with a leatherback turtle. In this case, the turtle was killed by fishing gear.

Leatherback turtles are present and potentially vulnerable as bycatch in the Pacific coast groundfish fishery during the summer-fall period (June through November) (Jannot, *et al.* 2011). Upwelling associated with the California Current system is most intense north of Point Conception, CA (Bakun, *et al.* 1974), but decreases considerably north of Cape Blanco, OR due to inconsistent wind patterns and changes in localized surface currents (Barth, *et al.* 2000). Although green and loggerhead turtles occur in the area, there are no known interactions with the groundfish fisheries.

Table 8: West coast sea turtles species and observed occurrence in the groundfish fisheries. (Jannot et al. 2011)

Species	Distribution **	ESA	Number observed
Leatherback (<i>Dermochelys coriacea</i>)	Distinct western Pacific population is highly migratory throughout tropical and temperate waters. Off the west coast, they have been observed as far north as Alaska but are more common off of central California (Benson et al. 2007b). Sightings data from Monterey Bay, California indicate that they are most abundant in late summer and early fall (Starbird et al. 1995). Leatherbacks are more abundant during periods of intense coastal upwelling, which could create favorable foraging conditions (Benson et al. 2007b).	Endangered	2008 -1
Green turtles (<i>Chelonia mydas</i>)	Habitat includes open ocean convergence zones and coastal areas for "benthic" feeding. In the eastern North Pacific, green turtles have been sighted from Baja California to southern Alaska, but most commonly occur from San Diego south. (www.nmfs.noaa.gov/pr/species/turtles/green.htm)	Endangered	None
Loggerhead (<i>Caretta caretta</i>)	Habitat includes open ocean and nearshore coastal areas. In the eastern Pacific, loggerheads have been reported as far north as Alaska, and as far south as Chile. In the US, occasional sightings are reported from the coasts of Washington and Oregon, but most records are of juveniles off the coast of California. (www.nmfs.noaa.gov/pr/species/turtles/green.htm)	Endangered	None

As described in Section 2.6, protected resources other than seabirds are not expected to be affected by the proposed action but are important considerations for the groundfish fishery as a whole. Therefore, analyses of protected resources in the Environmental Impact Statement for the 2013-2014 Groundfish Harvest Specifications and Management Measures are incorporated by reference and not considered further in this EA.

3.4 SEABIRDS

3.4.1 ESA-Listed Seabirds⁶

ESA-listed endangered seabirds in the project area include short-tailed albatross (*Phoebastria albatrus*), California least tern (*Sterna antillarum browni*), and Marbled murrelet

⁶ This section adapted from NWFSC 2011.

(*Brachyramphus marmoratus*), but of those, only short-tailed albatross is known to interact with the groundfish fishery (USFWS 2011). For that reason, the remainder of this discussion is devoted to short-tailed albatross.

Short-tailed albatrosses are large, pelagic seabirds with long, narrow wings adapted for soaring just above the water surface. Short-tailed albatross are central place foragers and bring food back to nestlings after surface feeding on primarily squid (especially the Japanese common squid [*Todarodes pacificus*]), shrimp, fish (including bonitos [*Sarda* sp.], flying fishes [Exocoetidae] and sardines [Clupeidae]), flying fish eggs, and other crustaceans (Hasegawa and DeGange 1982, Tickell 1975, Tickell 2000). There is little information on non-breeding diet, but it is thought that squids, crustaceans, and fishes are important prey (Hasegawa and DeGange 1982).

Marine Range

At-sea sightings since the 1940s indicate that short-tailed albatross are distributed widely throughout their historic foraging range in the temperate and subarctic North Pacific Ocean (Sanger 1972). While observations are concentrated along the edge of the continental shelf, in the northern Gulf of Alaska, Aleutian Islands, and Bering Sea (McDermond and Morgan 1993, Sherburne 1993), individual short-tailed albatross have been recorded along the West Coast of North America and as far south as the Baja Peninsula, Mexico (Palmer 1962).

From December through April, short-tailed albatross foraging is primarily concentrated near the breeding colonies, although individual trips may extend hundreds of miles or more from the colony sites. During the non-breeding season, short-tailed albatross range along the Pacific Rim from southern Japan to northern California, primarily along continental shelf margins. Post-breeding birds either disperse rapidly north to the western Aleutian Islands or stay within the coastal waters of northern Japan and the Kuril Islands throughout the summer, moving in early September into the western Aleutian Islands; once in the Aleutians, most birds travel east toward the Gulf of Alaska (Suryan et al. 2006).

Juveniles and sub-adults are prevalent off the West Coasts of Canada and the U.S. (Environment Canada 2008). In late September, large flocks of short-tailed albatross have been observed over the Bering Sea canyons (Piatt et al. 2006); these are the only known concentrations of this species away from their breeding islands. Short-tailed albatross forage extensively along continental shelf margins, spending the majority of time within national EEZs, particularly the U.S. (off Alaska), Russia, and Japan, rather than over international waters (Suryan et al. 2007a, Suryan et al. 2007b).

Critical habitat

Critical habitat has not been designated for this species. In the 2000 final listing rule, the USFWS determined that designation of critical habitat was not prudent, due to the lack of habitat-related threats to the species, the lack of specific areas in U.S. jurisdiction that could be identified as meeting the definition of Critical Habitat, and the lack of recognition or educational benefits accruing to the American people as a result of such designation (65 FR 147:46651-46653).

Status

The short-tailed albatross was originally listed as endangered in 1970. Due to an administrative error, the species was listed as endangered throughout its range except within the United States (50 CFR 17.11). The error was corrected on 31 July 2000, when the U.S.

Fish and Wildlife Service published a final rule listing the short-tailed albatross as endangered under the ESA throughout its range, including the United States (65 FR 147:46643-46654). The Short-Tailed Albatross Recovery Plan was finalized in 2008 (USFWS 2008).

Abundance and trend

As of spring 2011, the global population estimate of short-tailed albatross was 3,463 individuals (P. Sievert and H. Hasegawa, unpubl. data). Pre-exploitation global population estimates of short-tailed albatross are not known, but Dr. Hiroshi Hasegawa estimated there were at least 300,000 breeding pairs on Torishima Island alone (cited in USFWS 2008). From 1881 to 1903, an estimated five million short-tailed albatross were harvested from the breeding colony on Torishima Island, and they were harvested into the 1930s (except for a few years following a 1903 volcanic eruption); by 1949, there were no short-tailed albatross breeding at any of the historically-known breeding sites, including Torishima Island, and the species was thought to be extinct (Austin 1949); however, a small number of birds are thought to have been at sea that later returned to re-populate Torishima Island.

Threats (from Recovery Plan (USFWS 2008) or Listing documents)

Short-tailed albatross face significant threats on breeding colonies and at sea. The major threat of over-exploitation that led to the species' original endangered status no longer occurs. Current threats listed in the Recovery Plan include catastrophic events, such as a volcanic eruption on the main breeding site on Torishima Island. Other catastrophic events, particularly monsoons, can also threaten habitat and nesting success. Past volcanic activity has restricted breeding to sparsely vegetated and steep slopes of loose volcanic soil, and monsoon rains result in frequent mudslides and severe erosion, which can reduce habitat, destroy nests, and reduce breeding success. Global threats may also include indirect adverse effects related to climate change and oceanic regime shifts.

While known and potential threats from commercial fishing include U.S. and international demersal longline, pelagic longline, gillnet, jig/troll, and trawl fisheries, short-tailed albatross populations are not declining due to seabird bycatch in commercial fisheries (USFWS 2008). Other threats include contamination from organochlorines, pesticides, metals, and oil, and consumption of plastics. There has been an observed increase in the occurrence of plastics in birds on Torishima Island over the last decade, but the effect on survival and population growth is not known (USFWS 2008).

Past Fishery Impacts

There have been 16 reported lethal takes of short-tailed albatross in commercial fisheries since 1983; mostly in hook-and-line fisheries. The most recent reports—two takes in the Alaskan cod longline fishery and one take in the West Coast sablefish longline fishery—were the first reported in U.S. fisheries since 1998.

California, Oregon, Washington One known lethal take of short-tailed albatross has been reported off the West Coast of the continental U.S. In April 2011, a single short-tailed albatross juvenile was reported caught by longline gear in the limited entry sablefish fishery approximately 65 kilometers off the Oregon coast (WCGOP, unpubl. data).

Japan, Russia There is virtually no seabird bycatch information reported from Japanese fisheries, although it is likely that take has occurred in pelagic fisheries off Japan. During brood rearing, adults forage for food off the east coast of Honshu, and individuals on

Torishima Island have been observed with fishhooks in their mouths of the same type used in Japanese commercial fisheries (USFWS 2008). There is also inadequate seabird bycatch information from Russian fisheries, although demersal longline fisheries in the Russian EEZ are a known threat to short-tailed albatross (USFWS 2008), and short-tailed albatross have been taken in driftnet fisheries that still operate in the Russian EEZ.

Alaska and Hawaii No known takes of short-tailed albatross have been reported in domestic pelagic longline fisheries in the North Pacific. Demersal longline fisheries in the U.S. EEZ off Alaska (Bering Sea/Aleutian Islands area and Gulf of Alaska) are a known threat to short-tailed albatross, with almost all known takes occurring in demersal longline groundfish fisheries; no takes have been reported in groundfish trawl or pot fisheries. Two separate analyses for the demersal groundfish longline fisheries have estimated that, on average, one short-tailed albatross is taken in the Bering Sea hook-and line fishery each year (Stehn et al. 2001), and mitigation measures have likely reduced this rate since those estimates were developed. U.S.-based pelagic longline swordfish and tuna fisheries in the vicinity of the Hawaiian Islands have the potential to affect short-tailed albatross; overall seabird (and albatross) bycatch rates have declined in Hawaii's pelagic longline fishery since bycatch reduction regulations were promulgated (Gilman and Kobayashi 2005, NMFS 2011). A recent analysis of the continued operation of the Hawaii-based pelagic longline fisheries (NMFS 2011) calculated rates of incidental take of short-tailed albatross of one per year for both the shallow-set longline and deep-set longline fisheries. The rate of incidental takes of seabirds in general and albatross in particular has declined markedly in Alaskan demersal longline fisheries since bycatch reduction regulations were instituted (USFWS 2008).

3.4.2 Other Seabirds⁷

The US West Coast supports a diversity of seabird species, which exhibit a wide range of life history characteristics. Seabirds for which takes have been documented in the West Coast groundfish fishery include species that breed locally such as Brandt's cormorant, brown pelican, common murre, Leach's storm petrel and the western gull. Takes have also been documented for seabird species that pass through the California Current system during migration or foraging periods, but breed elsewhere such as the black-footed albatross, northern fulmar and the sooty shearwater.

All of the California Current system seabirds (breeding or transitory) are highly mobile and require an abundant food source to support their high metabolic rates (Ainley et al. 2005). Because of these shared characteristics, the abundance of most seabird species along the US West Coast is influenced by the same physical and biological factors, e.g., oceanic productivity and prey availability (Tyler et al. 1993, Ainley et al. 2005). Specifically, the seasonal and latitudinal distribution of seabirds is defined by the intensity of coastal upwelling, which delivers nutrient rich water and supports greater prey biomass in surface waters accessible to seabirds (Tyler et al. 1983). On the US West Coast, upwelling is most intense south of Cape Blanco, OR (42° 50' N latitude) (Bakun et al. 1974, Barth et al. 2000), which supports a large percentage of the nesting sites of locally breeding seabirds (Tyler et al. 1993). The location of stable nesting sites reflects oceanographic conditions that support long-term food availability (Tyler et al. 1993). Transient species to the California Current system are also most abundant in areas of strong upwelling intensity and high productivity (Briggs and Chu 1986, Hyrenbach et al. 2002).

⁷ This section adapted from Jannot et al. 2011.

In addition to varying by latitude, both coastal upwelling and the distribution of seabirds also vary by season. Three distinct oceanic seasons have traditionally been defined for the US West Coast: the Upwelling, Oceanic, and Davidson Current seasons (Ford et al. 2004). The Upwelling season coincides with late spring and summer, when northerly winds transport surface waters southward and away from the coast. The distribution of breeding species in summer largely reflects the location of nesting colonies, which are most prevalent adjacent to the central and northern portion of the California Current system (Tyler et al. 1993, Ford et al. 2004). However, during this time, breeders are outnumbered by visiting species, which are attracted by greater oceanic productivity and prey abundance associated with upwelling. Commonly observed visiting species in summer include the sooty shearwater (*Puffinus griseus*), Northern fulmar (*Fulmarus glacialis*), and black-footed albatross (*Phoebastria nigripes*) (Tyler et al. 1993). In the fall (Oceanic season), northerly winds and upwelling intensity decrease, and sea surface temperature reaches its annual maximum. Several species that nest farther south in Mexico and southern California move northward, including the brown pelican (*Pelecanus occidentalis*) and storm-petrels. As winter approaches, these species again return south and breeders from boreal nesting colonies become more abundant, particularly off of California (Tyler et al. 1993). The winter months along the West Coast are characterized by warmer water delivered by the Davidson Current and reduced levels of primary production (Davidson Current season). Seabird abundance during this time is generally low (Tyler et al. 1993).

3.5 SOCIOECONOMIC AFFECTED ENVIRONMENT

Of the many types of fishing gear used in the groundfish fishery, only vessels that use fixed gear, specifically bottom longline, will be affected by the proposed action. There are three major sectors in the fixed gear groundfish fishery that would be affected: the LE sablefish endorsed sector, the LE non-sablefish-endorsed sector, and the Federal open access sector. In addition, a new sector has emerged since the implementation of the ITQ program that allows trawlers to “gear switch” and harvest their trawl quota with longline gear (50 CFR 660.140(k)).

3.5.1 Affected Sectors

Limited Entry Sablefish Primary Tier-Endorsed Fixed Gear

Vessels participating in the LE sablefish-endorsed sector range in size from 33 to 95 feet and operate north of 36-degrees N. latitude. Fishing generally occurs in depths greater than 80 fathoms. Nearly all of the vessels participating in this sector deliver their iced catch to shoreside processors. Catch in the LE sablefish-endorsed fishery is composed mostly of sablefish, with bycatch primarily composed of spiny dogfish shark, Pacific halibut, rockfish species, and skates. LE sablefish-endorsed permits provide the permit holder with an annual share of the sablefish catch. Sablefish-endorsed permits are assigned to Tier 1, 2, or 3. Each Tier 1 permit receives 1.4% of the primary-season sablefish allocation, with Tiers 2 and 3 receiving 0.64% and 0.36%, respectively. Each year, these shares are translated into amounts of catch (in pounds), or “tier limits”, which could be caught during the primary fishery. Regulations allow for up to three LE sablefish-endorsed permits to be ‘stacked’ on a single vessel. Permit stacking was implemented to increase the economic efficiency of the fleet and promote fleet capacity reduction. Stacking more than one sablefish-endorsed permit on a vessel allows the vessel to land sablefish up to the sum of the associated tier limits. However,

permit stacking does not convey additive landing limits for any other species. LE sablefish-endorsed primary season fishing currently takes place over a seven-month period from April 1 to October 31. The seven-month season was first implemented in 2002. Permit holders land their tier limits at any time during the seven-month season. Once the primary season opens, all sablefish landed by a sablefish-endorsed permit is counted toward attainment of its tier limit. Vessels that have LE sablefish-endorsed permits can fish in the LE non-sablefish-endorsed fishery under trip limits once their quota of primary season sablefish has been caught or when the primary season is closed, from November 1 through March 31.

Limited Entry Non-Sablefish-Endorsed Fixed Gear

The LE non-sablefish-endorsed fixed gear sector occurs coastwide but operates primarily out of southern California ports. The fishery operates year-round, but the majority of fishing activity occurs during the summer months when weather conditions improve. Vessels in the LE non-sablefish-endorsed sector range in size from 17 to 60 feet, with an average length of 34 feet. Vessels catch a variety of groundfish species, including thornyheads, sablefish, rockfish, and flatfish. The fleet typically operates in depths greater than 80 fathoms. Nearly all of the vessels participating in this fishery deliver their iced catch to fresh fish markets. LE non-sablefish-endorsed fixed gear permits are subject to daily and weekly trip limits for sablefish, thornyheads, and other groundfish species.

Gear Switching

Under the trawl rationalization program, vessels are no longer restricted to a specific gear type. Vessels that were previously limited to trawl gear may now opt to use non-trawl gear. As with other elements of the trawl rationalization program, it is unknown how this will influence fishing effort profiles. Market analysis suggests it may be economically beneficial for some fishermen to harvest sablefish by bottom-longline instead of trawl; however, it is not yet known if this will occur or, if it does, the magnitude of change. As mentioned above, starry flounder, “other flatfish,” and chilipepper rockfish south of 40°10’N latitude have been allocated to nontrawl fisheries in excess of historical amounts. Similar to sablefish, it is not possible to determine if this will result in a net increase in non-trawl effort. NMFS is actively monitoring changes in the fishery that result from the trawl rationalization program.

Open Access Fixed Gear

As the open access sector of the fixed gear groundfish fishery does not require Federal or state permits (state requirements for commercial fishing licenses notwithstanding), characterizing the participants can be difficult. Vessels range in size from 10 to 97 feet, with an average length of 33 feet. Vessels catch a variety of groundfish species, including sablefish, spiny dogfish, and skates. Vessels operate out of all three coastal states and generally fish in waters shoreward of 30 fathoms or seaward of 100 fathoms. Open access fixed gear vessels are subject to daily and weekly trip limits for sablefish, spiny dogfish shark, and other groundfish species. Flatfish species—including dover sole, arrowtooth flounder, petrale sole, English sole, starry flounder, and all other flatfish—are managed as a single group for the open access fishery.

3.6 SAFETY-AT-SEA

The deployment of streamer lines raises potential safety issues. For example, lines may become entangled during the setting of the longline and create a safety hazard. There are not data available to quantify the frequency of safety issues related to the deployment of streamer

lines; however, industry experts with experience in the Alaskan groundfish fisheries suggest safety issues are rare there because of long-term experience using streamer lines and a regulatory exemption from using streamer lines in rough weather. Further, low-tensile strength “break-aways” are sewn into streamer lines so that if entanglements occur, the line breaks without creating a safety hazard such as entanglement in the prop (Guy 2013; pers comm). NMFS’ funded outreach is expected to reduce the risk of safety hazards by teaching fishermen safe deployment techniques.

3.7 ENFORCEMENT⁸

Enforcement of fishery regulations has become increasingly complex with the addition of large closed areas, smaller cumulative trip limits and bag limits, and depth-based closures for commercial and recreational fisheries. Enforcement is closely coordinated among Federal and state enforcement agencies. Decreased OYs and the need to rebuild depleted stocks have placed additional importance on controlling and monitoring fishery-related mortality. Enforcement agencies continue to use traditional methods to ensure compliance with groundfish fishery regulations including dockside sampling, at-sea patrols, and air surveillance. VMS enhances, rather than replaces, traditional enforcement techniques.

Recent declines in enforcement agency budgets, combined with increased regulatory complexity, have stressed the ability to adequately monitor fisheries for regulatory compliance. In response, NMFS implemented a VMS monitoring program, which includes satellite tracking of vessel positions and a declaration system for those vessels legally fishing within an RCA. VMS was initially implemented on January 1, 2004, and is currently required on all commercial vessels that take and retain, possess or land federally-managed groundfish species taken in Federal waters or in state waters prior to transiting Federal waters.

• 4.0 ENVIRONMENTAL CONSEQUENCES

The proposed action would have a negligible influence on normal fishing operations. For example, the proposed action would not affect when, where, or to what degree fishermen will fish and therefore, impacts would not be expected on the following resources or issues: groundfish (including overfished species), non-groundfish, listed species with the exception of short-tailed albatross, non-listed species with the exception of seabirds, the marine ecosystem, habitat, tourism and recreation, environmental justice, human health, cultural resources, and climate change. The full range of environmental consequences associated with normal fishing operations are fully considered in the following EIS: Proposed Harvest Specifications and Management Measures for the 2013-2014 Pacific Coast Groundfish Fishery and Amendment 21-2 to the Pacific Coast Fishery Management Plan, Final Environmental Impact Statement (PFMC and NMFS 2012). Resources directly associated with implementation of the proposed action and therefore considered in the following

⁸ This section adapted from PFMC 2008.

analyses are: (a) seabirds; (b) cost to vessels of procuring streamer lines; (c) safety issues associated with deploying streamer lines; and (d) enforcement.

4.1 SEABIRD RESOURCES

4.1.1 ESA-Listed Seabirds

Impact of West Coast Groundfish fisheries on population growth rate

West Coast groundfish fisheries are imposing some additional (non-natural) mortality on short-tailed albatross. The number of takes per year is very likely higher than the number of takes observed (one lethal take over the period of 2002–2011), and based on the black-footed albatross mortality rate, is probably ~1/year and unlikely to be >2/year. On its own, this level of mortality is very small compared to the annual growth rate of the population (~6.5%; currently >200 birds/year). Even when combined with known mortality from other fisheries on a global scale, there is no reason to change the conclusion from the USFWS Recovery Plan that mortality from fishing is not a significant impediment to the growth and recovery of the species (USFWS 2008). Analyses of the impacts of Alaskan trawl mortality on the Torishima Island short-tailed albatross population suggest that trawl-related bycatch exceeding the current expected incidental take in that fishery (two takes in any 5-year period) by even a factor of 10 would have little impact on when the species' proposed recovery goals are achieved (Zador et al. 2008). NMFS' Biological Assessment quantifies the level of mortality in another set of fisheries, but does not change the basic conclusion that, at present, the level of estimated fishing mortality is small compared to the annual growth rate of the population. Use of mitigation measures, such as streamer lines or integrated weighted lines like those employed in Alaskan fisheries, would be expected to reduce take even further (NWFSC 2011; USFWS 2008; and, WA Sea Grant 2011).

Comparison of the Alternatives

None of the alternatives will result in significant impacts to short-tailed albatross. All alternatives are expected to reduce take due to voluntary use of seabird avoidance devices; and implementation of a regulatory requirement for vessels 55 ft LOA or larger to follow seabird avoidance measures under alternatives 2, 3, and 4 is expected to reduce take of short-tailed albatross more than no-action. There is a negligible difference among alternatives 2, 3, and 4 for ESA-listed seabirds.

USFWS concluded that take levels associated with the no-action alternative are not likely to result in jeopardy to short-tailed albatross and provided for an average incidental take of one bird per year (USFWS 2011). As described above, alternative 1 is not significantly impeding a relatively robust recovery rate.

Each alternative includes outreach and subsidies to encourage voluntary use of streamer lines as described in section 1.4. As such, fishery interactions with short-tailed albatross will be less likely to result in lethal hooking events as the use of streamer lines is likely to increase under each alternative. As of 2011, 221 streamer lines were distributed free of charge to West Coast longline vessels at the vessels request for voluntary use. However, it is not possible at this time to quantify how many vessels will voluntarily deploy streamer lines or how effective the streamer lines will be at reducing short-tail albatross mortality. Alternatives 2-4 would hedge against low voluntary compliance by ensuring that, at a minimum, large vessels use streamer lines and associated seabird avoidance measures. In

addition, research on the practical application of streamer lines may result in a re-design of streamer lines to be more appropriate for the West Coast longline fleet. Over time, this could result in increased voluntary deployment under each alternative.

4.1.2 Other Seabirds

In 2009, northern fulmars comprised the largest proportion of seabird bycatch in West Coast groundfish fisheries, followed by unspecified tubenoses and unspecified alcids. Bycatch estimates for 2009 could not be provided for cormorants, gulls, or murres because CVs exceeded 80%. Shearwaters, gulls, and cormorants were commonly observed seabird bycatch from 2002-2008. Seabird bycatch was most common from April through October, which coincides with the limited entry fixed gear sablefish endorsed season. Although bycatch rates for most seabird species were highest in association with longline gear, common murres, cormorants, and storm petrels were also caught by trawl gear.

In 2009, there were no observed takes of black-footed albatross in West Coast groundfish fisheries. There was a single opportunistic take of black-footed albatross in the at-sea hake fishery in 2009. During 2002-2008, seabird bycatch estimates were greatest for the black-footed albatross, which was primarily caught by longlines in the limited entry sablefish endorsed (primary) sector from May through October. Black-footed albatross bycatch exhibited an increasing trend from 2002 to 2007, followed by a slight reduction in 2008. Takes for this species occur on approximately 2.6% of observed sablefish longline trips, with 1-2 birds typically caught at a time. Bycatch estimates could not be provided for several species in 2006 and 2007 because of high CV values. Annual coverage in the limited entry sablefish primary sector was close to 24% in both of these years, and the total number of takes in this sector was 13 and 48, respectively. However, bycatch events of black-footed albatross in 2006 and 2007 were unusual in that they were concentrated on consecutive sets within the same trip. For instance, one observed vessel caught 32 individuals across several sets off the coast of southern Oregon, representing 2/3 of the total number of observed takes for that year. This resulted in high variance among takes from one trip to the next and produced bycatch estimates with CVs as high as 96%.

Comparison of the Alternatives

All of the alternatives are expected to reduce seabird mortality due to voluntary use of seabird avoidance devices; and implementation of a regulatory requirement for vessels 55 ft LOA or larger to follow seabird avoidance measures under alternatives 2-4 is expected to reduce seabird mortality more than no-action. There is a negligible difference between alternatives 2, 3, and 4 for ESA-listed seabirds.

All the alternatives include outreach and subsidies to encourage voluntary use of streamer lines as described in Section 1.4. As such, fishery interactions with seabirds will be less likely to result in lethal hooking events as the use of streamer lines increases under each alternative. However, it is not possible at this time to quantify how many vessels will voluntarily deploy streamer lines or how effective the streamer lines will be at reducing short-tail albatross mortality. Alternatives 2-4 would hedge against low voluntary compliance by ensuring that, at a minimum, large vessels use streamer lines and associated seabird avoidance measures. In addition, research on the practical application of streamer lines may result in a re-design of streamer lines to be more appropriate for the West Coast longline fleet. Over time, this may result in increased voluntary deployment under each alternative.

4.2 SOCIOECONOMIC RESOURCES

4.2.1 Fishing Industry

The number of vessels that would be affected by the proposed action changes from year to year. There were 227 LE fixed gear permits in 2009. LE fixed gear permits are either sablefish-endorsed or non-sablefish-endorsed. In addition, all LE fixed gear permits have gear endorsements (longline, pot/trap, or both). Of the 227 LE fixed gear permits in 2009, 164 had sablefish-endorsements. Of these, 132 were associated with longline gear, 32 were associated with pot/trap gear, and 4 were associated with both longline and pot/trap gear. The remaining 63 limited entry non-sablefish-endorsed permits were all associated with longline gear. The open access fixed gear sector does not require Federal or state permits. Therefore, the total number of participants varies widely from year to year. Open access vessels can use any type of hook-and-line or pot/trap gear, including longline, fishing pole, and vertical longline.

A reasonable approximation of affected vessels is the total number of vessels 55 ft LOA or greater that deployed longline gear in 2011. Out of 408 total vessels deploying longline gear, 43 or 10.3% met the length requirement. Table 3.1 shows a break-down by state.

Table 9: Affected Universe of Vessels (Source: GMT 2012)

State	Longline Vessels 55 ft LOA or larger
Washington	18
Oregon	12
California	13
	Total=43 (10.3% of total longline vessels)

Cost of Streamer Lines

As described in Section 1.4, direct cost of the proposed action to industry is zero for as long as NMFS continues to fund the subsidy and free lines are available. Under current funding, the subsidy is expected to last a minimum of 2-3 years but it probably will continue into the foreseeable future. In the event that NMFS discontinued the subsidy, the affected industry would be required to build or purchase streamer lines. Estimates for the cost of streamer lines range from \$100-\$150 each (\$200-300/pair) (Melvin pers comm & Colpo pers comm).

Comparison of the Alternatives

Direct costs associated with the alternatives are limited to the costs of streamer lines, which for the foreseeable future, is subsidized by NMFS. Therefore, direct costs are zero under all alternatives. If in the future NMFS discontinues the subsidy, alternative 1 would still be a zero cost; however, alternatives 2-4 would impose a \$100-300 cost each time the vessel needs to purchase streamer lines. For purposes of this analysis, we assume the vessel would need to purchase streamer lines once/year thereby imposing a direct cost of \$100-300 per vessel per year under alternatives 2-4. There is no socioeconomic difference among alternatives 2, 3, and 4 since whether there is a rough-weather provision does not affect the cost to the vessel.

4.2.2 Human Safety

The deployment of streamer lines raises potential safety issues. For example, lines may become entangled during the setting of the longline and create a safety hazard. There are not data available to quantify the frequency of safety issues related to the deployment of streamer

lines; however, industry experts with experience in the Alaskan groundfish fisheries suggest safety issues are rare there because of long-term experience using streamer lines and a regulatory exemption from using streamer lines in rough weather. Further, low-tensile strength “break-aways” are sewn into streamer lines so that if entanglements occur, the line breaks without creating a safety hazard such as entanglement in the prop (Guy 2013; pers comm). NMFS’ funded outreach is expected to reduce the risk of safety hazards by teaching fishermen safe deployment techniques.

Comparison of the Alternatives

Safety-at-sea issues are present under all the alternatives because NMFS is encouraging the voluntary use of streamer lines that may become a hazard through entanglement. Mitigating factors exist, including outreach on the safe use of streamer lines and the use of low-tensile strength “break-aways.” Further, the incidence of entanglements is expected to be reduced over time as the fleet gains experience.

The GMT commented that it is not known if the Alaska exemption for rough weather is appropriate to mitigate safety risks on the West Coast (GMT 2012). It is unclear at this time what an appropriate threshold is. So, it is not clear how much risks associated with Alternative 2 will be mitigated. Alternative 3, by removing the rough weather exemption, has an added element of risk for vessels’ crews who chose to fish in rough weather. The rough weather exemption for Alternative 4 will be developed through the rulemaking process and is expected to balance seabird conservation with safety for an appropriate level of mitigation.

4.3 ENFORCEMENT

The streamer line provisions of the proposed action would primarily be enforced by a combination of dockside and at-sea patrol. Dockside checks would be utilized to determine compliance with technical specifications for streamer lines, and at-sea patrols would be utilized to enforce their application during fishing operations. These may be supplemented by other means (e.g., observer program reports).

Alternative 1 does not include a regulation and therefore, does not change status quo enforcement. Alternatives 2-4 implement streamer line regulations that require enforcement of technical specifications and deployment during fishing operations. Enforcement of those provisions in Alaska is ongoing and presents no unique challenges. It is assumed for purposes of this EA that enforcement on the West Coast will be similar to the experience in Alaska.

The provisions to sink baited hooks quickly and discharge offal in a manner that distracts birds from baited hooks do present enforcement challenges. Alternative 4 removes those provisions and is therefore more enforceable than alternatives 2-3.

4.3 CUMULATIVE EFFECTS

A cumulative effects analysis is required by the Council on Environmental Quality (CEQ) (40 CFR part 1508.7). The purpose of a cumulative effects analysis is to consider the combined effects of many actions on the human environment over time that would be missed if each action were evaluated separately. CEQ guidelines recognize that it is not practical to analyze the cumulative effects of an action from every conceivable perspective, but rather,

the intent is to focus on those effects that are truly meaningful. A formal cumulative impact assessment is not necessarily required as part of an EA under NEPA as long as the significance of cumulative impacts has been considered (U.S. EPA 1999). The following addresses the significance of the expected cumulative impacts as they relate to the federally managed groundfish fishery and seabird interactions.

In Chapter 3 (Description of the Affected Environment), the resources affected by the proposed action are identified and are carried forward here for the cumulative effects analysis. Those resources are:

- Seabirds (ESA-listed short-tailed albatross and other);
- Socioeconomic issues specific to fixed-gear fishermen;
- Safety-at-sea; and,
- Enforcement.

4.3.1 Geographical and Temporal Boundaries

The analysis of impacts focuses on actions related to the harvest of Pacific Coast groundfish by longline vessels 55 ft or longer LOA. The core geographic scope for each of the resources is focused on the Eastern Pacific Ocean; and more specifically, the U.S. EEZ off the coasts of Washington, Oregon, and California. The core geographic scope for short-tailed albatross and other seabirds can be considered the overall range of these species in the Eastern Pacific Ocean as described in Chapter 3. For socioeconomic issues, the core geographic boundaries are defined as those U.S. fishing communities directly involved in the harvest or processing of the managed resources, which were found to occur in coastal states from Washington through California. For enforcement issues, the core geographic scope is the U.S. EEZ off the coasts of Washington, Oregon, and California.

The temporal scope of past and present actions for the potentially affected resources is primarily focused on actions that have occurred after FMP implementation (originally implemented on October 5, 1982). The temporal scope of future actions for all affected resources extends about five years into the future. This period was chosen because the research described in Chapter 1 is likely to be concluded within that timeframe and therefore, more information will be available to managers to potentially adapt accordingly.

4.3.2 Actions Other than the Proposed Action

4.3.2.1 PAST, PRESENT, AND REASONABLY FORESEEABLE FUTURE ACTIONS

Fishery-related Actions

Albatross, like many seabirds, attack baited hooks of both pelagic and demersal longlines after the hooks are deployed; if they get hooked or snagged, they are likely to be injured or pulled underwater with the rest of the gear and drowned (USFWS 2008, page 20). Interactions with trawls may occur when seabirds fly behind vessels or float in offal plumes that trail vessels. Individuals can strike the trawl cables (warps) or the sonar cable (third wire) attached to the net or become entangled on the outside of nets towed at or near the surface; the former in particular are very unlikely to be detected as they do not show up on the vessel's deck to be sampled (USFWS 2008, page 22).

At least one short-tailed albatross has been killed incidentally in the Russian driftnet fishery (USFWS 2008, page 23). Information from foreign fisheries is incomplete (USFWS 2008, page 24). In U.S. waters, there were two reported fishery-related mortalities of short-tailed albatross in the 1980s. The first bird was found dead in a fish net north of St. Matthew Island, Bering Sea, in July 1983. The second was killed in October 1987, by a halibut vessel in the Gulf of Alaska. Both mortalities were reported by fishermen (USFWS 2008, page 20). Since 1990, fisheries observers have reported eight short-tailed albatross mortalities in Alaska's fisheries and one in the Pacific Coast Groundfish Fishery. Seven mortalities occurred in demersal longline groundfish fisheries; and the two mortalities from the IFQ sablefish fishery did not have gear type indicated (Table 2).

Table 10: Known short-tailed albatross mortalities associated with North Pacific and West Coast fishing activities since 1983 (Source UFWFS 2012).

Date	Fishery	Observer program?	In sample?	Bird age	Location	Source

The nature of the fishery management process is intended to provide the opportunity for PFMC and NMFS to regularly assess the status of the fisheries and to make necessary adjustments to ensure that there is a reasonable expectation of meeting the objectives of the FMP and the targets associated with any rebuilding programs under the FMP. The statutory basis for Federal fisheries management is the Magnuson-Stevens Act. The cumulative impacts of past, present, and reasonably foreseeable future Federal fishery management actions on the affected resources should generally be associated with positive long-term

outcomes. Constraining fishing effort through regulatory actions can often have negative short-term socioeconomic impacts. These impacts are usually necessary to bring about long-term sustainability of a given resource, which should, in the long-term, promote positive effects on human communities.

PFMC and NMFS continue to work together on the trawl rationalization trailing actions. All of these actions are expected to increase benefits from the fishery and are not expected to appreciably interact with the action considered here, except as noted in the following list. Details on each action are available on the PFMC website (<http://www.pcouncil.org/groundfish/fishery-management-plan/trailing-actions/>). The main trailing actions are as follows:

Trawl/Fixed Gear Permit Stacking (final PFMC action taken, not yet implemented) — This action allows fixed gear and trawl permits to be registered to the same vessel at the same time and may influence the number of vessels that deploy longline gear.

Gear Issues (under PFMC consideration, deliberations delayed) -- Gear issues include multiple gears on a trip, gear modifications to increase efficiency, and restrictions on areas in which gears may be used. Consideration on this issue has been delayed until September 2013.

Furthermore, PFMC is considering the adoption of a Fishery Ecosystem Plan (FEP) which would broaden its current authority to species and issues not currently addressed in existing FMPs, including the groundfish FMP. The scope of the plan is still under consideration. The guidance provided to the plan development team thus far has included:

- Development of an FEP that would primarily be advisory in nature with the potential to expand in the future.
- Amend existing FMPs to include management measures for forage fish as the Council deems appropriate.
- Develop a list of species not included in any FMP and that are not being managed to define their trophic associations and ecological roles.
- Complete an analysis of unmanaged species and potential processes for their management.

Implementation of an FEP could have positive environmental and biological impacts associated with forage fish and unmanaged fish protection. Such protections could accrue benefits to managed species such as groundfish which depend on forage fish and some unmanaged fish for their survival and reproduction. While adverse impacts on forage fish and unmanaged fish under any of the alternatives are expected to be minimal, actions taken under the FEP are expected to further benefit these resources, helping to offset any negative impacts. There could potentially be negative short-term socioeconomic impacts if actions taken to protect forage species and unmanaged species resulted in reduced harvest opportunity for managed species. In the context of regulations that may impose further restrictions on harvest, alternatives which alleviate production costs may be more beneficial to stability in the industry than would be the case if harvest conditions were expected to remain stable.

Non-Fishing Actions

Natural Events

Torishima Island, the main short-tailed albatross breeding colony, is an active volcano. There were minor and major eruptions throughout the 20th century, and as recently as 2002. It is estimated

that a catastrophic eruption during the breeding season could kill up to 54% of the short-tailed albatross population. In addition to outright deaths, volcanic eruptions have the potential to reduce breeding habitat by destroying vegetation (USFWS 2008, page 17).

Intense storms accompanied by high winds and heavy rains have reduced breeding habitat on Torishima Island in the past. Additionally, years with intense storm activity correspond to years with

lower breeding success.

Invasive Species

Black rats (*Rattus rattus*) were introduced to Torishima Island at some point during human occupation. The effect of these rats on short-tailed albatross is unknown, but rats are known to feed on chicks and eggs of other seabird species (Atkinson 1985), and there have been numerous efforts to eradicate rats to protect other seabird colonies (Taylor et al. 2000, page 151).

Disease and Parasites

Diseases and parasites are not currently adversely affecting short-tailed albatross. Tick parasites, feather louse and a carnivorous beetle have been documented infesting short-tailed albatross on Torishima Island, although not recently (USFWS 2008, page 27). No diseases have been documented in short-tailed albatross. Although, they could be vulnerable to avian influenza, West Nile virus, fungal and bacterial infections.

Predation

Shark predation is documented among other albatross species but has not been observed for short-tailed albatross (USFWS 2008, page 27). This predation would likely be in the form of sharks preying upon fledgling short-tailed albatross as they depart their natal colony.

Oil Pollution

There is potential for oil spills to occur in the action area which could affect short-tailed albatross. Oil contamination can adversely affect short-tailed albatross either through acute toxicity from being directly oiled or as a result of chronic or sublethal exposure to low levels of oil. Petroleum exposure may: (1) compromise seabirds' thermoregulation through fouling of

feathers; (2) cause direct toxicity through ingestion (e.g., during preening); (3) contaminate the birds' food resources; (4) reduce prey availability from toxic effects on prey species; and (5) cause embryotoxic effects (USFWS 2008, page 26, USFWS 2009, pages 48-49).

Plastic Pollution

The presence of plastics in the North Pacific is a serious threat to albatrosses. Plastics are likely eaten when they are mistaken for food or have flying fish eggs adhering to them. Plastics likely reduce chick survival when they are fed to chicks prior to their ability to regurgitate. This can clog the digestive tracts, leading to the eventual starvation of chicks. Another possible consequence of plastics ingestion is the transfer of toxic compounds to short-tailed albatross (USFWS 2008, page 26, USFWS 2009, pages 49-50).

Contaminants

Albatrosses at Torishima Island, including short-tailed albatross, have higher concentrations of pollutants in eggs, pectoral muscles, and stomach oil than albatrosses in other parts of the North Pacific. Possible consequences of this contamination are shell thinning (from pesticides), disruption of physical and embryonic development, and reproductive inhibition from exposure to organochlorines and heavy metals (USFWS 2008, page 25).

Climate Change

USFWS (2008, pages 18-19) cites two major studies documenting climate change. The authors suggest that climatic change would shift the range of short-tailed albatross prey items northward increasing energetic costs to foraging birds. Additionally, USFWS suggests climate change would likely cause shifts in vegetation on the main breeding colony at Torishima Island.

Nesting Habitat Destruction

Non-native plants, such as shrubs, can limit or destroy suitable nesting habitat on breeding islands. Although there is currently no known invasive plant problem on Torishima Island, accidental introduction remains a threat. Catastrophic events listed under Natural Events above can change habitat at breeding colonies. These events can result in permanent loss of habitat.

Cumulative effects include the effects of future state, tribal, local or private actions that are reasonably certain to occur within the action area considered in this EA. Whereas the action area includes state waters, the continued operation of state fisheries is being considered for cumulative effects to short-tailed albatross. Additionally, state fisheries occasionally occur in the EEZ, such as the pink shrimp fishery. This situation occurs when a specific fishery is not regulated by the NMFS, is regulated by the state, and the targeted species overlaps with the EEZ.

There is no documented harm to short-tailed albatross due to state fisheries. As with the Pacific Coast Groundfish Fisheries, USFWS looked towards information from the NMFS Observer Program and information on harm to black-footed albatross in the action area as a proxy for short-tailed albatross. The NMFS Observer Program report included data for the following state fisheries sectors, 2002-2009 (Jannot et al. 2011, pages 43-45):

- Commercial state-permitted shrimp trawl;
- Commercial limited access non-midwater trawl-targeting California halibut;
- Commercial open access non-midwater trawl-targeting California halibut; and,
- Commercial fixed gear state-permitted nearshore (Oregon/California).

Unobserved fisheries include tribal (non-hake), state fisheries not listed above, non-regulated fisheries, recreational, and research. The harm of black-footed albatross has been zero in the eight years of observer data collected on state fisheries. The analysis of a risk assessment using the black-footed albatross for a surrogate for the short-tailed albatross is not possible as zero multiplied by any number is zero. If we scaled down the analysis of the EEZ (3-200 nautical miles off shore) to the state waters (0-3 nautical miles), the level of expected harm would be 1.5 percent of the harm expected in Federal waters, based on area only. Based on expected harm of about one short-tailed albatross killed per year from the proposed action in Federal waters, 1.5 percent equates to an estimated mortality of 0.015 short-tailed albatross a year or about one short-tailed albatross every 66 years.

The short-tailed albatross is a continental shelf edge specialist. They can be relatively common nearshore, but only where upwelling hotspots occur (Piatt et al. 2006, page 7). From observer data on the West Coast, the short-tailed albatross seems highly associated with the breaking of the continental shelf north from the Monterey Bay area of California (Figure 1). Within the action area, the continental shelf break occurs minimally in state waters (0-3 miles off shore). Therefore, we have determined that due to the short-tailed albatross preferring the area of the continental shelf break where the majority of state fishing is occurring there is a potential for harm; however, it is extremely small.

A potential for oil spills exists in the action area which could affect short-tailed albatross. Vessels that have sunk or been damaged in the action area may periodically release oil from fuel tanks. Historically, oil spills have occurred along the West Coast of North America from a variety of sources, including shipwrecks and oil well blowouts. To date, no known deaths of short-tailed albatross can be directly attributable to oil contamination, although a significant threat exists.

Discarded plastic cigarette lighters and light sticks that drift away from longline gear, among other plastic debris, float in the water column and are consumed by seabirds while they are foraging. The ingestion of plastic may compromise seabirds and result in dehydration and starvation, intestinal blockage, internal injury, or exposure to dangerous toxins (Sievert and Sileo 1993, page 214). Both Laysan and black-footed albatross that occur within Hawaiian waters have been documented to be impacted by plastic debris.

Derelict gear will continue to accumulate in the action area, as long as fisheries continue to lose fishing gear. As cumulative effects include all other fishing, some gear types are expected to float and pose a threat to short-tailed albatross. Although in the high energy environment that the short-tailed albatross uses in the open ocean, the time derelict gear remains suspended may be shorter than in protected environments such as the Puget Sound in Washington (NRC 2007, page 15). No known harm to short-tailed albatross has occurred due to derelict gear.

Climate change is not expected to reduce the biodiversity in the West Coast EEZ (Hazen et al. 2012, page 11). Therefore, climate change is not expected to directly impact prey availability for short-tailed albatross. There may be indirect effects from climate change due to more top predators moving into the action area to take advantage of this stable area of biodiversity.

Increase in top predators may lead to greater competition for prey and/or may result in more predation from sharks. Sharks may scavenge albatross that have been already injured or killed within the action area, but the actual effect of this activity on short-tailed albatross cannot be quantified at this time. The potential impact to short-tailed albatross from greater competition for prey also cannot be quantified at this time. Therefore, USFWS is unable to predict the extent that climate change will have on short-tailed albatross within the action area.

As the potential harm to short-tailed albatross from state fisheries and other threats in the action area are extremely small, USFWS does not believe that cumulative impacts change the expected population growth rates from those discussed above.

4.4 SUMMARY OF THE ENVIRONMENTAL CONSEQUENCES OF THE ALTERNATIVES

This section summarizes the preceding analyses of environmental consequences.

Short-tailed Albatross and Other Seabirds

Alternative 1 is having a positive effect on short-tailed albatross and other seabirds by reducing fisheries-related mortality through the non-regulatory measures described in Chapter 1. Alternatives 2-4 would ensure through regulation that larger boats deploy seabird avoidance measures and are therefore, expected to have a more positive effect – the extent of which is not calculable with available information. However, alternatives 2-4 are all consistent with the USFWS B.O. and would be expected to keep short-tailed albatross mortality within allowable incidental take levels (USFWS 2012) whereas alternative 1 is not (see Table 3).

Socioeconomics

The primary socioeconomic issue associated with the proposed action is the cost of seabird avoidance gear which is currently subsidized by NMFS. Short-term costs are therefore neutral. NMFS cannot guarantee the subsidy will continue, so in the long-term, vessels may have to procure their own gear at an estimated maximum cost of \$300/year that would apply equally to Alternatives 2-4 (see Table 3).

Safety-at-Sea

The deployment of seabird avoidance gear during fishing operations presents a mild safety hazard that increases in rough weather. Alternative 1 is the least hazardous because gear is only deployed voluntarily. The risk goes up for Alternatives 2-4 with alternative 3 being the most hazardous because it lacks a rough-weather exemption. At this time, an appropriate rough-weather exemption for the West Coast is being developed in cooperation with the affected industry; therefore, it is not yet clear what the difference is between alternatives 2 and 4 (see Table 3).

Enforcement

Based on the experience of NMFS Enforcement in Alaska, Alternatives 2-4 do not present a unique enforcement challenge and are considered highly enforceable. Alternative 4, however, removes provisions identified by West Coast groundfish managers as subjective and is therefore considered the “most” enforceable. See Table 3.

Table 11: Summary of the Environmental Consequences of the Alternatives.

	Alt. 1	Alt. 2	Alt. 3	Alt. 4
Short-tailed Albatross & Other Seabirds	+	++	++	++
Short-term Socio-economic	neutral	neutral	neutral	neutral
Long-term Socio-economic	neutral	0-\$300/year	0-\$300/year	0-\$300/year
Safety-at-Sea	Least hazardous	?	Most hazardous	?
Enforcement	N/A	Highly Enforceable	Highly Enforceable	Most Enforceable

Therefore, when this proposed action is considered in conjunction with all the other pressures placed on fisheries by past, present, and reasonably foreseeable future actions, it is not expected to result in any significant impacts, positive or negative. Based on the information and analyses presented in past FMP documents and this document, there are no significant cumulative effects associated with the action proposed.

● APPENDIX A –DRAFT REGULATION

NMFS proposes to amend 50 CFR part 660 as follows:

PART 660 – FISHERIES OFF WEST COAST STATES AND IN THE WESTERN PACIFIC

1. The authority citation for part 660 continues to read as follows:

Authority: 16 U.S.C. 1801 *et seq.* and 16 U.S.C. 773 *et seq.*

2. In § 660.11, add the definition for “seabird” in alphabetical order and add new paragraph (6)(v) to the definition of “fishing gear” to read as follows:

§ 660.11 General definitions

* * * * *

Seabird means those bird species that habitually obtain their food from the sea below the low water mark.

* * * * *

Fishing gear * * *

(6) * * *

(i)(A) Snap gear means a type of bottom longline gear where the hook and gangion are attached to the groundline using a mechanical fastener or snap.

* * * * *

3. In §660.12, paragraph (a)(15) is added to read as follows:

§ 660.12 General groundfish prohibitions.

In addition to the general prohibitions specified in § 600.725 of this chapter, it is unlawful for any person to:

(a) * * *

(15) Fail to comply with the requirements of the Seabird Avoidance Program described in §660.61 when commercial fishing for groundfish using bottom longline gear.

4. § 660.61 is added to read as follows:

§ 660.61 Seabird Avoidance Program

This section contains the requirements of the Seabird Avoidance Program.

- a. Purpose. The purpose of the Seabird Avoidance Program is to minimize interactions between fishing gear and seabird species, including short-tailed albatross (*Phoebastria albatrus*).
- b. Applicability. The requirements specified in paragraph (c) of this section apply to the following fishing vessels:
 1. Vessels greater than or equal to 55 ft (16.8 m) LOA engaged in commercial fishing for groundfish with bottom longline gear pursuant to the gear switching provisions of the Limited Entry Trawl Fishery, Shoreside IFQ Program as specified in §660.140(k) or pursuant to Subparts E or F of this Part, except as provided in paragraph (b)(2) of this section.
 2. Exemptions: The requirements specified in paragraph (c) of this section do not apply to Pacific Coast treaty Indian fisheries, as described at §660.50, or to anglers engaged in recreational fishing for groundfish, as described in Subpart G of this Part.
- c. Seabird Avoidance Requirements
 1. General Requirements: The operator of a vessel described in 660.61(b)(1), must:
 - i. Gear onboard. Have onboard the vessel seabird avoidance gear as specified in paragraph (c)(2) of this section;
 - ii. Gear inspection. Upon request by an authorized officer or observer, make the seabird avoidance gear available for inspection;
 - iii. Gear use. Use seabird avoidance gear as specified in paragraph (c)(2) of this section that meets the standards specified in paragraph (c)(3) of this section while hook-and-line gear is being deployed.
 - iv. Sink baited hooks. Ensure that baited hooks sink as soon as they are put in the water.
 - v. Offal discharge. **(NOTE: The Sink baited hooks provision and the Offal discharge provision are both removed for alternative 4)**
 - A. If offal is discharged while gear is being set or hauled, discharge offal in a manner that distracts seabirds from baited hooks, to the extent practicable. The discharge site must be either aft of the hauling station or on the opposite side of the vessel from the hauling station.
 - B. Remove hooks from any offal prior to discharging the offal.
 - C. Eliminate directed discharge through chutes or pipes of residual bait or offal from the stern of the vessel while setting

gear. This does not include baits falling off the hook or offal discharges from other locations that parallel the gear and subsequently drift into the wake zone well aft of the vessel.

- D. For vessels not deploying gear from the stern, eliminate directed discharge of residual bait or offal over sinking hook-and-line gear while gear is being deployed.

vi. Handling of hooked short-tailed albatross.

- A. Safe release of live short-tailed albatross. . Make every reasonable effort to ensure short-tailed albatross brought on board alive are released alive and that, wherever possible, hooks are removed without jeopardizing the life of the bird(s). If the vessel operator determines, based on personal judgment, that an injured bird is likely to die upon release, the vessel operator is encouraged to seek veterinary care in port. Final disposition of an injured bird will be with a Wildlife Rehabilitator. If needed, phone the U.S. Fish and Wildlife Service at 503-231-6179 to assist in locating a qualified Wildlife Rehabilitator to care for the short-tailed albatross.
- B. Dead short-tailed albatross must be kept as cold as practicable while the vessel is at sea and frozen as soon as practicable upon return to port. Carcasses must be labeled with the name of vessel, location of hooking in latitude and longitude, and the number and color of any leg band if present on the bird. Leg bands must be left attached to the bird. Phone the U.S. Fish and Wildlife Service at 503-231-6179 to arrange for the disposition of dead short-tailed albatross.
- C. All hooked short-tailed albatross must be reported to U.S. Fish and Wildlife Service Law Enforcement by the vessel operator by phoning 360-753-7764 (WA) 503-682-6131 (OR) or 916-414-6660 (CA). as soon as practicable upon the vessel's returning to port.
- D. If a NMFS-certified fisheries observer is on board at the time of a hooking event, the observer shall be responsible for the disposition of dead, injured, or sick short-tailed albatross and reporting requirements to U.S. Fish and Wildlife Service Law Enforcement . Otherwise, the vessel operator shall be responsible.

2. Gear Requirements. The operator of a vessel identified in paragraph (b)(1) of this section must comply with the following gear requirements:

- i. Snap gear. Vessels using snap gear as defined at §660.11 must deploy a minimum of a single streamer line in accordance with the requirements of paragraphs (c)(3)(i)-(ii) of this section, except as provided in paragraph (c)(2)(iii)(A) of this section.
 - ii. Other than snap gear. Vessels not using snap gear must deploy a minimum of one pair of streamer lines in accordance with the requirements of paragraphs (c)(3)(i) and (c)(3)(iii) of this section, except as provided in paragraph (c)(2)(iii)(B) of this section.
 - iii. Weather Safety Exception (**NOTE: This Weather Safety Exception applies to Alternative 2 and is removed for Alternative 3. Alternative 4 maintains the Weather Safety Exception but leaves the technical threshold To Be Determined through the Proposed Rule process**).
- A. The use of streamer lines is discretionary for vessels using snap gear when wind speeds exceed 45 knots (storm or Beaufort 9 conditions).
 - B. When wind speeds exceed 30 knots (near gale or Beaufort 7 conditions) but are less than or equal to 45 knots, vessels not using snap gear must deploy from the windward side of the vessel a single streamer line meeting the standards of paragraphs (c)(3)(i) and (c)(3)(iii)(A)-(C) of this section. The use of streamer lines by such vessels is discretionary when wind speeds exceed 45 knots.

3. Gear performance and material standards:

- i. Material standards for all streamer lines. All streamer lines must:
 - A. Have streamers spaced a maximum of every 16 ft 5 in (5 m);
 - B. Have individual streamers that hang attached to the mainline to 10 in (0.25 m) above the waterline in the absence of wind.
 - C. Have streamers constructed of material that is brightly colored, UV-protected plastic tubing or 3/8 inch polyester line or material of an equivalent density.
- ii. Snap gear streamer standards. For vessels using snap gear, a streamer line must:
 - A. Be a minimum length of 147 ft 7 in (45 m).
 - B. Be deployed so that streamers are in the air a minimum of 65 ft 7 in (20 m) aft of the stern and within 6 ft 7 in (2 m) horizontally of the point where the main groundline enters the water before the first hook is set.
- iii. Standards for gear other than snap gear. Vessels not using snap gear must use paired streamer lines meeting the following requirements:

- A. Streamer lines must be a minimum length of 300 feet (91.4 m);
- B. Streamer lines must be deployed so that streamers are in the air a minimum of 131 ft (40m) aft of the stern for vessels under 100 ft (30.5 m) LOA and 197 ft (60m) aft of the stern for vessels 100 ft (30.5 m) or over.
- C. At least one streamer line must be deployed in accordance with paragraph (c)(3)(iii)(B) before the first hook is set and a second streamer line must be deployed within 90 seconds thereafter.
- D. For vessels deploying hook-and-line gear from the stern, the streamer lines must be deployed from the stern, one on each side of the main groundline.
- E. For vessels deploying hook-and-line gear from the side, the streamer lines must be deployed from the stern, one over the main groundline and the other on one side of the main groundline.

5. In § 660.140, paragraph (k)(1)(viii) is added to read as follows:

§ 660.140 Shoreside IFQ Program

* * * * *

(k) * * *

(1) * * *

(iv) The vessel must comply with prohibitions applicable to limited entry fixed gear fishery as specified at § 660.212, gear restrictions applicable to limited entry fixed gear as specified in §§ 660.219 and 660.230(b), and management measures specified in § 660.230(d), including restrictions on the fixed gear allowed onboard, its usage, and applicable fixed gear groundfish conservation area restrictions, except that the vessel will not be subject to limited entry fixed gear trip limits when fishing in the Shorebased IFQ Program. Vessels using bottom longline gear as defined at §660.11 are subject to the requirements of the Seabird Avoidance Program described in §660.61.

6. In § 660.230, paragraph (b)(5) is added to read as follows:

§ 660.230 Fixed gear fishery-management measures.

* * * * *

(b) * * *

(5) Vessels fishing with bottom longline gear as defined at §660.11 are subject to the requirements of the Seabird Avoidance Program described in §660.61.

* * * * *

7. In § 660.330, paragraph (b)(2)(i) is revised to read as follows:

§ 660.330 Open access fishery-management measures.

* * * * *

(b) * * *

(2) * * *

(i) Fixed gear (longline, trap or pot, set net and stationary hook-and-line gear, including commercial vertical hook-and-line gear) must be attended at least once every 7 days. Vessels fishing with bottom longline gear as defined at §660.11 are subject to the requirements of the Seabird Avoidance Program described in §660.61.

* * * * *

● APPENDIX B – OUTREACH REPORT

Bringing albatross conservation to West Coast groundfish fisheries: progress on outreach efforts in the longline fleet.

Washington Sea Grant, University of Washington

24 August 2011

Introduction

The recent take of a short-tailed albatross in the West Coast Groundfish Fishery has focused attention on seabird conservation efforts. Alaska has a long history with seabird mitigation, and approaches pioneered in Alaska are currently being adapted to the West Coast. A brief history of bycatch mitigation research and a summary of conservation efforts occurring throughout the west coast are provided below.

Alaska Mitigation and Outreach

In 1999 and 2000, Washington Sea Grant (WSG) led a research program in collaboration with industry, National Marine Fisheries Service (NMFS), and the U.S. Fish and Wildlife Service (USFWS) testing a host of seabird bycatch mitigation measures in the Alaska longline fisheries. The streamer line, sometime referred to as tori line or bird scaring line, was shown to be the most effective mitigation measure trialed; it reduced the mortalities of surface foraging seabirds such as albatrosses by 100% when used in pairs bracketing the sinking longline and by 96% when used singly (Melvin et al. 2001). The streamer lines used in Alaska fisheries consist of a 90 m line that runs from a high point at the stern to device that creates drag at its terminus (Melvin 2000, Figure 5). As the vessel moves forward the drag acts to suspend a section of line in the air. Brightly colored streamers hang from the aerial extent and scare birds from sinking baits.

Based on the results of WSG's research, streamer lines with performance and material standards were adopted almost immediately by the Alaska industry two years prior to seabird avoidance regulation changes. Through 2006 (the most current summary of observer data available) seabird bycatch rates in the Alaska longline fisheries were reduced by 78% from pre-research levels (9,000 to 26,000 birds/year; Fitzgerald et al. 2008, Figure 1). With funding from the USFWS and NMFS, streamer lines designed by WSG and built and distributed through the Pacific States Marine Fisheries Commissions, have been made available to the Alaska longline fleet since 1999. After 12 years with no short-tailed albatross takes in the Alaska longline fisheries, two were taken in the Bering Sea in 2010. During this time period the short-tailed albatross population doubled. Incidental take statement limits specified in the ESA Biological Opinion have not been exceeded to date for either the Alaskan groundfish or Pacific halibut longline fisheries (USFWS 2003).

Figure 1. The seabird bycatch rate in the Alaska longline groundfish fishery. Seabird mortality rate has decreased by 78% and albatross mortality has been reduced by 88% since streamer lines were introduced in 1999 – 2000 (Based on Fitzgerald et al. 2008).

Further research in 2002 clarified appropriate streamer line configuration for smaller vessels and for vessels using snap-on gear (Melvin and Wainstein, 2006). Data from seabird surveys designed by WSG and carried out by NMFS and the International Halibut Commission from 2004 to 2006 showed that seabird bycatch mitigation was unnecessary in Alaskan inside waters of Southeast Alaska, Prince William Sound and Cook Inlet (Melvin et al 2006). Alaska seabird bycatch regulations were changed again in 2008 to reflect these new findings.

WSG led research continued in 2005 developing and testing integrated weight longlines as a means to further reduce seabird mortality for the Bering Sea cod freezer-longline vessels (Dietrich et al. 2009). Additional studies developed and tested methods to prevent seabird strikes and related mortality with trawl cables on pollock catcher processors in the Bering Sea (Melvin et al. 2011).

West Coast Outreach

In 2008, West Coast Groundfish Observer Program (WCGOP) data showed black-footed albatross were incidentally killed in the West Coast groundfish fisheries (NWFSC 2008). At this time, use of seabird bycatch mitigation in the fishery was rare and awareness of seabird bycatch issues among industry stakeholders was low. Growing conservation concern for black-footed albatross, and a recent increase in sightings of the ESA listed short-tailed albatross, highlighted the need for a proactive course of action. In response, WSG published a press release and distributed informational pamphlets to stakeholders along the west coast from Neah Bay, WA to Morro Bay, CA to raise awareness of the need for albatross conservation and to inform fishermen of the success of streamer lines at reducing seabird bycatch in similar Alaskan fisheries. In August 2008, the Fishing Vessel Owner's Association (FVOA) in a letter to its membership recommended they voluntarily use streamer lines in accordance with Alaskan regulations when fishing in West Coast waters.

The WCGOP bycatch data and fishery/seabird overlap analysis (Guy et al. In Prep.) suggested that outreach efforts should focus on the fixed gear sablefish fishery. The west coast hook and line fleet consists of approximately 300 vessels. WCGOP observers began documenting the use and characteristics of seabird avoidance gear starting in 2009. In addition, the WCGOP compiled a photographic library of over 243 vessels coast wide. WSG analyzed these photographs and determined that 84% of West Coast longline vessels have the infrastructure (mast or poles) necessary for deploying streamer lines.

Streamer Line distribution

In a 2009-2011 pilot project, WSG facilitated the extension of free streamer line program in Alaska to the West Coast longline fleet. WSG conducted visits to major Washington and Oregon ports in partnership with Englund Marine and Industrial Supply to raise awareness and promote voluntary use of streamer lines. Streamer lines and best-practice information were delivered to volunteer fisherman in Neah Bay, La Push, Westport, Ilwaco, Astoria, Newport, Charleston, and Port Orford. Additionally, streamer lines were made available at the ports of Eureka, Crescent City and Fort Bragg via Englund Marine and Industrial Supply's network of stores and partners. As of July 2011, 221 Alaskan-style streamer lines have been distributed to federal and tribal longline vessels (Table 1).

Table 1. The number of streamer lines distributed to West Coast longline vessels. Some vessels use more than one streamer line so the total number of vessels equipped with streamer lines is unknown.

Year	Federal	Tribal	Grand Total
2009	52	115	167
2010	52		52
2011	2		2
Grand Total	106	115	221

The infrastructure to provide free streamer lines to the WC longline vessels is in place. Based on feedback from volunteers and experiences in other fisheries, WSG developed an Alaska-style streamer line that is designed to improve performance for the West Coast fleet. Design changes included using lighter materials to reduce weight and thus increase aerial extent, and substituting material and hardware to reduce streamers tangling.

Funding

Funding for this project was provided by the Northwest Science Center, the Northwest Region, Pacific States Marine Fisheries Commission and Washington Sea Grant.

● APPENDIX C – RESEARCH PROTOCOL

Reducing the Mortality of Albatrosses and Other Seabirds in the West Coast Longline Fishery for Sablefish

Washington Sea Grant and Oregon State University

Program Description

Washington Sea Grant and Oregon State University are leading a research program, funded by NOAA Fisheries, the Packard Foundation, and the National Fish and Wildlife Foundation and in collaboration with fishing industry, to develop practical and safe tools to reduce seabird bycatch in west coast longline fisheries. Industry partners currently include the Fishing Vessel Owners Association, Washington coastal tribes, and others. A specific objective is to develop streamer line designs and configurations that are best suited to the diversity of longline gear used in this fishery and to promote their voluntary use. Results will be used to develop recommendations on effective and practical seabird bycatch mitigation options for the sablefish longline fleet in collaboration with stakeholders for possible Council action.

Mitigation Treatments

We will evaluate the performance of two streamer lines treatments, one vs. two streamer lines, to a control of no streamer lines across the variety of longline gears used by the west coast sablefish fleet (snap-on, tubs, skate-bottom, auto-bait...etc.) in the course of production fishing. Host vessels will be partially compensated for participation to offset increased costs (insurance, food and possible bait loss) and to provide an incentive. Streamer line configuration – aerial extent, height of attachment, towed device, and number and type of streamers – will be manipulated as needed to match streamer lines to specific longline gears. To start streamer lines will be those designed by Washington Sea Grant and currently being made available to the West Coast fleet via PSMFC with funding from NOAA Fisheries (Figure 1). We will also explore increasing the sinking speed of longlines by manipulating line weights and/or floats as necessary.

Experimental Design

Longline sets will be made during daylight hours to allow researchers to monitor seabird behavior in response to the mitigation treatments (one vs. two vs. none streamer lines). To reduce bias due to environmental factors, treatments will be deployed in a random sequence within day and from day to day within a give fishing trip. The host captain, in consultation with researchers, will determine the number of hooks per set, and the number of sets per day. If a short-tailed albatross is observed interacting, or about to interact with longline gear, we will maximize protection of baited hooks by immediately deploying two streamer lines (if the vessel has the capacity) or terminate/relocate fishing operations.

Fishery researchers will collect data on seabird attacks on baited hooks and seabird numbers during each set. A primary “attack” is any unambiguous attempt by a bird to take bait off a hook – typically a dive or plunge directly over a sinking hook. A secondary attack is another bird or a group of birds attempting to steal a bait or baited hook at the surface from a bird that made a primary attack. The number of attacks will be recorded for the duration of each research set, or for a minimum of 15 minutes depending on the number of hooks deployed in a given set. Researchers will record the number of attacks occurring within 100 m of the stern in 10-m increments and lateral position relative to streamer lines (to port or starboard of a single streamer lines or within or to port or starboard of two streamer lines). Markers inserted into the streamer lines or a measuring line (with no streamer line controls), will serve as reference

points to judge distance. Immediately prior to and following each attack rate observation, researchers will record the number of seabirds (on the water and in the air) by species in a 100 m hemisphere centered at the midpoint of the stern. Data will also be collected on the performance of streamer lines (aerial extent and design variants), the physical environment (wind speed, wind direction, swell height, cloud cover) and vessel operations (speed in knots, bait type and quality, presence of weights or floats; etc.)

During each haul, researchers will record the catch of all seabirds (expected to be rare) and fishes to species or species group for a minimum of 50% of the haul. To the extent possible, we will track the catch of fish and birds relative to weights and floats along the groundline. Special attention will be paid to quantifying the number of fish damaged by hagfish depredation relative to the proximity of weights and floats. Researchers will also estimate the number of seabirds within 50 m of the hauling station by species and the presence or absence of discards associated with fish processing (heading and gutting).

Wildlife Computer MK9s time-depth-recorders will be used to determine the sink rate of longlines and to the extent possible the position of longlines on the sea floor. Sink rates will be used to estimate the distance astern that longline sink beyond the benchmark depth of 2 m, our assumed diving depth of North Pacific albatrosses. This sinking distance will be compared to attack rate by distance data for each streamer line treatment to inform streamer line design and configuration. Bottle lines, 750 ml plastic bottles attached to a 2-m length of gangion will also be used to demonstrate to crew where lines sink beyond 2 m.

As fishing locations and catch data are confidential, they will not be shared or graphically represented only in an aggregated form.

Analysis

Because seabird bycatch events are rare in west coast longline fisheries, we will evaluate mitigation strategies based on multiple metrics:

- Intensity and location of seabird attacks on baited hooks during the set;
- Catch rates of target and non-target species;
- Depredation damage to target species;
- Streamer line(s) configuration, performance, and alignment with fishing gear sink profiles;
- Compatibility with safe and efficient fishing operations as evaluated by the captain and crew.

Data on gear sink rates, bird attack rates as a function of distance astern, bird abundance and bird catch rates (to the extent it is available) will be used to inform streamer line configurations necessary to protect birds for each gear type. Generalized linear modeling techniques will be used to evaluate seabird bycatch, fish catch rates (target and non-target), and attack rates as a function of mitigation treatments and other relevant environmental and operation factors. To the extent possible we will also evaluate the relationships among seabird abundance, attack rates and bycatch rates.

ENFORCEMENT CONSULTANTS REPORT ON SEAVIRD AVOIDANCE REGULATIONS

The Enforcement Consultants (EC) has reviewed the documents associated with Agenda Item H.1.b and also received a summary report from Mr. Steve Copps.

The EC endorses Alternative 4. This alternative adopts the “Alaska style” seabird avoidance regulations for vessels 55 feet in length or greater, minus the provisions related to the sinking of baited hooks and offal discharge. These provisions are very subjective and difficult to enforce. Mr. Copps advised the EC that industry education and outreach could be effectively utilized to assist with seabird avoidance related to these two items. The EC recommends that the threshold for a rough weather exemption be determined by the issuance of a National Oceanic and Atmospheric Administration National Weather Service forecast of a gale warning or higher for the maritime location currently being fished. The EC believes that this sets a standard for the rough weather exemption that is easier to enforce, as opposed to a specific wind speed threshold. All vessels have communications equipment that can easily obtain a weather forecast.

GROUND FISH ADVISORY SUBPANEL REPORT ON
SEABIRD AVOIDANCE REGULATIONS

The Groundfish Advisory Subpanel (GAP) recommends National Marine Fisheries Service (NMFS) Alternative number 4 for adoption to minimize the take of short tailed albatross. This option incorporates Alternative 2 minus provisions to sink baited hooks quickly and control offal discharge. The exact threshold for a rough water exemption would be determined through the rulemaking process. The GAP recommends a rough water exemption when the weather reaches a 35 knot wind force which is considered a gale force wind. The exemption in Alaska is at 45 knots which is a storm force wind. Alternative 4, makes a distinction between snap-on gear and traditional longline gear, in that all vessels over 55 feet and using traditional longline gear would use two tory lines while a snap on vessel of 55 feet or longer would use a single tory line.

The safety concerns of the fleet when deploying tory lines occurs when there are strong winds which cause the tory lines to foul with the out-going ground line. The tory lines can break and snap back at the crew setting gear. The crew, when setting the tory lines, often deploys the lines from on top of the bait house and in rough seas this can become a safety concern. Another reason for a 35 knot exemption as opposed to the 45 knot exemption in Alaska is that the vessels that fish off Washington, Oregon and California tend to be of a smaller size class than those in Alaska.

The operators do not generally want to fish in weather with winds greater than 35 knots. However, a trip for sablefish can last up to seven days. The weather when leaving port may be fine but there can be days during the fishing trip when the weather exceeds 35 knots. Once a vessel has taken fuel and provisions it may fish through these blows and that is when an exemption may be needed.

GROUND FISH MANAGEMENT TEAM REPORT ON SEABIRD AVOIDANCE REGULATIONS

The Groundfish Management Team (GMT) reviewed the preliminary draft Environmental Assessment (EA) on measures to minimize take of short-tailed albatross in the Pacific coast groundfish fisheries (Agenda Item H.1.b, Preliminary Draft EA) and offers the following comments for Council consideration.

Comments Relating to Council Action to Adopt Regulations

Weather Safety Exception - Alternative 2 contains a weather safety exception whereby streamer line requirements are modified (e.g., single streamer line) or are not required in winds greater than 45 knots (Beaufort 9). Alternative 4 contains a weather safety exception whereby streamer line requirements are modified (e.g., single streamer line) or are not required but is requesting public input on the most appropriate metrics and threshold.

In June the Council requested that the National Marine Fisheries Service (NMFS) add an alternative that removed the weather safety exception to streamer line requirements; the new alternative (Alternative 3) would require streamer lines to be used when fishing longline gear, regardless of weather conditions.

The GMT notes that National Standard Guideline 10 tells us, to the extent practicable, to promote safety of human life at-sea. It is the GMT's understanding that the rationale for a rough-weather exception is that deployment of streamer lines creates additional potential for safety hazards compared to fishing without streamer lines, and that the level of risk increases in rougher weather. However, it is unclear whether vessels would even be fishing in weather conditions in which the exception would apply. If the fleet does not fish in those conditions anyhow, a rough weather exception would not improve safety, and might be unnecessary. The GMT is looking to industry representatives to comment on whether it is a possibility that requiring streamer lines in all conditions might actually discourage fishing in rough weather and therefore increase safety at sea. The GMT also notes inclusion of a weather safety exception may be risk-neutral to short-tail albatross given the seasonal patterns of albatross migration paired with seasonal weather patterns. The EA could give more detailed analysis on this issue by considering the seasonality of the albatross' presence in our area and the wind patterns during those times. We would expect gale and storm force winds to be infrequent during the spring and summer months when the albatross are most likely to be feeding off the west coast.

It is unclear exactly what data source would be used to enforce a weather safety exception. One example could be to use the forecasts from the NOAA Weather Service, which are available to mariners as well as enforcement.

Process for Alternative 4 - The GMT acknowledges the desire for additional public input under Alternative 4 for setting the criteria for the weather safety exception. To have the regulations effective by April 1, 2014, the start of the limited entry fixed gear primary sablefish fishery, NMFS will likely finish drafting the final rule in February for publication in the Federal Register by March 1, 2014. There would not be a Council meeting between the proposed rule and the

final rule stage, so the Council would not have an opportunity to formally consider and comment on the final regulations. The Council could consider providing guidance to NMFS, Council staff, or both, regarding review of the regulations prior to their publication in the final rule.

The GMT is looking to industry and enforcement to provide feedback on appropriate thresholds and to provide additional information on the metrics (e.g. wind speed, gale warnings, small craft advisories, etc.) that are readily and reliably available, if a weather safety exemption is included in the Council's final preferred alternative.

Comments on the Draft Environmental Assessment

Section 3.3 Protected Species (other than seabirds) - On page 22 under the section "Green Sturgeon", the EA states that "[t]he majority of green sturgeons encountered by the west coast groundfish fishery are believed to be from the southern DPS (Al-Humaidhi et al. 2011)." The GMT would like to note that another interpretation could be drawn from the data referred to in this study. For example, the direct evidence supporting this statement was mostly collected from the California halibut trawl fishery, and not the groundfish trawl fishery. The GMT would like to work with NMFS on this and other minor clarifications and comments prior to publication of the Draft EA.

For quick reference, the draft regulations in Appendix A state:

iii. Weather Safety Exception (NOTE: This Weather Safety Exception applies to Alternative 2 and is removed for Alternative 3. Alternative 4 maintains the Weather Safety Exception but leaves the technical threshold To Be Determined through the Proposed Rule process).

A. The use of streamer lines is discretionary for vessels using snap gear when wind speeds exceed 45 knots (storm or Beaufort 9 conditions).

B. When wind speeds exceed 30 knots (near gale or Beaufort 7 conditions) but are less than or equal to 45 knots, vessels not using snap gear must deploy from the windward side of the vessel a single streamer line meeting the standards of paragraphs (c)(3)(i) and (c)(3)(iii)(A)-(C) of this section. The use of streamer lines by such vessels is discretionary when wind speeds exceed 45 knots.

EXEMPTED FISHING PERMITS

Exempted fishing permits (EFPs) provide a process for testing innovative fishing gears and strategies to substantiate methods for prosecuting sustainable and risk-averse fishing opportunities.

Two EFP applications were submitted for Council consideration at this meeting. Both of these EFPs were approved for 2013-2014 and are proposed again for the next management cycle. The first EFP, sponsored by Steve and Kathy Fosmark, seeks to test the effectiveness of trolled longline gear to selectively harvest chilipepper rockfish in waters off central California. A progress report on 2013 efforts under this EFP is provided in Attachment 1. The EFP application for 2015-2016 is provided in Attachment 2. The second EFP, sponsored by the San Francisco Fishermen's Cooperative and Mr. Dan Platt, seeks to test the effectiveness of vertical hook-and-line gear to selectively harvest midwater species such as yellowtail rockfish. A progress report on 2013 efforts under this EFP is provided in Attachment 3. The EFP application for 2015-2016 is provided in Attachment 4. Finally, a progress report on the third EFP approved for 2013-2014, "Supporting a Spatial Analysis of the Distribution and Size of Rebuilding Stocks in the Rockfish Conservation Areas Through Directed Fishing Surveys", is provided in Attachment 5. The sponsors of this EFP are not requesting consideration for a new EFP in 2015-2016.

The Council should review these EFP applications, consider public and advisory body comments, and consider moving the 2015-2016 EFP applications forward for public review. Any recommended modifications to EFP applications will be communicated to the EFP sponsors and the public. The Council is scheduled to decide their final recommendations for 2015-2016 EFPs at the June 2014 meeting in Garden Grove, California.

Council Action:

- 1. Consider EFP applications for 2015-2016 and provide preliminary recommendations for public review.**
- 2. Adopt yield set-asides to accommodate those EFPs recommended for public review.**

California Longline Chilipepper EFP
Kathy and Steve Fosmark - EFP Holder
3059 Sherman Road, Pebble Beach, CA 93953

October 9, 2013

Ms. Dorothy Lowman, Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, OR 97220-1384

Re: Progress report on EFP Epibenthic Trolled Longline Gear to Selectively Catch Chilipper
Rockfish off the Coast of Central California

Chair Lowman, and Council Members:

I am not able to provide data at this time. I would like to report where we are with the EFP. The participants will fish the EFP in winter and spring of 2014. The issue date of the permit came in June 2013. We hoped for a spring fishery. Because of the nature of this gear and obligations relating to dedicated fisheries, these vessels must fish in early spring. Traditionally, in this area hook and line groundfish fisheries take place during winter and spring and consequently this would apply to the EFP designated area. These vessels also fish salmon and albacore in late spring, summer and fall. The equipment for the EFP has been fully updated and is prepared to go. When data becomes available we will, submit information and provide a complete report. Please accept my sincere apology for not reporting data at this time. Thank you.

Kind regards,

Kathy Fosmark

Evaluation of an epibenthic trolled longline to selectively catch chilipepper rockfish (*Sebastes goodei*) off California

Date of Application: October 08, 2013

Purpose and Goals

Chilipepper rockfish stocks on the west coast are considered healthy. However, because of weak stock management, harvest of these stocks is limited. In 2009, the total catch of chilipepper was estimated to be 311 mt of a 2,885 mt OY, or 11% of the total allowable catch. Area closures to protect overfished rockfish species have effectively closed access to this resource.

The goal of this project is to describe and evaluate the effectiveness of a species-selective longline technique, which if proven effective, will allow commercial fishermen access to chilipepper rockfish, a relatively abundant species of rockfish, while avoiding the weaker stocks. This fishery is constrained by the current rockfish area closures (Rockfish Conservation Areas, RCA), implemented to protect overfished rockfish species. Despite the depressed condition of some west coast groundfish stocks, there are other stocks that remain healthy. These healthier stocks could safely sustain increased harvest levels if they could be fished more cleanly and without bycatch of more depleted stocks. If stronger stocks could be targeted without increasing fishing mortality on depressed stocks, the California commercial fishing fleet would have additional fishing opportunities that would provide some economic relief to the industry while providing the public with a highly desirable product.

The research goal for the EFP is to establish the performance characteristics of the gear and to rigorously document the catch and bycatch when deployed in areas where chilipepper are abundant and bycatch species are not, under commercial fishing conditions. Specific objectives of the experiment are:

- 1) to test the trolled gear and fishing strategy with vertical lines and artificial flies, and
- 2) determine Groundfish Fishing Areas that are abundant with chilipepper rockfish, and that correspond to low densities of overfished species.

This latter objective may better help to answer the question of how EFP results can potentially be translated into future fleet-wide fishing opportunities.

Disposition of Catch

Target species (chilipepper) and legal incidental catch, such as widow rockfish, will be retained for sale. Fish not authorized for sale would be released alive if possible. If desired, incidental catch of certain species (e.g., canary and yelloweye) that cannot be released alive could be retained by the observer and provided to NMFS, CDFG, or other researchers.

Justification and Broader Significance

This EFP seeks to explore development of new, cleaner fishing opportunities in fulfillment of and compliance with the Magnuson-Stevens Act (MSA) mandates and goals (e.g., National Standards 1, 8, and 9). If more selective fishing methods can be developed, it is hoped that there will be additional opportunity in the groundfish fishery, which has been greatly constrained since rockfish conservation areas (RCAs) and lowered quotas were implemented to rebuild overfished species.

The long-term goal, if experiments prove successful, is to allow commercial fishing with this gear off the entire West Coast, including in the RCAs, by the Open Access and Limited Entry participants. This gear could also be used by fishermen to avoid species of concern and could create a fishery that would fill out the portfolios of those who make up the bulk of the fishermen in the West Coast's coastal communities. Thus, the benefits of this EFP would extend beyond the initial EFP participants.

Despite the generally depressed condition of many west coast groundfish stocks, there are some stocks that remain healthy. These healthier stocks could safely sustain increased harvest levels if they could be fished more cleanly and without bycatch of more depleted stocks. If stronger stocks could be targeted without increasing fishing mortality on depressed stocks, the West Coast commercial fishing fleet would have alternative fishing opportunities that would provide some economic relief to the industry while providing the public with highly desirable sustainably harvested local seafood.

Details

Total Duration of the EFP

This EFP proposal is for a total of 2 years (2015-2016).

Location of Fishing under the EFP

The EFP fishing would be conducted off **central California** between 38.0 degrees (Pt. Reyes) and 36.0 degrees (Point Lopez).

Within this area, fishing would occur at **depths of approximately 80-120 fm**. It is thought that there is a high-density of the target chilipepper rockfish in this range and that they tend to get smaller in size and schools are thinner in shallower depths. This range is currently within the non-trawl RCA established to protect overfished rockfish species. Vessels authorized under this EFP would be allowed to fish inside the current RCA using otherwise legal open access fixed gear.

Fishing effort will be concentrated in areas with canyon edges and walls, smooth hard bottom, with no rocks (example: canyon south of Año Nuevo). Areas to be selected for high-density target species will be between 38.0 degrees (Pt. Reyes) and 36 degrees (Point Lopez).

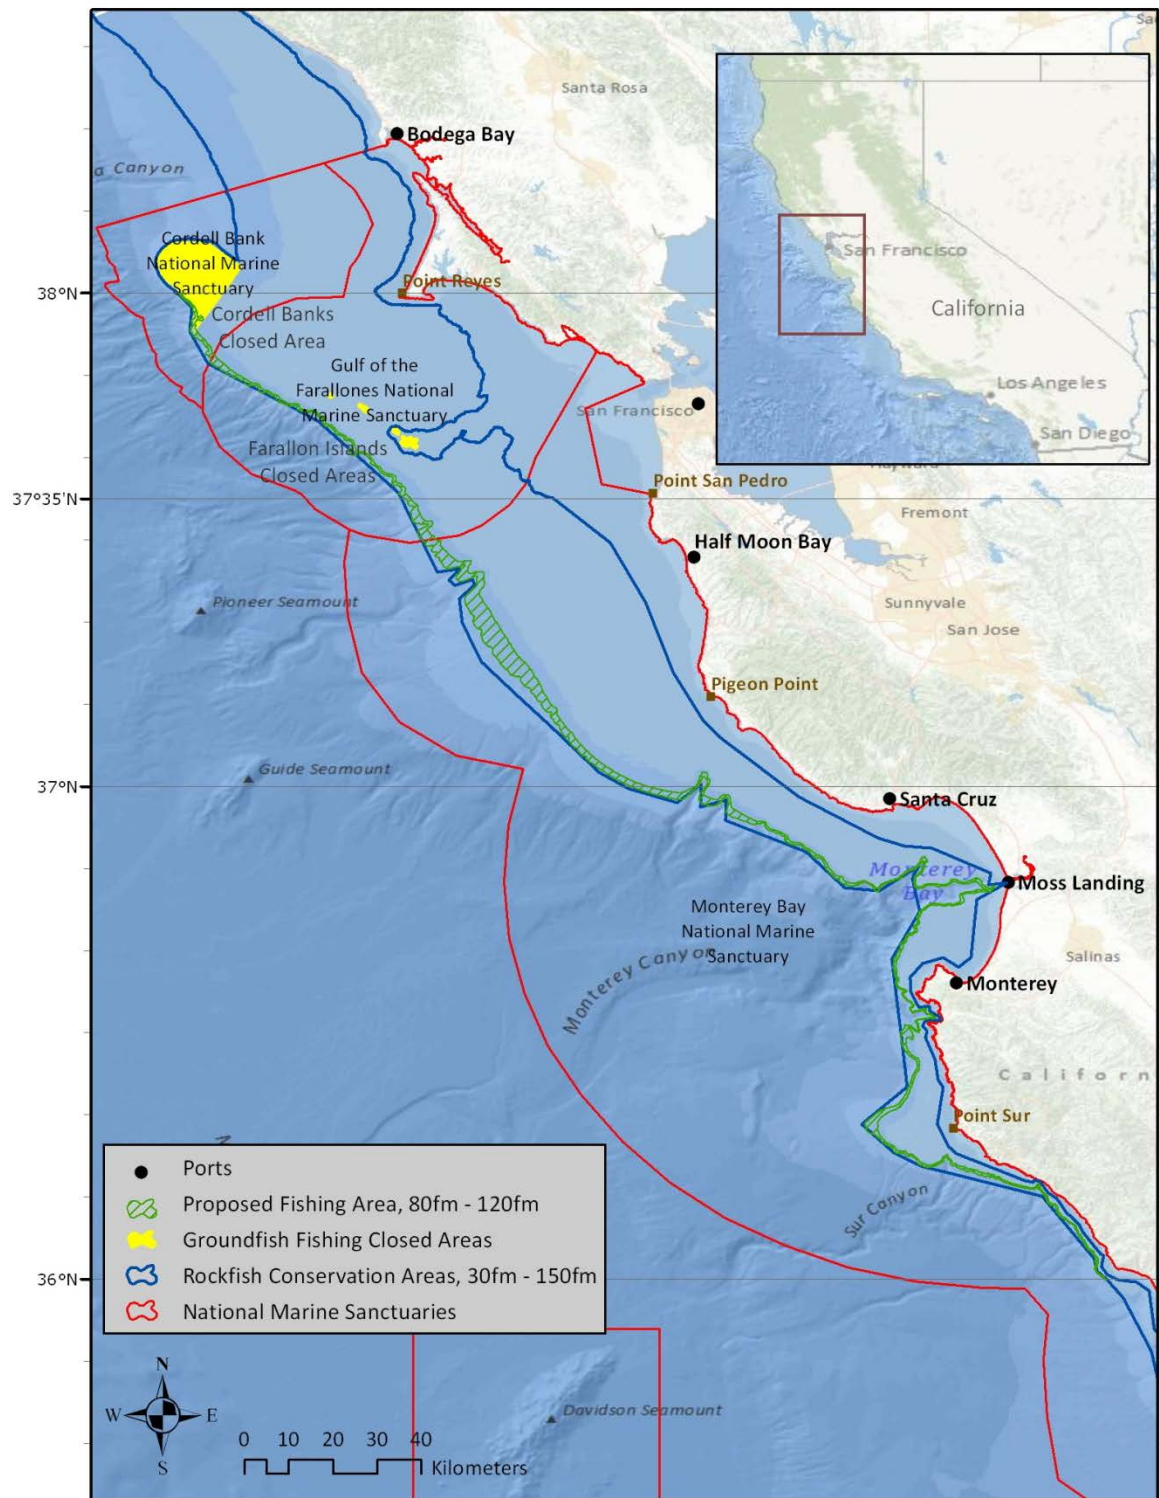

Figure 1: Map of the proposed EFP fishing area.

Description of the Gear to be Used

The gear is designed to selectively catch target chilipeppers in mid-water, when properly deployed, and will involve prospecting to avoid non-target species. A variety of gear is involved, including a hydraulic puller, conveyor belting or wide runner, fly-hooks, line, wire, snaps, small buoys (floats), one large buoy, and weights.

Figure 2. Gear description A

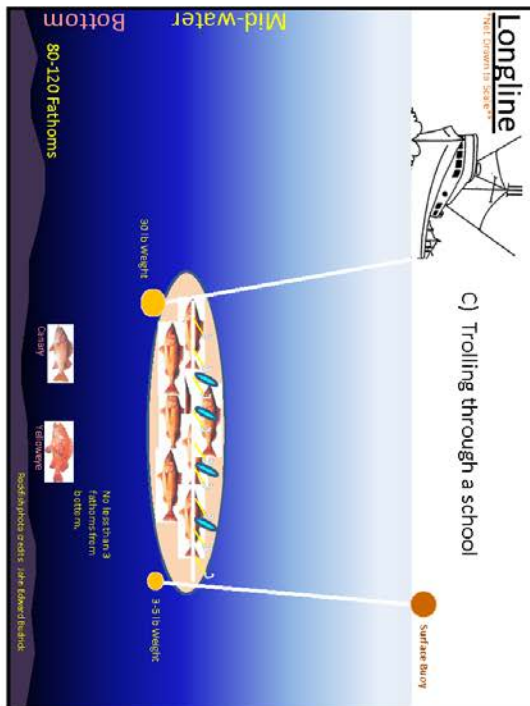

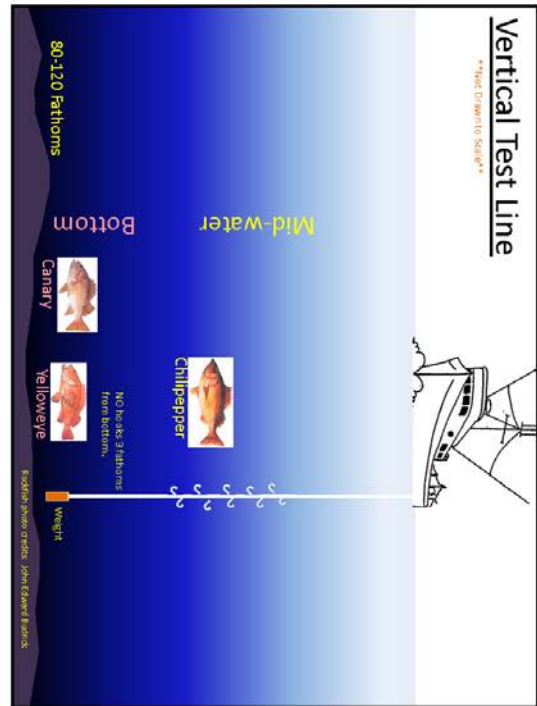

Figure 3. Gear description B

Specifications

Vertical Test Line

- No more than twenty (20) hooks (shrimp flies)
- No hooks closer than 3 fm of the weight
- Weight – 3-5 lbs

Longline

- 3 segments:
 - a drop line from a surface buoy
 - linked (skates) main line,
 - a drop line attached to a reel
- All lines maintained at least 3 fathoms from the bottom
- DROP LINE - FROM BOUY
 - Weight - 3 to 5 lb (mainline will connect at least 3 fathoms above this weight)
 - Surface buoy
- MAINLINE – Between two drop lines
 - 200-1000 lb. test monofilament (lower test for smaller vessels, stronger test for larger vessels)
 - Approximately 500 - 1,083 feet
 - 1000 hooks per set maximum (at least 500 hooks to fund 100 percent observer coverage)
 - shrimp flies (hooks) (no bait)
 - 12” monofilament gangions/leaders with swivel (approximately 60 lb test)
 - leaders spaced approximately 13” apart
 - 20 small floats, every 50 hooks (floats have short tethers and attach to the mainline w/ snaps)
- DROP LINE – FROM VESSEL
 - Weight - 30 lb

Deployment

Vertical Test Line

- Prior to setting the longline gear, a test set will be made with vertical line to ensure that the target species is present and minimize the chance of encountering any overfished rockfish.
- Mainline will connect at least 3 fathoms above weight
- Using acoustic soundings, no hooks will get within 3 fm of the bottom.
- The weight may hit the bottom initially, then immediately be pulled up a bit.

Longline

Once the test set establishes the presence of chilipepper rockfish, the longline will be deployed:

- The vessel moves slowly ahead as the longline is deployed (gear is attached to the vessel at all times).
- The mainline may be spooled to a drum. One end, with buoy and weight attached in such a way that the gear does not touch the bottom, is sent overboard as the boat moves slowly ahead, and the remaining gear is deployed.
- The weighted buoy line length is adjusted in such a way that does not have bottom contact to reduce the likelihood of bycatch and to prevent the hooks from hanging up on bottom.

- When the line reacts to bites, take the boat out of gear and fish will climb the line to the floats as they do with vertical gear on up and as line is pulled, line rises to the surface. Boat must be going ahead while pulling to keep the fish on. The terminal drop line remains at 85 fathoms.
- As the boat moves forward the drop line moves close to the end of the boat tight and fish continue to climb the line.
- As the line is towed in, fish stay in area of line where school is, (pull through spot of fish). As line is pulled on board it becomes vertical and can be alternatively stacked in basket gear.

Effort

Time to fish will be short each fishing day, taking place at daybreak and late evening. During the day chilipepper come off the bottom and once they are mid-water they are difficult to catch by this method. Therefore the morning and evening are the best times.

Number of vessels covered under the EFP

Three (3) vessels are proposed for participation. This is not a precaution to avoid overfished species as much as a limitation for when chilipeppers are present in mid-water.

Species to be Harvested (target and incidental)

Table 1 provides an overview of the species that may be caught under the EFP, their status, and estimated catch amounts.

Table 1. Overview of Target and Incidental Species Caught under the EFP

Species	Target or Incidental?	Overfished? Y/N	Depth Range	Estimated Amount of EFP Harvest
Chilipepper <i>Sebastes goodei</i>	Target	No	0-1080 ft (0-180 fms)	200
Widow Rockfish <i>Sebastes entomelas</i>	Incidental	Yes*	0-1050 ft (0-175 fms)	9
Bocaccio <i>Sebastes paucispinis</i>	Incidental	Yes	0-1050 ft (0-175 fms)	3
Canary Rockfish <i>Sebastes pinniger</i>	Incidental	Yes	0-900 ft (0-150 fms)	3
Yelloweye Rockfish <i>Sebastes ruberrimus</i>	Incidental	Yes	150-1200 ft (25-200 fms)	0.023
Cowcod <i>Sebastes levis</i>	Incidental	Yes	132-1620ft (22-270fms)	0.015
Darkblotched Rockfish <i>Sebastes crameri</i>	Incidental	Yes	240-1200ft (40-200fms)	0.1
Pacific Ocean Perch <i>Sebastes alutus</i>	Incidental	Yes	180-2100ft (30-350fms)	0
Petrale Sole	Incidental	yes		0

Lingcod S of 42° N lat.	Incidental	No		0.5
Sablefish N of 36° N lat.	Incidental	No		3
Splitnose	Incidental	No		1.5
Minor Slope S of 40°10' N lat.	Incidental	No		1
Minor Slope S of 40°10' N lat.	Incidental	No		1
Black Rockfish S of 46°16' N lat.	Incidental	No		1
Pacific Whiting	Incidental	No		1
Other Fish	Incidental	No		1

Catch of species other than those listed in Table 1 are expected to be uncommon, although some yellowtail and perhaps other rockfish may be encountered in small numbers.

a. Species Descriptions

Descriptions of the **species life histories** can be found in Appendix B2 of the Pacific Coast Groundfish Fishery Management Plan.

<http://www.nwr.noaa.gov/Groundfish-Halibut/Groundfish-Fishery-Management/NEPA-Documents/upload/FMP-Appendix-B2.pdf>

Updated information on **species abundance** can be found in Chapter 3 of the Proposed Harvest Specifications and Management Measures for the 2011-2012 Pacific Coast Groundfish Fishery and Amendment 16-5 to the Pacific Coast Groundfish Fishery Management Plan to Update Existing Rebuilding Plans and Adopt a Rebuilding Plan for Petrale Sole; Final Environmental Impact Statement.

http://www.nwr.noaa.gov/Groundfish-Halibut/Groundfish-Fishery-Management/NEPA-Documents/upload/1112GF_SpexFEIS_100806-FINAL_feb21_.pdf

b. Estimated Harvest Amounts

Harvest amounts will be determined by the GMT.

Catch Accounting and Compliance

Attaining any of the above aggregate catch limits will terminate the EFP for all vessels. It is requested that there not be a trip limit for target species.

This EFP will incorporate a standardized data collection and reporting format as determined by NMFS Southwest Fisheries Science Center, Santa Cruz Lab, and Northwest Fisheries Science Center (Observer Program).

Observers: Under this EFP there will be 100% observer coverage with the cost of observer coverage borne by the EFP participants. Fisheries Observers will record all fish caught and ensure that aggregate bycatch limits are not exceeded, as well as collect data on fishing gear, location, catch, and disposition of catch.

Precautionary Measures

Given the potential to catch overfished species and by fishing in the RCA, the utmost caution will be taken with this experiment. The following measures are proposed and applicants are open to working with the PFMC, NMFS, and CDFG to implement others deemed necessary.

1. **Observers** – 100% observer coverage (a standard measure for EFPs, but worth noting here).
2. **Caps** – Based on input from the PFMC and NMFS, each boat will have either a *daily* or *trip* limit/cap of canary and yelloweye. If this cap is reached, based on catch accounting reports verified by the observer, fishing will cease for that day or trip.
3. **Trip reports and catch accounting** – On a timeline agreeable to NMFS and CDFG, trip and cumulative catch reports will be provided after each trip (e.g., within 48 hours).
4. **VMS and Vessel Marking** – Before each trip a vessel will call the West Coast Groundfish Declaration Line to report the trip. (This procedure should work for both the EFP and for future use of this gear type. Vessels participating in this EFP will also display a banner with” EFP Fishing” written in 2 foot high letters.

Data Collection and Analysis Methodology

Data Collection

The following data will be collected by observer for all fishing under this EFP:

Gear Configuration

- Number of hooks
- Number of floats
- Weight sizes
- spacing of hooks
- number of hooks between floats
- length of drop line

Set and Haul Data:

- Position (GPS coordinates)
- Depth
- Time

Catch of each set of gear

- Species
- Total weight
- Species distribution
- Disposition (landings and discards)

If desired, incidental catch of certain species (e.g., canary and yelloweye) that cannot be released alive could be retained by the observer and provided to NMFS, CDFG, or other researchers for biological sampling.

Data Analysis

The applicant and the scientist (NMFS Santa Cruz Lab) will be responsible for data analysis. Data analysis will consist of statistical analysis of catch and bycatch of all species by set, trip, and month. Catch rates will be expressed as catch per hook, per set, per day, and per trip. Value of the catch will be recorded following sale. The final report will provide an estimate of fishing effort and total catch; absolute and relative species composition summarized by set, trip, and month; size composition of catch and bycatch; and sex ratio (if possible) and stage of maturity for chilipepper.

Participation

Choosing Participants

Vessels to participate in this EFP fishery will be chosen based on their ability to accommodate and pay for an observer, their willingness to maintain detailed catch data, and their willingness to participate during months when fish are available to this fishery.

Planned EFP Fishing by Participants

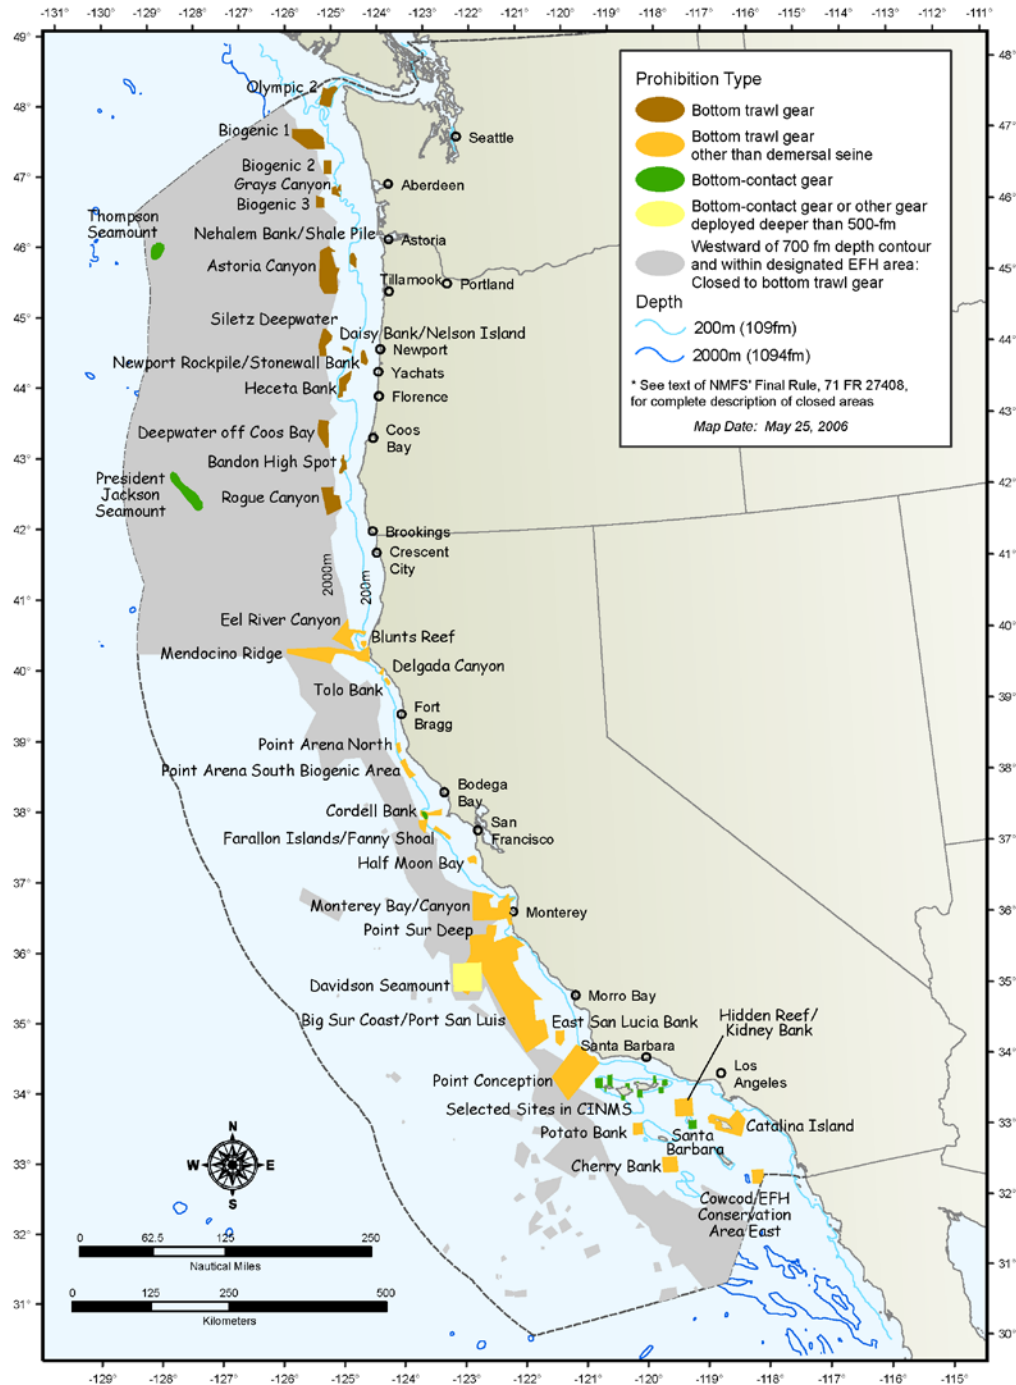

Timeframe / Months of fishing – Could be year round, but would be constrained by weather, marketing, and availability of observers.

Signatures

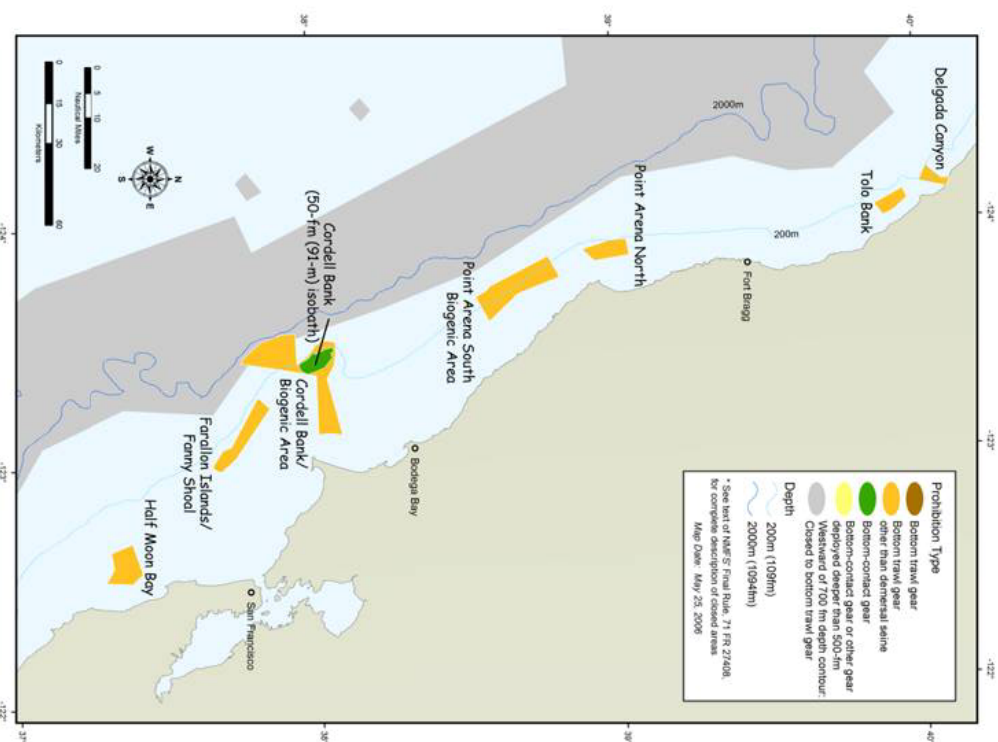

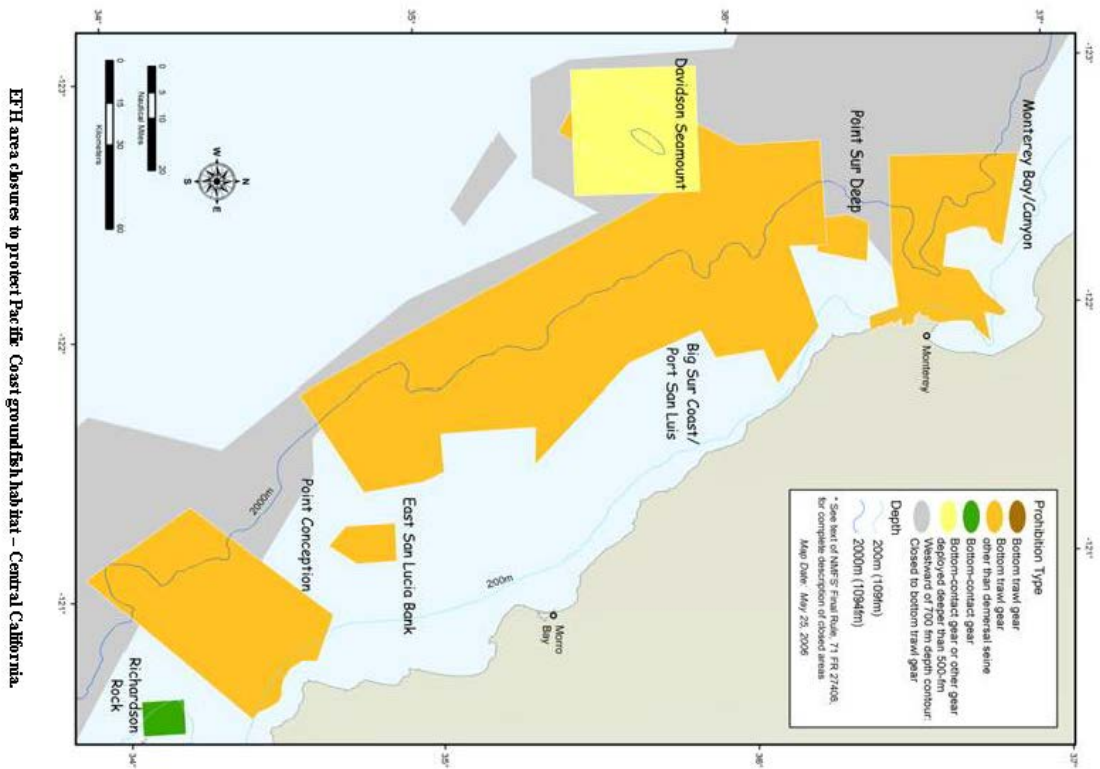

Steve Fosmark

Kathy Fosmark

EFH area closures to protect Pacific Coast groundfish habitat - Coastwide.

INTERIM REPORT:
EXEMPTED FISHING PERMIT
TESTING COMMERCIAL JIG FISHING GEAR TARGETING YELLOWTAIL ROCKFISH
FOR 2013/2014 GROUND FISH FISHERIES

Summary 2013 EFP activity:

We didn't receive our permits until the late spring (June). Most of the EFP fisherman are salmon fisherman and chose to continue fishing for salmon before starting the EFP. The salmon season was in full swing at that point and the price was good. Dan Platt on the Captain Cook switched to EFP fishing in August and made his first EFP trip August 21st. This was the very first trip and a bit of a learning experience. There was one Canary caught. Dan made a second EFP trip August 29th. This trip was successful in the sense that more yellowtail were caught with minimal bycatch (1 Canary and 6 Boccaccio).

On October 6 the High Hopes made its first trip. John plans to go again as soon as he replaces the blown out window (rogue wave).

Sean on the Smeagol is still fishing for salmon and Black Cod. He plans to take his first EFP trip as soon as salmon season is over (October 15).

During all trips the gear worked very well at catching target species while avoiding canary and yelloweye. We are looking forward to a full year in 2014 and many more EFP trips. It is getting late in the year now but we will try to do some more trips later this year.

So far the ratio is 932.5 lbs Yellowtail to approximately 7 lbs of Canary (4) and zero pounds of yelloweye.

(please refer to attached data sheets and landing receipts).

Table 1. Catches made to date in the EFP.

Catch Category	Allocation (mt)	Allocation Remaining (mt)	Caught to Date (mt)	Trip # (Trip Weights in kg)	Capt. Cook 8-20	Capt. Cook 8-29	High Hopes 10-7

Purpose and Goals

Purpose

West Coast fisheries have been increasingly restricted in state and federal waters over the last decade to reduce impacts from fishing. Yet, demand remains for fresh, local seafood. To harvest healthy and abundant fish stocks with less impact, conservation engineering and gear experimentation is needed. The purpose of this EFP is to test the potential for a new commercial jig gear configuration to harvest currently underutilized rockfish species (yellowtail) while avoiding overfished stocks to enhance optimum yield in the mixed stock West Coast groundfish fishery.

Goals

This EFP seeks to fulfill and comply with national mandates and goals of the Magnuson-Stevens Act (MSA) for fisheries, fisheries resources, and fishing communities by addressing specific conservation and management issues in the mixed stock groundfish fishery off of California.

1. Consistent with MSA National Standard 1 (optimum yield) and National Standard 9 (minimize bycatch), harvest abundant stocks while minimizing bycatch and providing for rebuilding of overfished stocks.
2. Consistent with the purpose of MSA to conserve and manage U.S. fishery resources to realize their full potential (i.e., by providing employment, food, and revenue to the nation) and consistent with MSA National Standard 8 (fishing communities), seek to develop and utilize gear technology that contributes to sustained participation of fishing communities while also preventing overfishing and ensuring rebuilding of overfished stocks.
3. Provide additional opportunity in the groundfish fishery off California that has been greatly constrained since rockfish conservation areas (RCAs) and lowered quotas were implemented to rebuild overfished species.
4. Test the success of this experimental commercial jig gear configuration at: 1) avoiding deep dwelling overfished rockfish stocks (canary and yelloweye) while selectively harvesting an abundant mid-water rockfish stock (yellowtail), and 2) providing enough harvest of abundant rockfish species to support, or at least contribute to, a commercial fishery off the West Coast in the long-term.

Disposition of Catch

Target species (yellowtail rockfish) and legal incidental catch, such as chilipepper rockfish, will be retained for sale. Fish not authorized for sale would be released alive if possible. If desired, incidental catch of certain species (e.g., canary and yelloweye) that cannot be released alive could be retained by the observer and provided to NMFS, CDFG, or other researchers.

Justification

The fishing grounds which have been historically accessible to portfolio fishermen in California's coastal communities are geographically identified as "shelf", and because of this, the gear used by these fishermen isn't useful for catching fish on the "slope" (depths greater than 100 fathoms-see Figure 5). The creation of the non-trawl rockfish conservation area (RCA) over the shelf (between 30 and 150 fathoms) has pushed fishermen outside their historical fishing grounds into deeper waters where fishing is no longer feasible with their current gear (see Appendix E).

In order to protect and rebuild overfished yelloweye and canary rockfish off California, depth and area closures were implemented off of California. Unfortunately, these closures have also prevented harvest of more abundant yellowtail rockfish that live higher in the water column. Combined with lower quotas, these measures caused many fishermen in California's coastal communities to switch fisheries and/or supplement their incomes in non-fishery jobs because they could no longer harvest the abundant groundfish stocks. If a gear could be developed capable of harvesting the more abundant mid-water species while avoiding catch of the overfished bottom dwellers, then the optimum yield of the fishery could be enhanced. There are currently no conservation concerns with yellowtail rockfish which is an under-utilized species.

In 2009, the Oregon Recreational Yellowtail Rockfish EFP, approved by the Council, was permitted to the Southern Oregon Sport Fishermen and Recreational Fishing Alliance (Oregon Chapter) for fishing in 2010 and 2011. Although not identical, this OR EFP is based on the same concept (i.e., placing hooks near the target species in mid-water and away from non-targets on the bottom). Therefore, it offers

interesting insights of some relevance to this EFP application, particularly its catch composition and success at avoiding the non-target species. Under this EFP, 29 trips were made with an average of 11 anglers and 33 hooks per vessel (3 per line) were deployed on average. Reported catch of 4.3 mt (as of Aug. 1, 2011) was composed of roughly 62% Yellowtail, 23% Widow, 12% Canary and 3% other rockfish and 4kg of Yelloweye (2 fish) (see Appendix B). This catch is well below the 1 mt of Canary and 100 kg Yelloweye authorized for year two alone.

A similar design will be tested under this EFP with some modifications for use in a commercial fishery (e.g., number of hooks, size of weight). An EFP is necessary to test this gear because it is not currently authorized under the Groundfish FMP regulations and because fishing conducted under this EFP is proposed for areas that are currently closed to fishing. If the proposed modified vertical hook and line fishing technique is successful, this exempted fishing permit (EFP) would allow commercial fishermen to access historical fishing grounds targeting healthy rockfish stocks and would promote ecologically and economically sustainable fisheries in Central and Northern California.

Broader Significance

The long-term goal, if experiments prove successful, is to allow commercial jig fishing with this gear off the entire West Coast, including in the RCAs, by the Open Access and Limited Entry participants. If successful, this gear could also be used by the Nearshore fleet to avoid species of concern and could create a fishery that would fill out the portfolios of those who make up the bulk of the fishermen in the West Coast's coastal communities. The recreational fleet might also benefit from using a similar gear with fewer hooks, similar to the Oregon Yellowtail EFP previously mentioned. Thus, the benefits of this EFP would extend beyond the initial EFP participants.

Despite the generally depressed condition of many west coast groundfish stocks, there are some stocks that remain healthy. These healthier stocks could safely sustain increased harvest levels if they could be fished more cleanly and without bycatch of more depleted stocks. If stronger stocks could be targeted without increasing fishing mortality on depressed stocks, the West Coast commercial fishing fleet would have alternative fishing opportunities that would provide some economic relief to the industry while providing the public with highly desirable sustainably harvested local seafood.

Details

In determining the proposed specifications for this experiment, several factors have been considered.

- **Creating a statistically valid sample size** – allowing for a sufficient number of hooks, lines, days, vessels, and locations that can provide valid conclusions as to the success of this gear at avoiding overfished non-target species and harvesting the target yellowtail in sufficient quantity to allow for potential expansion of this gear to support future commercial fishing.
- **Feasibility and efficiency** – whether participants can at least cover the costs involved to perform these experiments (including observer costs, fuel, gear, and bait), even if no profit is made under the EFP.
- **Safety-at-sea** – ensuring participants can fish on days with safe weather conditions.
- **Precaution and minimizing risk** – Knowing that overfished rockfish could be encountered and because at least some of the fishing would take place in the RCA, several precautionary measures are proposed.

With consideration of these factors, applicants are open to discussing modifications to this proposal with the GMT and GAP (e.g., # hooks, depth range, etc.).

Total Duration of the EFP

This EFP proposal is for a total of 2 years (2013-2014) with 30 fishing days for the first year, and possibly 45-60 days in the second year. In the second year, additional time and other modifications may be desired and/or necessary (e.g., number of participating vessels, hooks, area and days fished), but would be subject to review and approval through the PFMC process and NMFS.

Location of Fishing under the EFP

The fishing will occur between Point San Pedro and the Oregon/California border (37°35'N and 42°N), between 35 and 100 fathoms. Fishing will take place deeper than 35 fms to avoid hydrocorals (primarily *Stylaster spp.*) found mainly shallower than 30 fathoms. Locations for the EFP fishing have been chosen based on known yellowtail habitat, rather than lines of latitude or fathom lines and it is known that there is appropriate yellow-tail habitat in this area, i.e., high relief rocky reef deeper than 30 fathoms (see Appendix D).

Yellowtail rockfish is the target in this experiment because they are underutilized and because they are a mid-water species, whereas the overfished rockfish species of greatest concern tend to be more bottom associated. (i.e., canary and yelloweye). The hooks would be located only in the mid-water column based on the hypothesis that this will be in the range of yellowtail but out of range for canary and yelloweye rockfish, making it less likely that they would encounter the hooks.

Fishing under this EFP is proposed to occur within the RCAs making this a sensitive and delicate experiment that would be undertaken with precautionary steps, such as having 100% observer coverage and daily limits (see section on **Precautionary Measures**). Unfortunately, it is thought that yellowtail rock fish live primarily inside the RCAs and it would be useful to verify this assertion by reviewing fish ticket information from years prior to implementation of the RCAs. Recently, the Superintendent of the Cordell Bank National Marine Sanctuary reports seeing very large numbers (“clouds”) of yellowtail rockfish on the “high spots” while in a submersible and saw no adult yelloweye and very few canary rockfish in this same area.

If the project proves successful in avoiding stocks of concern, then fishermen in other West Coast harbors may want to explore other appropriate habitat in their area. Much of the area proposed for this EFP is within the boundaries of the Gulf of the Farallones and Cordell Bank National Marine Sanctuaries. These sanctuaries are in support of this experiment. It has been 10 years since any fishing has taken place in this area, and the Sanctuaries’ superintendents are very interested in learning the results of this experiment.

Description of the Gear to be Used

Specifications

- A vessel will fish up to two lines.
- Each line will consist of all of the following:
 1. a tuna cord mainline
 2. a float at least 3.5 inches in diameter, above the top hook to keep the gear from contacting the bottom, as suggested by the GMT in 2009; a monofilament ganton with 25 to 50 hooks (shrimp flies) each, spaced 1-3 feet apart
 3. a weight of no more than 15 lbs
 4. a breakaway (lower test line) that is a minimum of 30 feet (5 fathoms) located between the lowest hook and the weight
 5. When two lines are used they may be deployed with different lengths of breakaway line.
- Still to be determined: weight and strength of the breakaway line.

Storage and Deployment

- The mainline can be coiled in a basket, wound on the reel of a fishing pole, or spooled on the boat's gurdies.
- The hooks can be placed on a "pinning rail" (usually a long piece of rubber with slots for the hooks) followed by the breakaway and the weight.
- After the weight is thrown overboard followed by the breakaway, the hooks will peel off the pinning rail.
- The float will be attached above the hooks as the gear is deployed.
- Once the fisherman feels the weight hit bottom, he immediately pulls the line up so that it does not drag on the bottom and to avoid tangling in the rocks.

Figure 6. Conceptual drawing of the proposed gear

Effort

- *Trip length:*
 - Vessels out of Ft. Bragg and south – 4 to 5 days (2 day travel time, 2-3 fishing days);
 - Vessels out of Crescent City – 1 day
- *Drops per day:* TBD (depends on conditions), possibly 5 hours total drop time
- *Length of drop:* possibly 5 min to 30 minutes

Number of vessels covered under the EFP

A total of 4 vessels would participate in the study the first year (potential vessels: 2 out of San Francisco, 1 out of Ft. Bragg, 1 out of Crescent City). While the area is very large for 4 vessels to cover, we want the first year simply to explore whether the gear will be able to catch Yellowtail and successfully avoid overfished bottom-dwelling species. If successful and with PFMC approval, in the second year, the experiment could expand with more vessels to cover more area and locate additional suitable habitat (applicants are open to GMT/GAP feedback to determine an appropriate level of expansion if a specific proposal is necessary at this time or leaving it at 4 for both years). Applying for a second two-year EFP for the 2015-2016 cycle might be appropriate to discover more suitable habitat in a larger West Coast area and add more vessels.

Species to be Harvested (target and incidental)

Table 1 provides an overview of the species that will be caught under the EFP, their status, and estimated catch amounts.

Table 1. Overview of Target and Incidental Species Caught under the EFP

Species	Target or Incidental?	Overfished? Y/N	Depth Range	Requested Amount of EFP Harvest (mt)
Chilipepper <i>Sebastes goodei</i>	Target	No	0-1080 ft (0-180 fms)	200
Widow Rockfish <i>Sebastes entomales</i>	Incidental	No	0-1050 ft (0-175 fms)	9
Bocaccio <i>Sebastes paucispinis</i>	Incidental	Yes	0-1050 ft (0-175 fms)	3
Canary Rockfish <i>Sebastes pinniger</i>	Incidental	Yes	0-900 ft (0-150 fms)	3
Yelloweye Rockfish <i>Sebastes ruberrimus</i>	Incidental	Yes	150-1200 ft (25-200 fms)	0.023
Cowcod <i>Sebastes levis</i>	Incidental	Yes	132-1620ft (22-270fms)	0.015
Dorkblotched Rockfish <i>Sebastes crameri</i>	Incidental	Yes	240-1200ft (40-200fms)	0.1
Pacific Ocean Perch <i>Sebastes alutus</i>	Incidental	Yes	180-2100ft (30-350fms)	0
Petrale Sole	Incidental	Yes		0
Lingcod S of 42°	Incidental	No		0.5
Sablefish N of 36°	Incidental	No		3
Splitnose	Incidental	No		1.5

Minor Slope S of 40.10°	Incidental	No		1
Minor Shelf S of 40.10°	Incidental	No		1
Black Rockfish S of 46.16°	Incidental	No		1
Pacific Whiting	Incidental	No		1
Other Fish	Incidental	No		1

a. Species Descriptions

Descriptions of the **species life histories** can be found in Appendix B2 of the Pacific Coast Groundfish Fishery Management Plan.

<http://www.nwr.noaa.gov/Groundfish-Halibut/Groundfish-Fishery-Management/NEPA-Documents/upload/FMP-Appendix-B2.pdf>

Updated information on **species abundance** can be found in Chapter 3 of the Proposed Harvest Specifications and Management Measures for the 2011-2012 Pacific Coast Groundfish Fishery and Amendment 16-5 to the Pacific Coast Groundfish Fishery Management Plan to Update Existing Rebuilding Plans and Adopt a Rebuilding Plan for Petrale Sole; Final Environmental Impact Statement. http://www.nwr.noaa.gov/Groundfish-Halibut/Groundfish-Fishery-Management/NEPA-Documents/upload/1112GF_SpexFEIS_100806-FINAL_feb21_.pdf

b. Estimated Harvest Amounts

Requested allocation is found in Table 1. To assist in determining potential harvest amounts, provided for consideration is an estimated range of CPUE and potential catch composition. Appendix A includes CPUE estimates, which was derived in order to consider the landings likely needed to cover costs of fishing under this EFP.

No prior data exists from which to pull an exact catch composition estimate from this gear. However, some data may be informative and could possibly be considered as the best available proxies. A possible proxy may potentially be derived from the mix of species caught during the first two years of the Oregon Recreational Yellowtail Rockfish EFP. If considered appropriate and desirable to use, an attempt to analyze this data can be found in Appendix C. Under that EFP, the reported catch of 4.3 mt (as of Aug. 1, 2011) was composed of roughly 62% Yellowtail, 23% Widow, 12% Canary and 3% other rockfish and 4kg of Yelloweye (2 fish) (see Appendix B). Also, analysis of PacFIN data to look at block data from groundfish landings from relevant ports could be another potential source. However, limitations with this data include: the landings would encompass trawl and hook & line gear together, past landings data could reflect abundance issues (i.e., lower abundance because of overfished stocks), and concerns with the accuracy of block reporting. Landing data from 1992-1998 for all California Ports North of 37° were summed by DFG Block. The data show that most blocks within the proposed area have some yellowtail catch during the years prior to the RCA (See Appendix F).

Catch Accounting and Compliance

This EFP will incorporate a standardized data collection and reporting format. Under the terms of this EFP there will be 100% observer coverage. Fisheries Observers will collect data on fishing gear, location, catch, and disposition of catch.

Precautionary Measures

Given the potential to catch overfished species and by fishing in the RCA, the utmost caution will be taken with this experiment. The following measures are proposed and applicants are open to working with the PPMC, NMFS, and CDFG to implement others deemed necessary.

1. **Observers** – 100% observer coverage (a standard measure for EFPs, but worth noting here).
2. **Caps** – Based on input from the PPMC and NMFS, each boat will have either a *daily* or *trip* limit/cap of canary and yelloweye. If this cap is reached, based on catch accounting reports verified by the observer, fishing will cease for that day or trip.
3. **Trip reports and catch accounting** – On a timeline agreeable to NMFS and CDFG, trip and cumulative catch reports will be provided after each trip (e.g., within 48 hours).
4. **Status and evaluation call before each trip** – Before each vessel departs on a trip, a cumulative catch accounting report (i.e., running total for the season) and evaluation of the trips taken thus far will be reviewed to determine if another trip can be made and to discuss lessons learned (e.g., float sizes, bait, etc.). If it is likely that the allocated harvest cap would be exceeded in the upcoming trip, then all fishing under the EFP will cease for the season. Participants on each call would include the EFP participants and could include NMFS (SF & OLE), CDFG (Marine Region & Enforcement) and National Marine Sanctuaries Service.
5. **VMS and Vessel Marking** – Before each trip a vessel will call the West Coast Groundfish Declaration Line to report the trip. (This procedure should work for both the EFP and for future use of this gear type). Vessels participating in this EFP will also display a banner with “EFP Fishing” written in 2 foot high letters.

Data Collection and Analysis Methodology

Data Collection

The following data will be collected by observer for all fishing under this EFP:

Gear Configuration

- | | | |
|----------------------------|--------------------------|--------------|
| • Number of hooks and type | Weight size | • Float size |
| • Breakaway line length | • Distance between hooks | |

Set and Haul Data:

- | | |
|------------------------------|--------|
| • Position (GPS coordinates) | • Time |
| • Bottom Depth | |

Catch

- | | |
|---------------------------------------|---------------------------------------|
| • Species | • Disposition (landings and discards) |
| • Total weight | • Count |
| • Length | |
| • Biological Sampling (if applicable) | |
| • Species | |
| • position on line (e.g., hook #) | |

Attachment of depth recorders may be used, as available.

If desired, incidental catch of certain species (e.g., canary and yelloweye) that cannot be released alive could be retained by the observer and provided to NMFS, CDFG, or other researchers for biological sampling.

Data Analysis

Catch per unit effort will be calculated based on hooks per hour fished. This will allow comparison between short and long drops and different gear configurations. The data will be reported on a trip by trip level. The catch data will be analyzed for CPUE of all species and each species individually.

We have received a grant to engage an undergraduate student to provide data analysis and to ensure statistically valid data. We have begun to make arrangements with Cal Poly for that student and his/her supervisor,

Participation

Choosing Participants

Vessels participating in this EFP will be chosen on their ability to accommodate an observer, which means having bunk space for overnight trips; a life raft for enough people and a coast guard decal and their willingness to maintain detailed catch data. Vessels will also be required to have VMS as required by the open access and limited entry groundfish regulations.

Planned EFP Fishing by Participants

Fishing will take place in appropriate habitats within the latitudes and fathom curves mentioned earlier. Finding these habitats is important to the success of the EFP. Weather conditions are critical for this type of fishing, which involves drifting (not too much wind or current), so times will be left to the discretion of the captains. It is likely that October will be the best time of year, but fishing would not be limited to October. The gear is as described earlier except that a vessel may choose to use less gear than authorized to check species composition prior to setting all gear.

Appendix A- CPUE Estimates

Catch per unit effort is calculated below using 1 hook per hour as a unit of effort. The assumed effort per day is 5 hours of actual fishing time (gear in the water). Therefore, total catch is calculated for various numbers of hooks and CPUE of either 1 fish (2kg) or 2 fish (4kg) per hook per hour five hours a day. These numbers are expanded for 30 and 45 fishing days (3 vessels) and 40 and 60

fishing days(4 vessels). The green highlighted fields represent the estimated catch required to meet expenses of \$800/day.

Estimated effort for 3-6 vessels				
One day of effort is approximately 5 hours of wet gear time				
# of vessels	Days per vessel		Total Days	
	4 trips / vessel	6 trips / vessel	10 days/ vessel	15 days/ vessel
3	10	15	30	45
4	10	15	40	60
5	10	15	50	75
6	10	15	60	90

Assessment of estimated harvest for Year 1 of the EFP

Preferred Gear \$800 a day needed to cover expenses (Including Observer Coverage, Fuel, fish = all fish caught, not species specific Amount that would cover expenses
Configuration Bait, and Gear) specific

Comparison of gear configuration by day and CPUE

# of hooks/line (2 lines / boat)	Total # of hooks per boat	spacing between top hook and bottom hook (1-3 ft btwn hooks)	Possible CPUE Values in # of fish / hour		Possible CPUE Values in kg of fish / hour	
			CPUE = 1 fish per hook per hour x 5 hours	CPUE = 2 fish per hook per hour x 5 hours	CPUE = 1 kg per hook per hour x 5 hours	CPUE = 2 kg per hook per hour x 5 hours
10	20	9-27ft	100	200	100	200
20	40	19-57ft	200	400	200	400
25	50	24-72ft	250	500	250	500
30	60	29-87ft	300	600	300	600
40	80	39-117ft	400	800	400	800
45	90	44-132ft	450	900	450	900
50	100	49-147ft	500	1000	500	1000
100	200	99-297ft	1000	2000	1000	2000

Conclusion: At least 50 hooks would be needed to meet expenses if CPUE was between 1 and 2 fish per hook per hour with 5 hours of wet gear time.

Comparison of number of hooks for 30 days of fishing

# of hooks/line (2 lines / boat)	Total # of hooks per boat	total days	Possible CPUE Values in # of fish / hour		Possible CPUE Values in kg of fish / hour	
			CPUE = 1 fish per hook per hour x 5 hours	CPUE = 2 fish per hook per hour x 5 hours	CPUE = 1 kg per hook per hour x 5 hours	CPUE = 2 kg per hook per hour x 5 hours

Conclusion: With 60 days of fishing, between 24 and 48 MT of fish would be harvested

Appendix B- Oregon EFP Catch

In 2009, the Oregon Recreational Yellowtail Rockfish EFP, approved by the Council, was permitted by NMFS to the Southern Oregon Sport Fishermen and Recreational Fishing Alliance (Oregon Chapter) for fishing in 2010 and 2011. Although not identical, this OR EFP is based on the same concept (i.e., placing hooks near the target species in mid-water and away from non-targets on the bottom), and, therefore, offers interesting insights of relevance to this EFP application, particularly the catch composition and success at avoiding non-target species. Under this EFP, 29 trips were made with an average of 11 anglers and 33 hooks per vessel (3 per line) were deployed on average.

Oregon Recreational Yellowtail Rockfish EFP Catch

Year 1	kg	% of total	anglers	catch per angler day
Total	2083	100	137	15.20437956

Supporting a Spatial Analysis of the Distribution and Size of Rebuilding Stocks in the Rockfish Conservation Areas Through Directed Fishing Surveys

Mary Gleason: Associate Director of Conservation Science, The Nature Conservancy
Rick Starr: Moss Landing Marine Laboratories/California Sea Grant Extension Program

10/9/2013

I. Project Overview

The U.S. West Coast groundfish fishery is comprised of more than 90 species of fish, many of which are inherently vulnerable to overfishing because of long life spans and low productivities. Managing and assessing multi-species fisheries that include stocks of various resiliences to overfishing has proven challenging. Nine species in total were declared overfished by the National Marine Fisheries Service (NMFS) between 1999-2002 including: Bocaccio (*Sebastes paucispinis*), Canary Rockfish (*S. pinniger*), Cowcod (*S. levis*), Darkblotched Rockfish (*S. crameri*), Pacific Ocean Perch (*S. alutus*), Widow Rockfish (*S. entomelas*), Yelloweye Rockfish (*S. ruberrimus*), Lingcod (*Ophiodon elongatus*), and Pacific Hake (*Merluccius productus*). The Magnuson Stevens Act (MSA) requires an end to overfishing, and as a result of an overfished status and a requirement for mandatory rebuilding plans, a set of strict measures were implemented to eliminate overfishing. These measures include catch reductions, gear restrictions, and establishment of the coast-wide Rockfish Conservation Areas (RCAs). The RCAs were established in 2002 by NMFS as a set of depth based spatial closures along the outer edge of the continental shelf and upper slope. The primary goal of the RCAs was to help protect overfished species (OFS) that occur in discrete depth zones and help with rebuilding efforts (67 CFR 57973). In addition, as the trawl sector of the groundfish fishery transitioned to an IFQ program, requirements for full accounting of catch were implemented, including a requirement for 100% of trips to include human observers.

These management measures have proven useful for rebuilding stocks of OFS; however, fishing opportunities, and the economic and social benefits associated with them, may be unnecessarily constrained in the groundfish fishery, because the RCAs cover a large percentage of continental shelf and slope habitats due to a lack of understanding of the spatial distribution of OFS. Landings of many targeted species (e.g. Lingcod, Yellowtail Rockfish, and Chilipepper) are significantly lower than quota allocations due to efforts by fishermen to avoid encountering rebuilding species during exploratory fishing or fishing near the RCAs.

To date, there has been little research on the finer scale demographic and distributional patterns of OFS that could help fishermen target healthy populations while avoiding depleted ones. Our collaborative research project aims to bring a diverse array of partners together to develop a better understanding of the distribution of OFS. As a first step in the process, the NOAA Biogeographic team has developed coast-wide predictive distribution maps for OFS and target species using existing fisheries dependent and independent data. As a second step, we are conducting surveys to ground-truth those predictive maps in the central CA coast (between Pt. Conception and Half Moon Bay). We are doing so by using directed fishing surveys inside the RCA using standardized hook and line surveys to estimate encounter rates with OFS. This fishing is occurring through an Exempted Fishing Permit (EFP) [Permit #: 13-14-TNC-01 “Supporting a spatial analysis of the distribution and size of rebuilding stocks in the rockfish conservation area through directed surveys”]. We are also conducting visual surveys using a stereo-video camera system to characterize abundance, length, and habitat associations of OFS and target species in those same locations.

The goals of the project are to:

1. Compile existing data about the distribution of OFS collected from NMFS trawl surveys, underwater visual surveys, and historical catches;

2. Use the combination of existing fisheries independent and dependent data and local knowledge to develop predictive maps on the distribution and abundance of overfished groundfish stocks along the entire West Coast;
3. Ground-truth the predictive maps by performing scientific sampling (visual surveys and directed fishing) to assess encounter rates with OFS in a subset of locations inside the RCA in Central California with predicted high, medium, and low density (“hotspots”, “warm spots”, and “cold spots” respectively) of OFS, and;
4. Characterize the abundance, length, and habitat associations of OFS in those same locations, as well as collect biological samples of OFS for growth and maturity studies.

This is a collaborative project that involves many partners interested in developing a better understanding of OFS distributions to inform fishing and management decisions. Partners include: Central California Seafood Marketing Association (CCSMA), The Nature Conservancy (TNC), Environmental Defense Fund (EDF), Moss Landing Marine Laboratories (MLML), California Sea Grant, University of California at Santa Barbara, the National Marine Fisheries Service/Southwest Fisheries Science Center (NMFS/SWFSC Santa Cruz lab), and the California Department of Fish and Wildlife. Quota to conduct the directed fishing surveys were supplied by TNC, in collaboration with the California Risk Pool, and is being closely monitored to ensure hard caps for rebuilding species are not exceeded.

Through the EFP process, we requested permission to conduct directed fishing surveys of areas with predicted high, medium, and low fish density (“hotspots”, “warm spots”, and “cold spots”) inside the RCAs to develop the scientific support for important fishing and management decisions. This EFP is a key part of a broader research project that will result in a synthesis of existing data and best available information regarding the spatial distribution of overfished stocks; to help inform bycatch avoidance plans and maximize fishing opportunities of healthy stocks. Furthermore, this work will provide new data on the abundance and productivity of stocks within the RCAs that may help support bycatch avoidance plans, stock assessments, and spatial management decisions. Using a combination of spatial modeling, fishermen’s knowledge, and scientific surveys, the opportunity exists to increase the potential for fishermen to meet target quotas, while reducing interactions with rebuilding species.

This interim report is intended to provide the Pacific Fishery Management Council (Council) with information on the planning and early implementation phases of this multi-year project. Some preliminary information is provided on field research efforts and landings to date; however, the first year of field research is still underway and a more detailed and comprehensive report of the first year of directed fishing efforts will be provided to the Council at their September 2014 meeting.

II. Progress to Date on Key Project Elements

This EFP is part of a multi-year collaborative research effort to advance our understanding of the distribution of OFS. Here we report on progress on key elements of the project.

A. Securing the EFP

This EFP was approved by the Council at their June 2012 meeting in San Mateo, CA. It was approved with recommended revisions from both the Council and the Scientific and Statistical Committee (SSC). The SSC recommendations were accepted and included in the revised May 2012 application, and only 2 further recommendations were given by the Council at their June 2012 meeting:

- 1) That the permittee be granted an exemption from the non-trawl RCA, and;
- 2) There should be no testing of trap gear to target lingcod.

TNC then submitted the revised EFP application to NMFS in November 2012, and the EFP terms and conditions were finalized in early September 2013. TNC, as a partner and holder of the trawl permits and quota assumed the leading role in matters related to the issuance and management of the EFP, including serving as permittee on behalf of the research partners.

B. Securing Observers for the project

One of the requirements the EFP is 100% human observer coverage. Project partners went through a process to select observers and an observer provider, and Alaskan Observers Inc. (AOI) was selected based on a competitive bid process. Two observers were chosen by both AOI and project partners based on their qualifications and knowledge of fisheries. Both observers went through the catch share observer training program during May and completed all of the required coursework and passed their exams to become certified federal at-sea observers and shore-side monitors.

C. Selecting Fishermen and Vessels for the Directed Fishing

Project partners worked with local fishermen and representatives from the Morro Bay Commercial Fishermen's Organization (MBCFO) to develop an application form to guide the selection of fishermen for the directed fishing portion of the study. The application was distributed to: harbor masters, city representatives, commercial fishermen organizations, fish processors, and fishermen up and down the coast between Port San Luis and Half Moon Bay in mid-April 2013.

Interested and qualified applicants had until May 24th, 2013 to complete and return the applications to TNC. Once all applications were received a review committee of 5 members representing city officials, academic, non-profit organizations, and representatives from a fishermen coop organization independently scored and ranked each of the candidates. Based on those scores, the selection committee chose 4 candidates (Roger Cullen of the F/V Dorado, Mike Ricketts of the F/V Sea Hawk, Brad Leage of the F/V Princess, and Tom Mattusch of the F/V Hulicat). Selected candidates then had the required background check conducted by NMFS Northwest Region Office of Law Enforcement to ensure that they had no violations.

D. Selecting a Fishermen and Vessel for the Visual Surveys

NOAA (grant NOAA-NFA_NFAPO-2012-2003133) is providing funding for the fishing vessel days to support the visual surveys. NOAA put out a request for proposals (RFP's) to select an appropriate vessel with specifications to support the visual surveys using a drop camera system. Captain Tim Maricich of the F/V Donna Kathleen was selected to provide vessel support for the visual surveys.

E. Developing Predictive Maps of the Distribution of OFS and Target Species

Project partners worked with the NOAA Biogeographic team from the National Center for Coastal and Ocean Science (NCCOS) to develop predictive groundfish models (maps) using fishery-independent trawl survey data collected as part of the annual West Coast Groundfish Bottom Trawl Survey and provided by the NWFSC-Fisheries Resource Analysis and Monitoring Division (FRAM). Annual surveys conducted from 2003 to 2010 were compiled into a single dataset and used to develop a single predictive response surface representing the long-term average catch per unit effort (CPUE) of each species. Abundance data from the trawl surveys were analyzed with other data sets on habitat, depth, oceanographic parameters using generalized linear models (GLMs), so that fish-environmental relationships could help generate better predictions.

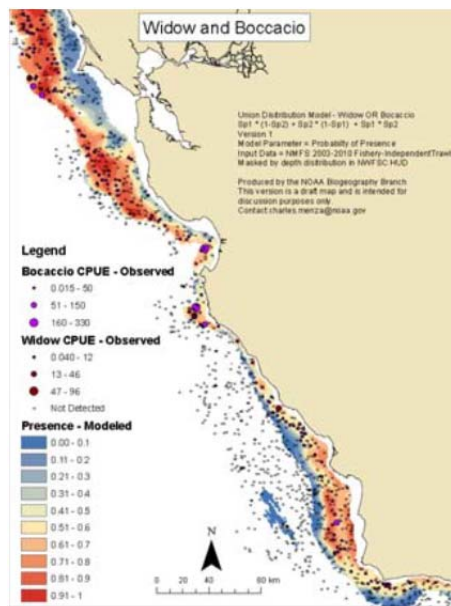

Figure 1: An example of Modeled Widow rockfish and Bocaccio CPUE based on NMFS Trawl Survey Data.

F. Site Selection and Study Design

The field surveys are being conducted along California's Central Coast between Pt. Reyes and Pt. Conception. We have identified specific study sites using a collaborative approach with fishermen, external scientists, and our study team. We conducted meetings with fishery managers, fishermen, habitat ecologists, and other informed stakeholders to select study sites that are based on the spatial analysis and predictive modeling by the NOAA Biogeographic team, existing submersible and ROV survey data, and information from historical catches by participating fishermen. We identified a total of 28 potential study blocks, covering a range of predicted hot, medium, and cold areas for OFS. These are located within or adjacent to the trawl RCA (100-150 fathoms) where predicted abundance from the spatial analysis and modeling correlates well with observational information and local knowledge (e.g. an OFS hotspot would

be a location where the spatial analysis predicts high abundance and observational data or prior catch would predict high abundance of OFS).

We stratified the study blocks to account for regional variability, as well as improve study logistics by minimizing travel time from port. We are surveying at least two types of habitats: areas with canyon walls (e.g., nearly vertical heads and sides of canyons) and areas with high relief rock outcrops, either on the continental slope or on the shelf edge. The following figures show the study blocks that have been selected, broken out into 4 geographic regions.

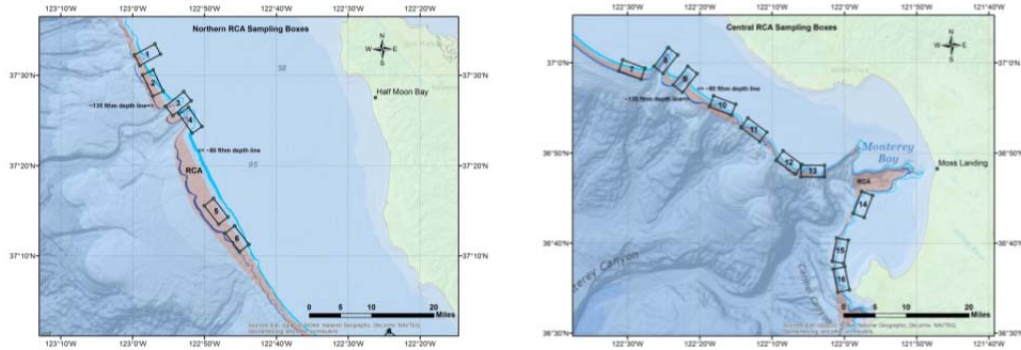

Figure 2: Northern Study Region (left) and Central Study Region (right).

Figure 3: Pt. Sur Study Region (left) and Southern Study Region (left). Note: no directed fishing surveys will occur at Pt. Sur due to limited OFS quota and high risk of yelloweye rockfish encounters.

G. Directed Fishing Surveys

Within each study block we are conducting standardized, timed fishing activities using vertical hook and line gear (hydraulic snapper reel with 15 hooks/line, 10/0 stainless steel hooks baited with squid). The onboard researcher directs a fisherman to fish within that block to catch target fish such as chilipepper, widow rockfish, and lingcod. Each deployment of the vertical hook and line gear constitutes a sample unit, and we aimed for less than full saturation of hooks to help estimate CPUE. The vertical

hook and line gear is deployed twenty-five feet above the seafloor to target Chilipepper, Widow Rockfish, and to minimize the risk of encountering Yelloweye Rockfish and Cowcod (constraining OFS for which there is limited quota). We will not be fishing in the Pt. Sur blocks given the high risk of encountering OFS, but will be conducting visual surveys in those locations.

Fishing vessel captains are instructed to distribute their efforts across all blocks in their geographic region with at least a minimum of 5 locations within each block. Fishing was categorized by two depth zones, shallow 49-82 fathoms (90-150 m) and deep 82-140 fms (150-250 m), targeting chilipepper and widow rockfishes.

Any overfished species landed are immediately put on ice and brought to the NOAA SWFSC lab in Santa Cruz, CA, where growth, maturity, and fecundity data will be collected by Dr. John Field (NMFS project partner). Target species of interest to NMFS stock assessment scientists are also being provided for biological analysis. Target species not needed for biological analysis will be sold commercially by the fishermen.

H. Visual Surveys Using a Video Lander System

TNC contracted with Marine Applied Research and Exploration to design, build, and test a Stereo Video Camera Lander (a “video lander system”) for this study. This video lander system can be deployed to depths of 300 m and has a rotating turntable so the paired cameras rotate 360 degrees. Preliminary surveys have demonstrated that both target and OFS species are readily observable with this drop camera within the depths of the RCAs.

Within 1-2 days after a fishing sample has been collected, we are deploying the Video Lander System at the fishing locations to assess density, size, and habitat associations of fish. We are also conducting visual surveys in other areas of habitat structure where fishing is not occurring. Video images from the paired cameras are transmitted to the surface and stored on a hard drive for post processing by MLML. We are using software developed by Euan Harvey and Jim Seager (www.seagis.com.au/) to obtain lengths, density, and habitat association of fishes observed by the Video Lander System.

III. Fishing Effort and Landings to Date

To date we have completed the 1st phase of the directed fishing surveys for the southern geography. A total of 15 days of fishing by two vessels (F/V Dorado and F/V Princess) between September 9-23, 2013. In this geography, 236 vertical hook and line sets resulted in 722 individual fish caught for a total of 3,474 lbs. landed (Table 1). At the same time, using the stereo video lander we recorded species abundance, length, and habitat associations for 96 locations within the southern geography.

The ratio of target species catch to rebuilding species catch for the fishing surveys to date is 8:1. The most abundant species caught was Vermilion Rockfish (*S. miniatus*) with 2,911 lbs. total, followed by other target species such as Yellowtail Rockfish (*S. flavidus*), Chilipepper (*S. goodei*), and Lingcod (*Ophiodon elongatus*).

The overfished species weight caught to date for the project was 371 lbs. of Bocaccio and 14 lbs. of Canary Rockfish. These specimens were sent to Dr. John Field at the NMFS/SWFSC Santa Cruz lab. No Yelloweye Rockfish or Cowcod have been caught to date, but we have seen several of each of these species with the stereo video lander, including some large individuals.

It should be noted that the fishing and visual surveys for 2013 are still underway and due to be completed by October 20th, thus these results are preliminary and incomplete for the 2013 EFP implementation.

Table 1: EFP project total landed and discard weight by species (September 9-23, 2013). Please note discard weights are not finalized yet.

Species	Project Summary 9/9/13-9/23/13	
	Landed Wgt (lbs)	Discard Weight (lbs)
* Bocaccio	371	0
* Canary Rockfish	14	0
Chilipepper	34	7
Lingcod	43	27
Southern Shelf Rockfish	2,909	6
Halfbanded Rockfish	0	1
Speckled Rockfish	3	0
Vermilion Rockfish	2,906	5
Widow Rockfish	3	5
Yellowtail Rockfish	97	6
Project Totals	3,474	52

***Refers to overfished/rebuilding species**

All data in Table 1 were recorded by the shore-side monitor/first receiver for landed weight, while discard weights were recorded by at-sea observers.

Please note that discard weights should be considered preliminary as observers are still working to verify this with their de-briefers. Also note that the data above represent only a portion of the first year of fishing effort, and that these efforts are part of a two year directed fishing effort study.

IV. Next Steps

The next steps for the project are as follows:

October 2013:

- Complete remaining fishing and drop camera surveys for central and northern geographies

November 2013 – June 2015

- Analyze fishing data and video from year 2 (Nov. 2013 – May 2014)
- Complete year 1 annual report (June 2014)
- Conduct 2nd year of directed fishing and drop camera surveys (Sept. – Oct. 2014)
- Analyze fishing data and video from year 3 (Nov. 2014 – May 2015)
- Conduct outreach to agencies, fishing community, others (ongoing)
- Complete year 2 annual report (June 2015).

V. Summary

There is a growing awareness of the need to incorporate spatial information in fisheries management and fishing decisions and a need to build off of the knowledge of local resource users. Our collaborative approach aims to advance our understanding of OFS and fill in gaps and knowledge of their spatial distribution, habitat associations and demographic patterns to inform management and fishing decisions at smaller scales. Specifically, we are testing an approach to bridge the gaps among data of different spatial scales (i.e. between coast-wide data and fine-scale data collected at sites) and between science (e.g. coast-wide trawl survey data, site-scale observational data from submersibles, remotely operated vehicles, etc.) and local fishermen's knowledge to advance our understanding of OFS distributions.

The project to date has developed new approaches (e.g. modeling) and tools (e.g. Stereo video lander) to try to fill the gaps in our understanding of OFS distributions. Our preliminary impressions of field surveys are that the video lander is a useful tool in determining the relative abundance of several OFS across a broad region of the coast, the fishing gear we are using can selectively target specific high-relief habitats, and that OFS are contagiously distributed. It is important to consider this clumped distribution of OFS in high-relief; non-trawlable areas when developing stock assessments.

VI. Acknowledgements

The project partners wish to extend many thanks to local area fishermen who provided valuable input into the study design and objectives and for sharing their local knowledge of fishing grounds including: Jim Anderson, Geoff Bettencourt, Bill Blue, Roger Cullen, Vince Doyle, Steve Fitz, Tom Hafer, Chris Kubiak, Brad Leage, Tom Mattusch, Joe Penissi Jr., Joe Penissi Sr., Mike Ricketts, John Rowley, and Mark Tognazzini.

We also appreciate the generous support from the California Risk Pool, comprised of members from CCSMA and the Fort Bragg Groundfish Association (FBGA), for providing OFS quota for the study and for their valuable insight and input on the study design, helpful comments and suggestions, and also for their enthusiasm and support for the projects research efforts and collaborative partnership.

Also, the work could not have been completed without the help of staff and students from all of the project partners and contractors.

**Proposal for Electronic Monitoring Exempted Fishing Permit to Test The
Effectiveness of Electronic Monitoring Without the Effect of On-Board Observers**

Date: October 21, 2013

Applicants:

- F/V San Giovanni: Giuseppe Pennisi, owner
- P.O. Box 1347
- Monterey, Ca 93940
- (831)372-5807
-
- Jiri Nozicka, operator
- 698 Prescott Ave
- Monterey, Ca 93940
- (831)393-4945

THE REASONS, PURPOSES AND JUSTIFICATIONS FOR EFP

- The current EM program studies have been criticized for not testing The Observer Effect, where the vessel crew might behave differently with and without the physical observers aboard simultaneously with the camera equipment. There seems to be a great need to prove or disapprove this criticism. This EM EFP will allow PFMC, NMFS to advance in its development of the current Electronic Monitoring program for the Groundfish fishery by allowing the current system to follow real, at sea data from limited number of vessel(s).

- Some vessels and communities in smaller ports needs to be able to access the allocations granted to them through the IFQ Catch Share Groundfish Fishery Plan adopted by the PFMC in 2010 and current observer “shortages” make it very difficult to operate under current situation.

The Electronic Monitoring EFP will allow PFMC and NMFS to assist these vessels, operations and communities in their adjustment to the IFQ Catch Shares program, which in its current status quo does not provide enough flexibility to utilize its allocations of the fishery resources. The EM EFP will enable some vessels to operate even though the observer availability is becoming harder to secure for some of these smaller fishing communities.

- According the National Standard 8 the FMP shall take into an account the importance of fishery resource to fishing communities in order to(1)Provide for the sustained participation of such communities and(2) To the extent practicable, minimize adverse economic impact on such communities:

The EM EFP will provide data needed for the PFMC and the NMFS to develop alternative solutions to the 100% monitoring requirement, which is not effective in some smaller communities along, mostly California Coast.

PROBLEM:

- The F/V San Giovanni #244706 is a bottom trawl vessel registered in the port of Monterey. Until May 9th the vessel has been operating with a Federal Groundfish permit #0707 under the West Coast Shorebased IFQ Program. Because of the unavailability of the observer in the port of Monterey by any of the existing observer providers the vessel has been forced out of the program entirely.

: The F/V San Giovanni has been the only trawl groundfish vessel operating in the port of Monterey in the last decade and the only participating vessel in the Catch Share Program. The F/V San Giovanni has been the only vessel delivering fish for the Royal Seafood Co., the only First receiver site for the Catch Share program in Monterey. The Royal Seafood Co. is being affected by its only vessel being inactive to the extent of closing its operation after 40 years. Another processing facility North Coast Fisheries out of Santa Rosa is also being affected by the vessels inactivity. The F/V San Giovanni has been fishing for the North Coast Fisheries since 2007. Since May 9th 2013 the port of Monterey has seen no landing of groundfish coming across its docks. As we understand the North Coast Fisheries has been also affected by the observer coverage shortage in the port of Fort Bragg, which severely affected the operation of fishing vessels delivering catch for their company in the years 2012-13

under the IFQ program. We believe that these impacts are sufficient to justify needed changes to the current FMP to accommodate the Electronic Monitoring EFP to allow fishing communities access to their allocation of the groundfish in their historic fishing grounds. We understand that the EM EFP will not provide long term solution for this problem, but it will provide a “buffer” for these affected communities and also for the council to bring forth changes to accommodate needed improvements to the current FMP to ensure long term success of the fishery and survival of communities which depend on it.

EFP IN USE- VESSEL PROCEDURES

The vessel (San Giovanni) if granted the EFP will operate with the vessels valid Limited Entry GF permit (GF#0707) with its assigned allocation of groundfish.

- The vessel will abide by the rules and regulations applicable to other Groundfish vessels within the IFQ sector.
- The vessel will maximize the retention of its catches.
- All discards will be discarded in an allocated space, where the camera is focused (every vessel operating with and EM EFP will work at its best camera positioning, discard and weight spaces with the equipment provider and monitoring crew)
- The vessel will coordinate with the monitoring personnel on improving the visibility and reliability of the sorting process on the vessel.
- All discards can be sorted and weighed, or estimated by weight (baskets)
- All restricted species will be retained and weighed at the dock.

Note; this EFP WILL NOT require the council to allocate any additional fish, open any closed areas, or grant any special treatment other than the trust to the vessel crew and the Electronic equipment aboard.

LOCATIONS:

- Every vessel operating with the EM EFP will have to provide a designated area of its operation.
- for example North of 40 degree Lat, South of 36 degree
- the operation of the F/V San Giovanni will be in the area between 36 N and 40 N(area 550)

DATA COLLECTING AND ANALYZING:

We would like to ask for additional time between the date of this application and the next PFMC meeting in November 2013 in Costa Mesa, California to provide for more detailed options.

- All data collected by the electronic equipment should be analyzed by the NMFS and its office analyzing the current Electronic Monitoring program or monitoring provider contracted by NMFS.

DURATION OF THE EFP

Because of the critical situation, we are asking you to consider the season of 2014 for the initial year for the EM EFP. At the same time we are also applying for this EFP for the period 2015-16.

Once approved, we are anticipating operating through the entire seasons. The F/V San Giovanni is a full time year-round trawler.

WHY THE SAN GIOVANNI?

During last several years we have adjusted our fishing gear and methodology to maximize our catches for our markets while minimizing our discards and utilizing our own portfolio of allocations.

It is critical for us to remain in our part of the coast to truly maximize the knowledge of our fishing grounds and to be able to stay in contact with our past fish buyers to also maximize the retention of our catches.

Our vessel is 60 ft X 18ft. Our deck space is over 20ft long with plenty of space for extra equipment.

About 80-90% of our fishing time is spent targeting the DTS complex in depths ranging mostly between 300-400 fathoms. During the last couple of years our discards during these tows were very minimal. The rest of our fishing effort is being done predominately in flat sandy areas of our coast targeting mostly Sand dabs and Petrale sole. These tows are usually made during the last (return) parts of our trips. When we are successful in catching a decent amount of sand- dabs, we are using short sorting tables to sort out our catch and slide the discarded fish directly from the slides to the sorting or discard baskets. In the past we have even sorted most of the discards by species. We can do the same in the case of the EM setup. During this process the different flatfishes can be put in separate discard baskets and either weighed or estimated by weight prior to discarding. I would like to stress out that even though we are trying to avoid catches of unmarketable fishes, it sometimes does not mean that we are always successful at it.

In this letter I am including our last and this years catch and discard data. As you can see in these prints we have been considerably successful in fulfilling the goals of the CS program. But also, as I have mentioned above, during our trip on March 2nd 2013 our discards were much higher than usual. Trips like that do not happen often as you can see, but they will occur from time to time and will affect the vessel and its operations success at minimizing its discard rate.

WILL THERE BE ANOTHER BOATS PARTICIPATING IN THE EM EFP?

At this point in time we are not sure of how many vessels would want to participate in this EFP, but as we understand there is a great interest in other alternatives to the current system among many fishermen, especially in smaller ports and smaller vessel operators along the California coast.

We would like to ask for extra time between this date and the next PFMC meeting in November 2013 in Costa Mesa, Ca. to contact some of these smaller communities and provide at least approximate number of potentially interested vessels.

CRITERIA FOR THE VESSELS FOR THE EM EFP:

- All participating vessels will have to operate with a West Coast Limited Entry Trawl Permit
- Special consideration should be given to the vessels in Central and Northern California ports.

PFMC

10/22/13

INTERIM REPORT:
EXEMPTED FISHING PERMIT
TESTING COMMERCIAL JIG FISHING GEAR TARGETING YELLOWTAIL ROCKFISH
FOR 2013/2014 GROUND FISH FISHERIES

Summary 2013 EFP activity through October 31, 2013 (No further 2013 trips planned): We didn't receive our permits until the late spring (June). Most of the EFP fisherman are salmon fisherman and chose to continue fishing for salmon before starting the EFP. The salmon season was in full swing at that point and the price was good. Dan Platt on the Captain Cook switched to EFP fishing in August and made his first EFP trip August 21st. This was the very first trip and a bit of a learning experience. There was one Canary caught. Dan made a second EFP trip August 29th. This trip was successful in the sense that more yellowtail were caught with minimal bycatch (1 Canary and 6 Boccaccio).

During all trips the gear worked very well at catching target species while avoiding canary. However, the last EFP trip had two yelloweye rockfish which together weighed 16 lbs. At that point it looked like if we took a chance with even one more trip it might tip us over the edge which is 22 lbs. Our group got together and we decided not to take that chance and we are forgoing any more fishing until after January 1, 2014. We are looking forward to a full year in 2014 and many more EFP trips.

For the five trips completed in 2013 the following fish were caught:

Species or Species Complex	Set-aside (mt)	Caught to Date (mt)	Set-aside Remaining (mt)	% Caught
Minor Shelf S of 40.10° (Yellowtail in parens)	30	0.8803 (0.8450)	29.1197	2.9%
BOCACCIO	3	0.09575	2.90425	3.2%
CANARY ROCKFISH	1	0.02094	0.97906	2.1%
YELLOW EYE ROCKFISH	0.01	0.0072	0.0028	72.0%
Widow Rockfish	9	0.4359	8.5641	4.8%
Other Fish	1	0.03265	0.96735	3.3%

This catch represents 1863 lbs of yellowtail and 961 lbs of widow while only catching 211 lbs of bocaccio, 46 lbs of canary, and 16 lbs (2 fish) of yelloweye..

Requested changes for 2015-16 EFP.

1. Allow up to 4 lines per boat with 25 hooks each instead of the current 2 lines with up to 50 hooks each.
2. Change the outside depth from 100fms to 150fms.

GROUND FISH ADVISORY SUBPANEL REPORT ON EXEMPTED FISHING PERMITS

The Groundfish Advisory Subpanel (GAP) reviewed exempted fishing permit (EFP) applications and offers the following comments on three of them.

Fosmark/chilipepper longline EFP: The GAP believes this EFP does not entail a lot of workload issues for managers, and the terms and conditions of the EFP are being met. Therefore, we suggest this EFP move forward to the next management cycle.

San Francisco Fishermen's Cooperative-Dan Platt/midwater vertical hook-and-line gear: Mr. Dan Platt provided the GAP with an interim report on this EFP and requested some modest changes in order to provide some flexibility and continue to test the effectiveness of this fishing method.

The EFP has been successful so far at harvesting increased amounts of targeted midwater species, and shows promise for minimizing impacts to overfished species (OFS). At the same time, proponents of the EFP were constrained by the very low set-asides of yelloweye rockfish (the equivalent of two or three fish). This created an odd situation: two large yelloweye were caught, leaving a very low margin of error and insufficient pounds to continue to test the gear; fishing had to be stopped for the year.

Therefore, the EFP sponsors are requesting an increase in yelloweye set-asides, from 0.01 metric tons, or 22 pounds, to 0.03 mt, or 66 pounds in 2014. The GAP supports this increase, since it will have zero to minimal impact overall and will not affect other sectors. This small increase will allow the EFP to continue to test the worth of this alternative gear. Furthermore, this set-aside amount should be included in the 2015-16 biennial specifications cycle.

The GAP also supports the request to modify the EFP to allow four lines of 25 hooks instead of two lines with 50 hooks. The EFP proponents said using a fishing pole with 50 hooks is simply unmanageable.

The proponents also request the outside depth restriction be changed from 100 fathoms to 150 fathoms to allow one of the vessels to target chilipepper rockfish. The GAP supports this change as well.

F/V San Giovanni-Jiri Nozicka/electronic monitoring EFP: The GAP heard a presentation from Mr. Jiri Nozicka regarding a proposed EFP to allow electronic monitoring and full retention without an observer on board.

The GAP understands the San Giovanni situation is unique, but also likely indicative of potential future problems with observer coverage in the trawl rationalization program, particularly in small ports. The San Giovanni cannot obtain observer coverage in Monterey due to extenuating circumstances and has not been able to fish for the last six months.

This situation results in a fisherman who has faithfully participated in the program and secured quota but cannot prosecute the fishery in which he has participated for several years. This is unacceptable.

The GAP readily admits this issue is a little ahead of schedule and that the issue of electronic monitoring as a whole will be considered later this week. However, we request the Council give consideration to this particular situation.

GAP discussion centered around whether full retention would be a problem, for what purpose the EM/video would be used, whether this could be implemented in 2014, and the potential for this single situation to become widespread in the trawl fleet.

Mr. Nozicka said full retention would not be an issue, as he's worked to develop markets for underutilized species.

He also stated the video would be used for confirmation of logbook catch recordings as well as species identification, if that is something that can be tested at this stage of electronic monitoring.

The GAP supports this EFP, recognizing there are other vessels that would like to take advantage of the opportunity but acknowledging National Marine Fisheries Service may not be ready to implement it in 2014. However, the reason EFPs are timed with the biennial specifications process is to allow for set-asides. This EFP would require none, as the San Giovanni has its own quota to use. At the very least, the GAP feels this EFP should move forward in 2015-16 and could be expanded to include more of the trawl fleet as progress is made on electronic monitoring issues.

SUMMARY:

- 1. Fosmark EFP:** Move forward for the 2015-16 management cycle.
- 2. SF CFA-Dan Platt EFP:** Move forward to 2015-16 with these modifications:
 - Increase yelloweye set-asides from 22 pounds to 66 pounds in both 2014 and the 2015-16 specifications cycle;
 - Change the EFP to allow four lines of 25 hooks each (instead of two lines with 50 hooks); and
 - Change the outside depth from 100 fathoms to 150 fathoms.
- 3. F/V San Giovanni-Jiri Nozicka electronic monitoring EFP:** Move forward for the 2015-16 management cycle. If at all possible, allow for an off-cycle EFP in 2014.

GROUNDFISH MANAGEMENT TEAM REPORT ON PRELIMINARY REVIEW OF EXEMPTED FISHING PERMITS FOR 2015-2016 GROUNDFISH FISHERIES

The Groundfish Management Team (GMT) reviewed the technical merit of two renewal exempted fishing permit (EFP) applications and one new application for 2015-2016 relative to the evaluation criteria in the Council Operating Procedure ([COP 19](#)) on EFPs. The following discussion focuses on the technical merits of the EFPs. The Council's final decision will have to consider the availability of overfished species relative to the 2015-2016 harvest specifications, among other things.

The Council will adopt set-aside amounts to be deducted from the annual catch limits (ACLs) or annual catch target (ACTs) under Agenda item H.10. The total set-aside amount will include the amounts reserved for EFPs approved under this agenda item. A table of requested impacts by species and EFP is included for reference; however, no species-specific discussion on appropriate EFP bycatch limits is included (Table 1).

A primary requirement of EFPs is the evaluation of fishing gear or management measures that can be transferred into regulation and eventually applied fleet-wide. EFPs that rely upon operator experience, skill, or abilities that cannot be harnessed through a regulation or readily replicated by other fishermen, fail to meet this requirement because the resulting bycatch rates may differ from those estimated in the EFP.

The applications for 2015-2016 EFPs submitted for the advance briefing book are renewals of EFPs issued for 2013-2014. Therefore, comments found in our 2011 statement ([Agenda Item E.3.b. Supplemental GMT Report, November 2011](#)) still apply. One additional application for a new EFP was included in the supplemental briefing book materials ([Agenda Item H.2.b., Supplemental Attachment 6](#)). The GMT had a great deal of discussion on that application. A summary of those discussions is summarized below.

The GMT had some additional discussions about the overall goals of the EFP program. The team notes that we have seen some EFPs applied for over multiple cycles. One of our concerns is how many times should an EFP be renewed, before either moving into the regulatory process or ending. The GMT had some discussion about if performance metrics should be put into COP 19 to address these questions. However, we do not see this as needing to be done immediately (i.e. this cycle), but we present these thoughts for future consideration.

EFP Renewals

Evaluation of an epibenthic trolled longline to selectively catch chilipepper rockfish (*Sebastes goodei*) off California – Kathy and Steven Fosmark

The goal of this EFP (Agenda Item H.2.a., Attachment 2) is to evaluate the effectiveness of a species-selective longline fishing technique; it fishes a gear designed to target abundant

chilipepper rockfish and avoid overfished species. This application is identical to the final application submitted to NMFS for their 2013-2014 EFP. Therefore, based on the previous review of the technical merits of the application, the applicants' responses to previous requests, and the previous issuance of this EFP, the GMT recommends that it go forward for public review.

The GMT notes that while the requested set-aside amounts are identical to what was requested for 2013-2014, the Council adjusted those set-asides in final action based on recommendations by the Groundfish Advisory Subpanel (GAP) ([Agenda Item E.3.b, Supplemental GAP Report, November 2011](#)). Many of the amounts they recommended were adjusted either up or down for consistency among EFPs and to ensure that set-asides encouraged focus on the intended target species and not associated species (see table below). The GMT also notes that the project could harvest, though in small amounts, other species for which set-asides have not been requested. For those species or species groups, the GMT recommends that trip/cumulative limits should apply for those species or species groups (e.g. open access trip limits would apply for vessels fishing commercially but not registered to a limited entry permit).

Yellowtail rockfish jig fishing off California – San Francisco Community Fishing Association

The GMT would like to extend thanks to Barbara Emley for coming to speak with us, for the presentation of results of their project to date, and for being available for questions.

The goal of this EFP (Agenda Item H.2.a., Attachment 4) is to evaluate the effectiveness of a species-selective commercial hook and line gear; it fishes jig gear designed to target abundant yellowtail rockfish and avoid overfished species. This application is identical to the final application submitted to NMFS for their 2013-2014 EFP. Therefore, based on the previous review of the technical merits of the application, the applicants' responses to previous requests, and the previous issuance of this EFP, the GMT recommends that it go forward for public review.

During development of the 2013-2014 terms and conditions for this project, NMFS revised the location of fishing slightly so that the depth restriction was defined by latitude/longitude coordinates and were enforceable (from 35 fm depth contour to the boundary line that approximates the 30 fm depth contour). NMFS also worked with Cordell Bank National Marine Sanctuary staff to delineate other discrete closed areas to protect hydrocorals. The GMT recommends that the proposed location of fishing and applicable maps and figures in Agenda Item H.2.a., Attachment 4 be updated, if appropriate.

The GMT notes that while the requested set-aside amounts are identical to what was requested for 2013-2014, the Council adjusted those set-asides in final action (see table below) for the same reasons as discussed above.

New EFP

Supplemental Application from Giuseppe Pennisi and Jiri Nozicka (F/V San Giovanni) which proposes to use electronic monitoring (EM) without an observer in the shorebased IFQ bottom trawl fishery

The GMT would like to extend thanks to Jiri Nozicka for coming to present their EFP proposal and for being available for questions.

This EFP ([Agenda Item H.2.a., Supplemental Attachment 6](#)) is intended to “allow PFMC, NMFS to advance in its development of the current Electronic Monitoring (EM) program for the groundfish fishery by allowing the current system to follow real, at sea data from limited number of vessel(s)”. Some on the GMT agreed that evaluating EM with and without observers on board may be necessary to tease out potential observer impacts to fishing behavior. It was also noted that the Pacific States Marine Fisheries Commission (PSMFC) may be testing this particular concern and this EFP may be a natural extension of PSMFC’s research. In discussion with Mr. Nozicka, he informed the Team that Mr. Dave Colpo from PSMFC had confirmed staff time to review the EM products that could come from the F/V San Giovanni. He also informed us that four other vessels expressed interest in participating in an EFP what would utilize EM.

The GMT did review the contents of this application based on the criteria and questions in [Council Operating Procedure 19](#). There are many of the EFP applications protocols and guidelines which have not been met including: submitting the application by the advanced briefing book deadline or two weeks prior to the Council meeting; completeness of the application; description of data collection methodology; information on the number of vessels participating, information on the infrastructure in place to administer, monitor, and analyzed the project; and coordinate with appropriate federal and state agencies, among others. During the presentation to the GMT, the applicants did provide more information and answered questions, however there is still information missing which prevents the GMT from fully evaluating the technical merit of the application.

It should be noted that this EFP application is not requesting any set-asides. All impacts will be accounted for with the vessel(s) IFQ and trip limits for non-IFQ species, so if this application/project were considered at a later date, it would not impact the EFP off-the-top set-asides being analyzed and accounted for in the biennial harvest specifications and management measures process.

It is also the GMT’s understanding that under the Electronic Monitoring (EM) agenda item at this meeting, the Groundfish Electronic Monitoring Policy Committee report will recommend that an EFP be explored to test EM, possibly beginning in 2014. If that recommendation is pursued, the GMT would encourage the applicants to work within that process, so that all EM EFPs are consistent and the results applicable across a larger swath of the fleet.

Therefore, the GMT recommends that this EFP moves forward within the EM pilot project process as this may help to align the goals of this EFP with the goals of the EM process. However, if the Council would like to move this EFP forward as part of the 2015-16 EFP

process, the GMT recommends that the applicants refine their project proposal and application and bring it back to the GMT in March 2014.

Progress reports on 2012 EFPs

The GMT reviewed the three progress reports submitted for 2013-2014 EFPs that are contained in the briefing book materials. The GMT would like to thank the EFP applicants for submitting the progress reports. We do not have any further comments on the content of the progress reports at this time.

The GMT has been notified that participants in the yellowtail 2013 EFP have encountered 2 yelloweye (16 pounds) out of their 3 fish (~23 pound) limit, and therefore have ceased fishing for this year so as to not exceed the limit. The EFP holders may be requesting additional set-aside for yelloweye rockfish for 2014 during inseason, and for their 2015-16 application. The GMT does not have a recommendation on changing the set-aside, we see that as a Council policy decision.

GMT Recommendations:

- 1. The two renewal applications are essentially identical to what was reviewed and approved for 2013-2014, therefore the GMT recommends forwarding them for public review.**
- 2. The GMT recommends that this EFP moves forward within the EM pilot project process as this may help to align the goals of this EFP with the goals of the EM process. However, if the Council would like to move this EFP forward as part of the 2015-16 EFP process, the GMT recommends that the applicants refine their project proposal and application and bring it back to the GMT in March 2014.**

Table 1. Proposed Impacts on Overfished Species by Applications for 2015-2016 EFPs, in Metric Tons

	Species	Fosmark	SFCFA	San Giovanni	Total EFP Requests	2014 Council approved set-asides

Other Fish e	1.000	1.000	2.000	3.000

- = **no impacts requested**

a values taken from 2009 EFP statement, with an increase in widow to account for new stock assessment

b non-overfished non-target species are roughly 2 bi-monthly OA trip limits for each of 4 vessels

c all impacts will come from quota pounds of applicants, except for non-IFQ species

d there are yelloweye impacts in attachments 1 and 2 however they round to less than 0.1 mt (0.023 mt for each one, totaling 0.045 mt)

e 1.0 mt put in as a place holder

Dear panel members,

Please consider this letter as a formal request for the Experimental Fishery Permit for Electronic Monitoring System for our vessel the San Giovanni(fed#244706) under the Catch Share management program.

During last several years we have adjusted our fishing gear and methodology to maximize our catches for our markets while minimizing our discards and utilizing our own portfolio of allocations.

It is very critical for us to remain in our part of the coast to truly maximize the knowledge of our fishing grounds and to be able to stay in contact with our past fish buyers to also maximize the retention of our catches.

Our vessel is a 60 ft X 18ft. Our deck space is over 20ft long with a plenty of space for extra equipment.

About 80-90% of our fishing time is spent in the DTS complex in the depths ranging mostly between 300-400 fathoms. During last couple of years our discards during these tows were very minimal and consisted mostly of Tanner crab, deep water Sea stars and deep water Sharks. Rest of our fishing effort is being done predominately in flat sandy areas of our coast targeting mostly Sand dabs and Petrale sole. These tows are usually made during last(return) parts of our trips. When we are successful in catching decent amount of sand dabs we are using short sorting tables to sort out our catch and slide the discarded fish directly from the slides to the observers baskets. In the past we have even sorted most of the discards by species. We can do the same in the case of the EM setup. Most of other fish(larger rock fishes, crab, Skates..) than flatfishes are pulled aside and sorted before they are being shoveled onto the sorting slide. During this process the different flatfishes can be put in separate discard baskets and either weighed or estimated by weight prior to discarding. If it would be necessary during the EFP or the initial period of the EM we are willing to maximize our retention by bringing all groundfish to the docks to make this initial process more reliable. I would like to stress out that even though we are trying to avoid catches of unmarketable fishes it sometimes does not mean that we are always successful at it. We can catch larger quantities of smaller fishes, and we are forced to discard most of them. But we would be willing to undergo the extra work to accommodate these initial challenges.

Regarding of the catches of constraining species, we can bring all rock fishes to the docks to be documented there.

In this letter I am including our last and this years catch and discard data. As you can see in these prints we have been considerably successful in fulfilling the goals of the CS program. But also, as I have mentioned above, during our trip on March 2nd 2013 our discards were much higher than usual. Trips like that do not happen often as you can see, but they will occur from time to time and will affect the vessel and its operations success.

Please consider this letter as a offer of our expertise in helping to establish better and more flexible monitoring system for the West Coast grounfish fishery. If you have any questions rearding of this letter, our vessel or any part of our operation, please feel free to contact me any time.

Thank you,

Jiri Nozicka

NORTH COAST FISHERIES, INC.

P.O. Box 8219 • Santa Rosa, CA 95407
Telephone: 707-579-0679 • Fax: 707-579-0361

Dear supervisors and board members:

I have very large concerns over the current federal monitoring system of ground fish vessels. I am in total support of monitoring all catches and using what is caught, however I have seen countless trips cancelled due to the lack of ability to get an approved said monitor on the vessel for the fishing trip.

I have seen smaller vessels that are not adequately set up to accommodate this extra body safely completely give up and retire out of the business or fold up their operation. ***This was not the objective of federal monitoring and needs to be addressed immediately.***

We cannot afford to have more consolidation and more true independents leave the business. The larger vessels further north in Oregon and Washington *many of which have deep company strings tied to them have had less struggles getting monitors aboard than have the vessels in California.* This is due to more vessels and more monitors in the area. It is putting Oregon and Washington at a great and unjust advantage over California vessels and California Based processors of which there are only a small handful to begin with.

It seems to me that in this modern world it should be a quite easily improved system by using electronic monitoring whereby when the motor is fired up monitoring is also fired up. I know this can be done and wonder why this was not implemented as the top choice in the first place. Fishing is dangerous and less bodies on the vessel is a preferred way to go.

Financially I can only say that multiple trips have been cancelled due to lack of availability of these monitors, millions of pounds of fish have ***Not*** been caught, processed, and sold to markets and this is a ***loss of millions of dollars to the economy.*** Can we really sit idle and wait for a better solution while the vessels that now exist starve to death financially? I have a crew of 45 workers that would like this resolved, we have several vessels that we buy the product from that would like this resolved and we need your help and some appropriate pressure applied to right this wrong. ***California fisheries are every bit as important as Washington, Oregon, and even Alaska it is about time we started getting treated as such.***

Sincerely,

A handwritten signature in dark ink, appearing to read "Michael T. Lucas".

RE: Support for Fee Waiver: FOIA Request, Tracking # DOC-NOAA-2013-0001206

Dear Dr. Stein,

Monterey is one of the West Coast's most historic fishing ports, yet the City has been severely challenged to maintain our fishing infrastructure, and to preserve the economic and cultural benefits that our fisheries contribute to the City. Until recently, there has been only one bottom trawl vessel landing groundfish in Monterey—the "San Giovanni". This vessel has participated in NOAA's NMFS West Coast Trawl Catch Share Observer program. However, the owner and operator of this vessel have been informed by the observer program contractor, Alaska Observers, Inc, that they will no longer provide observers for this vessel due to allegations that the vessel is unsafe, a charge which is strongly disputed by the vessel owner. Further, according to the San Giovanni operator, the observer contractor intimated that the contractor was not finding it profitable to provide services to Central California, as there are so few trawl vessels.

This situation effectively puts the San Giovanni out of business, but also has large consequences for our community. Monterey is just completing a Community Fisheries Sustainability Plan, in which the need to preserve the groundfish fishery is a key recommendation. The City is also supporting the development of a Community Quota Fund, now in its early stage, as a way of securing groundfish quota in our region. The loss of observer coverage to the remaining trawl vessel, or Central California, would be an unexpected and significant setback for the groundfish fishery, but also could undermine the success of the Catch Share system generally. As it stands, the community has had no trawl landings since early May, 2013.

The Freedom of Information Act request seeks information that would shine the public light on the reasons the observer contractor is refusing to serve the San Giovanni. It is only with transparent information as to the rationale for this decision that the vessel owner, the City, and NOAA, can determine a course of action. It is for these reasons that the City of Monterey supports the request that the administrative/copying fees for this FOIA be waived.

Regards,

Chuck Della Sala

My name is Jiri Nozicka. I am the current operator of the F/V San Giovanni. The F/V San Giovanni(Fed# 244706) has been operating out of port of Monterey under the West Coast Trawl Catch Share Program since the programs launch in 2011. Due to the shortage of observers we are now being forced out of the Catch Share program entirely until at least next spring at best.

The F/V San Giovanni have been the only bottom trawl vessel operating out of Monterey's Harbor for last 8 years and the only vessel providing local catches of groundfish for local markets and the only vessel working with the Royal Seafoods co. which has been so greatly affected by this problem, that it's owners are considering shutting their operation completely. The Royal Seafood is the only licensed Catch Shares first receiver in Monterey.

The F/V San Giovanni have also worked for the North Coast Fisheries, where most of our catches were processed in last 5 years. Their operation is also being affected by our vessel not being able to bring our catches to them as well. As I learned from their representative, one of their other boats from Fort Brag had a very difficult time finding observers for many fishing trips trough last and this year. This problem is seems to getting bigger and I am afraid it can get worse.

We fully understand and accept the need of the 100% data monitoring requirement for the success of the Catch Share program, but under current circumstances and conditions the status quo actually threatens the very existence and the future of our industry and its infrastructure in our and other similar ports and possibly the rest of California.

Having said all this, I understand the challenge that more flexible and small port and small operator friendlier monitoring system might be to developed and establish, but this might be the exact time to try to bring it in to existence.

Our vessel have been recently scheduled to install a electronic monitoring equipment aboard, I understand that the Archipelago co. is really confident in accurate monitoring aboard of bottom trawl vessels. I also understand that council is considering an Experimental Fishing Permit for electronic monitoring aboard of bottom trawl vessels within the Catch Share program.

I personally would like to ask you to consider implementing the Electronic monitoring and I would like to request that our boat will be selected to demonstrate how the electronic monitoring without the observer aboard can be successful in accurate monitoring of our fishing operation

I am very confident in our ability to provide good and reliable process aboard of our vessel, to make the monitoring process easy, accurate and reliable. We can assure you that we will provide the best service for this program, to ensure future success for our industry. I would also like to bring to your attention the possible problems regarding of the catch monitor positions, because even if we will have success in launching of the electronic monitoring, we will most likely face challenge in searching for the catch monitors for the offloading, unless there will also be cameras installed on the docks as well.

At last, I would like to thank you for your time and effort you have already put in resolving this issue, but I would like to stress one more time how urgent this is for the very existence and the survival of our operations and jobs in our area. It would be very unfortunate, if more full time, year around fishing operations like ours as well as small

ports like Monterey, would have to face the very hard choices of leaving the industry for a problems like this. We love to fish in our area and the way we do. We have been adjusting to the new management and we were becoming part of what you might call "boutique fisheries" on our coast. Most of us, who are left, do smaller volume fishing and are focusing on developing more direct and higher quality and value marketing. Our industry is changing and we need your help in matching the management and the monitoring system to the real situations and problems in our world that might differ from the areas in Oregon and Washington. I firmly believe, that this situation can bring the needed changes and it will actually help the industry in the long term. I would like to offer you my help and expertise in solving this issue for the better end. Please consider our plea, and our commitment.

Thank you

Sincerely

Jiri Nozicka

SABLEFISH PERMIT STACKING PROGRAM REVIEW SCOPING

The limited entry fixed gear (longline and fishpot) sablefish permit stacking program is a type of catch share program. At its September 2013 meeting, the Council considered a draft calendar that called for completion of a review (Phase 1), followed by consideration of potential program changes identified during the review (Phase 2). However, the Council decided to include one issue in the Phase 1 review of this program: consideration of a change in the way control is determined for the purpose of assessing the three-permit control limit. At the end of the meeting, under workload planning, the Council decided to solicit comment for this meeting on other potential changes the public would like to see considered and, on the basis of the response, to determine at this meeting whether to roll the two phases together into a single deliberation process (Agenda Item H.3.a, Attachment 1 shows the calendar as currently envisioned). This solicitation was posted in a blog on the Council website and a direct mailing sent to all permit-owners and lease holders (Agenda Item H.3.a, Attachment 2).

In September NMFS presented an outline for the review document and has continued to work to refine the outline. Due to the Federal government shutdown, an updated outline is not available for the advance Council briefing materials. The main issue for the program review is an evaluation of the degree to which the program is meeting its original objectives. Council staff has provided a listing of potential indicators which may be useful in evaluating accomplishment of objectives (Agenda Item H.3.a, Attachment 3).

Council Action:

- 1. Decide which additional potential program changes should be considered in Phase 1 and whether or not a second phase should be planned to cover any issues not included in Phase 1.**
- 2. Provide guidance on the indicators which may be helpful for evaluation of the issue of programs performance with respect to the original program objectives.**

Reference Materials:

1. Agenda Item H.3.a, Attachment 1: Sablefish Permit Stacking Review Calendar.
2. Agenda Item H.3.a, Attachment 2: Notice soliciting comment on potential changes for the program.
3. Agenda Item H.3.a, Attachment 3: Limited Entry Fixed Gear Sablefish Permit Stacking Program – Indicators For Evaluating Program Performance.
4. Agenda Item H.3.c, Public Comment.

Agenda Order:

- a. Agenda Item Overview
- b. Reports and Comments of Advisory Bodies and Management Entities
- c. Public Comment
- d. **Council Action:** Identify Issues and Alternatives for Consideration of Changes in the Sablefish Permit Stacking Program

Jim Seger

SABLEFISH PERMIT STACKING REVIEW CALENDAR

	Council's Review Activity
September	<ul style="list-style-type: none"> • Approve calendar for review process. • Decide on need for and composition of advisory body(ies). • Provide guidance on report outline and content, including identification of an initial list of issues for particular attention in the review.
November	<ul style="list-style-type: none"> • Decide on which additional program changes should be considered in Phase 1 and whether or not a second phase will be required. • Provide further guidance on report content, including finalizing issues for particular attention in the review.
Winter 13/14	<ul style="list-style-type: none"> • Develop draft program review document. • Hold advisory body review of preliminary draft program review document.
April	<ul style="list-style-type: none"> • Adopt draft program review document for public review. • Consider a draft range of alternatives for assessing control of limited entry sablefish tier permits.^{a/}
June	<ul style="list-style-type: none"> • Adopt final program review document. • Adopt final preferred alternative to address the permit control issue. • Prioritize issues identified for possible Council action in Phase 2 of the process and adopt calendar for consideration.^{b/}

a/ Under the sablefish program review item in September, the Council directed that if any concerns come up around implementation of the Council's previous action on trawl/fixed gear permit stacking that these issues be brought back to the Council at its April 2014 meeting. This issue originally came up as a trawl catch share program trailing action item and was presented by NMFS in September under both the fixed gear program and trawl trailing actions. If this issue comes back to the Council for some reason, a determination will be made as to the most appropriate agenda item for addressing it.

b/ At its November 2013 meeting, the Council may decide not to schedule a second phase.

Pacific Fishery Management Council

NOTICE

FOR IMMEDIATE RELEASE

September 30, 2013

CONTACT: Mr. Jim Seger

503-820-2416

***Public Comments Sought on Possible Changes for the
Trawl Fixed Gear Permit Stacking Program
Deadlines: October 9, 2013 and October 21, 2013***

For its upcoming November meeting, the Pacific Fishery Management Council (Pacific Council) is asking the public to identify any and all potential changes that may be desirable for the limited entry fixed gear permit stacking program.

The Pacific Council has initiated a review of this program and as part of the review will be reconsidering the means by which control is determined for the purpose of applying the three permit limit on the maximum number of permits controlled. At its November meeting, the Pacific Council will decide whether to add other potential changes to the review or to consider other changes during a second phase of the process. If only minor additional changes are identified, they might be wrapped into the actions taken through the review process, and there would be no second phase. If more significant changes are identified, a second phase may be scheduled.

Comments on potential changes to the fixed gear permit stacking program should be provided by midnight (11:59 p.m.) October 9 to be included in the briefing book materials provided in advance of the November Council meeting and by midnight (11:59 p.m.) October 21 to be included in the supplemental materials provided at the meeting.

FOR IMMEDIATE RELEASE
September 30, 2013

PACIFIC COAST GROUND FISH FISHERY **Limited Entry Fixed Gear Sablefish Permit Stacking Program Review**

NOAA Fisheries and the Pacific Fishery Management Council (Council) are responsible for the conservation and management of fisheries in federal waters (3-200 nm offshore) off the U.S. West Coast. Together, they are conducting a review of the Pacific Coast limited entry fixed gear sablefish permit stacking program. At its November meeting, the Council plans to address the list of potential action items (program changes) that will be considered during the review process and is seeking public comment on changes that should be covered.

Need for a Program Review

Twelve years have elapsed since implementation of the Sablefish Permit Stacking Program, a type of individual fishing quota (IFQ) program. A review would evaluate whether the program is functioning as originally intended and whether it has met the goals and objectives of Amendment 14 to the Pacific coast groundfish fishery management plan (FMP), the overall FMP, and the Magnuson-Stevens Fishery Conservation and Management Act (MSA). In addition, a review would also identify any potential modifications or improvements to the program. A program review is consistent with the requirements in 303A of the MSA, to have periodic reviews of limited access privilege programs (LAPPs).

Program Review Process

This program review was first discussed by the Council at its September 12-17, 2013 meeting in Boise, Idaho. At this meeting, the Council adopted a calendar for the program review, please see page 3 of the Council Meeting Decision Summary Document for more information:

<http://www.pcouncil.org/wp-content/uploads/0913decisions.pdf>.

For its November 1-6 meeting in Costa Mesa, California, the Council is seeking public comment on the issues that may be considered as part of the program review process. Comments on potential changes to the permit stacking program should be provided by midnight October 9th to be included in the briefing book materials provided in advance of the November Council meeting and by midnight October 21st to be included in the supplemental materials provided at the meeting.

Over the 2013-2014 winter, NOAA Fisheries and Council staff will draft program review documents for the Council's April 5-10, 2014 meeting in Vancouver, Washington.

Potential Issues for Inclusion in the Review

Some of the issues we are considering for inclusion in the review document are given below. We welcome comments on these and additional issues:

- Are the primary ports for sablefish landings (both primary season landings and landings made in the daily trip limit (DTL) fishery) providing benefits to the same fishing communities that benefitted before the program was implemented, or to different fishing communities?
- How much permit stacking is occurring overall? By port? By vessel?
- Is there still a reason to hold an April-October primary season, or could it occur year-round, like the DTL fishery?
- Can we improve catch accounting between the sablefish primary fishery and the limited entry sablefish DTL fishery, and for the different permit tiers, by moving to an electronic fish ticket system?

- How can this program meet the MSA requirement for cost recovery?
 - What fishery-entry costs affect people who want to participate in the fishery?
 - Are the limits on the number of permits that may be owned and/or held by an individual or entity still useful? Should it be changed?
 - Is the owner-on-board requirement still useful? Should it be changed?
 - How do this program's regulations interact with the regulations that affect the rationalized groundfish trawl fishery? For example, how well do the two programs work to integrate requirements for catch accounting, observer monitoring, and registering more than one permit to a vessel?
- Note: the Council has already taken action on trawl rationalization, so any review of the trawl rationalization regulations will focus only on how they interact with limited entry fixed gear sablefish regulations.

If you are interested in reading more about this program review, briefing book documents from the September 2013 Council meeting may be found at the following website under "Agenda Item G.2: Sablefish Permit Stacking Program Review":
<http://www.pcouncil.org/resources/archives/briefing-books/september-2013-briefing-book/#groundfishSeptember2013>

LIMITED ENTRY FIXED GEAR SABLEFISH PERMIT STACKING PROGRAM – INDICATORS FOR EVALUATING PROGRAM PERFORMANCE

This document contains the original objectives for the sablefish permit stacking program, as listed and discussed in Amendment 14 to the groundfish fishery management plan (FMP), and some possible indicators for use in evaluating performance against those objectives.

Objective 1

Rationalize the fleet and promote efficiency. Capacity reduction is one of the key elements of the strategic plan. The strategic plan generally approaches capacity reduction by reducing the number of fishing vessels. This reduction does not of itself imply the rationalization of the fleet or increased efficiency. It is possible that the most efficient fixed gear sablefish harvest could involve a greater number of vessels taking sablefish as bycatch in other fisheries. However, given the high degree of overcapitalization in the fishery, it is believed that a reduction in capacity will generally move the fishery toward greater efficiency, addressing National Standard 5 and FMP Objective 6.

Possible indicators:

1. Number of vessels in the fleet over time
2. Combinations of stacked permits and participation in trawl rationalization program (formatted as exemplified in Table 1).

Table 1. Number of vessels and allocations for various combinations of stacked permits, in 2012 [Key: white = 3 permits stacked, grey = 2 permits stacked, black = 1 permit (no permits stacked)].

Number of Permits Stacked, By Tier			Relative Total Allocation for the Permit Combination	Number of Vessels			Per Vessel Pounds Represented by This Combination of Tiers	Per Vessel Percent of Fleet Total Represented by This Combination of Tiers	Percent of Total Represented by All Vessels With This Combination of Tiers	Share of Trawl Quota Pounds Acquired by These Vessels
Tier 1	Tier 2	Tier 3		Vessels Stacking Only Longline Permits	Vessels Stacking Only Pot Permits	Vessels Stacking Both Pot and Longline Permits				
3			11.55							
2	1		9.45							
2		1	8.7							
2			7.7							
1	2		7.35							
1		2	5.85							
1	1	1	6.6							
1	1		5.6							
	3		5.25							
	2	1	4.5							
1			3.85							
	1	2	3.75							
	2		3.5							
		3	3							
	1	1	2.75							
		2	2							
1			1.75							
	1		1							

Consider providing versions of this table for 2004 and 2008 (without the trawl quota column).

3. Graph the concentration of primary sablefish season¹ harvest among sablefish tier vessels in 1996, 2000, 2004, 2008, and 2012.
4. Gini coefficients for concentration of harvest among vessels in 1996, 2000, 2004, 2008, 2012.²
5. Economic Revenue: Overall level of economic revenue per vessel compared to total costs in 2008 (NWFSC, 2012, Figure 8) and compared to vessel market values (NWFSC, 2012, Table 35). Provide comparison to trawl in 2008. NOTE: More recent data may become available before completion of this review.
6. Permit Prices: Possibly available from NWFSC. Are there other sources for permit prices?
7. Economic Revenue: Overall level of economic revenue per vessel compared to total costs (NWFSC, 2012, Figure 8) and compared to vessel market values (NWFSC, 2012, Table 35).
8. Percentage of the limited entry daily-trip-limit (DTL) fishery taken by vessels with tier permits (2000, 2004, 2008, and 2012).

¹ The allocations to tiered permits are fished during the primary sablefish fishery, which occurs from April 1 through October 31. Permits without sablefish tier endorsements are able to fish under daily-trip-limit (DTL) regulations year round. Permits with tier endorsements are able to fishing in the DTL fishery prior to the start of the primary season and after they have caught their tier limit or after October 31st, whichever comes first.

² Gini coefficients are a numeric representation of a distribution among entities with zero representing a completely equal distribution and one representing a single entity with all of the distribution

Objective 2

Maintain or direct benefits toward fishing communities. This objective relates to National Standard 8 on fishing communities, and FMP Objective 17.

Possible indicators:

1. Port involvement (ratio of a port's fixed gear program sablefish landings to coastwide landings) and dependence (ratio of a port's exvessel revenue of fixed gear program sablefish landings to all other landings in the port) for 1996, 2000, 2004, 2008, and 2012.
2. Proportion of owner operators (NWFSC, 2012, Table 33).
3. Proportion of corporate and multiple partner owned sablefish permits over time.
4. Proportion of permits having transferred ownership at least one time (for evaluating phase-in of permit owner-on-board requirements).
5. Proportion of the fixed gear allocation harvested by year 1996-2012.

Objective 3

Prevent excessive concentration of harvest privileges. This objective relates to National Standard 4 on allocation, National Standard 8 on fishing communities, and FMP Objective 16.

Possible indicators:

1. Number of owners with multiples sablefish endorsed permits in 2012 (formatted as exemplified in Table 2).
2. Graph the ownership concentration of sablefish tier permit allocations in 1996, 2000, 2004, 2008, and 2012.
3. Gini coefficients² for ownership concentration of sablefish tier permit allocations in 1996, 2000, 2004, 2008, 2012.
4. Number of entities controlling³ sablefish endorsed permits, for 2012 (formatted as exemplified in Table 2).
5. Graph the control³ concentration of sablefish tier permit allocations in 1996, 2000, 2004, 2008, and 2012.
6. Gini coefficients² for control³ concentration of sablefish tier permit allocations in 1996, 2000, 2004, 2008, 2012.
7. Number of non-sablefish endorsed limited entry fixed gear permits owned by individuals who also own tier permits (formatted as exemplified in Table 2).

³ A permit is controlled by an entity if that entity has a partial interest in ownership of the permit or has a partial interest in the ownership of a vessel to which the permit is registered.

Table 2. Number of entities owning combinations of sablefish tier and non-sablefish fixed gear limited entry permits, for 2012.

	Number of Non-sablefish Fixed Gear Permits Owned				
Number of Sablefish Tier Permits Owned	None	One	Two	Three	Four or More
	Number of Permit Owners With This Combination				
None					
One					
Two					
Three					

Objective 4

Mitigate the reallocational effects of recent policies (3-tier system and equal limits).

This objective relates to National Standard 4 on allocation and FMP Objectives 13 on equitable allocation and 15 on minimizing disruption.

Leading up to the permit stacking program there were a series of policies which substantially flattened the distribution of harvest among vessels in the fleet. The last year of derby fishing was 1996. In 1997 equal cumulative limits were provided for all limited entry fixed gear permits qualifying for a sablefish endorsement. The first step toward restoring the prior distribution was the implementation of tiered cumulative limits in 1998. Each sablefish endorsed permit was assigned to one of three tiers based on its landing history. Tier 1 permits received cumulative limits 3.85 times that of Tier 3 permits and Tier 2 permits received cumulative limits 1.75 times that of Tier 3 permits. The final step in mitigating the reallocation effects was implementation of the permit stacking program in August 2001. This program allowed up to three tier endorsed permits and their associated tier limits to be stacked on a single vessel. The first full year of implementation was 2002

Possible indicators:

1. Graph the concentration of harvest among vessels 1996, 1997, 1998, 2002, 2012

Objective 5

Promote equity. This objective relates to National Standard 4 on allocation and FMP Objective 13 on equitable sharing.

Much of this objective was addressed through the re-establishment of the opportunity for a distribution of harvest among vessels similar to distributions present prior to imposition of equal cumulative limits in 1997 and similar to what is seen in many other fisheries. Another equity related issue is compliance. If some fishermen are not complying with the program they are often viewed as gaining an unfair advantage over other fishermen.

Possible indicators:

1. Graph the concentration of primary sablefish season harvest among sablefish tier vessels in 1996, 2000, 2004, 2008, and 2012.
2. Number of vessels landing amounts in excess of the limits associated with their stacked permits, by year (2002-2012).

Objective 6

Resolve or prevent new allocation issues from arising. This objective relates to National Standard 4 on allocation and FMP Objectives 13 on equitable sharing and 15 on minimizing disruption.

Since implementation of the permit stacking program in 2002, there have been a few calls for any changes to the allocations within the fixed gear sector. Most discussion and concern has been with intersector allocations, however, even during the Council's formal consideration of its groundfish allocations (Amendment 21) it was decided that there was not a sufficient need to examine reallocations of sablefish among sectors, relative to other workload concerns. Within the limited entry fixed gear sector 15% of the sablefish is set aside for a daily trip limit fishery. There has been some suggestion that this allocation and its management might be revisited but up until the time this program review was initiated the interest in modifications has not been sufficient to bring the topic onto the Council agenda.

Possible indicators:

Absence of strong calls for new allocations or reallocations within the limited entry fixed gear sector over the last 11 years (up until initiation of this review).

Objective 7

Promote safety. This objective relates to National Standard 10 and FMP Objective 18 on safety.

While the USCG keeps safety statistics it is only possible to isolate those statistics by date and area, not by the fishery in which the vessel was participating. At this time, it is not apparent that there is any direct information that might be useful in evaluating the safety record of the fleet before and after implementation of the fixed gear stacking program. Indirectly, the elimination of the derby fishery through extension of the primary season to seven months would be expected to reduce the pressure to fish under unsafe conditions.

Possible indicators:

Absence of anecdotal reports on safety problems associated with the primary fishery, particularly in comparison to concerns expressed during the derby fisheries of the mid-1990s.

Objective 8

Improve product quality and value. This objective relates to National Standard 5 on efficiency and FMP Objective 6 on net national benefits.

Changes in exvessel price are strongly driven by markets but might also indicate a change product quality. Most informative might be a price comparison of the difference between fixed-gear-caught and trawl-caught sablefish during the derby relative to the difference in prices between these gears after the implementation of the permit stacking program. A widening gap might indicate an improvement in the quality of fixed gear caught sablefish.

Larger fish generally bring higher prices (might be considered a higher “quality”). Size of fish landed may be increased by gear selectivity or highgrading.

Possible indicators:

1. Compare prices of trawl caught, longline caught, and pot caught sablefish (holding fish size and time of year constant), by year for 1994-2012.
2. Compare size distributions of sablefish landed with fishpot gear and with longline gear, by year for 1994-2012.

Objective 9

Take action without creating substantial new disruptive effects. This objective relates to FMP Objective 15 on minimizing disruption.

This objective was achieved with program implementation by allowing fishermen to acquire and stack permits rather than directly changing the allocation among permits.

Possible indicators:

Absence of anecdotal reports on disruptions in the fleet and communities under the stacking program, particularly in comparison to concerns expressed during the derby fisheries of the mid-1990s.

Objective 10

Create a program that will readily transition to a multimonth IQ program. This objective relates to capacity reduction recommendations in the strategic plan. Where individual quotas are transferable and divisible they address National Standard 6 by providing the fleet with substantial flexibility to respond to changing conditions in the fishery and National Standard 5 by taking efficiency into account. FMP Objective 6 is also addressed.

At the time it was implemented, the permit stacking program transitioned to a multimonth catch share program. As pointed out in the discussion of this objective, divisibility could be added to the program to increase achievement of at least some National Standards and FMP objectives. However, this might diminish achievement of other standards and objectives. Net effects would have to be assessed as part of the deliberations on such a change. To date, there have been no moves to consider allowing the sablefish tiers to be separated from permits and divided into smaller units, such that the permit stacking program would resemble a more typical individual fishing quota (IFQ) program. While there have been no moves to make a transition, the objective was to create a program that could readily make such a transition, not necessarily to make the transition. The existence of an already implemented allocation among permits addresses one of the major challenges for new catch share programs (the initial allocation). On that basis, this objective might be considered to have been met.

Possible indicators:

1. An evaluation of the programs ability to transition to a more typical IFQ Program.
2. The presence/absence of policy development to make a transition to a more typical IFQ program.

ENFORCEMENT CONSULTANTS REPORT ON SABLEFISH PERMIT STACKING PROGRAM REVIEW SCOPING

The Enforcement Consultants (EC) has reviewed the documents pertaining to agenda item H.3 Sablefish Permit Stacking Program Review November 2013 and has the following comments:

As reported at the September Pacific Fishery Management Council (Council) meeting in Boise Idaho, the EC's primary concern for this fishery is catch accounting. Under the current system, when a sablefish fixed gear tier delivery is made, the delivery by regulation is recorded on a state fish ticket. One to three tiers may be delivered and recorded on this one trip ticket. If not specified by the operator, the delivery is apportioned to the individual tiers (up to 3) by an even split until the tiers are reduced to a point where they are equal to or less than the daily-trip limits (DTLs). All of this tabulation is done by the state agency(s) and then sent to Pacific States Marine Fisheries Commission (PSMFC) for entry into Pacific Fishery Information Network (PACFIN).

We remain concerned that the current reporting system creates an environment that provides limited access to data by officers, does not allow for the tracking of landings for vessels that fish in multiple states, and is limited in its ability to provide accurate landing data for permit transfers. This creates a situation where at sea boarding or dockside inspection can do little besides checking the permit status, but has no real time information on the actual status of the tier(s) being fished.

We heard from Ms. Culver that Washington requires the tier permit number be listed on the state fish ticket and that Washington enforcement and management personnel have ready access to the Washington State landing data. As a result, Washington can accurately track landings made within their state. But for Oregon and California, this is not the case.

Unlike Washington, in Oregon and California there are no state regulatory requirements for the tier permit number to be listed on the state fish ticket. Since inception of the tier program, there has been a voluntary request made to the state agencies to list the federal permit number on the state ticket. To the extent the voluntary request is working is a matter of conjecture, but the reality is that Oregon and California cannot, when asked, answer the question: What is the status of a given tier? To the extent that this is a West Coast fishery, and that a Washington registered vessel may have made a delivery in California or Oregon, Washington enforcement personnel have incomplete information as well.

Can Office of Law Enforcement (OLE) or state enforcement personnel request information from their individual states or from PACFIN? Yes, but the process is laborious, time consuming, dated, and most importantly, does not lend itself to making information available to an agent or officer working in the field 24/7 performing patrol related activities. Contrast this with the trawl rationalization catch accounting system with its web based access to near real time accounting of individual fishing quota (IFQ) vessel accounts, inclusive of PSMFC e-ticket landings data. The EC believes the timeliness of data and access to the PACFIN data could be greatly improved through a Federal regulation requiring all tier deliveries be recorded on a PSMFC E Fish Ticket. The E Fish Ticket program is now in its fifth year of implementation (2 years as an EFP, 3 years under trawl rationalization). Since inception of the trawl rationalization program over 9,000 IFQ

trawl deliveries have been made with 96% of the tickets reconciled and in the data base within 48 hours. Contrast this with the state paper system that can take weeks to months.

As envisioned, the tier permit(s) would be “loaded” with the appropriate pounds within an established corresponding vessel account. When deliveries are made, the operator would be required by rule to designate which tier said pounds should be applied too. As with the corresponding trawl rationalization IFQ data access that is currently enjoyed by all interested parties; the operator, tier owner, science centers, state and federal managers and enforcement would have access to tier delivery information, with no time lag or guessing whether the delivery is a tier delivery, under who’s permit, or is, in fact, not a tier delivery, but a DTL delivery.

The PSMFC E-Fish Ticket already has the appropriate fields and drop down boxed to accommodate this fishery. Washington, Oregon, and California allow “split deliveries” ergo, a trip being landed on multiple e-tickets. This feature will readily accommodate the existing owner on board requirement where the portion of the trip that is attributed to one or more tier permits would be recorded on separate tickets, with the owner of the permit signing the e-ticket as validation that he/she was truly on board during the trip.

The EC encourages the Council to take advantage of the investments made in your e-ticket program. We believe this proposal represents a vast improvement in catch accounting, and is in fact necessary to ensure compliance in this highly valued, highly regarded fishery.

EC recommendations:

- (1) Require all Limited Entry Fixed Gear Sablefish deliveries to be recorded on the PSMFC E Fish Ticket.
- (2) Use the IFQ Vessel Account System to load and track fixed gear sablefish tier deliveries.
- (3) Include analysis of these recommendations in the Phase 1 review.

PFMC
11/02/13

GROUND FISH ADVISORY SUBPANEL REPORT ON SABLEFISH PERMIT STACKING PROGRAM REVIEW SCOPING

The Groundfish Advisory Subpanel (GAP) heard presentations and reviewed materials from Mr. Jim Seger of the Council staff and Ms. Ariel Jacobs of NMFS. The GAP would like to thank staff for providing us with written analysis, and the extra effort involved in doing so, given the government shutdown.

We also appreciate that in addition to the *Federal Register* notice, in order to encourage maximum permit holder participation, the Council sent a notice to all permit holders regarding this agenda item.

For this meeting, the Council direction on this issue was to request the GAP make recommendations as to:

- 1) What potential changes to the program should be included in phase #1 review of the program?
- 2) What, if any, additional proposed program changes should go forward if there is a phase #2?
- 3) What information would be helpful in identifying whether the program has met its objectives?

The GAP noted that the main issue for program review is an evaluation of the degree to which the program is meeting its original objectives. At the September Council meeting, based on a request from industry, the Council decided to include in phase #1 a consideration of how “control and ownership” is determined for the purpose of assessing the three permit control limit.

We reviewed two documents from staff, “Potential Changes to Own and Hold Regulations” and “Potential Changes to Catch Accounting,” as well as the written public comment (1) submitted to the briefing book.

In regard to “Potential Changes to Own and Hold Regulations,” the GAP recommends the following alternatives for further analysis:

Alternative 1: Status Quo.

Alternative 2a: Only ownership of more than 20% of a vessel counts toward “holding.”

Alternative 2b: Only ownership of more than 30% of a vessel counts toward “holding.”

With Alternatives 2(a) and (b), the GAP recommends that there be a maximum of partial ownership in two (2) vessels only.

Alternative 1, 2(a), and 2(b) specifically address the “hold” issue raised by industry for vessels that participate in the fixed gear fishery on the West Coast and in the individual quota fishery in Alaska.

The GAP eliminated consideration of Alternative 3, 4, 5, and 6 as being too complex and/or likely to result in a far greater control/concentration of permits in one owner than was intended by the program.

In regard to “Potential Changes to Catch Accounting,” the GAP acknowledged enforcement’s concerns that for all of the fixed gear sablefish fisheries, the current regulations have resulted in an opportunity for under-reporting that is extremely high. As between the states, there are not uniform reporting requirements on the fish tickets. There exists confusion as to whether a delivery is a limited entry (LE)/daily-trip-limit (DTL) landing or a LE/Tier delivery and/or to which permit the landing is to be attributed.

The technology is readily available to modernize catch accounting in this fishery. All interested parties (i.e. owner, state and federal management, public, enforcement) would have access to delivery information without the current lag time and guesswork. The GAP recommends the following alternatives for further analysis:

Alternative 1: Status Quo.

Alternative 2: All Limited Entry tier deliveries be recorded on an electronic fish (EFISH) ticket.

Alternative 3: All Limited Entry Tier and DTL deliveries be recorded on an EFISH ticket.

Alternative 4: All imited Entry Tier, DTL and Open Access deliveries be recorded on an EFISH ticket.

The GAP also recommends that this potential change to the program and an analysis of these alternatives take place in phase #1 of the program review. Because of time constraints in the GAP meeting, only a subcommittee of the GAP reviewed Attachment 3 “Indicators for Evaluating Program Performance.”

In general, for each of the original program objectives, fixed gear LE representatives offered some suggestions for analysis by staff. These suggestions included: where to obtain permit price information, the extent to whether initial permit recipients remained in the fleet, the frequency of permit transfers from season to season, the extent of permit leasing and its costs, use of sablefish and halibut derby fisheries in Alaska as a proxy to assess improvements in safety, and relative price differences from time of the derby fishery to the current fishery.

The GAP also addressed the possibility of the Council proceeding with a phase #2 for possible changes to the fixed gear permit stacking program. There was a written public comment that suggested a fisherman be able to decide whether a landing was a DTL landing or a tier landing at the time of delivery. Another suggestion from one GAP member was to eliminate the bimonthly DTL fishery, and re-allocate the DTL fish to both the tier sablefish-endorsed permit holders and those limited entry permit holders that do not have a sablefish endorsement, based on participation. There was another suggestion that the DTL fishery be eliminated, and the fish be allocated equally to all tier permit holders, with a portion set aside for a DTL for those that do not have a sablefish endorsement. The ramifications and details of these suggestions are not addressed in this statement. It was acknowledged by the GAP members that the consideration of any change in the DTL fishery and its allocation would involve most all of the issues that pertain to the establishment of a new individual quota fishery. If the Council were to consider any modifications of the DTL fishery, it is recommended that it be addressed in a Phase #2 process.

GROUND FISH MANAGEMENT TEAM REPORT ON THE SABLEFISH PERMIT STACKING PROGRAM REVIEW SCOPING

The Groundfish Management Team (GMT) would like to thank Mr. Jim Seger and Ms. Ariel Jacobs for their presentation on this agenda item.

The GMT reviewed the briefing book materials, two supplemental National Marine Fisheries Service (NMFS) reports, and public comments on the sablefish permit stacking program review (Agenda Items H.3.b, Attachments 1-3, Supplemental NMFS Reports 1 and 2, and Public Comment, November 2013). The GMT provides the following comments for the Council's consideration.

The GMT reviewed the indicators presented in Attachment 3 ([Agenda Item H.3.b, Attachment 3](#)) and supports the use of indicators for evaluating program performance, as this is a key component of the program review process. We appreciate the indicators developed and offer no additions.

The GMT agreed that the issues presented in [Agenda Item H.3.b, Supplemental NMFS Report 2](#), should be analyzed during this first phase of the program review. **The GMT recommends a requirement to record the Federal permit number(s) on the fish ticket be considered** and notes that this could be done in conjunction with recording fixed gear sablefish landings on e-tickets. This will reduce the opportunity for underreporting, and may also increase precision of how catch estimates are attributed to each sector of the fixed gear sablefish fishery (e.g., limited entry daily trip limit (DTL), open access DTL, and Tier fisheries).

The GMT also recommends that the range of alternatives shown in Supplemental NMFS Report 2 should be expanded to include paper fish tickets. Perhaps each alternative adds a sub-option utilizing paper fish tickets, for comparison (i.e., replace e-ticket with paper tickets under each option). We feel that the broader analysis is needed to reveal the costs and benefits of implementing e-tickets compared to paper fish tickets.

The GMT agreed, in general, that an evaluation of potential program changes (e.g., Phase 2) should move forward if issues are identified in the program review.

The GMT also considered [Agenda Item H.3.c, Public Comment](#) and notes that changes to sablefish fishery operations of this magnitude would require expansive changes to the methods used for catch accounting, as well as the methods to project harvest and recommend trip limits.

SABLEFISH PERMIT STACKING PROGRAM REVIEW: POTENTIAL CHANGES TO THE OWN AND HOLD REGULATIONS

Current Own/Hold Regulations

The Sablefish Permit Stacking Program was implemented through Amendment 14 to the Pacific coast groundfish fishery management plan (FMP). Amendment 14 limits permit ownership (by number of permits and by only allowing individuals to own permits) and provides an owner-on-board requirement intended to maintain the owner-operator character of the fleet, encourage local ownership of small businesses, and a connection between the fishing fleet and local coastal communities (Am 14 EA, p.33 & 38). The current own/hold regulations limit participants in this program to owning or holding three permits, whereby ownership or holdership of any percentage of a permit counts as 1 permit.

The ownership restrictions were outlined in the Amendment 14 EA (March 2001) as follows (summarized for space):

- The Council restricted the number of fixed gear sablefish permits owned by an individual to three permits.
- Exceptions were made for individuals who owned permits in excess of the limit as of November 1, 2000. These individuals were not allowed to accumulate more permits.
- An individual's ownership is calculated by summing the total permits for which an individual held some ownership interest, regardless of how small the percentage.
- At the time of final adoption of these provisions, the Council struck language that would have required permit owners to also have an ownership share in the vessel for which the permit was registered.

Regulations at 660.25(b)(3)(iv)(C)(2) specify the ownership restrictions listed above and also state that ownership interest from "holding" permits is counted towards the 3 permit limit in addition to owning permits. A permit holder is the owner of the vessel registered to sablefish permits. However, the implementing regulations (from Amendment 14a final rule, 66 FR 41152, p. 41155, changes from proposed rule) clarified that those "holding" permits should be included in the count towards the 3 permit limit, and was confirmed by the Council as what they had intended with Amendment 14.

Current Status of Permits

As of July 2013, there are a total of 164 sablefish permits, which are owned by 109 unique owners; 72 own just one permit, 21 own 2 permits and 15 own 3 permits, additionally 1 entity owns 4 permits. It's important to note that there are instances where some of these unique permit owners contain shareholders in common. However, most of the individuals owning 1 permit are either one individual or a husband/wife partnership. Approximately 45 permits are registered to vessels where the vessel owner does not own the permit.

The Issue

A motion made under Agenda Item G.2 at the September 2013 Council meeting "add[ed] a bullet under 'April' [to the program review calendar] to consider a draft range of alternatives for the

ownership and control of LE Sablefish tier permit issue as recommended in the supplemental GAP Report”. Due to the need to have a range of alternatives available for analysis over the winter, a draft range of alternatives is presented after the following description of the issue.

The 3 permit own and hold limit has created an issue for some permit owners who participate in both the Pacific coast sablefish permit stacking program and the North Pacific Fishery Management Council (NPFMC) managed Individual Fishing Quota (IFQ) Program for fixed-gear Pacific halibut and sablefish fisheries in and off of Alaska. Regulations for the Alaska sablefish IFQ program require that individual owners of catcher vessel quota shares (QS, vessel categories B, C, or D) be onboard the vessel during all IFQ fishing. An exemption to the owner on board requirement allows initial recipients of catcher vessel QS to employ hired masters to fish his or her IFQ, but only if the initial recipient owns a minimum of 20 percent interest of the vessel on which they hire a master to fish their IFQ permits. The regulations were structured in this way to maintain a predominantly owner-operator fishery. In order to harvest their QS under this exemption, participants in the Alaska sablefish fishery have invested in partial ownership of multiple vessels, some of which also harvest sablefish in the Pacific coast sablefish primary fishery. When vessels that are owned in part by QS holders in the Alaska IFQ program switch to fishing in the Pacific coast sablefish primary fishery, they find it impacts the owner’s sablefish permit count such that they are at, or may exceed the 3 permit own and hold limit in the primary sablefish fishery.

U.S. West Coast sablefish: May not have ownership interest in more than 3 endorsed permits

U.S. North Pacific halibut/sablefish: May have 20% ownership interest in up to five vessels. Must have 20% ownership interest to avoid owner-on-board requirements

Figure 1: Simplified schematic of ownership interest requirement differences for U.S. sablefish fisheries off West Coast and Alaska

Potential Range of Alternatives for Consideration

Alternative 1: Status Quo, the limit to own and hold is 3 permits. Any level of permit ownership would count as 1 permit towards limit of 3. Additionally, any permits registered to a vessel, wholly or partially owned by the entity, would count toward the three permit limit. Select permit owners are grandfathered in with more than 3 permits based on what they owned as of 11/1/00.

Any group ownership interest in the permit results in a permit count of 1 being attributed to each group member.

Example: The partnership of Mary and Mike Smith hold a tier permit. As a result, each have 1 permit towards the 3 permit limit, and the partnership also has a count of 1 towards the limit. Similarly, Group Z (owned by John Doe and his partners) has X% ownership of a vessel registered to the permit owned by Mary and Mike Smith. Group Z accrues a count of 1 permit held towards the 3 permit limit AND John Doe and each of his partners accrue a count of 1 permit held towards the 3 permit limit.

Another Example: John Doe owns GF0001 (a limited entry fixed gear sablefish endorsed permit). John Doe is the sole shareholder in Doe Inc. GF0002 is owned by Mary and Mike Smith.

Doe Inc. owns the vessel Fairweather and it is registered to GF0001 and GF0002. Doe Inc. is credited with a count of 2 and John Doe is credited with a count of 2 (owns 1 permit and holds 1 permit). (Mary and John each have a count of 1.)

Alternative 2a: Status Quo for permit ownership (any percentage ownership in a permit is a count of 1), however holding a permit is counted only if the vessel owner has a greater than 20% share.

Example: John Doe owns GF0001 and 20% of the vessel Fairweather. Fairweather is registered to GF0001 and GF0002. GF0002 is not owned by John Doe. John Doe has a count of 1 permit because he owns GF0001 but is not credited with a hold count for GF0002 because he only has a 20% interest in the vessel.

If John Doe owned 21% of Fairweather, then his own and hold count would be 2 because he owns GF0001 and owns more than 20% of the vessel registered to the second permit.

Alternative 2b: Status Quo for permit ownership (any percentage ownership in a permit is a count of 1), however holding a permit is only counted if the vessel owner has a greater than 30% share.

Example: John Doe owns GF0001 and 30% of the vessel Fairweather. Fairweather is registered to GF0001 and GF0002. John Doe has a count of 1.

If John Doe owned 31% of Fairweather, then his own and hold count would be 2 because he owns GF0001 and owns more than 30% of the vessel registered to the second permit.

Alternative 3: Maintain a three permit limit but calculate control based on percentage ownership of permits and vessels. Total ownership (permit ownership and holdership) is capped at 300%. 1st and 2nd generation owners would be limited to a total of 300 percent. (The intent being to limit total ownership to 3 permits which is status quo.)

Example: John Doe wholly owns GF0001 and 20% of the vessel Fairweather. Fairweather is registered to GF0001 and GF0002. John Doe has a count of 120%.

Another possible example: The partnership of Mike and Mary Smith own 3 permits. As such, Mike and Mary Smith, as a partnership, have 300% of total ownership, which is the limit. However, Mike as an individual has 150%, as does Mary.

Alternative 4: Increase the own and hold limit to 6 permits. Partial or any percent ownership or holdership is a count of 1 towards the limit of 6. (Permit counts are determined as under status quo.)

Example: John Doe owns GF0001, GF0003, and 20% of the vessel Fairweather. Fairweather is registered to GF0001, GF0002, and GF0004. John Doe owns 2 permits and holds 2 additional permits due to partial ownership of Fairweather for a total count of 4.

Alternative 5: Status Quo on permit owner (no one may own more than 3 permits unless grandfathered in). Cap the number of tier permits an entity may register to a vessel at 3. Cap the number of limited entry fixed gear tier vessels an entity can own at three. The maximum own and hold limit is effectively increased to 12 permits (an entity could own 3 permits and have partial or total ownership of three vessels each of which are registered to three different permits owned by others).

Example: John Doe owns GF0001, GF0002, and GF0003. Mr. Doe also owns 20% of the vessel Alpha, 10% of the vessel Beta, and 30% of the vessel Gamma. Alpha is registered to GF0004, GF0005, and GF0006; Beta is registered to GF0007, GF0008, and GF0009; and Gamma is registered to GF00010, GF00011, and GF00012. John Doe owns 3 permits and has partial ownership of 3 vessels that each hold 3 permits; his total count is 12. In this example, Doe could not register his own permits to any other vessels he owns beyond Alpha, Beta, and Gamma, but he could lease the additional permits out to other vessels. He has maxed out on the number of vessels he has an ownership interest in and they are in the primary fishery. Also, Alpha, Beta, and Gamma are at the limit of 3 permits registered to them during the primary season; they cannot remove a permit mid season and add a 4th permit.

Alternative 6: Status Quo on 3 permit limit, but the calculation is based only on ownership of permits; holding or leasing a permit/ ownership in the vessel would not count towards the 3 permit limit. A person could own 3 permits and hold any number of additional permits by registering the vessel(s) they own to permits owned or leased by other persons.

Example: John Doe owns GF0001, GF0002, and GF0003, and 20% of the vessel Fairweather. Fairweather is registered to GF0004, GF0005, and GF0006. John Doe owns 3 permits and his partial ownership of a vessel registered to other permits does not affect his own and hold limit; his total count is 3.

Table. Summary of Alternatives

Alternative	Cap	Permit Ownership	Holding (owning a vessel for which a permit is registered but not owning the permit)	Data Required
Alternative 1	3 permits	Status Quo (any part ownership of a permit counts as full control of the permit)	Status Quo (any part ownership of a vessel counts as full control over any permits associated with the vessel)	A list of permits and vessels in which an individual has any ownership interest.
Alternative 2a	3 permits	Status Quo	Only ownership of more than 20% of the vessel counts.	Requires submission of percent of ownership forms for vessels (as required for trawl – exception for owning less than a 2% interest).
Alternative 2b	3 permits	Status Quo	Same as 2a but use a 30% threshold.	Same as Alt 2a
Alternative 3	300% of a permit.	Control calculated based on percent ownership of vessel.	Control calculated based on percent ownership of vessel.	Same as Alt 2a
Alternative 4	6 permits	Status quo	Status quo	Same as Alt 1
Alternative 5	12 permits (3 owned permits and ownership in 3 vessels which may each have three permits)	Status quo	Status quo	Same as Alt 1
Alternative 6	3 permit ownership limit, no limit on number held for the vessels an individual owns.	3 Status Quo	N/A (no limit)	Same as Alt 1

Additional Considerations

- To what extent is holding or leasing a permit controlling it; how could this impact the owner-operator nature of the fleet?
- How will increasing the control limits affect those that are grandfathered in with exceptions to the current control limits?

- How will the alternatives affect data collection (i.e. time burden of filling out ownership interest forms)?

SABLEFISH PERMIT STACKING PROGRAM REVIEW: POTENTIAL CHANGES TO CATCH ACCOUNTING

The Issue

Under the current system, when a sablefish fixed gear tier delivery is made, the delivery by regulation is recorded on a state fish ticket. One to three tiers may be delivered and recorded on this one trip ticket. If not specified by the operator, the delivery is apportioned to the individual tiers (up to 3) by an even split until the tiers are reduced to a point where they are equal to or less than the daily-trip limits (DTL). All of this tabulation is done by the state agency(s) and then sent to Pacific States Marine Fisheries Commission (PSMFC) for entry into Pacific Fishery Information Network (PacFIN).

At the September 2013 meeting of the Pacific Fisheries Management Council (Council), the Enforcement Consultants (EC) report outlined several concerns with the existing reporting requirements. Their primary concern was that the opportunity for underreporting is extremely high under the current regulations, which defer to the states to report catch data and permit numbers on paper fish tickets, and enforcement agents often have little access to data that is often times severely outdated. This creates a situation where at sea boarding or dockside inspection can do little besides checking the permit status, because no real time information on the actual status of the tier(s) being fished is available.

Since inception of the tier program, there has been a voluntary request made to the state agencies to list the federal permit number on the state ticket. Washington requires the tier permit number be listed on the state fish ticket and Washington enforcement and management personnel have ready access to the Washington State landing data, for Oregon and California, this is not the case.

Unlike Washington, in Oregon and California there are no state regulatory requirements for the tier permit number to be listed on the state fish ticket.

Although federal or state enforcement personnel may request information from their individual states or from PACFIN, the process is laborious, time consuming, dated, and most importantly, does not lend itself to making information available to an agent or officer working in the field performing patrol related activities.

Draft Range of Alternatives

Alternative 1: Status quo. Under the current system, when a sablefish fixed gear tier delivery is made, by regulation, the delivery is recorded on a state fish ticket. One to three tiers may be delivered and recorded on this one trip ticket. If not specified by the operator, the delivery is apportioned to the individual tiers (up to 3) by an even split until the tiers are reduced to a point where they are equal to or less than the daily-trip limits (DTL). All of this tabulation is done by the state agency(s) and then sent to Pacific States Marine Fisheries Commission (PSMFC) for entry into Pacific Fishery Information Network (PacFIN).

Alternative 2: A Federal requirement that **all tier** deliveries be recorded on an E Fish Ticket. That Tier Permits be loaded into the IFQ Vessel Account System with deductions made as appropriate when a tier delivery is made and recorded on the E Fish Ticket.

As envisioned, the tier permit(s) would be “loaded” with the appropriate pounds within an established corresponding vessel account. When deliveries are made, the operator would be required by rule to designate which tier said pounds should be applied too. As with the corresponding data access that is currently enjoyed by all interested parties, for the IFQ program, the operator, tier owner, science centers, state and federal managers and enforcement would have access to tier delivery information, with no time lag or guessing whether the delivery is a tier delivery, under whose permit, or is in fact not a tier delivery, but a DTL delivery. The PSMFC E Fish Ticket already has the appropriate fields and drop down boxed to accommodate this fishery. Washington, Oregon, and California allow “split deliveries” ergo, a trip being landed on multiple e tickets. This feature will readily accommodate the owner on board requirement where the portion of the trip that is attributed to one or more tier permits would be recorded on separate tickets, with the owner of the permit signing the e ticket as validation that he/she was truly on board during the trip.

Alternative 3: A Federal requirement that **all limited entry permit sablefish deliveries (primary/tier and DTL)** be recorded on an E Fish Ticket. That Tier Permits be loaded into the IFQ Vessel Account System with deductions made as appropriate when a tier delivery is made and recorded on the E Fish Ticket.

Alternative 4: A Federal requirement that **all sablefish deliveries (primary/tier, DTL, and open access)** be recorded on an E Fish Ticket. That Tier Permits be loaded into the IFQ Vessel Account System with deductions made as appropriate when a tier delivery is made and recorded on the E Fish Ticket.

History Behind the Current Catch Accounting Process

At the time of implementation of Amendment 14, no federal regulations requiring fish ticket documentation of the groundfish permit number associated with sablefish landings in the primary (tier) sablefish fishery were enacted. Documentation of catch against tier limits and documentation of permit numbers was left to the states to implement.

The following is taken from the Amendment 14b final rule (71 FR 10614, 3/2/2006), comment & response section:

Comment 1: The Washington Department of Fish and Wildlife (WDFW) is in the process of a comprehensive, agency-wide review of potential changes to their state fish ticket system. In the interim, to respond to new regulations for the primary sablefish fishery, beginning in 2007, WDFW will require the Federal permit number to be entered into the state fish ticket field currently reserved for dealer’s use. This information, along with appropriate identifiers, would be captured separately from WDFW’s routine state fish ticket data entry, and subsequently, entered into Pacific Fisheries Information Network (PacFIN). WDFW will also require a separate state fish ticket to be filled out for sablefish catch attributed to each permit. The Oregon Department of Fish and Wildlife (ODFW) will record Federal permit numbers on state fish tickets, but is not able to modify their data system to enter and transfer that data into PacFIN at this time.

Response: As stated in the proposed rule (70 FR 59296, October 12, 2005), WDFW, ODFW and California Department of Fish and Game (CDFG) should require that Federal sablefish-endorsed permit numbers be written somewhere on the state fish ticket, as appropriate. It is beneficial to have these Federal limited entry sablefish-endorsed permit numbers entered into the PacFIN database so that enforcement agents could query a given Federal permit number and their

associated state fish ticket landings. However, until such time, having the Federal sablefish-endorsed permit number on the paper state fish ticket would allow hand searching by enforcement agents of paper state fish tickets for investigations.

NMFS is requesting this change to aid in enforcement of the owner-on-board provision and mid-season transfers. Adding a Federal sablefish-endorsed permit number to the state fish ticket is expected to aid enforcement agents by creating a record of which sablefish permit was being fished on a given fishing trip. Thus, if enforcement agents boarded a vessel at sea, they could record which owners were on board the vessel. At a later time, they could then verify which permit the sablefish landings were credited to on the state fish ticket and double-check that the owner of that permit was on board if the owner was not exempt from the owner-on-board provisions.

For mid-season transfers, a mid-season certification is required on the permit office form for enforcement purposes, because it is a means to associate specific amounts of landings to date with an aggregate amount reported on state fish tickets for a particular permit owner. If during a post-season audit of landings associated with a permit, the landings exceed the amount available to be landed on the permit, NMFS may begin enforcement proceedings against any party that had an ownership interest in the permit during the calendar year, including the vessel owner or operator.

Adding a Federal sablefish-endorsed permit number to the state fish ticket is expected to aid enforcement agents by creating a record of which sablefish permit is attributed to which state fish ticket. This system will allow enforcement agents to attribute overages of sablefish landings to the appropriate party.

Currently, only the CDFG has added a line for Federal permit information on their state fish tickets and enters that information into the PacFIN database. In the proposed rule, NMFS provided alternative ways to implement the owner-on-board and mid-season transfer provisions depending on whether or not WDFW and ODFW would require the Federal sablefish-endorsed permit number to be written on the state fish ticket and whether that information would be entered into PacFIN. NMFS understands that system and funding constraints make it difficult to change the state fish ticket system to provide information to PacFIN and to reprint the state fish tickets with a line for the Federal permit number. While the ability to pull state fish ticket data and permit information directly from PacFIN is ideal, it is not necessary to implement the owner-on-board requirement or mid-season transfers. As long as the Federal sablefish-endorsed permit number is required to be written somewhere on the state fish ticket, NMFS enforcement can audit state fish tickets, as needed, to determine whether the appropriate permit owner was on board the vessel or to determine a particular permit's catch. NMFS appreciates that WDFW and CDFG will provide Federal permit information into the PacFIN database. Because CDFG already requires the Federal permit number on the state fish ticket and because WDFW and ODFW will require it beginning in 2007, NMFS will implement the provisions of the sablefish permit stacking program that allows for mid-season transfers and requires only the owner of the sablefish endorsed permit being fished to be onboard the vessel while that permit is being fished. NMFS acknowledges that WDFW and ODFW will continue to work towards an improved state fish ticket system to meet the growing needs of fisheries management and enforcement.

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON
SABLEFISH PERMIT STACKING PROGRAM REVIEW SCOPING

Mr. Jim Seger (PFMC) briefed the Scientific and Statistical Committee (SSC) regarding the preliminary plans for the sablefish permit stacking program review. The SSC discussion focused on highlighting priority indicators for several of the objectives described in Agenda Item H.3.a, Attachment 3. The list of priority indicators recommended for objectives 1-3 follows.

1. Objective 1 – Rationalize the fleet and promote efficiency
 - a. Season length and average fishing days by year
 - b. Table 1 as currently defined
 - c. Table 1 information for before and after program implementation, not aggregated by tier ownership
 - d. Permit price for available years.
2. Objective 2 – Maintain or direct benefits toward fishing communities
 - a. Port involvement and dependence ratio
 - b. Proportion of fixed gear allocation harvested by year
 - c. Percent of landings by owner on board versus non-owner on board vessels
3. Objective 3 – Prevent excessive concentration of harvest privileges
 - a. Graph of ownership concentration
 - b. Gini coefficients for ownership concentration
 - c. Graph of control concentration
 - d. Gini coefficients for control concentration

Subject: Reducing Sablefish discards
Date: Wed, 9 Oct 2013 20:35:50 -0700

If the primary sablefish season were year round and each fishermen with a tiered permit had a choice at the time he unloaded to designate his catch towards his tier limit or make it a DTL landing instead, it would significantly reduce sablefish discards. For example, when we set our longlines we never know how many fish will be on the gear. When fishing is slow, and the catch is at or below the DTL limit we could then make a DTL landing. When the catch is much greater, we can retain all the fish and make a landing towards our tier limit without any discards.

It is understood that the two month periods and limits on the DTL would still apply, and if we made a DTL landing we would have to wait for the new weekly period before we could make any more landings. If however we made a tier landing, we could go back out immediately providing we had more on our tier. I believe this system would be easy to comply with and would good the future of the fishery. There have been numerous times in the past when we had to discard a lot of fish when we could have retained them under the example explained above. The current regulations create a lot of waste, time, and money.

STOCK COMPLEX RESTRUCTURING

The 2006 reauthorization of the Magnuson-Stevens Act (MSA) included a mandate to end overfishing. The revised National Standard 1 (NS1) guidelines of 2009 recommended a framework for accomplishing the MSA mandate, including criteria for managing stocks in a complex to reduce the risk of overfishing. Stock complex means a group of stocks that are sufficiently similar in geographic distribution, life history, and vulnerabilities to the fishery such that the impact of management actions on the stocks is similar. The framework recommended in the revised NS1 guidelines was incorporated in the groundfish fishery management plan (FMP) under Amendment 23, which was implemented in 2011.

The Council initially considered strawman stock complex alternatives for six species groups (nearshore rockfish, shelf rockfish, slope rockfish, flatfish, cartilaginous fish, and roundfish) at the June 2013 meeting. At its June and September meetings, the Council considered but eliminated alternatives for all these species groups from further consideration in this management cycle, other than the cartilaginous fishes and roundfish. This decision addresses concern for the Other Fish complex, currently the most poorly constructed complex in the Groundfish Fishery Management Plan (FMP) since it is comprised of species with disparate life histories, ecological relationships, distributions, and vulnerabilities to overfishing. The first recommended separation of these species is to aggregate the cartilaginous fish species separately from the roundfish species. Further alternatives for these species groups are offered by the Groundfish Management Team (GMT) in Agenda Item H.4.b, GMT Report.

One of the proposed actions in consideration for restructuring the Other Fish complex is to consider bringing new species into the FMP. This may help to determine overfishing limits using catch-based methods for species that have been landed in generic species' market categories (e.g., unidentified skates). The Council decided to consider adding the non-FMP cartilaginous and roundfish species listed in the GMT's September report proposing stock complex alternatives for analysis ([Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#)). Further, the GMT is recommending the Council consider adding other species to the FMP since they are considered to be in the fishery or candidate Ecosystem Component species according to their analysis (Agenda Item H.4.b, GMT Report 2).

The Council task at this meeting is to adopt a final preferred alternative for groundfish stock complex restructuring. The Council should consider the recommendations of Council advisory bodies and the public before taking action on this item.

Council Action:

- 1. Adopt final preferred alternatives for restructuring stock complexes.**
- 2. Provide guidance on further refinement of stock complex restructuring for future cycles.**

STOCK COMPLEX ALTERNATIVES

Council staff compiled the Slope Rockfish Alternatives from the September Council meeting from the Groundfish Management Team Report ([Agenda Item G.8.b, Supplemental GMT Report 5](#)), in response to the National Marine Fisheries Service report at this meeting ([Agenda Item H.4.b, Supplemental NMFS Report](#)), which requests the Council consider including slope rockfish alternatives for further analysis.

GROUND FISH MANAGEMENT TEAM REPORT ON RESTRUCTURING THE OTHER FISH COMPLEX

Introduction and Background

In September 2013, the Council recommended limiting further analysis for restructuring west coast groundfish stock complexes to the Other Fish complex. Analysis of the remaining stock complexes (Nearshore Rockfish, Slope rockfish, and Shelf Rockfish) was deferred until future cycles (e.g., 2017 and 2018). Reasons for deferring those analyses were provided in some of the references shown below (Appendix A), as well as in Council minutes.

This document provides a GMT-recommended process (thoroughly described under [Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#)) for reorganizing groundfish stock complexes, as well as alternatives for reorganizing the Other Fish complex that the Council may consider. The process described herein may be used by the Council to develop its own alternative(s) based on the Council's objectives. This statement provides alternatives for the Other Fish complex only. Alternatives, rationale, and the process for consideration of reorganizing the remaining complexes may be provided during future cycles.

Materials provided over the past 2 years clearly described analytical methods, alternatives, justifications, socio-economic impacts, and considerations for restructuring stock complexes. Rather than repeating much of that information, we provide a list of these previous reports beginning April, 2013, along with a brief description of contents and a link to access them (see Appendix A). Electronic versions of these reports can also be found at the following FTP site: (ftp://ftp.pcouncil.org/pub/Stock_Complex_Materials/). Note there were additional reports on this subject matter prior to April, 2013, however, those were omitted in the bullets and are not included on the FTP site. Omitted GMT statements include (1) [Agenda Item E.4.b, Supplemental GMT Report, March 2010](#) and (2) [Agenda Item G.5.b, Supplemental GMT Report, September 2011](#)).

Objectives

There is a need to evaluate and consider changes to the current structure of stock complex groupings, to ensure that the species in each complex are sufficiently similar in geographic distribution, life history, and vulnerabilities to the fishery such that management impacts are similar.

The GMT notes that stock complexes may be reorganized for biological purposes (e.g., remove species from complexes to reduce the probability of overfishing a particular stock), for logically consistent purposes (e.g., match stocks with similar life histories, distributions, and vulnerabilities), or some combination of the two. There are consistency issues with some of the current stock complexes in the groundfish fishery management plan (FMP). For instance, the Other Fish stock complex includes species with dissimilar life histories and species that do not co-occur. Also, as shown below, only one species within the Other Fish complex has

experienced historical catches that have approached the component overfishing limit (OFL; i.e., dogfish shark), whereas the other species within that complex may be at much lower risk of overfishing (e.g., cabezon). Additionally, the Other Fish complex, similar to the other complexes, includes stocks that have very low OFLs (e.g., California skate) or very high OFLs (e.g., spotted ratfish). Disparate OFLs within a single complex may cause overfishing for susceptible stocks with relatively low OFLs. This provides an example of a “logical consistency” and biological purpose for reorganizing a complex. The ideal complex would be of stocks that co-occur in proportion to their component OFLs-allowable biological catches (ABCs).

The scientific and statistical committee (SSC) has noted that no two stocks are exactly alike, and in establishing stock complexes there will always be tradeoffs between management practicality and concerns about individual species ([Agenda Item I.3.b, Supplemental SSC Report, April 2012](#)) and

Process for Reorganizing Stock Complexes

A process and considerations for reorganizing stock complexes was developed and described in detail by the groundfish management team (GMT) in [Agenda Item F.8.b, Supplemental GMT Report 2, June 2013](#) and [Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#). A summary of that process follows. For all steps, considerations should include balancing biological need, management practicality, and socio-economic impacts. Other examples of considerations are shown after each step in the process.

(1) Should any species be added to the FMP, removed from the FMP, or designated an ecosystem component (EC) species? See Agenda Item H.4.b, GMT Report 2, November 2013.

- a. What are the implications of adding new species to the FMP (and a particular complex) that have no calculated OFLs?
- b. What are the implications of adding a new species to the FMP as an EC species?
- c. What are the implications of removing species from the FMP (and a particular complex) that have OFLs, leaving a complex with only a few of the remaining species with contributing component OFLs?

(2) Consider removing species from the complex for individual management because it may be potentially at risk of overfishing.

- a. For those species with component OFLs available, the ratio of catch to OFL/ABC should be used to evaluate the risk of overfishing. Furthermore, cumulative catch relative to cumulative OFL/ABC is most indicative of a potential problem.
- b. Although individual management may be presumed for stocks that are potentially at risk of overfishing, that is not necessarily the best choice.
 - i. Tradeoffs between management practicality and concerns about individual species need to be evaluated.
 - ii. In some cases, individual species management may not be necessary for implementing management measures necessary to prevent the risk of biological overfishing (e.g., blue rockfish in CA where the component OFL has not been exceeded since the stock was assessed in 2008 and harvest guidelines were (HG) were implemented).

(3) Consider removing species from the complex for individual management because it may be an inflator species that may cause others within the complex to be potentially at risk of overfishing.

- a. Considerations are similar to those described for species at risk of overfishing (above).

(4) Consider creating new complexes to better align stocks in terms of life history, appearance, and spatial overlap, and thereby decreasing the potential of overfishing any single stock within the complex.

- a. Considerations are similar to many of those described above.

A worksheet is provided in Table 1 that may be useful for applying this process for reorganizing stock complexes. The most desirable complex is dependent on objectives.

Table 1. Worksheet for reorganizing stock complexes.

Overarching Considerations while Selecting Alternatives

Categorization and Management of Species Caught Primarily or Exclusively in State Waters

The Other Fish complex prioritized for revision includes some stocks that primarily or exclusively occur in state waters, and as such could be considered for removal from the fishery

management plan, and management by the states. Some of the species, if not most, are already managed individually by the states as part of recreational bag limits and other measures. One problem we have identified is that some of the alternatives shown below make changes that would leave some of these state-water species in complexes with others species that do not share much in common. This matter is addressed in more detail within our statement on the classification of stocks in the groundfish FMP (see Agenda Item H.4.b, GMT Report 2).

The Council's authority over state waters is a matter of legal jurisdiction. Our NMFS colleagues were not available at our October discussion to advise us, yet the matter has come up in other contexts at the Council and is addressed directly by the National Standard 1 Guidelines and accompanying background materials. While the Council should get more detailed advice from NMFS and NOAA General Counsel, the Council does not have direct authority to recommend conservation and management measures over the states. Section (f)(5)(iii) of the Guidelines describes dividing annual catch limits into state and federal portions based on the distribution of the stock between the areas. And Section (g)(5) states that Council management/accountability measures can only apply in federal waters. These issues are also addressed in the response to Comment 71 in the final publication of the revised Guidelines ¹.

At the same time, the Guidelines also promote coordination and cooperation between state, federal, and tribal management jurisdictions and this is the spirit that has been followed at this Council for many species. The GMT as a whole recognizes the advantages of such collaboration, some of which we note below, and are not raising the need to change it. To be clear we are highlighting the state-federal jurisdiction in the context of this Other Fish stock complex.

Some of the species discussed here just do not group easily with other species in some of the alternatives proposed below. Leopard shark and spotted ratfish provide an example of such a mismatch. In this example, designating leopard shark as a state water species in the FMP might be preferential to grouping it with spotted ratfish.

The situation of each species may differ slightly. While some are occasionally caught within federal waters, their primary range is within three miles of shore, due to their association with nearshore habitats. Examples of such species include cabezon, kelp greenling and all other greenlings, California skate, and leopard shark. However, there are a number of considerations that provide support for their continued inclusion in the fishery management plan, or conversely, state based management. Inconsistencies would remain in either case relative to species that are currently in and out of the FMP.

An argument can be made that cabezon and greenlings primarily co-occur with nearshore species which are also primarily caught within three miles of shore in state waters and could also be managed by the state. State management could however be more complicated for some states because greater flexibility to take inseason action may exist through the Council process than is available with state management. Similarly, leopard shark is primarily caught in the California recreational fishery within state waters; they are encountered in the trawl fishery outside three miles of shore. Management of leopard shark within the Council process is more streamlined and allows routine management action in a single meeting rather than emergency action or a

¹ [74 Federal Register 3197 \(January 16, 2009\).](#)

three meeting process within state management. For some states, there are greater efficiencies in managing these nearshore species within the Council process compared to state management in some cases.

Cabazon is closely monitored and managed by the state in Oregon and timely action to affect changes in the recreational and commercial fisheries is afforded within state management. In California, there is close state management of cabazon and kelp greenling in the commercial and recreational fisheries. While cabazon does not have a specified OFL in Washington waters, recent actions have been taken by the state to implement a length restriction and reduced bag limit to proactively conserve the stock. An additional consideration is that cabazon and kelp greenling are managed as components of the Rockfish, Cabazon, and Greenling (RCG) complex in California for which, recreational bag, season and depth restrictions are specified in state and federal regulations. Regulations are specified on the RCG complex basis to reflect the co-occurrence of cabazon and kelp greenling with rockfish, which may necessitate their inclusion in the FMP to facilitate fishery management.

“Risk” and the Stock Complex Evaluation

With this approach to evaluating the stock complexes, the GMT has aimed at helping the Council to prioritize changes by looking to the highest needs or risks first. All of the Groundfish FMP’s stock complexes could certainly be better aligned with the National Standard 1 (NS1) Guidelines, and principles of good fisheries management. Yet with heavy workload again this management cycle, the GMT’s risk-based approach was meant to highlight changes that might involve more urgency or benefit than others.

Importantly, however, in the Council’s September discussion we noted some differences in how “risk” was being spoken of. We recognized those differences because they have also arisen many times in GMT discussions. We discuss some of these differences here because they can affect one’s view of what should be done with the stock complexes.

Discussions on the stock complexes cover almost every aspect of harvest specifications and management measures and therefore can raise the full-range of viewpoints involved with fisheries management. It can be difficult to move through the discussions and issues stepwise. After considerable discussion in this and in past cycles, the GMT arrived at a specific, narrow type of risk in mind when formulating this analytical approach and suggesting it to the Council at the June meeting: the risk that catch might exceed the “component” OFLs and ABCs of each stock managed in a stock complex. When we have spoken of high or low risk, we have been referring to how likely it is that catch will go over an ABC or OFL if no management changes are made.

The analysis of this risk starts with the same question that the Council takes up each biennial management measure cycle: are new management measures needed to keep catch within annual catch limits (ACLs) and other harvest specifications for particular stocks? Although typically discussed as part of the harvest specifications, in this regard the stock complex evaluation is largely in the nature of a management measures analysis. The structure of a complex itself is the first-level management measure. Yet an ACL set at the level of a stock complex may result in a

wide variety of catches of the component stocks and result in the “risk” that catch exceeds the component OFL/ABCs for one or more stocks. To address the risk, the Council can restructure that first-level management measure or, as discussed in the harvest guideline discussion and elsewhere, employ other measures to bring catch into acceptable proportions. However, there are some unanswered questions remaining about how to assess risk to the sustainability of a stock given estimates of component OFL/ABCs that we also raise in this discussion. The difference in views about risk that we have observed arise from the next level question of what it means for catch to exceed component OFLs and ABCs. People may hold the same view on the likelihood of a component ABC or OFL overage but then can differ over views on the consequences of and the appropriate response to that overage. Some hold the view that it is not as consequential to exceed component OFLs and ABCs as it is to exceed the same for individually managed stocks. Others hold similar views about overages for stocks estimated to be above the B_{MSY} management targets, rougheye rockfish and spiny dogfish being two examples from this cycle. Our point here is that these differences on the need for new management measures have driven differences in GMT views on the relative need to restructure the stock complexes. We imagine similar dynamics may be at play at the Council level.

In addition, at the bottom of the stock complex discussion and the nature of the component OFL and ABCs is a view that harvest specifications should be more in the nature of a “target”—where overages of certain magnitude are expected and acceptable—than a “limit” where overages are to be avoided. The discussion, however, has not always been explicitly framed in this way. While “targets” have long been used in fisheries management, it is unclear to some why the more flexible targets should be allowed for stocks managed as part of a complex but not individually managed stocks. For one, the stock complexes include many of the stocks that we know least about, and on that same logic, a higher buffer for scientific uncertainty is used between their OFL and ABCs. It is not clear then why we would be less concerned about catch overages (or indeed what level of overage should trigger a concern) than for individually managed stocks for which, the consequences of an overage are, in theory, better known. However, most agree that chronic or very large overages warrant additional attention whether through additional management measures, prioritization for future assessments, or other appropriate means to ensure that the sustainability of the stock is not in jeopardy.

The view on component OFLs and ABCs is based in part on the SSC’s advice to evaluate stock complexes using average/cumulative catch (i.e., overages in any one year are not cause for concern if catch on average has been under OFLs/ABCs). Others on the team have concerns about this view because it involves unresolved questions which lead to inconsistency in management. To that point, the SSC has given the same advice about average catch performance with rebuilding ACLs and the individual fishing quota (IFQ) carryover program, yet even small annual overages have been avoided in both.

These matters have certainly not been straightforward. The SSC’s advice from September about the risk faced by tiger rockfish is illustrative ([Agenda Item G.8.b, Supplemental SSC Report](#)). The question about what it means to exceed a component OFL or ABC combines many issues ranging from the fundamental matter of identifying the appropriate stock unit/unit to conserve, the quality/legitimacy of a stock’s OFL/ABC and the measures of scientific uncertainty used to arrive at them, the fairness of holding some areas to account for catch, and more. These matters

involve important questions but ones that are not the GMT's to resolve. Many of the questions are best addressed by the SSC guidance on the science and in Council discussions with the National Marine Fisheries Service (NMFS) and National Oceanic and Atmospheric Administration (NOAA) general counsel (GC) on what the law allows. The discussions are not simple and we do not expect that they could be fully worked out through this cycle.

We have included this discussion here also to highlight a key analytical purpose of our narrow definition of risk. In brief, our work goes smoothest when the policy objective that we are analyzing and the metrics and data for evaluating performance against the objective are clear. Treating the OFLs and ABCs of stocks differently based on a whole slew of reasons, reasons that potential differ among stocks, does not lend us that clarity and team discussions can easily become confused. As an example, some have argued that the need to address overages of shortraker rockfish's OFL or ABC is less than for other stocks because it is a data poor stock that is also more northerly distributed and only partially extends into the Council's management area. Others have not agreed to that reasoning and would argue that this type of question is more appropriately considered with the "in the fishery" analysis (i.e., should the stock even be in the FMP?), or the calculation of the OFL and ABC. Again, this is a type of question the GMT cannot resolve on its own.

So, to avoid the potential distractions created by treating the OFLs and ABCs of stocks as apples and oranges, we have tried to avoid the question altogether. In June, September, and here we have reported the best available estimates of catch for each component stock. We use the best estimates of each stock's OFL and ABC as the key points of reference/performance standards. From this foundation, the Council and others can have the policy discussion about the other levels of conservation risk that are related to the overages of component OFLs and ABCs and of OFLs and ABCs of stocks above their B_{MSY} management targets.

Lastly, the differences in views among GMT members are really matters of degree. All agree that that a stock complex that would allow large or regular overage of component OFLs and ABCs is undesirable and should be avoided or actions taken to respond to such overages. The disagreements really revolve around the question of how regular or how large overages could be and then what the appropriate response is. Others are simply troubled by the lack of clarity and potential inconsistencies mentioned above that have yet to be worked out.

Overview of Next Steps

It was just this year that we were able to comprehensively look at the past performance of the stock complexes by looking at total catch for each component stock separately. And to date, this look back at the "risk" discussed above has taken up most of the GMT's attention. The next step in the analysis is to look forward and consider what the catch risk might be in 2015-16 and beyond.

As mentioned above, the organization of a stock complex can be thought of as a "first-level" management measure. Management measure would ideally be set on the ACL for the complex as whole and achieve the desired level of catch risk with respect to each component stock. Where performance does not live up to this objective, then other management measures may be necessary to keep the catch risks to acceptable levels. Per the Council's direction in September,

we only consider the Other Fish complex in this report. For the other stock complexes, we consider the potential need for “second-level” management measures in the other stock complexes under Agenda Item H.10. These “second-level” measures have typically been targeted at component stocks using harvest guidelines to delineate the acceptable level of catch.

Before moving to the specific discussion of the Other Fish, we highlight one more overarching issue. As noted several times during this and past cycles, the groundfish stock complexes could be arranged more in line with the principles laid out in the NS1 Guidelines and elsewhere. In other words, we have identified many “logical problems” with the complexes. At the same time, we have recognized that these do not necessarily translate into immediate conservation problems, or more specifically, “risks” of the sort noted in the previous section. The Other Fish complex is a good example. Save for spiny dogfish and perhaps the new FMP candidates, we do not see the need for new management measures to address catch risk for the component stocks. At the same time, there are real questions about the rationale for grouping many of the Other Fish stocks together. The complex may be highly illogical yet the conservation risks are low.

To the point, depending on time and priorities, the Council could focus on just addressing the greatest catch risks—or on the other end of the spectrum—go full out and take on the matter of aligning the complexes with the logic of the NS1 Guidelines. The GMT approach was set up to allow the Council to address either end or something intermediate along this spectrum. Moreover, at the center of the GMT’s approach was the idea that the greatest catch risks could be addressed by pulling individual stocks out of the complex while leaving the remainder intact (or, similarly, pulling the inflator stocks out and leaving the rest intact). We raise this again because we heard the opposite impression expressed during the Council’s September discussion (i.e. that the GMT was suggesting that the Council fully attempt to address the “logical problems” this cycle). How much to take on this cycle is a policy choice the GMT does not speak to. Our main recommendation is that, if resources are limited, the Council could sensibly ration those resources by focusing on the highest risks first.

While only addressing the Other Fish complex here, we again think the Council has the flexibility with the Other Fish to focus on catch risks, on full alignment with the NS1 Guidelines, or something in between.

Other Fish Complex Alternatives

The species comprising the Other Fish complex have disparate life histories, ecological relationships, distributions, and vulnerabilities to overfishing. This complex consists of various roundfish and cartilaginous fish. The cartilaginous fish are comprised of elasmobranch species (e.g., sharks and skates) and chimaeras (e.g., ratfish). For this document, alternatives are provided as either (a) cartilaginous fish alternatives or (b) roundfish alternatives. This proposed division of the Other Fish complex was proposed and justified by Council staff ([Agenda Item F.8.a, Attachment 1, June 2013](#)) and by the GMT in June ([Agenda Item F.8.b, Supplemental GMT Report 2, June 2013](#)) and in September ([Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#)).

Alternatives provided below were brought forward from previous Council meetings (i.e., GMT and GAP alternatives) or developed by the GMT during our October meeting. Additional

alternatives may be brought forward in the supplemental briefing book. For example, the GMT discussed whether complexes with no calculated OFLs could be included as an alternative. This type of alternative requires further GMT discussion before it can be fully developed.

Tables and figures that may help in selecting alternatives are provided in Appendix B and Appendix C. Appendix B provides recent catch relative to OFLs and ABCs (i.e., “risk” analysis). Appendix C provides figures and tables that demonstrate the level of co-occurrence. Additional information that may inform the decision to add or remove species to or from the FMP, or designate EC species can be found in Agenda Item H.4.b, GMT Report 2, November 2013.

Status Quo Cartilaginous Fish

The cartilaginous fish stocks in the FMP, including those managed in the status quo Other Fish complex, are depicted in Table 2. Longnose skate, which was assessed in 2011, was removed from the Other Fish complex and managed individually beginning 2013. Longnose skate is not a quota species within the IFQ fishery, but rather is managed under trip limits. Note that a range of trip limits and Groundfish Conservation Areas (GCAs) were analyzed as potential management measures for both longnose skate and spiny dogfish for the 2013-2014 biennial harvest specifications and management measures final environmental impact statement (FEIS 2013). Species within the status quo Other Fish complex, along with their 2014 OFL contributions, include big skate (458 mt), California skate (86 mt), leopard shark (167.1 mt), spotted ratfish (1,441 mt), soupfin shark (61.6 mt), and spiny dogfish (2,950 mt).

Table 2. Status quo cartilaginous fish stocks and stock complex.

Cartilaginous Fish – Individually Managed Stocks	Cartilaginous Fish Complex
Longnose Skate	Big Skate California Skate Leopard Shark Spotted Ratfish Soupfin Shark Spiny Dogfish

Cartilaginous Fish Alternative 1

Alternative 1 creates a new complex described as cartilaginous fish complex (Table 3). This alternative was developed at the October GMT meeting. The only difference between this alternative and Status Quo is moving spiny dogfish out of the complex for individual management.

Similar to longnose skate, which is individually managed, spiny dogfish demonstrates a large OFL contribution relative to the other cartilaginous species (Appendix B). As such, this species

might inflate the OFL of a complex that included them. Another similarity between spiny dogfish and longnose skate is both have OFLs based on Category 1 stock assessments.

A dissimilarity between spiny dogfish and longnose skate is the potential “risk of overfishing” (see the discussion above; also see Appendix B). Although the maximum catches of dogfish shark during the years 2004-2012 (2,455 mt and 2,464 mt in 2005 and 2006, respectively) remained below the 2013 OFL, those levels of catches would have exceeded the 2013 ABC (2,044 mt) in 2005 (when catch was 2,455 mt) and in 2008 (when catch was 2,464 mt). The new spawning potential ratio (SPR) of $F_{SPR50\%}$ will produce a spiny dogfish OFL for 2015 of 2,523 mt, which is lower than the 2013 OFL (2,980 mt) that was calculated under the previous SPR of $F_{SPR45\%}$. Although maximum catches during 2004-2012 would not have exceeded the 2015 OFL, they approach it. Under the new SPR, using the status quo P-star (P^*) of 0.30, the resulting 2015 ABC would be 1,731 mt. This ABC would have been exceeded during 3 of 9 years between 2004 and 2012. Note the most recent reported catch of spiny dogfish was 1,662 mt in 2011, below the ABC for 2015. Preliminary data suggest the 2012 catch for spiny dogfish may be much lower.

Although the 2015 OFL was exceeded for California Skate once in 9 years (Appendix B), this alternative recommends leaving the species within the complex because it is largely state managed, and the 2015 OFL (86 mt) was exceeded only by catches in 2005 which reached 89 mt. Catches of California skate have not exceeded 18 mt since 2007.

Table 3. Cartilaginous Fish Alternative 1. Italics represent a new addition to a column relative to Status Quo. Strike out represents a species that was removed from a column relative to Status Quo.

Cartilaginous Fish-- Individually Managed Stocks	Cartilaginous Fish in the Other Fish Complex
Longnose Skate <i>Spiny Dogfish</i>	Big Skate California Skate Leopard Shark Spotted Ratfish Soupfin Shark Spiny Dogfish

Cartilaginous Fish Alternative 2

Alternative 2 creates a new complex (cartilaginous fish complex) and designates an EC species (Table 4). As shown and justified under Alternative 1, spiny dogfish would be moved out of the complex and join longnose skate for individual management, and California skate would remain in the complex. Ratfish, however, would be removed from the complex and designated an EC species. Ratfish may be considered an inflator species because it has a large OFL contribution relative to the other cartilaginous species, is never targeted or sold (as far as we know), and is largely protected by the trawl rockfish conservation area (RCA). Catch of spotted ratfish relative to the 2015 OFL (1,441 mt) averaged 12% from 2003-2012 and only 7% from 2009-2012. The

maximum catch of spotted ratfish during that time period was 304 mt in 2006 and the most recent reported catch was only 74 mt in 2011.

Table 4. Cartilaginous Fish Alternative 2. *Italics represent a new addition to a column relative to Status Quo. Strike out represents a species that was removed from a column relative to Status Quo.*

Cartilaginous Fish-- Individually Managed Stocks	Cartilaginous Fish Complex	Cartilaginous Fish EC Species
Longnose Skate <i>Spiny Dogfish</i>	Big Skate California Skate Leopard Shark Spotted Ratfish Soupfin Shark Spiny Dogfish	Spotted Ratfish ^a

Cartilaginous Fish Alternative 3

Alternative 3 creates two new complexes: a shark-ratfish complex and a skate complex (Table 5). This alternative was developed by the GMT in June ([Agenda Item F.8.b, Supplemental GMT Report 2, June 2013](#)) and presented again in September ([Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#)); the Council recommended moving this alternative forward for further consideration during the September Council meeting.

As shown and justified under Alternative 1, spiny dogfish would be moved out of the complex and join longnose skate for individual management. California skate would remain in the skate complex. There are good reasons for separating cartilaginous species into a shark-ratfish complex and a skate complex. The species do not co-occur to a high degree, and they are easily differentiable from one another. At the same time, however, the conservation need for separation may not be high. In general, cartilaginous species have life histories that are more similar to each other than to bony fishes, making their vulnerability to overfishing somewhat similar.

This alternative adds five species (or species groups) to the FMP: brown cat shark, Bering/sandpaper skate, Aleutian skate, rougtail/black skate, and all other skates (see discussion and Table 2 in Agenda Item H.4.b, GMT Report 2, November 2013). It is uncertain whether OFLs can be calculated for “all other skates”. If not, then adding this component to the complex may require further discussion. An alternative would be to designate “all other skates” as EC species, at least until OFLs can be calculated.

Leopard shark, which is largely caught inside of 3 miles off California, may be considered for removal from the FMP for management by the State. Some discussion of removing species from the FMP for State management was discussed above, and was provided as an alternative under Table 4 in Agenda Item H.4.b, GMT Report 2, November 2013.

Table 5. Cartilaginous Fish Alternative 3. This alternative was provided by the GMT under [Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#). Italics represent a new addition to a column relative to Status Quo. Strike out represents a species that was removed from a column relative to Status Quo. Bold represents species that may be considered for removal from the complex for state management.

^bConsider state management

Cartilaginous Fish Alternative 4 (GAP Alternative)

Alternative 4 creates two new complexes: a shark-ratfish complex and a skate complex (

Table 6). This alternative was developed by the Groundfish Advisory Subpanel (GAP) under [Agenda Item G.8.b, Supplemental GAP Report, September 2013](#) and [Agenda Item F.8.b, Supplemental GAP Report, June 2013](#). The GAP based this alternative on that shown in Table 13 of the Council Staff report shown under [Agenda Item F.8.a, Attachment 1, June 2013](#).

Under this alternative, longnose skate would be moved from being individually managed to the skate complex, where it would become an indicator stock. Although the SSC supports the possibility that longnose skate could be used as an indicator stock for the skate complex (see [Agenda Item F.8.b, Supplemental SSC Report, June 2013](#)), they showed that it may not be necessary to become a member a complex to simply to function as an indicator stock. The SSC cautioned: “Adding a stock to a complex simply to have an indicator stock could lead to the indicator stock becoming an inflator stock.” The GMT notes that further discussion is required on the concept and application of indicator stocks, and seeks further guidance from the SSC.

Alternative 4 adds non-FMP species to the FMP (Aleutian skate, Bering/sandpaper skate, black/rougthead skate, and all other endemic skates to the Skates complex), similar to what was done under Alternative 3. All endemic skates other than Aleutian skate, Bering/sandpaper skate, big skate, black/rougthead skate, California skate, and longnose skate would be designated EC species.

Soupfin shark would also be designated an EC species under this alternative. The catch of this species averaged 8 mt per year over 2007-2011, however, less than 1 mt on average was caught by Groundfish FMP sectors (see Agenda Item H.4.b, GMT Report 2, November 2013).

Table 6. Cartilaginous Fish Alternative 4. This alternative was presented by the Groundfish Advisory Panel (GAP) under [Agenda Item G.8.b, Supplemental GAP Report, September 2013](#), and was based on the Council Staff report under [Agenda Item F.8.a, Attachment 1, June 2013](#).

^aSpecify as EC species

^bRemove from the FMP

^cAdd to the FMP

Roundfish Complex Alternatives

Status quo and two alternatives are shown below for the roundfish stock complex. Both alternatives create additional complexes based on depth. Roundfish Alternative 1 was developed by the GMT during the June and September Council meetings, whereas Alternative 2 was developed by the GAP during the same Council meetings.

Discussions at the October GMT meeting contemplated even further sub-division of the Roundfish complex and potential management of the shallower complex components by the states (i.e., remove from the FMP for state management). More GMT discussions are necessary, however, before this potential alternative can be fully developed. Results of that discussion may be brought forward to the Council in a supplemental GMT statement. Nonetheless, we provide some considerations here regarding these shallow-water roundfish.

The Shallow-Water Roundfish complex is composed of species that are primarily caught within three miles of shore, in state waters, making them candidates for removal from the FMP and subsequent management by each state. This possibility was discussed above as well as in Agenda Item H.4.b, GMT Report 2. Individual management of cabezon and kelp greenling stocks at the state level may be advantageous given the low connectivity expected between states and the biology of the stocks. Though the complex includes shallow reef dwelling species, some species occupy disparate latitudes (see Appendix C). It is important to note that at present, only cabezon in Washington are included in the complex, while others are individually managed (Table 7). Also note that kelp greenling have only been assessed in California, and are managed closely by regulation in all states. Although at first glance removing some of these shallow-water stocks from the FMP and managing them individually at a state level of geographic

stratification may seem logical. Conversely, retaining these stocks within the FMP may offer increased efficiencies, in some cases (see the discussion above).

Another important consideration when evaluating the shallow-water stocks is the OFL contribution for kelp greenling. Since kelp greenling has only been assessed in California waters, the “coastwide” OFL contribution for the complex does not include Washington and Oregon contributions. The only contribution to the aggregate OFL comes from the portion of the kelp greenling stock in California. As a result, the mortality from the other stocks (i.e., those in Washington and Oregon) are counted against the complex OFL that includes only the OFL contribution from the California-greenling assessment. This situation could be solved if OFLs are calculated for the remaining kelp greenling stocks using data poor methods.

The GMT notes, based on this discussion, kelp greenling in California could be pulled out of the complex and individually managed within the FMP, if desired. The remaining component stocks could be left within the complex without OFLs at this time. However, this brings up the question of how to address complexes with little or no OFL contributions. This question will be addressed more thoroughly in a supplemental GMT statement.

Status Quo Roundfish

The roundfish included in the status quo Other Fish complex include cabezon in Washington, finescale codling, kelp greenling and Pacific grenadier (Table 7). Species within this complex may occupy differential depths and latitudes (Appendix C). As noted above, the OFL contribution for kelp greenling is offered only by the California portion of the stock (2014 OFL = 118.0 mt). Finescale codling and Cabezon (WA) currently have no OFL contributions. Pacific grenadier may be considered an inflator species, with an OFL contribution of 1,519 mt for 2014.

Table 7. Status quo roundfish stocks and stock complex.

Roundfish – Individually Managed Stocks	Roundfish in the Other Fish Complex
Cabezon (CA) Cabezon (OR) California scorpionfish Lingcod N and S of 40°10' Pacific cod Pacific whiting Sablefish N and S of 36°	Cabezon (WA) Finescale codling Kelp greenling Pacific grenadier

Roundfish Alternative 1

Alternative 1, presented by the GMT at the September Council meeting ([Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#)), divides the Status Quo roundfish complex into shallower and deeper groupings (Table 8). In this case, Cabezon (WA) and kelp greenling are included in the shallow-water complex, whereas finescale codling and Pacific grenadier are included in the deep-water complex.

This alternative adds several species to the FMP (see See Agenda Item H.4.b, GMT Report 2, November 2013), including Giant grenadier, all other grenadiers, and California slickhead in the deep and all other greenlings in the shallow.

Under Alternative 1, non-FMP grenadier species (i.e., giant grenadier and all other grenadiers) are added to the deep water complex, joining Pacific grenadier which is already in the FMP. Evaluation of species composition in the Pacific Fisheries Information Network (PacFIN) databases indicates that the majority of the “all other grenadiers” is primarily composed of retained Pacific grenadier. In aggregate ~40 percent of the grenadier identified as Pacific grenadier is retained, while the majority of giant grenadier is discarded due to its inferior flesh quality. However, adding giant grenadier into the FMP may simplify sorting if it were included in a complex with all other grenadiers (e.g., a Grenadier complex).

Of the remaining species in the deep-water roundfish complex, Alternative 1 brings California slickhead into the FMP for EC species designation. This alternative also considers designating finescale codling as an EC species. Finescale codling and California slickhead, though encountered with some regularity, are not retained. These species are not marketable due to poor flesh quality. If designated as EC species, mortality could be monitored, while acknowledging that they are not targeted in the fishery. Should the Council choose to manage the shallow-water complex species as individual stocks at a state level discussed above and to designate finescale codling and California slickhead EC species, the only stocks remaining within the complex would be the Pacific grenadier, giant grenadier and all other grenadier, which could comprise a grenadier complex. Such action would effectively eliminate the other fish complex. More information on the “in the fishery” question can be found in H.4.b, GMT Report 2, November 2013

Table 8. Roundfish Alternative 1. This alternative was provided by the GMT under [Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#). Italics represent a new addition to a column relative to Status Quo. Strike out represents a species that was removed from a column relative to Status Quo.

^aAdd to the FMP

^bConsider specifying as an EC species

Roundfish Alternative 2 (GAP Alternative)

Roundfish Alternative 2 (Table 9) was presented by the GAP at the April and June Council meeting under ([Agenda Item D.3.b, Supplemental GAP Report, April 2013](#) and

[Agenda Item F.8.b, Supplemental GAP Report, June 2013](#). This alternative contemplated removing species from the FMP and making others EC species.

This alternative suggests removing Pacific grenadier from the Groundfish FMP, because it is not targeted and only a fraction of the biomass of any grenadier species is currently fished as they are distributed into far deeper depths than are currently accessed. The GAP also recommended designating finescale codling as an EC species. Finescale codling is encountered with some regularity but not retained since due to poor flesh quality. Under this scenario, there would be no deep-water roundfish complex for management purposes.

Finally, roundfish Alternative 2 suggests adding all other greenlings to the FMP, as was shown under Alternative 1.

Table 9. Roundfish Alternative 2. This alternative was presented by the Groundfish Advisory Panel (GAP) under [Agenda Item D.3.b, Supplemental GAP Report, April 2013](#) and [Agenda Item G.8.b, Supplemental GAP Report, September 2013](#). The alternative was initially based on the Council Staff report under [Agenda Item F.8.a, Attachment 1, June 2013](#).

^bSpecify as an EC species

^cRemove from the FMP

Summary

In this paper, we provide example alternatives for reorganizing the Other Fish complex. Decisions to bring species into the FMP or removing species from the FMP should be made using guidelines and considerations offered in Agenda Item H.4.b, GMT Report, November 2013. We point out that numerous alternatives could have been developed and provided by the GMT, however, we provide only a few as examples. The Council may consider information provided in both GMT reports to create alternatives that best fit Council objectives.

Socio-economic impacts were not provided herein. Most potential impacts associated with restructuring complexes were discussed in detail in many of the previous reports (see Appendix A).

The GMT expects to provide some additional information and alternatives in a supplemental statement.

Appendix A. Reports associated with stock complex reorganization created beginning April 2013. These statements are organized by source (e.g., Council staff, states, or advisory bodies), date, and statement number.

Council Staff Reports

- Initial Proposal (Proposed Action, Alternatives, and Considerations) for Restructuring Groundfish Stock Complexes ([Agenda Item D.3.a, Attachment 1, April 2013](#))
 - Council staff white paper containing: (1) background and information regarding Magnuson-Stevens Act (MSA), National Standard 1 (NS1) guidelines, National Marine Fisheries Service guidance on how to meet the conservation objectives of the MSA; (2) description of methods used to evaluate alternatives; (3) description of alternatives for Nearshore Rockfish, Shelf Rockfish, Slope Rockfish, Other Flatfish, Roundfish, and Cartilaginous Fish complexes.
- Considerations for Restructuring Groundfish Stock Complexes ([Agenda Item D.3.a, Supplemental Agenda Item Overview PowerPoint, April 2013](#))
 - Council staff and GMT power point presentation describing methods and alternatives shown in the Council staff white paper (DeVore/Cope).
- Considerations for Restructuring West Coast Groundfish Stock Complexes: Preliminary Alternatives and Analyses ([Agenda Item F.8.a, Attachment 1, June 2013](#))
 - Council staff white paper containing: (1) background and information regarding Magnuson-Stevens Act (MSA), National Standard 1 (NS1) guidelines, National Marine Fisheries Service guidance on how to meet the conservation objectives of the MSA; (2) description of alternatives for Nearshore Rockfish, Shelf Rockfish, Slope Rockfish, Other Flatfish, Roundfish, and Cartilaginous Fish complexes; (3) description of methods used to evaluate alternatives; (4) effects of alternatives including socioeconomic impacts to fisherman and processors, as well as management agencies.

State Reports

- Oregon Department of Fish and Wildlife Report on the Oregon Commercial Sampling Program and Potential Changes to Species Complexes ([Agenda Item F.8.b, ODFW Report, June 2013](#))
 - ODFW report showing impacts such as (a) sampling procedures, (b) cost of increasing the number or configuration of species complexes, and (c) qualitative cost to the state commercial sampling program.

Groundfish Advisory Subpanel Reports

- Groundfish Advisory Subpanel Report on Stock Complex Assemblages ([Agenda Item D.3.b, Supplemental GAP Report, April 2013](#))
 - GAP provided concerns as well as recommendations for stock complex reorganization alternatives for Nearshore Rockfish, Shelf Rockfish, Slope

Rockfish, Other Flatfish, and Other Fish complexes. The GAP also provided comment on removing Pacific grenadier from the FMP.

- Groundfish Advisory Subpanel Report on Adopt Preliminary Stock Complex Aggregations ([Agenda Item F.8.b, Supplemental GAP Report, June 2013](#))
 - GAP statement providing recommended alternatives for Slope Rockfish and Other Fish complexes (cartilaginous fish and roundfish), along with impacts of restructuring stock complexes.
- Groundfish Advisory Subpanel Report on Consider Stock Complex Aggregations ([Agenda Item G.8.b, Supplemental GAP Report, September 2013](#))
 - GAP provided concerns and described impacts of stock complex reorganization, as well as recommendations regarding the reorganization of Slope Rockfish, Shelf Rockfish, Other Flatfish, and Other Fish complexes.

Scientific and Statistical Committee Reports

- Scientific and Statistical Committee Report on Stock Complex Assemblages ([Agenda Item D.3.b, Supplemental SSC Report, April 2013](#))
 - SSC review of methods developed for analyzing stock complex alternatives.
- Scientific and Statistical Committee Report on Adopt Preliminary Stock Complex Aggregations ([Agenda Item F.8.b, Supplemental SSC Report, June 2013](#))
 - SSC statement providing (1) a review of GMT methods/metrics used to evaluate stock complexes, (2) comment on complex components caught on either side of 40°10' N. latitude, (3) approaches to determine stock status within complexes (e.g., indicator stocks and data-moderate assessments).
- Scientific and Statistical Committee Report on Consider Stock Complex Aggregations ([Agenda Item G.8.b, Supplemental SSC Report, September 2013](#))
 - SSC review of risk analyses provided by the GMT; advice regarding recent catches of tiger rockfish relative to its component OFL/ABC; review and comment on use of PSA and other metrics for deciding which species should be “in the fishery”

Groundfish Management Team Reports

- Groundfish Management Report on Stock Complex Assemblages ([Agenda Item D.3.b, Supplemental GMT Report, April 2013](#))
 - The GMT provided recommendations for (1) Council schedule pertaining to stock complex reorganization and (2) prioritization of complexes to consider for reorganizing based on Productivity and Susceptibility Assessment (PSA) and historical harvest levels.

- Groundfish Management Team Report on Methods and Results That May Be Used to Evaluate Alternatives for Stock Complex Reorganization ([Agenda Item F.8.b, GMT Report, June 2013](#))
 - GMT description of five methods/analyses used to evaluate stock complex alternatives including spatial analysis, species co-occurrence tables, C-scores, cluster analysis, and a survey of port biologists and state fishery managers.

- Groundfish Management Team Report on Considerations for Restructuring West Coast Groundfish Stock Complexes ([Agenda Item F.8.b, Supplemental GMT Report 2, June 2013](#))
 - The GMT (1) discussed use of indicator species, and the cost of reorganization, (2) adopted a four-step approach to evaluate stock complex alternatives, and (3) developed alternatives for Other Fish complex and Slope Rockfish. Relevant figures and tables showing co-occurrence were attached.
 - The full suite of figures and tables used to support this analysis was posted at the Council website: [ftp://ftp.pcouncil.org/pub/Stock_Complex_Materials/GMT_June2013/](http://ftp.pcouncil.org/pub/Stock_Complex_Materials/GMT_June2013/)

- Figures and Tables Depicting At-Sea Hake and Recreational Fishery Catch and Effort Data for Slope Rockfish, Cartilaginous Fish, and Roundfish complexes ([Agenda Item F.8.a, Supplemental Attachment 2, June 2013](#)).
 - GMT products used to evaluate co-occurrence of potential complex component species using catch and effort data.

- Groundfish Management Team Report on Additional Methods that May Be Used to Evaluate Alternatives for Stock Complex Reorganization ([Agenda Item G.8.b, GMT Report 1, September 2013](#)):
 - GMT description of methods used to evaluate stock complex alternatives, including metrics to evaluate risk of overfishing.

- Groundfish Management Team Report on the Classification of Stocks in the Groundfish Fishery Management Plan ([Agenda Item G.8.b, GMT Report 2, September 2013](#))
 - GMT description of methods to evaluate whether stocks should be included in the FMP and in the fishery, or included in the FMP and designated EC species, or removed from the FMP.

- Groundfish Management Team Report on Port Sampling Surveys ([Agenda Item G.8.b, GMT Report 3, September 2013](#))
 - GMT reported results of surveys provided to State Managers and Port Biologists. This report provided potential impacts of stock complex reorganization at the state level (data quality, sampling programs, etc.) and at the plant/vessel level (i.e., potential impacts to sorting requirements and space).

- GMT PowerPoint - Complex Reorganization, A Summary of Reports and Results by the Groundfish Management Team ([Agenda Item G.8.b, Supplemental GMT Report 4, September 2013](#))
 - GMT PowerPoint presentation
- Groundfish Management Team Report on Restructuring West Coast Groundfish Stock Complexes ([Agenda Item G.8.b, Supplemental GMT Report 5, September 2013](#))
 - GMT provided a process for reorganizing stock complexes
 - An alternative for reorganizing Slope Rockfish was provided as an example, along with justification for the alternative, and associated implications.
 - Tables and figures supporting stock complex alternatives for Slope Rockfish, Shelf Rockfish, Other Flatfish, and Other Fish complexes were provided in this report. These tools included information regarding risk analysis and co-occurrence.
- Groundfish Management Team Report – Proposed Alternatives for Classifying Stocks in the Groundfish Fishery Management Plan ([Agenda Item G.8.b, Supplemental GMT Report 6, September 2013](#))
 - GMT narrows the candidates for potential classification as “in the fishery” or EC species in the FMP
- Groundfish Management Team Report on Consider Stock Complex Aggregations ([Agenda Item G.8.b, Supplemental GMT Report 7, September 2013](#))
 - GMT provided alternatives for reorganizing the Other Fish complex and evaluated whether any species within Shelf Rockfish were at risk of overfishing.

Appendix B. Risk Analysis Tables.

Appendix B - Table 1. Metrics that may be used to evaluate the risk of overfishing for the Cartilaginous Fish Complex. Metrics include (1) average annual catch (2011-2012, 2009-2012, and 2004-2012) as a percent of the 2015 ABC and the 2015 OFL, and (2) percent of years (N =2, 4, or 9 years) that catch would have exceeded the 2015 OFL or the 2015 ABC.

Appendix C - Figure 1. Spatial distribution of cartilaginous fish in WCGOP trawl data (2002 – 2011) for alternatives above. Colors represent CPUE relative to the maximum within each species (see the legend). Darkest red = highest CPUE; lightest yellow = lowest CPUE. Data for hatched boxes could not be displayed because of confidentiality (only 1 or 2 vessels carrying observers fished in the area) or because no vessels carrying observers fished in the area. White areas are places where 3 or more vessels fished and carried observers, but the species in question was not caught.

Appendix C - Figure 2. Spatial distribution of roundfish in WCGOP trawl data (2002 – 2011) for alternatives above. Colors represent CPUE relative to the maximum within each species (see the legend). Darkest red = highest CPUE; lightest yellow = lowest CPUE. Data for hatched boxes could not be displayed because of confidentiality (only 1 or 2 vessels carrying observers fished in the area) or because no vessels carrying observers fished in the area. White areas are places where 3 or more vessels fished and carried observers, but the species in question was not caught.

GROUND FISH MANAGEMENT TEAM REPORT ON THE CLASSIFICATION OF THE OTHER FISH AND LIKE STOCKS IN THE GROUND FISH FMP

Per Council direction given at the last meeting, this report continues the groundfish management team's (GMT's) suggested approach to evaluating the Groundfish fishery management plan's (FMP's) classification of stocks but focused just on those related to the Other Fish stock complex.

We described the approach and basic analysis that followed from it in two reports from September 2013:

- [Agenda Item G.8.b, GMT Report 2](#): Groundfish Management Team Report on the Classification of Stocks in the Groundfish Fishery Management Plan
- [Agenda Item G.8.b, Supplemental GMT Report 6](#)

We only briefly cover the background and data presented in those reports. In this report we provide an update on progress and present a set of alternatives for the Council to consider. We plan on providing more targeted background and advice to the Council in a supplemental report, presentation to the Council, or both. Some key tables from those reports—reporting the average catch, PSA vulnerability scores, and other metrics used to gauge relative need for conservation and management—are reproduced at the end of this report.

Recap of the Approach and Analysis

The 2009 revisions to the National Standard 1 Guidelines (“Guidelines”) suggested a new classification scheme for stocks and suggested that existing FMPs be evaluated against it. The Guidelines recommended an “in the fishery” classification for target stocks and non-target stocks that are valuable or otherwise desirable or vulnerable to overfishing or becoming overfished. The annual catch limit (ACL) requirement, which was the major focus of the revised Guidelines, is reserved for these “in the fishery” stocks. Other non-target stocks caught in the fishery could be classified as ecosystem component (EC) species and do not require ACLs.

As noted by the GMT in previous cycles, the basic problem statement noticed in initial evaluations was that species that are in the FMP currently, and hence “in the fishery” by default, are less vulnerable to the groundfish fisheries than certain species not listed in the FMP. To address this inconsistency, the Council would need to reclassify certain FMP stocks and/or non-FMP stocks as either “in the fishery” or as EC species. Put simply, the Guidelines and general principles of decision-making argue for treating species with similar conservation and management need similarly.

To aid the Council with this evaluation, the GMT used the most comprehensive dataset available for commercial and recreational catch, provided to us by the states and the West Coast Groundfish Observer Program (WCGOP), to look at all species caught in the groundfish and related fishery sectors. With FMP and non-FMP species combined, this dataset included over 500 different species and species categories. The GMT and Council staff had also scored the vulnerability of FMP and several non-FMP stocks using the Productivity and Susceptibility Analysis.

As described in the September 2013 [Agenda Item G.8.b, GMT Report 2](#), we filtered out many of the species caught in the groundfish fisheries so as to focus on vertebrate fish species caught predominately in federal waters and not managed under other FMPs or by the states. The species filtered out on those criteria are listed in that report. Then, to arrive at a narrower list of candidates for reclassification, as described in the September 2013 [Agenda Item G.8.b, Supplemental GMT Report 6](#), we flagged FMP species that had either less than 1 mt of average catch per year from 2007-2011 or more than a 1 mt of catch (rounded to the nearest mt) but less than 50 percent retention (i.e., 50 percent or more of the catch is discarded) and a PSA score of ~2.0 and lower. Then to create an overlapping range of non-FMP species, we included all stocks with an average catch per year of 1 mt and higher.

The intent was to apply transparent and objective criteria that flagged non-target stocks with questionable vulnerability to the fishery. As we stated in September, these criteria were also broad brush and not meant to provide decisive grounds for classification in the FMP. In this next step described here, we attempted to give more scrutiny to the criteria and other factors on a stock by stock basis for the stocks on the candidate list and those that might also be included for consideration.

Corrections to the September Analyses

We noted at least two corrections in our October discussions related to Table 1 in [Agenda Item G.8.b, Supplemental GMT Report 6](#). First, we should have filtered out Thornback Skate because

it appears to be encountered exclusively in state waters. Second, we left Spotted Ratfish off the candidate list when it should have qualified based on the criteria summarized above.

Potential Analysis Yet to Be Completed

As we have noted elsewhere, the federal government shutdown left us without input from the NMFS members of the GMT at our October meeting. One area this affected us in particular was that we were not able to look at the bottom trawl survey data to complete the analysis suggested by the SSC in September ([Agenda Item G.8.b, Supplemental SSC Report](#)). This analysis would help us better gauge if the average catch we report for the candidate stocks was likely to impact the stock or not. For instance, 10 mt of catch could be significant for a stock that is rare and/or unproductive or inconsequential for a stock that is very abundant and/or productive. We believe the analysis would be very informative for several stocks considered here, although not all, and hope to have it available when our NMFS colleagues are available to return to work.

On the List of Candidates Considered Here

The Council's direction was to consider only the Other Fish complex this cycle for reclassification of their FMP status. In questions and answers with the motion on the floor, members of the GMT had noted that the team had not anticipated that the Council would limit consideration of the FMP's stock classification at that point and so had not been rigorous in listing out all the potential Other Fish candidates in the report referred to in the Council's motion. To elaborate, the Council's motion referred to [Agenda Item G.8.b, Supplemental GMT Report 7](#), which considered alternatives for restructuring the Other Fish and other stock complexes. The team attempted to focus on the stock complex alternatives and on the "in the fishery" evaluation at the same time, yet the report writing efforts and discussion were necessarily separated because of time constraints and coordination between the two was not what the team hoped it would be. As a consequence, not every stock that could have been listed with the Other Fish in Report 7 was listed.

The main problem the team representatives attempted to communicate to the Council during discussion of the motion was that the "in the fishery" approach is one of relative comparison where like species are compared with like. Because the list of stocks considered in that Report 7 was incomplete, not all "like species" would be compared and contrasted at the same time leaving the potential for inconsistent treatment in the Council's final recommendation. As told to the Council during the question and answer session, the team has included all species here that it would have listed in Report 7 if time would have allowed. If the Council wishes to limit its reclassification recommendations to those species listed in Report 7, there may be a valid way to do so. We think there is value, however, in at least considering those species side by side with the fuller list presented here.

On a similar note, there is some concern among the team about conducting the "in the fishery" classification piecemeal. The reason is that the Council may make recommendations for the Other Fish related stocks that might be different if the Council were also considering the rockfishes and flatfishes. As noted below, however, the Guidelines suggest regular attention to the FMP's classification of stocks and so there should be opportunity to revisit any classification decisions based on new information and circumstances. Moreover, the species considered for reclassification are mainly those in marginal or questionable need of conservation and

management. The GMT sees this evaluation as addressing logical inconsistencies more so than pressing conservation risks. The FMP already has and will maintain those stocks most in need of conservation and management attention as “in the fishery.”

Again, what might be consistent with the National Standard Guidelines or otherwise acceptable interpretation of the Magnuson-Stevens Act is a matter for the Council to discuss with NMFS and National Oceanic and Atmospheric Administration (NOAA) General Counsel (GC). We recommend the Council seek clarification or correction of any of the interpretations and rationale we present here.

On the Feasibility of Calculating Overfishing Limits

During Council discussion in September on this motion, Council staff advised that it was important to know the list of candidate stocks so that overfishing levels (OFLs) could be requested. We all agree that OFLs are required and desirable for such stocks. Yet if given opportunity to respond, we would have pointed out that the question of whether an OFL could be calculated for a stock or not is one that follows after, logically speaking, from the classification question. The Guidelines speak to the relative need for conservation and management as the main factor to consider in classifying stocks in the FMP. And, the requirement for OFLs, acceptable biological catches (ABCs), and annual catch limits (ACLs) comes after the determination that the “in the fishery” classification is appropriated. To draw out the point, it would be theoretically possible to calculate OFLs for species that are in no appreciable need of conservation and management and for which the “in the fishery” classification is unnecessary. At the same time, it may be impractical over the short-term to calculate OFL given data and time constraints for stocks where the need for conservation and management is clear.

Our main point here is that whether or not OFLs could be calculated should not be the main factor for deciding to classify a stock as “in the fishery” or an EC species. OFLs for the new candidate stocks would certainly be informative to the question in that it provides a quantitative measure of how much fishing pressure a stock can take. Yet, again, an OFL could prove a stock to have very low vulnerability to overfishing; enough to suggest it would be best classified as an EC species. Shortbelly Rockfish is one such species in the FMP now with an OFL that we would likely have recommended for classifications as an EC species had the Council chosen to take up the full “in the fishery” evaluation.

With the federal government shutdown affecting NMFS, we are unsure of which species if any may have OFLs calculated in time to be reviewed at this meeting. The reality may be that OFLs are not achievable this cycle for one or more of the stocks this cycle. If so, the team recommends that these be viewed as scientific gaps to be filled in when practical to do so but not gaps that necessarily prevents the Council from making solid recommendations here. Yet these are matters on which the Council should seek advice from NMFS and NOAA GC. We do note that there are species in the FMP now without OFLs.

Lastly, the GMT recognizes that there may be practical considerations that arise for having stocks with undetermined OFLs in the FMP. We address these considerations more directly as part of the stock complex analysis and elsewhere.

The Problem with the Percent Retained Metric

As explained in our supplement report in September's [Agenda Item G.8.b, Supplemental GMT Report 6](#), candidates for reclassification were identified using "less than 50 percent retained" as one of the selection criteria. We chose this factor based on the Guidelines, which advise that EC species classification can be used for non-target stocks that are not generally retained and then elaborate that occasional retention of a species would not rule it out as a possible EC species classification. The interpretation that follows is then that stocks with general or more than occasional retention should be classified as "in the fishery."

In September we noted that our ability to apply this factor was limited because the landings of many species are reported on fish tickets in market categories that do not identify the species. We used Washington's Miscellaneous Fish category as an example. Eelpouts and even Pacific Grenadier would be reported under this category and the state does not sample the landings to produce estimates of each species as it does for other market categories like Slope Rockfish. To calculate the percent retained, it is necessary to match observer records to fish tickets. And observers record discard on a species specific basis that makes matching to landings records difficult if not impractical for many of these stocks that haven't received much management attention.

The Council specifically asked about the estimates for Pacific Grenadier. It provides a good example of the problem. Landings of Pacific Grenadier are reported in generic categories, again as Miscellaneous Marine Fish in Washington and mainly as "Grenadier" in California and Oregon. The observer records, in contrast, will report the catch as Pacific Grenadier, Giant Grenadier, etc. The result is that in our dataset Grenadier Unidentified—which represents mostly landed catch—appears to be highly retained and Pacific Grenadier and Giant Grenadier—which come from observer data—are fully discarded.

In the time available we could not better quantify the retention percentage for each species of grenadier. We have heard from port samplers and others that landings are mainly Pacific Grenadier, although we do not have quantified estimates of exactly how much. Yet using this anecdotal information we can conclude with some confidence that Giant Grenadier is almost certainly retained less than 50 percent of the time. And for Pacific Grenadier it is likely close to 50 percent. To illustrate, if we assume that all of the unidentified Grenadier catch in the dataset is Pacific Grenadier, then the overall retention percentage for the stock would be 47.6 percent. If we change the assumptions slightly so that Pacific Grenadier made up only 90 percent of the total unidentified Grenadier catch but then 100 percent of the landed portion, then the retention percentage would be 50.1 percent.

We could detail these calculations for the Council, yet more to the point, we would caution against using retention percentage as the decisive factor for classifying Pacific Grenadier or any stock as either in the fishery or an EC species. For one, we choose 50 percent for the filter arbitrarily because we saw a natural break in the data with most stocks being either highly retained or highly discarded. We could spend more time attempting to translate "generally retained" or "more than occasional retention" into percentages but, again, we recommend that the Council give fuller consideration to all the factors affecting the stock's potential vulnerability to overfishing and its relative need for conservation and management. We used Spiny Dogfish as an example of why in an earlier report. Over 90 percent of Spiny Dogfish is discarded and yet its

need for conservation and management is pretty clear. Dogfish's relatively high susceptibility to the fishery is driven most by its co-occurrence with target species or unavoidability in fishing grounds. And its relatively low productivity increases its potential vulnerability to overfishing. Another problem the team noted with focusing on retention is that some species might turn out to be retained more because they are difficult to sort out from the rest of the catch rather than because they are marketable. It is a stock's marketability or desirability that would be expected to increase its susceptibility to overfishing. Again, we recommend that the Council consider all such factors when making the final recommendation on how to classify stocks in the FMP.

The Purpose of the EC Species Classification

In team discussions some have wondered what the benefit of bringing new species into the FMP as EC species might be. The Guidelines offer some considerations, including:

- for data collection purposes;
- for ecosystem considerations related to specification of optimum yield (OY) for the associated fishery;
- as considerations in the development of conservation and management measures for the associated fishery;
- and/or to address other ecosystem issues.

They also add that “[w]hile EC species are not considered to be “in the fishery,” a Council should consider measures for the fishery to minimize bycatch and bycatch mortality of EC species consistent with National Standard 9, and to protect their associated role in the ecosystem.” This implies that bycatch should be addressed regardless of whether it rises to the level of overfishing and that the Council could employ management measures or monitoring requirements for EC species.

Mainly, however, the GMT has envisioned that the Council would treat EC species as monitored species. The benefit of classifying them in the FMP is one of public transparency. They would be marked as species that are caught in the fisheries but not thought to be at the risk of overfishing.

This monitoring function is clearly contemplated in the Guidelines. They state that all EC species “should be monitored to the extent that any new pertinent scientific information becomes available (e.g., catch trends, vulnerability, etc.) to determine changes in their status or their vulnerability to the fishery.” And if the new information shows that vulnerability has increased, then stocks “should be reclassified as ‘in the fishery’.”

Along these lines, the Guidelines suggest regular re-visitation of the FMP's classification of stocks. Specifically, section 600.310(d)(6) of the Guidelines states that the Council:

should monitor the catch resulting from a fishery on a regular basis to determine if the stocks and species are appropriately classified in the FMP. If the criteria previously used to classify a stock or species is no longer valid, the Council should reclassify it through an FMP amendment, which documents rationale for the decision.

Lastly, we would like to highlight that the scope of this analysis fits nicely with the intent of the Tier 1 environmental impact statement (EIS) and the broad, longer-term look at how the fisheries

of the Groundfish FMP are affecting the marine environment. More specifically, we have taken a broad look at the species being caught by the various groundfish and related sectors and made our best attempt to advise the Council on the relative vulnerability of those stocks to overfishing. The newness of this analysis made it somewhat time-intensive this round. We imagine with the framework started here, the analysis could be made more routine in future cycles. Nonetheless, doing this analysis every biennial cycle might be too often. Integrating the regular evaluation of the FMP's classification into the timeline of the Tier EIS could be more time efficient.

The Framework of the Alternatives

We have slightly revised the way we present the alternatives from what was shown in September ([Agenda Item G.8.b, Supplemental GMT Report 6](#), Table 1). We have attempted to group the species into alternatives where they are best grouped like with like in terms of being similarly situated as to their relative need for conservation and management. The thought is that this will ease the Council's decision by better highlighting areas of consistency.

As before, the Council's decision really focuses on each stock individually with three options for each: (a) in the fishery, (b) EC species, or (c) not in the FMP.

With this report we also decided to combine the second and third choices into one. That is, our recommendation is for the Council to either use the EC species classification broadly or not at all by only including the "in the fishery" classification in the FMP. So the EC species classification in each alternative below could be replaced with "not in the FMP"

We did this for a couple reasons. For one, it simplifies the alternatives. More substantively however, in our October discussions we could not see a simple way to draw a line on what would qualify a stock as an EC species. As an example, some worried that 1 mt of average catch was too low to consider for classifying a species in the FMP. Yet the reason we chose that level was because catch of some of the FMP species is lower than 1 mt. And at least one species in the FMP, Tiger Rockfish, has an OFL of 1 mt. We did not see a simple way to draw clear cut lines. Moreover, we did not see much of a need to draw such a line because the EC species classification does not have much practical management effect. We should be able to maintain the ability to monitor total catch by species regardless of the EC species designation. So in the team's view, it was just not worth the time to discuss what level of catch or PSA score would warrant an EC species classification over being left of the FMP altogether.

Lastly, a related thought on this issue was that for FMP species up for reclassification we assumed, perhaps wrongly, that there may be a higher analytical showing needed to remove a species from the FMP altogether as opposed to reclassifying it as an EC Species. This impression comes mainly from NMFS' partial disapproval of Amendment 23 where they disapproved the removal of Dusky Rockfish and Dwarf Red Rockfish from the FMP and the reasoning for it, which is partially addressed in the following excerpt from [the disapproval letter](#).¹

¹ http://www.pcouncil.org/wp-content/uploads/am_16-5_and_23_dec_letter.pdf

Removal of a species from the FMP would reflect a determination that conservation and management measures are not necessary. NMFS is not prepared to make that determination at this time without a more comprehensive discussion and review of how the Council and NMFS manage rockfish genera and species within the family of scorpaenidae. NMFS understands that the Council is planning to refine the existing stock complexes for the 2013-14 specifications and management measures. NMFS believes it is prudent, from a management perspective, to take a comprehensive look at all species and complexes in the FMP before deciding to remove or add any. The option to designate species as ecosystem component species is also another option that may be explored through the Council process.

Understanding that the Council is concerned about workload this cycle, using the EC species designation might be preferable if it indeed does require less analysis and review time to implement.

While we have framed the decision as all or nothing for EC species, the Council may see cause for an intermediate approach where some candidate species are designated as EC Species and others not.

The Grenadier Alternatives

The grenadiers, Pacific Grenadier in particular, may prove to be the toughest. We have therefore presented them first and as a group. As a brief note, by “Other Grenadier” we refer to the species caught within the Council’s management area based on the commercial catch data and NWFSC trawl survey data. We interpret “Other” in the same manner for the other species groups discussed below.

The reason we saw the grenadiers as presenting some difficulty for the Council is because there are two reasonable positions so far taken on Pacific Grenadier. One position gives weight to the low overfishing risk for Pacific Grenadier and the other to the fact that the stock does have some commercial value.

The Groundfish Advisory Subpanel (GAP) recommended removing Pacific Grenadier from the FMP. In brief, they argue that the stock is not in need of conservation and management because it is not targeted and because much of its habitat is closed to the fishery and so fishing is happening on a small portion of the stock. We can confirm this if and when we are able to examine the bottom trawl survey data, but from the data we have seen, we do believe that Pacific Grenadier are distributed deeper than fishing occurs and that recent catch levels will be low relative to what would be allowed by an OFL.

The other position—that Pacific Grenadier should remain as “in the fishery”—follows the Guidelines suggestion that desirable non-target stocks be included in the fishery. Pacific Grenadier does provide a source of revenue for some areas of the coast, especially in Central California. Over the period 2007-12, landings of grenadier have produced ~\$40,000 in ex-vessel revenue per year on average and about \$8,000 in Oregon. Again, we understand this is mainly if not all Pacific Grenadier. In Washington, the data is not available because grenadiers are recorded in a miscellaneous category.

The GMT recommends that the Council focus its policy deliberations on these arguments more so than on the percent retained criteria mentioned above. Other differences between the proposed alternatives are bulleted below Table 1.

Lastly, Pacific Grenadier provide an illustration of how management measures or monitoring triggers/requirements could accompany an EC species. If the Council were to designate Pacific Grenadier as an EC species but was also concerned about changes in targeting of the stock, it might still be possible to include trip limits or other landing limits on the stock, or, alternatively to identify a magnitude of increase in landings that would trigger consideration of reclassifying the stock as “in the fishery.” Such discussions would most appropriately take place under the management measures agenda item (Agenda Item H.10).

Table 1. Grenadier Alternatives

Classification	No Action	Alternative 1	Alternative 2	Alternative 3	Alternative 4
“in the fishery”	Pacific Grenadier	Pacific Grenadier Giant Grenadier	Pacific Grenadier	---	All Grenadiers
EC Species/not in the FMP	Giant Grenadier Other Grenadiers	Other Grenadiers	Giant Grenadier Other Grenadiers	Pacific Grenadier Giant Grenadier Other Grenadiers	---

- *Alternative 1* would keep Pacific Grenadier “in the fishery” and add Giant Grenadier because it is caught in higher amounts than Pacific Grenadier and is thought to have similar vulnerability based on PSA scores. Other Grenadiers would be EC species for monitoring purposes.
- *Alternative 2* differs from Alternative 1 by classifying Giant Grenadier as an EC species instead of as “in the fishery.” The rationale for the difference would be that Giant Grenadier is not marketable for human consumption and not thought to be generally retained. We may provide more information on the marketability of Giant Grenadier in a supplemental report.
- *Alternative 3* follows the rationale that all of the grenadier stocks are likely to be at a low risk of overfishing and so would be more appropriately classified as EC species.
- *Alternative 4* is based on a different approach and rationale than the rest. Its justification would be that Pacific Grenadier is appropriately classified as “in the fishery” but that the catch of all grenadiers would be used in the OFL calculation because of the lack of speciation in the historical catch. The other grenadier species would not necessarily rise to “in the fishery” status based on their vulnerability to the fishery, yet because their historical catch would factor into the OFL, their future catch would continue to be accounted against the OFL. Roughey Rockfish/Blackspotted Rockfish is a purer, recent example of a complex where the OFL and reference points are calculated based on the catch of different species. This suggestion is described in [Agenda Item F.8.a, Attachment 1](#) from the June 2013 meeting. The Council will want to hear from the SSC on the OFL calculation before deciding if this approach is beneficial.

Candidates for Classification as In the Fishery or EC Species

Somewhat like the Grenadiers, the species in this section could be, in the GMT's view, reasonably classified as either "in the fishery" or as EC species. The GMT sees the average catch levels and PSA scores for these species as indeterminate and therefore flags the classifications as a clear policy call for the Council to decide. These are species with average catch in the tens of tons (except for Spotted Ratfish) and PSA scores near 1.8 or higher.

The policy call is centered on the question of whether catch and vulnerability are high enough to require management with ACLs, most likely within a stock complex, or that and monitoring as EC species is sufficient to monitor their conservation and management need for now. With the possible exception of Big Skate and Spotted Ratfish, the GMT sees these stocks as similarly situated enough to be classified in the same manner (or stated in the negative, we do not see definitive reasons to classify them differently). The GMT plans on discussing Big Skate and Spotted Ratfish in more detail at the November meeting.

This is one alternative where additional data would help. All of these stocks appear to be well sampled by the survey and we should have a better idea of catch relative to biomass if we are able to have that analysis complete. Likewise, the SSC may even be able to recommend OFLs for these stocks. The OFL for Big Skate may be recalculated for 2015-16, yet the average catch over 2007-2011 equates to 21 percent of its 2014 OFL.

Lastly, as with the Grenadiers we have included Alternative 3 based on a possible OFL estimation rationale. It may prove necessary or beneficial to base the OFL on the historical catch of all skates. Again, the rationale is that one or more of these skates belong "in the fishery" and that all catch needs to be combined to estimate and track catch against the OFL. If the SSC so advises, then the skates listed in the next section would be affected as well. Longnose skate may or may not be included. In this situation, Brown Cat Shark becomes a question as well. If the Council wishes to place it "in the fishery" it may be best to calculate the OFL based on the catch of all cat shark species given the lack of speciation in the historical catch. We have labeled Alternative 3a for the situation where cat sharks and Spotted Ratfish are in the fishery and Alternative 3b where they are classified as EC species.

Table 2. Alternatives for species that could be classified as either EC species or "in the fishery" based on the Council's policy preference.

Classification	No Action	Alternative 1	Alternative 2	Alternative 3
"in the fishery"	Big Skate Spotted Ratfish	Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate Big Skate Spotted Ratfish	---	All skates All Cat Sharks (a) Spotted Ratfish
EC Species/not in the FMP	Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate	---	Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate Big Skate Spotted Ratfish	All Cat Sharks (b) Spotted Ratfish

Candidates for EC Species Classification Only

In this section we have grouped species that the GMT viewed as having catch and PSA scores being below the level. The PSA scores for these stocks are less than 1.8 or their average catch is less than 10 mt. We did not calculate PSA scores for stocks with an average catch of less than 10 mt. Like above, we do not see clear reasons to classify this set of stocks differently from one another (i.e., the thought is that they should all be removed/left out of the FMP or designated as EC species).

Walleye Pollock presents somewhat odd circumstances. If we had used 2004-2011 as the window period, its average catch would reach into the hundreds of tons. In some years, thousands of metric tons have been caught by whiting vessels.² As is well known, Pollock are very abundant north of the Council's management area. In some years, the stock has extended southward and been available to the fisheries off this coast. It is an extreme example of the transboundary stock issues we have noted frequently. Pacific Cod is a less extreme example of an FMP stock that is more available in the Council's management area in some years than in others.

Ragfish is another stock where the GMT had some questions and discussion in this group. Its PSA score of 1.8 could have placed it in the previous category and a candidate for "in the fishery" classification. Yet based on our discussions in October, the team believes that the susceptibility score in the PSA is an overestimate.³ In brief, the PSA susceptibility score is based in large part on the overlap of the species' range and depth with the areas fished. The high overlap expected based on those does not appear to be proven out in what we see in the trawl survey reports, where Ragfish are very rarely encountered. This leads us to believe that the species occupies non-trawlable habitats or somehow else has low selectivity to bottom trawl gear. The catch identified in our dataset has all come from the at sea whiting sectors. This could be because the species lives in midwater habitats or more an artifact of the 100 percent observer coverage in those sectors. Ragfish is a species that would not be reliably reported on fish tickets in the shoreside sectors. Over the 2007-2011 period, ragfish catches were variable with two years of the five years showing large catches. And in those years, there were spikes in catch in the month of May. We know very little about ragfish, yet one plausible theory is that Ragfish are thought to come into canyon areas to spawn, and that time, that their susceptibility to the whiting fleet increases. We will report more detail on these catches in a supplemental report.

² In 2002, over 4,500 mt of Pollock were landed on this coast.

³ The PSA scores are detailed in Table 9 of [Agenda Item G.8.b, GMT Report 2](#) in the September 2013 Briefing Book.

Table 3. Alternatives for stocks with low vulnerability to the fishery

Classification	No Action	Alternative 1

FMP Species that are Caught Mainly in State Waters and/or Other Fisheries

As described in September's [Agenda Item G.8.b, GMT Report 2](#), we filtered out non-FMP species from consideration based on Council guidance and the fact that they are thought to be caught in state waters or fisheries not regulated by the Groundfish FMP. The FMP stocks listed here would likely meet those same criteria. This set of alternatives is therefore different from the ones above and involve matters of Council versus state jurisdiction, which we briefly address in our first report under this Agenda Item but is an issue best handled in discussions between the Council and NMFS and NOAA GC.

Because of these different considerations, the EC species classification may not make the most sense for these stocks. Instead, the Council may wish to explore the state-federal jurisdiction question, either in this cycle or in the future. We expect to more fully address the reasons why the Council may wish to do so under the discussion of the Other Fish stock complex alternatives. The main issue described there is that these stocks do not fit well with the other stocks in the Other Fish category. Here we present the basic reasons why these stocks present a different set of circumstances.

- Only a small portion of Cabezon and Kelp Greenling are thought to occur in federal waters.
- The catch of California Skate is relatively low and 70 percent of it is taken in the California Halibut fishery, which is not regulated by the Council.
- Leopard Shark appears to be caught almost exclusively in state waters with 92 percent of the catch coming from California recreational fisheries and the remainder in the California Halibut fishery.
- The catch of Soupfin Shark averaged 8 mt per year over 2007-2011, and 85 percent of that catch was taken by gillnet gear where the top species caught include Pacific Herring,

White Sea Bass, California Halibut, and Thresher Shark. Less than 1 mt on average is caught by the Groundfish FMP sectors.

Table 4. Alternatives for species caught predominately in state waters or non-FMP fisheries

Classification	No Action	Alternative 1
"in the fishery"	Leopard Shark Cabezon California Skate Kelp Greenling Soupfin Shark	---
Species predominately caught in state waters or in fisheries not regulated by the Groundfish FMP	---	Leopard Shark Cabezon California Skate Kelp Greenling Soupfin Shark

Tables Adapted from the September GMT Reports

Table 5. PSA scores and average catch for Other Fish related candidate stocks from [Agenda Item G.8.b, Supplemental GMT Report 6](#) (Spotted Ratfish was accidentally omitted in that report but added here).

	Species	PSA score	Catch (avg.)	Notes
Skates & Rays	Aleutian Skate	1.71	3	
	Bering/Sandpaper Skate	1.80	70	
	Big Skate	1.99	95	
	Black/Roughtail Skate	1.68	44	
	California Skate	2.12	14*	*Only 29% from FMP sectors
	Deepsea Skate	--	1	
	Other Skates	--	725*	*Unidentified catch
	Thornback Skate	--	2	
Cat Sharks	Brown Cat Shark	1.84	90	
	Filetail Cat Shark	--	11	
	Longnose Cat Shark	--	3	
Other Chondrich.	Leopard Shark	2.00	35*	*Only 3% from FMP sectors (other than CA Recreational = 82%).
	Pacific Black Dogfish	--	1	
	Pacific Sleeper Shark	--	8	
	Salmon Shark	--	1	
	Southern Shark	2.02	8*	*Only 16% from FMP sectors
	Spotted Ratfish	1.72	146	
Slickheads	California Slickhead	1.10	28	
	Threadfin Slickhead	--	1	
	Other (incl. Tubeshoulders)	--	1	
Grenadiers	California Grenadiers	--	4	
	Giant Grenadiers	1.87	170	
	Other Grenadiers	--	135*	*135 mt of unidentified catch. Other species in data all < 1 mt per year.
	Pacific Grenadier	1.82	131	
Eelpouts	Bigfin Eelpout	--	3	
	Twoline Eelpout	--	3	
	Other Eelpouts	1.51	43	
Misc. Fish	Cabezon*	1.68	101	*Included b/c they're potentially distributed in state waters
	Duckbill Barracudina	--	1	
	Finescale Codling/Pacific Flatnose	1.48	13	
	Kelp Greenling*	1.59	43	*Included b/c they're potentially distributed in state waters
	King of the Salmon	--	6	
	Longnose Lancetfish	--	1	
	Ragfish	1.80	43	
	Snailfish spp.	--	5	
	Walleye Pollock	--	4	*Prior to 2007, catch has reached 1,000s of metric tons in some years

Table 6. Average catch estimates for the non-FMP species meeting the GMT's first filtering criteria (reproduced from Table 1 in September's [Agenda Item G.8.b, GMT Report 2](#). The “% FMP” column refers to the percentage of catch coming from sectors regulated under the Groundfish FMP. As discussed above, the “retained %” estimates are recognized to be inaccurate for many of these stocks.

Species	Avg. catch (mt)				Species	Avg. catch (mt)

GROUNDFISH ADVISORY SUBPANEL REPORT ON STOCK COMPLEX RESTRUCTURING

The Groundfish Advisory Subpanel (GAP) acknowledges that restructuring of some of the current stock complex aggregations merits consideration. However, it is obvious that there are real and immediate financial, staff, and resource constraints that will hinder the ability of the Council and NMFS to develop, analyze, and implement management actions. Therefore, the GAP strongly urges the Council to keep it simple and to focus on issues that make needed improvements.

The GAP also reiterates the need for developing a complete analysis of the environmental and socioeconomic effects of restructuring complexes, including an evaluation of the management implications of restructuring complexes and an analysis of the conservation effects of proposed changes. While it appears there is sufficient information for the Council to take final action on the suite of issues acted upon at the September 2013 meeting, the GAP suggests the Council consider specifically deferring final action on the slope rockfish complexes until the full suite of analyses are available to inform a decision on restructuring the slope rockfish stock complexes. This recommendation seems to align with the NMFS recommendation in Agenda Item H.4.b, Supplemental NMFS Report, November 2013.

In or Out of the FMP

In the spirit of keeping it simple and focusing on those issues that merit action, the GAP recommends that the Council take no action on the issue of whether new species should be added to or removed from the fishery management plan (FMP). In one of their November 2013 reports, the Groundfish Management Team (GMT) highlighted that there is no obvious conservation need for action on this issue – “the species considered for reclassification are mainly those in marginal or questionable need of conservation and management. The GMT sees this evaluation as addressing logical inconsistencies more so than pressing conservation risks. The FMP already has and will maintain those stocks most in need of conservation and management attention as ‘in the fishery’” (Agenda Item H.4.b, GMT Report 2, November 2013). There may be a point in the future where the Council has time and resources to take up this housekeeping issue. In the GAP’s opinion, now is not the time.

Other Fish Complex

The GAP reiterates our previous recommendation for restructuring the Other Fish complex. As noted previously, this complex is an assemblage of species with disparate life histories, distributions, co-occurrence in the fishery, and vulnerabilities to overfishing which should not be managed together.

Cartilaginous Stocks

The GAP does not recommend managing all cartilaginous species (i.e., sharks, skates, and ratfish) in one complex because of their disparate life histories, distributions, and vulnerabilities. The GAP recommends that skates be managed separately from the other cartilaginous species

(spiny dogfish and ratfish). The GAP does not recommend further subdividing skates into shallow and deep complexes as it would unnecessarily create an additional complex that is not fully supported by the current analyses. Therefore, the GAP is recommending creation of a shark-ratfish complex and a skate complex.

Additionally, the GAP does not recommend an alternative that adds brown catshark to the FMP and complex. Brown catshark is a species not caught in great amounts in any groundfish fishery with a depth distribution far deeper than the trawl fishery can be prosecuted (i.e., deeper than 700 fm), which is the only fishery with any kind of historical bycatch of this species. This is consistent with our recommendation to take no action on the In or Out of the FMP issue.

To correct the November 2013 GMT Report, the GAP has not recommended moving longnose skate from individual management to the skate complex (as erroneously noted on Table 6 of Agenda Item H.4.b, GMT Report, November 2013). The GAP has not previously recommended categorizing soupfin shark as an EC species, but the GAP supports the rationale provided by the GMT for this action. Similarly, and consistent with our advice to take no action on the In or Out of the FMP issue, the GAP recommends leopard shark be categorized as an EC species.

Specifically, the GAP recommends the following Cartilaginous Fish Alternative:

Cartilaginous Fish-Individually Managed Stocks	Shark-Ratfish Complex	Skate Complex	EC Species
Longnose Skate	Spiny Dogfish Spotted Ratfish	Big Skate California Skate	Soupfin Shark Leopard Shark

Finally, if the Council decides to remove spiny dogfish from the complex and manage the stock with stock-specific harvest specifications, then the GAP strongly recommends the use of harvest guidelines as the preferred management tool. The GAP opposes development of spiny dogfish quota shares. The uncertain spiny dogfish catch history makes it very difficult to allocate at the permit level, which would most likely be necessary if this species was managed with quota shares.

Roundfish

The GAP recommends creation of a nearshore (shallow-water) roundfish complex that would include kelp greenling and the Washington Cabezon substock. The GAP does not recommend adding California scorpionfish to the nearshore (shallow-water) roundfish complex.

The GAP previously recommended removing Pacific grenadier and not adding the other grenadier species to the FMP, as well as removing finescale codling (aka Pacific flatnose) from the FMP since the distribution of grenadiers and finescale codling extends far deeper than the 700-fm trawl limit and no fisheries target these species on the west coast. However, to be consistent with our recommendation to take no action on the In or Out of the FMP issue, the GAP recommends categorizing Pacific grenadier and finescale codling as EC species. The GAP reiterates our recommendation to not create a deep-water roundfish complex for these species.

The GAP does not recommend adding California slickhead, a deepwater species, which is distributed deeper than 700 fm and is not targeted on the west coast.

The GAP also does not recommend adding the California and Oregon Cabezon substocks into a new nearshore (shallow-water) roundfish complex. The GAP is satisfied that these stocks are managed well with stock-specific harvest specifications and management measures under state and federal management (e.g., with state trip limits).

Specifically, the GAP recommends the following Round Fish Alternative:

Roundfish – Individually Managed Stocks	Shallow-water Roundfish Complex (coastwide)	EC Species
Cabezon (CA) Cabezon (OR) California scorpionfish Lingcod N and S of 40°10' Pacific cod Pacific whiting Sablefish N and S of 36°	Cabezon (WA) Kelp greenling	Finescale codling Pacific grenadier

Slope Rockfish Complex

The GAP was briefed by Mr. Frank Lockhart about the Supplemental NMFS Report, H.4.b, November 2013 pertaining to minor slope complex stocks. The GAP recognizes that NMFS needs more time to consider and analyze this issue, and that further analysis might better inform Council decision making on this issue. The GAP believes there might be merits to further analysis of this issue. What is most critical to the GAP and the affected industry sectors is ensuring that there is sufficient flexibility in the system to develop management measures, if necessary, that provide appropriate management assurance without unnecessarily constraining fishing opportunities.

The GAP recommends the Council defer action on this issue to provide more time for NMFS to analyze the issue, which would also provide time for NMFS to work with the affected industries to develop a suite of management approaches for Council consideration. Finally, the GAP recommends NMFS (1) provide notice to the fishing industry that contemplation of future management measures for roughey rockfish, blackgill rockfish, and shortraker rockfish is underway and (2) that NMFS is seeking input from the fishing industry about measures (both voluntary and regulatory) that would help to maintain catches of these species within their harvest targets.

GROUND FISH MANAGEMENT TEAM RECOMMENDATIONS ON CLASSIFICATION OF STOCKS IN THE FMP AND THE OTHER FISH STOCK COMPLEX ALTERNATIVES

We presented alternatives for the classification of stocks in the fishery management plan (FMP) and the Other Fish stock complex alternatives in two earlier Groundfish Management Team (GMT) reports under this agenda item ([Agenda Item H.4.b, GMT Report](#) and [Agenda Item H.4.b, GMT Report 2](#)). This report addresses the connections between the two sets of alternatives and provides additional guidance on how to approach the decisions. The Northwest Fisheries Science Center (NWFSC) was also able to provide the analysis we mentioned in Report 2, which we present and discuss here. These analyses produced overfishing limit (OFL) estimates, which the Scientific and Statistical Committee (SSC) approved at this meeting, for most if not all of the “in the fishery” candidates.¹

To help organize the Council’s policy deliberations on the “in the fishery classification” and stock complex decisions, we recommend working through them in three basic steps:

1. Make recommendations on the “in the fishery” classification (see Report 2).
2. Looking to the stocks recommended as “in the fishery”, consider the Other Fish stock complex alternatives (see Report 1).
3. Consider classifying remaining stocks as ecosystem component species (EC) or removing stocks from the FMP.

We illustrate these steps below. We expect that the policy choices involved with the “in the fishery classification” will largely shape the Council’s decision on the proposed Other Fish reorganization. With the number of stocks in play, there are many theoretical combinations. Yet we see the policy decisions grouping together in a way that makes the task manageable.

The NMFS Alternative on Slope Rockfish

The National Marine Fisheries Service (NMFS) West Coast Region GMT representatives presented a draft of their report on the Council’s September slope rockfish recommendation. In September, the Council limited the GMT’s consideration to the Other Fish and so we limit our discussion here accordingly. However, if further analysis goes forward for the slope rockfish complex, we would recommend consideration of the GMT alternatives presented in September ([Agenda Item G.8.b Supplemental GMT Report 5 September 2013](#)), especially what we called Alternative 1. That alternative could be modified based on which stocks are to be considered for individual management, such as keeping aurora rockfish within a complex or separating blackgill rockfish from bank rockfish (an inflator species). We proposed the new structure as an alternative to apportioning small amounts of harvest across the 40°10' N. latitude management line and instead grouping species by co-occurrence.

Also, if the Council had gone ahead with consideration of the slope rockfish complex, then much of the remaining analysis, in our view, would have moved into the management measures process anyway. The Council is considering management measures that could address catch of the slope rockfish without any reorganization of the complex. Following the NMFS approach

¹ We do have questions about certain OFL estimates, particularly the OFL for Aleutian Skate because of the limited occurrences of the stock in the trawl survey.

would allow individual management of certain species to be compared and contrasted on the efficacy and costs of management with the status quo complex structure. Again, this was what we had envisioned the Council would do had it moved the slope rockfish forward in September.

New Analysis in this Report

The NWFSC trawl survey data is presented below, in Appendix 1. We had hoped to have had this information at our October GMT meeting yet the federal government shutdown intervened. We thank the NWFSC GMT representative and his colleagues for the efforts to produce the analysis in time for this meeting. The OFL calculations and survey biomass estimates were very helpful and are included in Table 1 and the Figures 1 and 2 in Appendix 1.

As we stated in Report 2, we do not think the fact that an OFL is calculable should determine whether a species is classified as “in the fishery” or not. California Slickhead is a good example. The 2007-2011 average catch for a stock is less than 30 mt and its OFL is over 6,000 mt. This is a strong indication of the stock’s low vulnerability to the fisheries. Such comparisons of average catch to the estimated OFLs can inform the Council’s deliberations on the FMP’s classification of stocks, although we see no clear line where vulnerability is enough to push a stock to “in the fishery” classification.

Also in Appendix 1 are survey biomass trends for stocks where no OFL was calculated. The biomass estimates can help judge the impact a given amount of catch might have on a stock. For example, we see less than 50 metric tons (mt) of eelpouts caught, on average, per year (Table 1). While this is more than for some FMP stocks, the thousands of metric tons seen in the survey suggest that the eelpouts are not very vulnerable to the groundfish fisheries (Figure 2). The survey does not sample some species as well (e.g., ragfish) and so did not add to our understanding of the significance of catch magnitude for all species. In such cases, we continued to rely on the Productivity-Susceptibility Analysis (PSA) scores as described in Report 2 and our September reports.

The Three Decision Steps

1. Make recommendations on the “in the fishery” classification

Our Report 2 lays out four alternatives for the Council to consider for reclassifying the FMP’s list of stocks. We reproduce those below with some modifications and additions. First, we moved California skate into the sharks and skates set of alternatives. Second, we removed some alternatives that are no longer necessary because of the way OFLs were calculated based on the trawl survey instead of historical catch based methods like DB-SRA. Third, thornback skate was removed from the candidate list (Table 1) because it should have been filtered out in previous reports for being a nearshore species. Lastly we raise some specific considerations for Aleutian skate given what we learned from the NWSFC trawl survey analyses.

In our discussions, the grenadiers and the sharks and skates present the main policy choices for the Council on this issue. The other two sets of alternatives in this step are more related to the second and third steps, which we describe below.

In this first step, the recommendation is for the Council to focus on which reclassification candidate stocks should be classified as “in the fishery.” We do not restate the criteria that we used to identify these candidate stocks or the factors for deciding whether a stock should be “in

the fishery” or not. We described these in Report 2 and in our September reports. NMFS and NOAA General Counsel can aid the Council in the interpretation of the National Standard 1 Guidelines. Over the course of our analyses, the main guiding principle is the need for conservation and management, with the risk of overfishing being the primary factor to consider. Our aim has been to help the Council identify stocks that are facing similar such risks so that they can be classified similar in the FMP. It is the apparent inconsistency in the treatment of stocks that is in need of attention from the Council.

In the following sections, we discuss the four categories of species individually.

A. The Grenadier Alternatives

Classification	No Action	Classification	Alternative 1	Alternative 2	Alternative 3
“in the fishery”	Pacific Grenadier	“in the fishery”	Pacific Grenadier Giant Grenadier	Pacific Grenadier	---
not in the FMP	Giant Grenadier Other Grenadiers	EC Species <i>or</i> not in the FMP	Other Grenadiers	Giant Grenadier Other Grenadiers	Pacific Grenadier Giant Grenadier Other Grenadiers

The Council’s policy choice remains as described in Report 2 and turns largely on views about the marketability and relatively low vulnerability of these species. In further discussions, however, the GMT has identified Alternative 2 as somewhat problematic in that it treats Pacific and giant grenadier differently. The reason for treating them differently is based on the fact that Pacific grenadier is more marketable. Yet looking to their OFLs, giant grenadier’s average catch is higher as a portion of its OFL than is Pacific grenadier’s (we assume that 90 percent of the unidentified catch is Pacific grenadier and the remainder giant grenadier). Of note, these OFLs are likely conservative because the survey data used to inform them does not cover the full range of the populations and the OFL calculations assume that it does (i.e., that the survey “q” equals one). The SSC may speak to this matter under this agenda item or Agenda Item H.6.

One topic raised in team discussion involved the potential catch accounting improvements of including all grenadiers in the FMP. Our conclusion is that catch accounting could be improved whether the Council classifies them as “in the fishery” or EC species. As explained in Report 2, the unidentified catch comes from the landed portion of the catch. The task of better reporting and sampling of the grenadiers would be best considered as part of the management measures discussion under Agenda Item H.10. This is because reporting and sampling of landings is led by the three states and considerations of the various costs and implications to the state fish ticket and sampling programs would need to be considered. Again, the team sees this as true regardless of EC species or “in the fishery” classification.

B. The Sharks and Skates Alternatives

Classification	No Action		Classification	Alternative 1	Alternative 2
“in the fishery”	Big Skate California Skate Spotted Ratfish		“in the fishery”	Aleutian Skate? Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate Big Skate California Skate Spotted Ratfish	---
not in the FMP	Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate		EC Species or not in the FMP	---	Aleutian Skate Brown Cat Shark Bering/Sandpaper Skate Black/Roughtail Skate Big Skate California Skate Spotted Ratfish

The OFLs reported in Table 1 bring new understanding to the relative vulnerability of the stocks to overfishing. However, this new information does not appear to change the nature of the Council’s decision in that we still see no clear line for calling a species vulnerable enough to be in the fishery.

As seen in Table 1, looking at the average catch of individual stocks versus their OFLs, Bering/sandpaper skate seems most vulnerable with catch at just under 40 percent of its OFLs. The others are near 20 percent or less. Aleutian skate is an exception, yet as discussed below, it is infrequently encountered in the survey and so the OFL is of questionable accuracy.

The unidentified skate catch—which is mostly landed catch—somewhat complicates these considerations. The amount of unidentified skate catch has lowered from what is reported in Table 1 to an average of 305 mt over 2010-2012. The main reason for this, we believe, is that Longnose skate was removed from the Other Fish complex beginning in 2009 and sorting began to improve over 2009 and 2010. Considering the 305 mt of unidentified skate catch still occurring, we do not have data to inform what the species composition might be. Assuming that none is Longnose skate, then average catch of the all other skates combined would be about 50 percent of their combined OFLs for all other skates. This could argue for classifying all skates as “in the fishery,” although as discussed with the grenadiers, catch accounting could still be improved if the skates here were classified as EC species. Some may prefer the EC species route and learning more about species-specific landings for the next time the Council considers the FMP’s classification of stocks. Again, we see reasonable justification for either position.

If the Council sees the unidentified skate catch relative to the OFLs as a reason to designate the skates as “in the fishery,” then spotted ratfish and brown cat shark present different circumstances. They are easily identifiable and not marketed. Looking to average catch versus their OFLs, brown cat shark is just under 40 percent and spotted ratfish just over 10 percent.

All in all, the GMT cannot say what percentage of an OFL catch would reach to raise a high enough risk of overfishing for classification as “in the fishery.” We view it is a matter for the Council’s policy discretion to decide which non-target stocks are in need of conservation and management with annual catch limits.

C. The EC Species Candidates

In looking at the NWFSC analysis, we did not see reason to change the list of candidates here. These stocks would be classified as EC species or removed from/left out of the FMP depending on the Council's preference under Step 3. We discuss the unique circumstance of Aleutian skate below.

Classification	No Action		Classification	Alternative 1
"in the fishery"	Finescale codling/Pacific Flatnose		"in the fishery"	---
not in the FMP	Aleutian Skate Duckbill Barracudina Deepsea Skate All Eelpouts Filetail Cat Shark King of the Salmon Longnose Cat Shark Longnose Lancetfish Pacific Black Dogfish Pacific Sleeper Shark Ragfish Salmon Shark All Slickheads and Tubeshoulders All Snailfish Walleye Pollock		EC Species or not in the FMP	<i>Aleutian Skate? (see above)</i> Duckbill Barracudina Deepsea Skate All Eelpouts Filetail Cat Shark Finescale codling/Pacific Flatnose King of the Salmon Longnose Cat Shark Longnose Lancetfish Pacific Black Dogfish Pacific Sleeper Shark Ragfish Salmon Shark All Slickheads and Tubeshoulders All Snailfish Walleye Pollock

D. The nearshore/state waters species

Classification	No Action	Alternative 1
"in the fishery"	Leopard Shark Cabezon (WA) Kelp Greenling Soupfin Shark	---
Species predominately caught in state waters or in fisheries not regulated by the Groundfish FMP	---	Leopard Shark Cabezon (WA) Kelp Greenling Soupfin Shark

These are species that are currently in the Other Fish complex but, practically speaking, are independently managed. The "individual management" designation for these stocks, however, might be somewhat unusual to some because they are not "Category 1" stocks in terms of how their OFLs are derived. Other stocks, like cabezon (OR) and cabezon (CA) are in similar circumstances. As noted, California skate is on this list in Report 2 but we moved it to the sharks and skates section because survey data showed it to extend into deeper waters than we had assumed.

The circumstances for soupfin shark are somewhat different from the rest. The stock may extend into deeper waters but is largely taken by gillnet gears in California that target species not managed in the Groundfish FMP. Based on the 2007-2011 averages, over 80 percent of the catch

comes from sectors managed elsewhere. The Council's ability to control catch through this FMP is therefore limited.

The reasons we saw the need to flag this list of species will, we hope, become more apparent under Step 2.

E. Considering Aleutian Skate

As mentioned above, we have questions about the validity of the OFL for Aleutian skate. As explained more in Appendix 1, the species was seen in fewer than 20 tows over the course of several years of the trawl survey. Aleutian skate is abundant in the waters off Alaska, with a biomass estimate for the Eastern Bering Sea and Aleutian Islands of 33,293 mt.² This is second only to Alaska skate in estimated abundance in that area. This suggests that the biomass estimate of 72 mt for the West Coast represents the tail of the stock's distribution. The GMT suggests that this may be reason to exclude Aleutian skate from a Skate Complex, or if Aleutian skate were to be included in a Skate Complex within the FMP, there would be reason for it to be combined with the Other Skates subset of the complex. This would allow the few occurrences in the trawl survey to contribute to the OFL calculation for the Other Skates, which is currently based only on observations of deepsea skate and starry skate.

2. Consider the Other Fish stock complex alternatives

The "in the fishery" decisions made under Step 1 will largely shape the decisions made for the reorganization of the Other Fish complex. We illustrate the possibilities using a few scenarios that we anticipate to be at focus in the Council's discussions.

A. The full EC Species scenario.

If the Council chooses Alternative 3 for the grenadiers, Alternative 2 for the sharks and skates on the "in the fishery" decision, and agrees with GMT's logic on soupfin shark, then the only cartilaginous "in the fishery" stocks would be leopard shark and dogfish. And these two stocks are independently managed without good reason for combining them into a complex. They do not co-occur and are not confusable in appearance.

A similar situation happens with the roundfish, with cabezon (WA) and kelp greenling being the only "in the fishery" stocks candidates remaining. As we describe below, the GMT does not see much reason to combine these stocks with one another.

B. The partial EC Species scenarios.

There are two major possibilities considered here. First, if the Council recommends Pacific and giant grenadier as "in the fishery" (Grenadier Alternative 1) but recommends the Skates and Sharks Alternative 2 (meaning they would be EC species), then the roundfish alternatives involve a grenadier complex made up of Pacific grenadier and giant grenadier. The situation

² Ormseth, O.A. 2012. Assessment of the skate stock complex in the Bering Sea and Aleutian Islands. In: 2012 North Pacific Groundfish Stock Assessment and Fishery Evaluation Reports for 2013. North Pacific Fishery Management Council, <http://www.afsc.noaa.gov/REFM/Docs/2012/BSAIs skate.pdf>.

described above and below with kelp greenling and cabezon (WA) would be present for the cartilaginous species.

The other possibility is the opposite situation where the Council recommends Grenadier Alternative 3 and Shark and Skate Alternative 2 (i.e., the grenadiers are EC species and the skates and sharks are “in the fishery”). Under this situation, the cartilaginous species alternatives would involve the same kelp greenling and cabezon (WA) situation. All alternatives for the cartilaginous species in Report 1 would be viable. We discuss this same situation below.

C. The minimal EC Species Scenario

If the Council chooses Grenadiers Alternative 1 and the Sharks and Skates Alternative 1 above, then the full range of cartilaginous alternatives would be in play. The Roundfish Alternatives would still present the kelp greenling, cabezon (WA) situation, described in more detail in the next section.

To work through the cartilaginous species alternatives, we have included all the alternatives from Report 1 as Appendix 2 on the final page of this report.

D. Discussion on Cabezon (WA) and Kelp Greenling

As noted, the GMT has discussed grouping of cabezon (WA) with kelp greenling. The common factors that argue for grouping species (e.g., co-occurrence, similarity of appearance) are not present between the two. For these reasons and the fact that the stocks are largely managed individually by each of the states, the GMT recommends the Council consider classifying them as individually managed. A potential issue arises because cabezon (WA) does not have an OFL yet calculated, and the kelp greenling OFL is based on the California sub-stock only. As stated in the SSC statement, there may be a way to calculate OFLs for the remaining kelp greenling sub-stocks and cabezon (WA) over the winter. If they cannot be calculated this cycle, then several issues may need further consideration in March or April. To illustrate, at the extreme, we do not see how the harvest specifications for kelp greenling in California provide status determination criteria on overfishing for cabezon off of Washington. Likewise, there would likely be concerns with the deducting cabezon (WA) catch, and catch of kelp greenling in Washington and Oregon, from the harvest specifications that derive from kelp greenling in California.

3. Consider classifying remaining stocks as EC species classification or removing stocks from the FMP

As noted, there are two logical possibilities for stocks not classified as “in the fishery.” The Council could designate them as EC Species or leave them out of the FMP altogether. As noted in Report 2, we do not see much reason to designate some stocks as EC species while leaving others out of the FMP altogether.

A more thorough analysis of the EC species classification might be added to the management measures process. The Council may still have questions about what EC species classification might entail. One possibility for EC species is that we do no more than we were able to do now and simply consider annual catch estimates on an annual or some semi-annual basis. Improvements in catch accounting could be considered as well. As discussed above in the grenadiers section, given the potential impacts to sampling programs and the fishing industry,

such changes would be best considered as part of the management measures process under Agenda Item H.10. Lastly, we have heard some guidance that designation as EC species might involve less analysis than complete removal or omission of a species from the FMP.

Appendix 1 – NWFSC Bottom Trawl Data and Analysis to Support the “In the Fishery” Question

Survey biomass estimates and associated OFL estimates described in [Agenda Item H.6.a Supplemental Attachment 6 November 2013](#) are included in Table 1. Biomass estimates have also been calculated for all additional species that are encountered by the NWFSC Groundfish Trawl Survey. Biomass estimates are based on the most recent 3 years of survey abundance available at the time of this analysis (Appendix Figures 1 and 2) and are only calculated for species that were encountered in all 3 years. A small subset of these species that were encountered annually, were seen in so few tows that the survey biomass estimates are unlikely to provide reliable estimates of biomass or OFL contributions. These species are Aleutian skate, Pacific sleeper shark, other slickheads (including tubeshoulders), and snailfish, all of which have occurred in fewer than 100 tows total (and never more than 20 tows in any given year). Of these species, Aleutian Skate is the only one for which an OFL contribution was presented in [Agenda Item H.6.a Supplemental Attachment 6 November 2013](#).

The OFL contributions for Other Skates and Other Grenadiers should not be directly compared to the average catches listed in these categories in Table 1. Landings in both of these groups have often not been identified to the species level. For instance, for the years 2007–2011, the average catch of unidentified skates was 725 mt, but this average includes longnose skate in the years prior to the individual management of that species. For the years 2010–2012, when longnose skate was landed separately, the unidentified skate landings averaged 305 mt, but this number still likely included large amounts of big skate. In contrast, the estimated 24.9 mt OFL contribution for Other Skates is based on survey observations of only starry skate and deepsea skate. Likewise, in the case of grenadiers, the average catch of unidentified grenadiers has been 135 mt for the years 2007–2011, but this is likely to include large amounts of Pacific grenadier that was not identified by species in landings records. That number should therefore not be compared to the 40.1 mt estimated OFL contribution for Other Grenadiers which is based on survey observations of smooth grenadier, popeye grenadier, softhead grenadier and California grenadier. Regardless of the actions taken by the Council on revising stock complexes, the catch data could be improved in future years to allow comparisons of catch to the OFL estimates presented here for Other Skates and Other Grenadiers. However, it can be noted that if all species are combined then the sum of all skate catches have been below the sum of all skate OFL contributions and the sum of all grenadier catches has been below the sum of all grenadier OFL contributions.

Table 1. PSA scores, average catch, OFL estimates and biomass estimates for Other Fish related candidate stocks from [Agenda Item H.4.b GMT Report 2 November 2013](#). Biomass estimates with darker shading are those for which the survey has few encounters and is unlikely to provide reliable estimates. Catch / OFL column represents that ratio of average catch (2007–2011) to OFL estimate for those cases where these values are both available and reasonable to compare.

	Species	PSA score	Catch (avg.)	OFL estimate	Catch / OFL	Biomass estimate	Notes
Skates & Rays	Aleutian Skate	1.71	3	3.6	83%	72*	*Biomass estimate based on few encounters
	Bering/Sandpaper Skate	1.80	70	177.4	39%	5,727

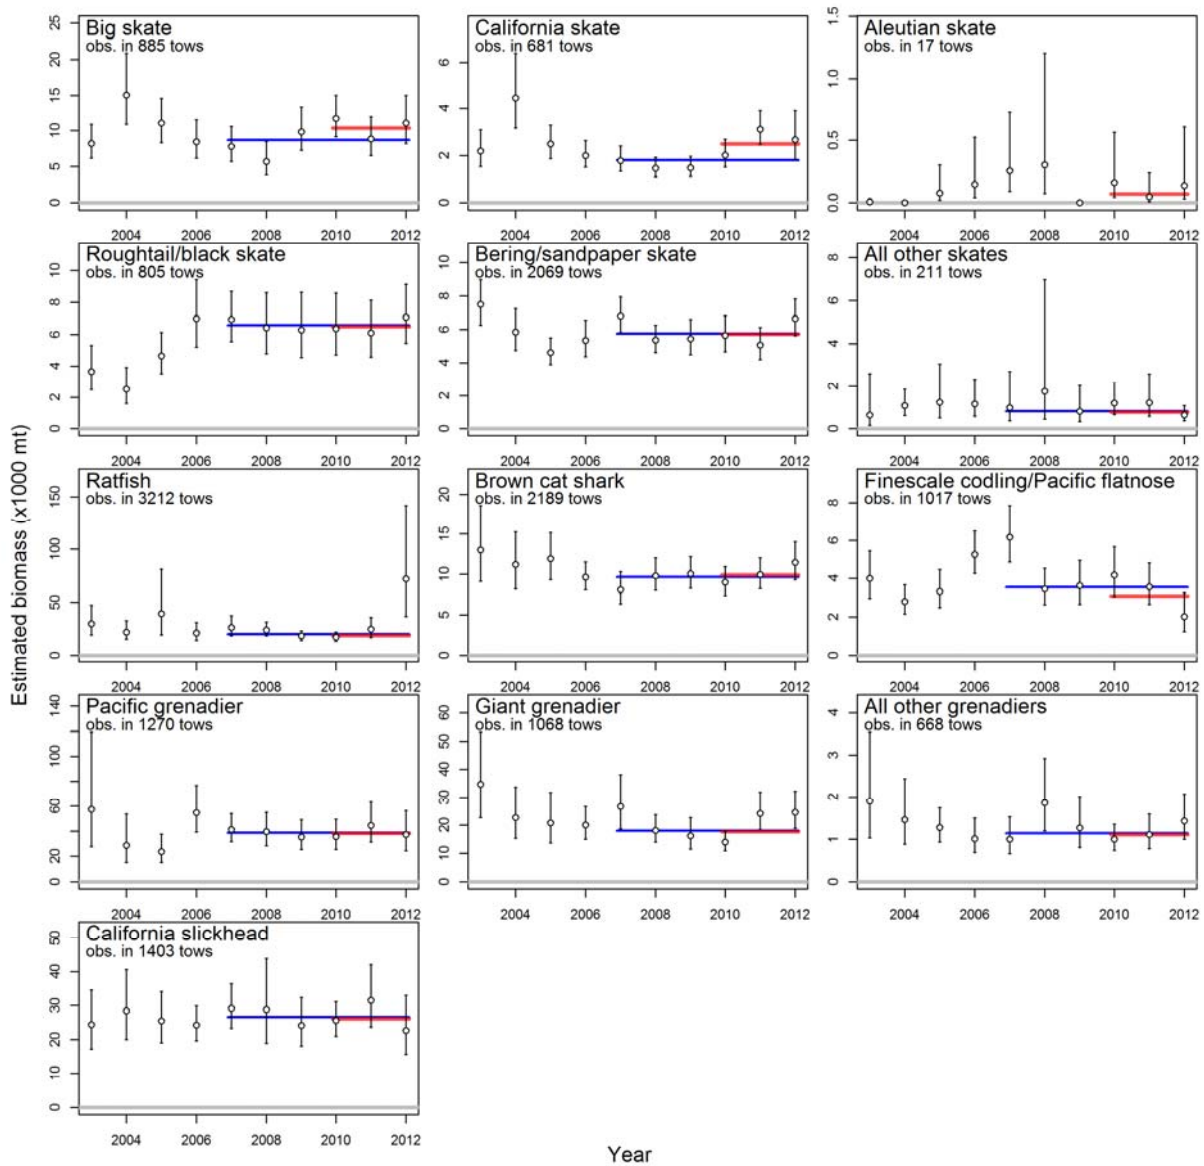

Figure 1. Time series of estimated survey biomass for species included in [Agenda Item H.6.a Supplemental Attachment 6 November 2013](#). Time period covers 2003–2012, with estimated 95% confidence intervals. Horizontal lines indicate weighted average value over most recent 6-year and 3-year periods. No 6-year average for Aleutian skate is reported because they were not encountered in the 2009 survey. Number of observations refers to total number of tows that included the species out of a total of 6453 tows for this 10-year period.

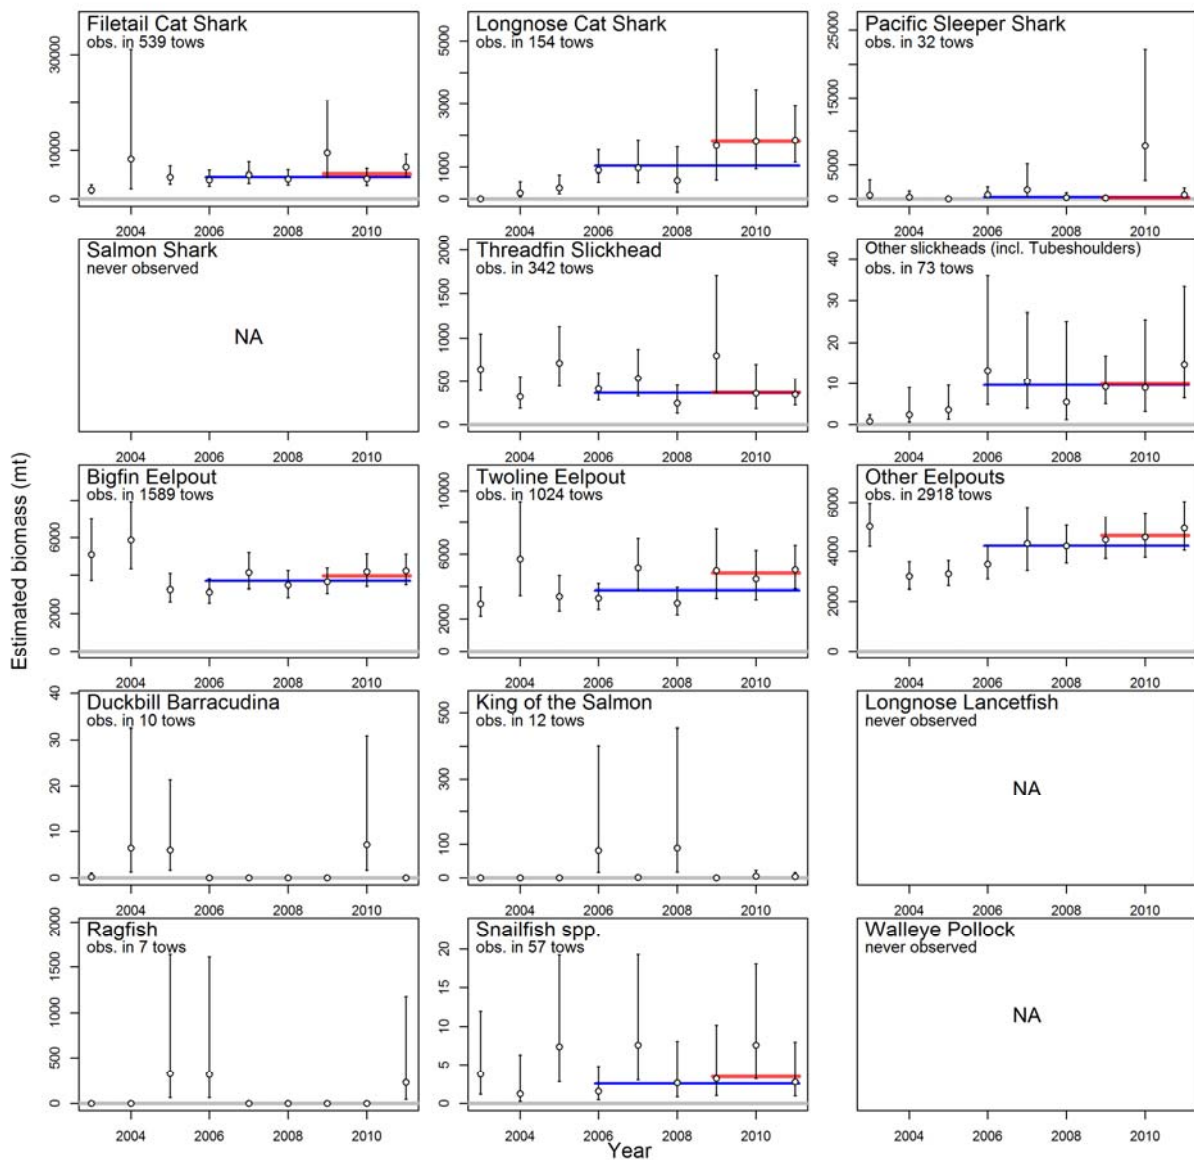

Figure 2. Time series of estimated survey biomass for additional species. Time period covers 2003–2011, with estimated 95% confidence intervals. Horizontal lines indicate weighted average value over most recent 6-year and 3-year periods. No averages are shown for periods that include no encounters. Number of observations refers to total number of tows that included the species out of a total of 5735 tows for this 9-year period. Note that the scale differs between Figures 1 and 2.

Appendix 2 – Alternative Tables, modified from GMT Report 1
([Agenda Item H.4.b, GMT Report](#))

Cartilaginous Species **Alternative 1.** The only differenced from status quo is moving spiny dogfish to individual management.

Cartilaginous Fish--Individually Managed Stocks	Cartilaginous Fish in the Other Fish Complex
Spiny Dogfish	Big Skate California Skate Leopard Shark Spotted Ratfish Soupfin Shark

Cartilaginous Species **Alternative 2.**

Cartilaginous Fish--Individually Managed Stocks	Cartilaginous Fish Complex	Cartilaginous Fish EC Species
Spiny Dogfish	Big Skate California Skate Leopard Shark Soupfin Shark	Spotted Ratfish

Cartilaginous Species **Alternative 3.** This alternative was provided by the GMT under Agenda Item G.8.b, Supplemental GMT Report 7, September 2013.

Cartilaginous Fish--Individually Managed Stocks	Shark-Ratfish Complex	Skate Complex
Spiny Dogfish	Soupfin Shark Brown Cat Shark Leopard Shark Spotted Ratfish	Big Skate California Skate Bering/Sandpaper Skate Aleutian Skate Roughtail/Black Skate All Other Skates

Cartilaginous Species **Alternative 4.** This alternative was presented by the Groundfish Advisory Panel (GAP)

Shark-Ratfish Complex	Skate Complex	EC Species
Spiny Dogfish Spotted Ratfish	Longnose Skate Big Skate California Skate Bering/Sandpaper Skate Aleutian Skate Roughtail/Black Skate All Other Skates	Soupfin Shark

MINOR SLOPE COMPLEX STOCKS WITH CONSISTENT OVERFISHING LIMIT CONTRIBUTION OVERAGES; COUNCIL CONSIDERATION OF REORGANIZATION OF BLACKGILL, ROUGHEYE, AND SHORTRAKER ROCKFISH FOR ADDITIONAL ANALYSIS

At the 2013 September meeting the Council decided (as a preliminary preferred alternative) to defer further consideration of reorganizing nearshore, shelf, and slope species complexes until the 2017-2018 Harvest Specifications cycle. At the September Council meeting, NMFS stated its intent to review this decision and report back to the Council at the November meeting. After further review, the Agency has come to the conclusion that further analysis of removing Blackgill, Roughey, and Shortraker from the minor slope complex is warranted, in addition to management measures that may be analyzed to keep catch of these stocks within their contributory OFLs to the Minor Slope complex. Additional analysis will help the Council in their final decision regarding harvest specifications and management measures in June of 2014.

Although the Minor Slope North and Minor Slope South complexes are divided at 40° 10' N. latitude, combining northern and southern individual stock contributions to the OFL is more informative when determining management performance of these stocks coastwide ([Agenda Item F.8.b, Supplemental SSC Report](#), June 2013). Accordingly, in its review the Agency compared past total mortality with preliminary 2015 OFL estimates for each stock.

Tables 1 and 2, below, demonstrate that mortality of blackgill, roughey, and shortraker rockfish was higher than their 2015 OFL contributions to the minor slope complex in most years since 2004¹. Although the Agency initially was concerned with aurora rockfish, results from the new category 1 assessment compared with historical total mortality of this species indicate that there is no overfishing trend for this species.

Table 1: Comparison of total mortality catch in selected years to preliminary 2015 OFLs for Aurora, Blackgill, Roughey, and Shortraker rockfish. Individual species-specific stock overfishing limit (OFL) estimates are combined coastwide north and south of 40° 10' N. latitude.

<i>Minor Slope (Managed N&S, Combined)</i>			
Species	Years Over 2015 OFL (2011-12)	Years Over 2015 OFL (2007-12)	Years Over 2015 OFL (2004-12)
Aurora	0/2	0/6	0/9
Blackgill	2/2, 100%	4/6, 67%	5/9, 56%
Roughey	2/2, 100%	5/6, 83%	5/9, 56%
Shortraker	2/2, 100%	6/6, 100%	7/9, 78%

¹ In its review, the Agency utilized data sets developed through the GMT's review of stock complexes. NMFS notes that actual total mortality of Roughey and Shortraker is somewhat higher than in the estimates provided in this supplemental report because an average catch (2007-2012) of 15.16 mt was reported in a Roughey/Shortraker WCGOP data field that has not yet been incorporated into GMT or Agency estimates. This further highlights the need to evaluate management options.

Table 2: Comparison of average total mortality catch (mt and percentage of 2015 OFL) in selected years (2007-2012) for Aurora, Blackgill, Rougheye, and Shortraker rockfish. Individual species-specific stock overfishing limit (OFL) estimates are combined coastwide north and south of 40° 10' N. latitude.

	<i>Minor Slope (Managed N&S, Combined)</i>		
	Average TM catch, 2007-2012	2015 OFL	Average TM catch (2007-2012)/2015 OFL
Aurora	49.18	91.7	53%
Blackgill	134.33	141.7	94%
Rougheye	226.16	206	110%
Shortraker	31.66	18.8	168%

- **Blackgill** (A category 2 stock): Historical catches of blackgill rockfish have consistently exceeded the estimated 2015 OFL and should be analyzed for removal or reorganization from status quo complexes. In 2013, harvest guidelines and trip limits were implemented to control fixed gear catch. However, further analysis of single species management may be helpful to the Council when considering decision-making regarding management measures for reducing blackgill rockfish catch.
- **Rougheye** (A category 2 stock): Historical catches of rougheye rockfish have consistently exceeded the estimated 2015 OFL and should be analyzed for removal or reorganization from status quo complexes. The new assessment (and associated 2015 OFL) indicates that historical total mortality could continue to result in an overfishing trend, even though the 2013 assessment indicates that the stock is healthy (>47% unfished biomass).
- **Shortraker** (A category 3 stock): Historical catches of shortraker rockfish have consistently exceeded the estimated 2015 OFL and should be analyzed for removal or reorganization from status quo complexes.

The SSC provided guidance to the Council on stocks where catch regularly exceed OFL contribution values in their April 2012 supplemental statement ([Agenda Item I.3.b, Supplemental SSC Report, April 2012](#)):

"The SSC recommends that for species with OFL contribution values, a comparison of recent catches with those values be used to identify whether stock complexes are working as they were intended. If catches regularly exceed OFL contribution values, this could indicate a problem with how the stock complexes are structured, and justify action in the next management cycle which could include removing the species concerned from the complex and prioritizing it for a full assessment."

Conclusion:

NMFS believes it is important for the Council to analyze removing or reorganizing blackgill, rougheye, and shortraker from the minor slope complexes (north and south). Targeted management measures (such as broad area closures) could reduce catch below the OFL, but may result in unintended impacts on other target species attainment and sectors, while also resulting in additional regulatory complexity. Management measures applied to address blackgill, rougheye, and shortraker contribution OFL overages without removing or reorganizing slope rockfish complexes may be unnecessarily disruptive. SFD endorses efforts to reduce regulatory complexity coupled with increased individual accountability.

STOCK ASSESSMENTS AND REBUILDING ANALYSES

The Pacific Fishery Management Council (Council) process for setting groundfish harvest levels and other specifications depends on periodic assessments of the status of groundfish stocks and a report from an established assessment review body or, in the Council parlance, a Stock Assessment Review (STAR) Panel. The Scientific and Statistical Committee (SSC) reviews this information and makes a recommendation relative to the standards of 1) the best available science, and 2) soundness for use in groundfish fishery management decision-making by the Council. The Council then approves the new assessments and relevant analyses used to set groundfish harvest levels and other specifications for the following biennial management period.

The Council requested further review of three data-moderate assessments for nearshore rockfish to consider alternative area stratifications. Specifically, the Council requested the assessments for brown and copper rockfish be limited to south of the California-Oregon border at 42° N lat. They additionally requested alternative assessment model runs for China rockfish to explore area stratifications of north and south of 40°10' N lat., as well as north and south of 42° N lat. The SSC's Groundfish Subcommittee will meet on October 30 to review these revised assessments. Further, a new cowcod rebuilding analysis will be reviewed by the SSC's Groundfish Subcommittee at their October 30 meeting. The subcommittee's recommendations will be evaluated by the full SSC and they will, in turn, provide their recommendations to the Council.

Federal government employees responsible for producing the revised assessments and the cowcod rebuilding analysis have been on furlough through the November briefing book deadline. Therefore, these assessments and the cowcod rebuilding analysis are not provided in the advanced briefing book.

The Terms of Reference for stock assessments requires documentation of available compositional data for stocks assessed using data-moderate methods. An updated documentation of these data are provided in Supplemental Attachment 1.

The Council should consider the assessments and the cowcod rebuilding analysis, as well as the advice of the Scientific and Statistical Committee, other advisory bodies, and the public before adopting the new stock assessments and the rebuilding analysis for use in groundfish management in 2015 and beyond.

Council Action:

Adopt those stock assessments and rebuilding analyses recommended by the SSC.

Reference Materials:

1. Agenda Item H.5.a, Supplemental Attachment 1: Available Age and Length Composition Data for the Nine Data-Moderate Stocks Undergoing Assessment in 2013.
2. Agenda Item H.5.a, Supplemental Attachment 2: 2013 Cowcod rebuilding analysis.
3. Agenda Item H.5.a, Supplemental Attachment 3 (or attachments): Data-moderate stock assessments for brown, China, copper rockfishes in 2013.

Agenda Order:

- a. Agenda Item Overview
 - b. Reports and Comments of Advisory Bodies and Management Entities
 - c. Public Comment
 - d. **Council Action:** Adopt Final Data-Moderate Stock Assessments for Copper, Brown, and China Rockfishes; Adopt Final Rebuilding Analysis for Cowcod Rockfish

Cowcod Rebuilding Analysis

October 30, 2013

DRAFT

E.J. Dick and Alec D. MacCall
NMFS SWFSC Fisheries Ecology Division
110 Shaffer Road
Santa Cruz, CA 95060
edward.dick@noaa.gov

Introduction

The status of cowcod (*Sebastes levis*) in the Southern California Bight was first assessed by Butler et al. (1999), who concluded that spawning biomass in 1998 was approximately 7% of the unfished biomass. The stock was declared overfished in 2000 and the first rebuilding plan was adopted under Amendment 16-3 (PFMC, 2004). The stock was assessed again in 2005 (Piner et al., 2006) and the original rebuilding plan parameters were supplanted by the rebuilding analysis of Piner (2006). Subsequent assessments and rebuilding analyses were completed by Dick et al. (2007), Dick and Ralston (2008), Dick et al. (2009) and Dick and Ralston (2009). Rebuilding reference points from previous analyses are provided in Table 1. This rebuilding analysis is based on the assessment by Dick and MacCall (2013). Results are derived from outputs of the Bayesian assessment model (Extended Depletion-Based Stock Reduction Analysis, XDB-SRA), and details regarding the rebuilding calculations are provided in this document.

Simulation Model and Rebuilding Calculations

Estimation of Virgin Biomass (B_0)

The base model for the 2013 cowcod stock assessment uses a generalized production function (details in Dick and MacCall, 2011), parameterized in terms of the annual rate of natural mortality (M), the ratios F_{MSY}/M and B_{MSY}/B_0 , and stock depletion (Δ) in the year 2000. Given a draw from the joint prior distribution, and a time series of removals since the beginning of the fishery, a value of total (male + female) vulnerable biomass is obtained by numerical solution. Draws from the joint posterior distribution are simulated by repeated resampling from the prior distributions with weights proportional to the likelihood for the abundance indices (i.e. sampling importance resampling). Nominal unfished female spawning biomass (B_0) is reported as half the total (male+female) vulnerable biomass, assuming a 1:1 sex ratio, knife-edge selectivity at age of maturity (11 years), and similar growth for males and females. The posterior median of unfished female spawning biomass is 1549 mt.

Simulation of Future Recruitments

In each rebuilding model run, 15000 simulated trajectories were generated using draws from the joint posterior distribution. Similar to the previous cowcod rebuilding analysis, variability in future recruitment is expressed as a weighted set of different states of nature (parameter values), rather than random deviations from an average stock-recruitment relationship. While the previous rebuilding analysis accounted only for uncertainty in the Beverton-Holt steepness parameter, the current analysis accounts for uncertainty in all estimated model parameters.

Mean Generation Time

Mean generation time for cowcod is estimated from the net maternity function (external to the model) and is 38 years. This is the same estimate for mean generation time as in the 2009 rebuilding analyses (see Table 2 for relevant age-specific quantities).

Recent Management Performance

Estimates of total cowcod mortality have not exceeded the ACL (or OY) in any year since 2003 (Table 3). Under the current SPR harvest rate ($F_{82.7\%}$), which is equivalent to an exploitation rate of 0.007 (catch over age 11+ biomass), $T_{REBUILD}$ is 2020. This is 48 years earlier than the current estimate of T_{TARGET} (2068). Reasons for the change are described in detail by Dick and MacCall (2013).

In recent years, the Council has set the ACL for cowcod in the Monterey & Conception INPFC areas equal to twice the ACL for the area south of Pt. Conception (PFMC and NMFS, 2006). However, there is no separate or distinct tracking of removals north or south of Point Conception.

Description of Model Runs

Model runs presented in this document follow the PFMC's Terms of Reference for the Groundfish Rebuilding Analysis (TOR) (PFMC, September 2012). All runs are based on output produced by the 2013 base model (Dick and MacCall, 2013). Rebuilding run numbers correspond to the list of requested runs in the TOR (PFMC, September 2012, pg. 8). In all models, the catches for 2013 and 2014 were set to the ACL for cowcod in the assessed area (1.5 mt for the region south of Point Conception).

The TOR lists the following minimum set of harvest policies for analysis:

- 1) eliminate all harvest beginning in the next management cycle (i.e., estimate $TF=0$),
- 2) apply the harvest rate that would generate the ACL specified for the current year (i.e., the latest year specified in regulations),
- 3) apply the spawning potential ratio or relevant harvest control rule in the current rebuilding plan,
- 4) apply the harvest rate that is estimated to lead to a 50% probability of recovery by the current $TTARGET$,
- 5) apply the harvest rate that is estimated to lead to a 50% probability of recovery by the $TMAX$ from the current cycle,
- 6) apply the harvest rate that is estimated to lead to a 50% probability of recovery by the $TMAX$ from the previous cycle,
- 7) apply the default (e.g. 40-10 or 25-5) harvest policy, and
- 8) apply the ABC harvest rate (i.e., $FMSY$ less the uncertainty buffer).

Methods

For all runs, removals in 2013 and 2014 were set to 1.5 mt. Projections were completed through 2024. Due to the time lag in the production model (11 years), production through 2024 is pre-determined in the projections. This allowed us to apply the harvest specifications described in runs 1-8 to each of 15000 trajectories using the posterior draws from the base model.

Run 1

Catches from 2015-2024 were set equal to zero and all trajectories run through 2024.

Run 2

Numerically solved for the exploitation rate generating a median catch of 1.5 mt in 2015.

Run 3

Referred to results from the 2009 rebuilding analysis to determine the harvest rate (0.007; based on catch divided by age 11+ biomass) associated with the SPR target specified in the previous rebuilding analysis (82.7%).

Run 4

An approximation was used to determine the harvest rate that rebuilds the stock by current T_{target} (2068) with 50% probability. First, we determined the harvest rate that produces a steady state (no change in median biomass) from 2015-2024. The associated exploitation rate, biomass, and catch were $E = 0.0466$, $B = 1049$ mt, and $C_{2015} = 52.2$ mt). Since target biomass (B_{msy} proxy) is 40% of 3099, or 1239.5 mt, the stock has to grow $1239.5 - 1049 = 190.5$ mt from 2015 to 2068 (53 years, or 3.5 tons/year). Removing this from the steady state catch ($52.2 - 3.5 = 48.7$ tons) we derive an approximate exploitation rate by multiplying the steady state exploitation rate (0.0466) by the ratio $48.7/52.2$, giving a reduced rate of 0.0435.

Run 5

A new T_{MIN} was calculated from the results of Run 1 (future catch = 0), with all biomasses increased by 8.2 mt, the total amount caught from 2001 to 2014. For time periods shorter than the age to maturity this catch-correction is consistent with the dynamics model in XDB-SRA. T_{MIN} is 2019. A new T_{MAX} was then calculated by adding 38 years to the new T_{MIN} , giving 2057. The approach is now the same as Run 4, changing the number of years needed to reach the target from 53 to 41. Specifically, $190.5 \text{ mt} / 41 \text{ yr} = 4.6 \text{ mt/yr}$, giving the ratio $(52.2 - 4.6)/52.2 = 0.912$, and a reduced exploitation rate of $0.912 * 0.0466 = 0.0425$.

Run 6

This run used the same approach as Run 4, changing the number of years needed to reach the target from 53 to 82. Specifically, $190.5 \text{ mt} / 82 \text{ yr} = 2.3 \text{ mt/yr}$, and gives the ratio $(52.2 - 2.3)/52.2 = 0.956$, and a reduced exploitation rate of $0.956 * 0.0466 = 0.0445$.

Run 7

Applied the 40-10 harvest control rule to each trajectory and summarized the results.

Run 8

Applied the ABC harvest rate, 0.04165 (83.3% of the E_{msy} proxy rate of 0.05), to each trajectory, and summarized the results.

GROUND FISH MANAGEMENT TEAM REPORT ON STOCK ASSESSMENTS AND REBUILDING ANALYSES

Groundfish Management Team (GMT) members attended the Scientific and Statistical Committee's (SSC) Groundfish Subcommittee review as well as SSC deliberations regarding re-stratified stock assessments for brown, copper, and China rockfishes and the rebuilding analysis for cowcod. These results were discussed with the remainder of the GMT. The GMT offers the following comments on alternative stock assessment stratifications, the data-moderate stock assessment process, and future assessments.

General Considerations about Stock Boundaries

One thing we took away from this experience was the importance of discussing "lines" used in the stock assessments and connecting the reason for the line to a biological or other data issue, or to some other management concern. Doing so is important for separating concerns about policy and management from the science of assessing stocks, and the GMT fully agrees that management discussions should follow after the biological stock boundaries are identified to best assess the stock. Yet the justifications for the lines we use are not always understood, and the science is not always clear. This issue about "lines" is probably best explored through discussions of the stock complexes in future meetings. For example, this cycle we will be apportioning the harvest specifications for copper rockfish across the 40°10' N. latitude management line. Our understanding is that the reason for that line was initially that it was a biological boundary reflecting the distribution of some of the component stocks, although, to our understanding, this assessment does not treat that line as a biological boundary for copper rockfish. Therefore, some have questioned the justification for apportioning catch across that line. Without going into detail, these questions relate to those we have raised in other reports about the management response for stocks managed within complexes.

Implications of the Management Line for China Rockfish

The alternative stratifications of the China rockfish stock assessment provides the Council with the option of choosing overfishing levels (OFLs) calculated north and south of 40°10' N. latitude, or north and south of 42° N. latitude. On the question of whether the line has a biological or management justification, we now understand the SSC to have said that there is a biological reason for a North-South line but that the science could not differentiate between the two options. Because of this, the advice we understood was that they felt it acceptable for management preferences to choose where to draw the line for the assessment. If the biological evidence strongly supported one line over the other, then the advice would have been different.

To help the Council weigh the management considerations between the two options, the GMT points out that China rockfish is caught almost exclusively by recreational and commercial nearshore fixed gear fisheries inside of state waters, and is largely managed by both state and federal bag and landing limits. The GMT projects bycatch of overfished species north of 42° N. latitude, between 40°10' and 42° N. latitude, and south of 40°10' N latitude. As such, the GMT model used to project overfished species is designed to operate at either management line that the Council may choose. The GMT concludes, therefore, that the choice has no consequence on either the biology of the stock or our projections of overfished species catch. However, the assessment at 42° N. latitude may better reflect differences in management measures employed

in each state, that affect the apportionment since it is currently conducted on the basis of historical catch. Otherwise, this is strictly a policy decision.

Considerations Regarding Future Data-Moderate Assessments

Regarding future data-moderate assessments, the GMT is in agreement with the SSC that additional time and an improved process is needed for the review of input data and indices used in data-moderate assessments. In addition, the spatial analysis of catch per unit effort (CPUE) and catch planned for off-year science in the next biennium may improve information available to inform a priori stratification of stock assessments. Lastly, taking on fewer assessments may increase the amount of effort that can be put into each to prevent issues from being addressed out of sequence.

The GMT points out that some revisiting of issues in cycle or between cycles will be necessary since improvements require an iterative approach in which analyses are conducted, issues are identified, and are then resolved. Addressing such issues in the course of a given cycle may be taxing on the system, but is timelier than waiting until the next assessment years in the future to resolve them. The GMT applauds the efforts of Dr. E.J. Dick in providing the rebuilding analysis and a presentation of the results of the re-stratified nearshore assessments despite having lost time to complete them between Council meetings due to the Federal furlough. We extend our gratitude and praise.

Prioritization of Stocks for Full Assessment in Future Management Cycles and Future Research Needs

The GMT continues to agree that stocks determined to be in the precautionary zone should be prioritized for full assessment in future cycles as outlined in [Agenda Item H.2.b, Supplemental NWFSC Powerpoint, March 2013](#). A full assessment of China rockfish in future cycles may provide an opportunity to bring length and age data on the status of the assessed region north of 40°10' N. latitude. No population genetic research was available to inform whether population structure occurs in the vicinity, but such research could help inform future stratification. In the interim we support examination of private and rental boat data to examine the trends in abundance between 40°10' N. latitude and 42° N. latitude to examine which stratification is most appropriate in reflecting the trend in abundance in the region in question. This also provides another source of abundance index data to complement data from the party boat fleet. Further off-year science research on methods to apportion catch across management boundaries may help address concerns expressed by some on the GMT regarding how the OFL is apportioned.

The GMT would appreciate continued opportunities to participate in the review of data used in data-moderate and full assessments, especially those for vulnerable species such as China and copper rockfishes.

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON
STOCK ASSESSMENTS AND COWCOD REBUILDING ANALYSIS

Data-moderate Stock Assessments

The Scientific and Statistical Committee (SSC) reviewed the results of revised stock assessments for brown, China, and copper rockfish conducted by Dr. E.J. Dick (SWFSC). The revised assessments considered alternative spatial stratifications and included a revised catch time series from the Oregon Recreational Boat Survey (ORBS). The revised assessments for all three species showed very minor differences in spawning biomass trajectories under the alternative spatial stratifications. In cases where assessment boundaries do not align with management boundaries, the overfishing limit (OFL) should be apportioned based on historical catch data.

For brown rockfish, the Stock Assessment Review (STAR) Panel approved a coastwide model. A revised model was presented for California only. The SSC concluded that insufficient data were available to assess the area north of California separately and recommends using the original STAR Panel-approved coastwide model to obtain the OFL. Any spatial allocations of the coastwide OFL should be done using historical catch proportions by area.

For China rockfish, the STAR Panel approved two models (northern and southern) split at 40°10' N. lat. A revised stratification was presented with the northern-southern split moved to 42° N. lat. The SSC finds no scientific basis to recommend choosing between these two alternatives. The models used to provide the OFL should reflect the management boundaries selected by the Council.

For copper rockfish, the STAR Panel approved two models; one for south of Point Conception and another covering the area from Point Conception to the U.S-Canada border. A revised stratification was presented for the area north of Point Conception, yielding two models with a split at 42° N. lat. Based on an evaluation of model diagnostics, the SSC does not have confidence in the results of the Oregon-Washington model. The SSC recommends using the STAR Panel-approved models and applying historical catch data to apportion the OFL, either at 40°10' N. lat., or at 42° N. lat.

The SSC discussed how requests for changes in stock assessment boundaries late in the process could be avoided in the future, since these requests were disruptive in this year's stock assessment process. Issues concerning stock boundaries should be addressed early in the stock assessment process. One possibility is to strengthen the recommendations in the Stock Assessment Terms of Reference for the stock assessment team (STAT) to consult early in the process with the GMT and fisheries managers about spatial management issues associated with the stock being assessed. The SSC emphasizes that biological and scientific considerations must take precedence in developing stock assessments.

Cowcod Rebuilding Analysis

The SSC reviewed a draft rebuilding analysis for cowcod (Agenda Item H.5.a., Supplemental Attachment 2), based upon the 2013 assessment. Progress towards rebuilding was reviewed in relation to the current median time to rebuild (T_{TARGET}) for cowcod of 2068. The current spawners per recruit (SPR) harvest rate ($F_{82.7\%}$) implies that the stock will rebuild by 2020 with a 50 percent probability, so rebuilding is ahead of schedule. The catches of cowcod have been lower than the cumulative annual catch limit (ACL) during the period of rebuilding. The SSC concludes that progress towards rebuilding is ahead of schedule.

The rebuilding analysis for cowcod was conducted using Extended Depletion-Based Stock Reduction Analysis (XDB-SRA) rather than the rebuilding software used for assessments conducted in Stock Synthesis (i.e., the Puntalyzer). There was limited time to conduct all the required model runs, and thus the analyses shown to the SSC were preliminary. However, successful runs providing projections of zero catch, catch given the current ACL, and catch under the current SPR rate (Runs 1-3) may provide sufficient basis for Council decision-making. The run needed for the SSC to set an OFL was not available to the SSC. The rebuilding analysis will be completed in time for an SSC Groundfish Subcommittee call in late 2013. Any requests for additional model runs (besides the appropriate OFL run) should be communicated to the STAT.

BIENNIAL SPECIFICATIONS FOR 2015-2016 GROUNDFISH FISHERIES

In June, the Council adopted a process and schedule for deciding harvest specifications and management measures for 2015 and beyond groundfish fisheries (see [Agenda Item F.7.a, Attachment 3, June 2013](#)). Based on this schedule, the Council will continue deciding groundfish harvest specifications and new management measures for 2015-2016 (and beyond) groundfish fisheries at this meeting. Specifically, the Council is tasked with adopting final preferred overfishing limits (OFLs) for those remaining stocks and complexes in which OFLs were not decided at the September 2013 meeting; final preferred acceptable biological catches (ABCs); and a range of annual catch limits (ACLs), including preliminary preferred ACLs for each stock and complex. Further, the Council will discuss modifications to Council Operating Procedure (COP) 9 (adoption of COP 9 is scheduled for later in the week under Agenda Item I.5) and any relevant miscellaneous issues other than new management measures for 2015-2016 fisheries, which will be considered under Agenda Item H.10.

Proposed 2015-2016 OFLs, with those OFLs not previously decided in September highlighted, the range of potential 2015 and 2016 ABCs based on the Scientific and Statistical Committee's (SSC's) estimated sigmas for each stock/stock category and a range of overfishing probabilities (P^* s), and presumptive ACLs based on the default harvest control rules decided for 2013-2014 are provided in tables in Attachment 1. The SSC will review these proposed harvest specifications, stock categories, and sigma values and make their recommendations to the Council. The Council should review these proposed harvest specifications and adopt those OFLs, stock categories, and stock/stock category sigma values recommended by the SSC. Additionally, the Council should adopt final preferred ABCs based on their P^* choice and a range of ACLs, including preliminary preferred ACLs, for more detailed analysis.

The Council discussed proposed changes to COP 9 (Attachment 2), the Council Operating Procedure outlining the biennial specifications decision-making process, at their September meeting. The Groundfish Management Team (GMT) provides their recommendations on modifications to COP 9 in Agenda Item H.6.b, GMT Report.

The Council decided in June to proceed with a Tier 1 Environmental Impact Statement (EIS) where 2015-2016 harvest specifications and management measures will be analyzed, as well as an analysis of longer term (i.e., 10 years) projections of potential harvest levels to provide efficiency and workload relief in future National Environmental Policy Act analyses. The GMT recommended a centerpiece of the Tier 1 EIS analysis should be done using ecosystem modeling. The SSC's Ecosystem-Based Management Subcommittee is scheduled to meet with ecosystem modeling experts on October 30 to discuss the current capabilities of ecosystem models to inform such analyses. Agenda Item H.6.a, Attachment 3 was prepared by staff to outline the issues and to raise questions to be discussed at the subcommittee meeting. Additional materials provided for this meeting are available on the November 2013 briefing book CD and website (electronic only). The SSC's recommendations on the use of ecosystem models for this analysis will be forthcoming in their statement to the Council under this agenda item.

The Council should consider the advice of the SSC, other advisory bodies, and the public before deciding final preferred OFLs, final preferred ABCs, and preliminary preferred ACLs for 2015 and 2016 groundfish fisheries. If there are outstanding questions that need further analysis, Council decision making may be delayed to Agenda Item H.10

Council Action:

1. **Adopt those remaining 2015-2016 OFLs, stock categories, and sigma values recommended by the SSC.**
2. **Adopt final preferred 2015-2016 P*s/ABCs for more detailed analysis.**
3. **Adopt a range of 2015-2016 ACLs, including preliminary preferred ACLs for more detailed analysis.**
4. **Discuss modifications to COP 9.**
5. **Provide other guidance as appropriate.**

a/ Values for these specifications are the sum of known contributions of component stocks.

b/ No OFL contribution for these stocks given the lack of an approved method.

c/ No OFL recommended pending decisions on restructuring this complex.

Table 2. The basis for proposed 2015 and 2016 OFLs for west coast groundfish stocks.

Stock	Comments
OVERFISHED STOCKS	
BOCACCIO S. of 40°10' N. latitude	Projected using a 50% SPR from the 2013 update assessment with a 6% reduction to subtract the portion of the assessed stock north of 40°10' N. lat.
CANARY	Projected using a 50% SPR from the 2011 rebuilding analysis.
COWCOD S. of 40°10' N. latitude	Sum of Conception and Monterey OFLs.
<i>COWCOD (Conception)</i>	Not available pending provision of a 2013 rebuilding analysis in Nov. Projected using a 50% SPR from the 2009 rebuilding analysis.
<i>COWCOD (Monterey)</i>	Not yet available. Revised DB-SRA estimate.
DARKBLOTCHED	Projected using a 50% SPR from the 2011 rebuilding analysis.
PACIFIC OCEAN PERCH	Projected using a 50% SPR from the 2011 rebuilding analysis.
PETRALE SOLE	Projected using a 30% SPR from the 2011 rebuilding analysis.
YELLOWEYE	Projected using a 50% SPR from the 2011 rebuilding analysis.
NON-OVERFISHED STOCKS	
Arrowtooth Flounder	Projected using a 30% SPR from the 2007 full assessment.
Black Rockfish (OR-CA)	Projected using a 50% SPR from the 2007 full assessment with the addition of the northern OFL 3% reduction to account for the portion of the stock estimated between Cape Falcon and the Columbia River.
Black Rockfish (WA)	Projected using a 50% SPR from the 2007 full assessment with a 3% reduction to account for the portion of the stock estimated between Cape Falcon and the Columbia River.
Cabazon (CA)	Projected using a 45% SPR from the 2009 full assessment.
Cabazon (OR)	Projected using a 45% SPR from the 2009 full assessment.
California scorpionfish	Projected using a 45% SPR from the 2005 full assessment.
Chilipepper S. of 40°10' N. latitude	Projected using a 50% SPR from the 2007 full assessment. The portion of the coastwide stock south of 40°10' N. lat. (93%) is based on average historical landings.
Dover Sole	Projected using a 30% SPR from the 2011 full assessment.
English Sole	Projected using a 30% SPR from the 2013 data-moderate assessment.
Lingcod N. of 40°10' N. latitude	Projected using a 45% SPR from the 2009 full assessment with 48% of the OFL S. of 42° N. latitude added to account for line shift.
Lingcod S. of 40°10' N. latitude	Projected using a 45% SPR from the 2009 full assessment with 48% of the OFL S. of 42° N. latitude subtracted to account for line shift.
Longnose skate	Projected using a 50% SPR from the 2007 full assessment. 2015 and 2016 OFLs projected using the status quo 45% SPR rate are 2,745 and 2,686 mt, respectively.
Longspine Thornyhead (coastwide)	Projected using a 50% SPR from the 2013 full assessment.
Pacific Cod	Status quo OFL.
Sablefish (coastwide)	Projected using a 45% SPR from the 2011 full assessment.
Shortbelly	MSY estimated from 2007 assessment.
Shortspine Thornyhead	Projected using a 50% SPR from the 2013 full assessment.

Stock	Comments
(coastwide)	
Splitnose S. of 40°10' N. latitude	Projected using a 50% SPR from the 2009 full assessment. The portion of the coastwide stock south of 40°10' N. lat. (64.2%) is based on average historical (1916-2008) landings.
Starry Flounder	Projected using a 30% SPR from the 2005 full assessment.
Widow	Projected using a 50% SPR from the 2011 full assessment.
Yellowtail N. of 40°10' N. latitude	Projected using a 50% SPR from the 2013 data-moderate assessment.
STOCK COMPLEXES	
Minor Nearshore Rockfish North	Sum of OFL contributions of component stocks in the complex.
<i>Black and yellow</i>	<i>DB-SRA estimate.</i>
<i>Blue (CA)</i>	<i>Projected using a 50% SPR from the 2007 full assessment. The portion of the assessed stock in CA north of 40°10' N. lat. (12.7%) is based on average historical landings.</i>
<i>Blue (OR & WA)</i>	<i>DCAC estimate.</i>
Brown	Not yet available. Projected using a 50% SPR from the 2013 data-moderate assessment.
<i>Calico</i>	<i>DB-SRA estimate.</i>
China	Not yet available. Projected using a 50% SPR from the 2013 data-moderate assessment.
Copper	Not yet available. Projected using a 50% SPR from the 2013 data-moderate assessment.
<i>Gopher</i>	<i>No harvest contribution (3a stock).</i>

PROPOSED REVISIONS TO COP 9

The following is an excerpt related to the biennial management cycle and activities for groundfish management (Schedule 1) from Council Operating Procedure 9. The original text can be found here <http://tinyurl.com/lbu2q7v>.

COUNCIL OPERATING PROCEDURE Management and Activity Cycles

9

Approved by Council: 07/10/85

Revised: 09/16/87, 04/06/95, 11/03/99, **03/11/05**

PURPOSE

To establish management and activity cycles conducted by the Pacific Fishery Management Council (Council), its advisory entities, staff for the groundfish, salmon, coastal pelagic species, halibut, and highly migratory species fisheries, and administrative matters.

MANAGEMENT AND ACTIVITY CYCLES

Schedule 1 Biennial management cycle and activities related to groundfish management.

SCHEDULE 1. Biennial management cycle and activities related to groundfish management.

Year	Month	Entity and Management Activity
Year 1	September	To begin development of specifications for the next biennial management period (Years 3 and 4), the <i>Groundfish Management Team (GMT) and Scientific and Statistical Committee (SSC)</i> review and incorporate new impact assessment methodologies, including new observer data from January through December of the previous year, approve stock assessments completed in Year 1, and recommend appropriate harvest specifications. <i>GMT and Groundfish Advisory Subpanel (GAP)</i> meet to review current fishery status and develop inseason management recommendations, as necessary. GMT and GAP provide recommendations to inform Council action on harvest specifications and management measures for Years 3 and 4.

		<p>Council adopts final modeling methodologies, stock assessments for the next biennial period (Years 3 and 4), final preferred overfishing limits (OFLs) and sigmas, as recommended by the SSC.¹ The Council will also adopt a range of P*/acceptable biological catches (ABCs), if applicable, including preliminary preferred values.</p> <p>Council will provide initial fishery management guidance, including a preliminary range of new management measures necessary to keep catch within the annual catch limits (ACL) or to address a habitat or protected resources concern.</p>
	September	<p>SSC Groundfish Subcommittee meets to review overfished species rebuilding analyses as well as any stock assessments approved for further review by the Council at the “mop-up” stock assessment review panel.</p>
	October	<p>GMT meets to review new stock assessments and rebuilding analyses. GMT drafts a recommended range of ACLs and preliminary management measures for consideration at the November Council meeting.</p>
	November	<p>GMT and GAP meet to review current fishery status and develop inseason management recommendations, as necessary.</p> <p>GMT and GAP provide recommendations to inform Council action on harvest specifications and management measures for Years 3 and 4.</p> <p>Council adopts rebuilding analyses and any assessments sent to the SSC Groundfish Subcommittee for review. Council adopts final preferred P*/ABCs; preliminary preferred non-overfished species ACLs, and, if necessary; a range of overfished species ACLs and preliminary preferred ACLs for overfished species.</p> <p>Council selects a range of 2-year allocations, final range of new management measures to keep catch within the ACL or to address a habitat or protected resources concern, and preliminary exempted fishing permit (EFP) applications for Years 3 and 4.</p>
Year 2	January	<p>GMT meets to review and analyze Council actions relative to harvest specifications and management measures provided in Year 1, if necessary.</p>

¹ Council action could be postponed from September to November for any stock assessments recommended for further review by the SSC.

March	<p><i>GMT and GAP</i> meet to review current fishery status and inseason management recommendations, as necessary.</p> <p><i>GMT and GAP</i> provide recommendations to inform Council action on harvest specifications and management measures for Years 3 and 4.</p> <p><i>Council</i> receives an informational briefing on selected results of the harvest specifications and management measures analysis. The <i>Council</i> may be asked to provide guidance or take action on emerging issues, as necessary.</p>
April	<p><i>GMT and GAP</i> meet to review Pacific whiting harvest specifications and management measures as well as current fishery status and inseason management recommendations.</p> <p><i>GMT and GAP</i> provide recommendations to inform Council action on harvest specifications and management measures for Years 3 and 4.</p> <p><i>Council</i> recommends inseason management adjustments as necessary.</p> <p>Consistent with the U.S./Canada agreement, the <i>Council</i> considers the harvest specifications recommended by the Joint Management Committee and confirms or recommends a lower U.S. TAC. The <i>Council</i> recommends set-asides and any adjustments to management measures for the Pacific Whiting fishery in Year 2.</p> <p><i>Council</i> adopts preliminary management measures for public review and final harvest specifications for Years 3 and 4.</p>
June	<p><i>GMT and GAP</i> meet to review current fishery status and inseason management recommendations, as necessary.</p> <p><i>GMT and GAP</i> provide recommendations to inform Council action on harvest specifications and management measures for Years 3 and 4.</p> <p><i>Council</i> recommends inseason management adjustments as necessary.</p> <p><i>Council</i> adopts final EFP applications and management measures as well as any corrections to harvest specifications for implementation by NMFS for Years 3 and 4.</p> <p><i>Council</i> recommends a prioritized list of new management measures to be analyzed outside of the harvest specifications and management</p>

		measures process.
	July	Council staff and GMT complete analyses and NEPA documents, as necessary, for biennial management specifications and submit them to NOAA.
	September	GMT, GAP, and Council participate in inseason management activities and off-year activities, as appropriate.
	November	GMT, GAP, and Council participate in inseason management activities and off-year activities, as appropriate.
Year 3 ¹	January	U.S. Department of Commerce implements harvest level specifications and management measures for next biennial management period (Years 3 and 4).
	March	GMT, GAP, and Council participate in inseason management activities and off-year activities, as appropriate.
	April	GMT and GAP meet to review Pacific whiting harvest specifications and management measures as well as current fishery status and inseason management recommendations, as necessary.
		Consistent with the U.S./Canada agreement, the Council considers the harvest specifications recommended by the Joint Management Committee and confirms or recommends a lower U.S. TAC. The Council recommends set-asides and any adjustments to management measures for the Pacific Whiting fishery in Year 3.
	June and September	GMT, GAP, and Council participate in inseason management activities and off-year activities, as appropriate.
	November	Repeat management activities of November in Year 1 to begin development of next biennial cycle.

¹ GMT generally meets in January, July, and October to review and discuss groundfish management issues, including stock assessments and STAR Panel reviews.

SSC ECOSYSTEM-BASED MANAGEMENT SUBCOMMITTEE WORKSHOP ON
ECOSYSTEM CONSIDERATIONS IN THE GROUND FISH HARVEST SPECIFICATIONS
EIS ANALYSIS

Background

At the June 2013 meeting the Council directed staff to organize a workshop with ecosystem experts from the Council's Scientific and Statistical Committee (SSC) and the NOAA Fisheries Science Centers to evaluate ecosystem modeling capabilities and how they might be integrated into the impact analysis in the environmental impact statement (EIS) being prepared for setting groundfish harvest specifications for 2015 and beyond. This EIS is intended to evaluate both the short-term effects of establishing harvest specifications for the 2015-2016 biennial period and the long-term effects of managing the groundfish fishery under the biennial process.

The workshop is scheduled for Wednesday, October 30, immediately preceding the November Council meeting. The SSC Ecosystem Subcommittee will meet with researchers from the Northwest Fisheries Science Center Conservation Biology Division and Southwest Fisheries Science Center Fisheries Ecology Division. The meeting is open to the public and representatives from the Groundfish Advisory Subpanel (GAP) and Groundfish Management Team (GMT) have been invited to attend. The SSC will report the results of the workshop, and any full SSC recommendations, to the Council under Agenda Item H.6. The GAP and GMT may also submit reports

To support ecosystem-based fishery management, researchers in the Conservation Biology Division, NMFS Northwest Fisheries Science Center, have developed a specific application of the Atlantis simulation model, the Central California Atlantis Model (CCAM). The application developers describe Atlantis as follows (internal citations omitted):

Atlantis is a recently developed simulation modeling approach that successfully integrates physical, chemical, ecological, and anthropogenic processes in a three-dimensional, spatially explicit domain. In Atlantis, ecosystem dynamics are represented by spatially explicit submodels that simulate hydrographic processes (light-driven and temperature-driven fluxes of water and nutrients), biogeochemical factors driving primary production, and food web relations among flora and fauna. The model represents key exploited species at the level of detail necessary to evaluate direct effects of fishing, and it also represents other anthropogenic and climate impacts on the ecosystem as a whole. (Horne, *et al.* 2010, pages 1-2).

After developing and calibrating the CCAM, these researchers conclude:

While no such model will ever perfectly replicate ecosystem processes in nature, we have calibrated and tested CCAM under a wide variety of conditions, and we believe the model produces an adequate representation of ecosystem dynamics. Thus we believe CCAM to be a powerful management tool, providing a platform for addressing important hypotheses relating to the effects of perturbations (e.g., harvest), characterizing the

potential trade-offs of alternate management actions, and testing the utility of ecosystem indicators for long-term monitoring programs. (Horne, *et al.* 2010, page 17).

The Council has expressed interest in using the CCAM to evaluate the impacts of the alternatives for the Groundfish Harvest Specifications EIS. The alternatives represent different ways of determining “default ACLs” at the outset of future biennial decision-making cycles. The proposed action maintains the Council’s flexibility to depart from these default catch limits when setting harvest specifications for the next 2-year period (as long as the specifications are consistent with the framework established in the Groundfish FMP). Under the No Action alternative, the default ACLs would be computed based on the harvest control rules in place during the year preceding the biennial period for which the Council is adopting harvest specifications. Alternative 1 is like No Action except that the p-star value used to determine ABCs would be set to 0.45. Under Alternative 2 the p-star value would be set to 0.25.¹ To analyze impacts, it is assumed that harvests will be consistent with the default ACLs since future ad hoc changes in catch limits made by the Council cannot be predicted.

The main numerical tool used to evaluate the alternatives (default harvest control rules) is 10-year forward projections of stock status for all assessed groundfish stocks. These projections are made under different “states of nature.” A state of nature expresses uncertainty about an influential parameter in the stock assessment by estimating stock status using at least three parameter values from a statistical distribution. These are expressed as a “low state of nature” (a parameter value that results in lower future yield compared to the most likely value), a “base case” (the statistically most likely parameter value), and a “high state of nature” (a parameter value that results in higher future yield). The results provide a range of “catch streams” for each assessed stock (along with indicators of stock status) based on both the p-star value in an alternative and the state of nature. The catch streams could represent catch at the ACL or some reduction from the ACL based on historical attainment rates.

The CCAM has been used to evaluate the impacts of different fisheries and management policies on ecosystem attributes (Kaplan, *et al.* 2013a; Kaplan, *et al.* 2012; Kaplan, *et al.* 2013b). Results are reported as the change in abundance of species or functional groups defined in the model. In the simulations reported in Kaplan, *et al.* (2013a; 2012) the researchers computed annual harvest rates (% year⁻¹) based on historical catch and held constant over the model period (50 years).²

¹ P-star expresses a risk that overfishing may occur due to abundance forecasts being higher than the true status of the stock. It is part of a formula used to compute a precautionary reduction from the overfishing limit (OFL) to determine the ABC. The lower the value of p-star, the larger the precautionary reduction. For example, a p-star value of .25 presumes that there is a 75 percent chance the true abundance (status) of the stock is higher than the point estimate, and a 25 percent chance the true abundance is lower than the point estimate. Note that the annual catch limit (ACL) is not set equal to the ABC for all stocks, although the ACL cannot exceed the ABC. For stocks where the ACL is not equal to the ABC there would be no difference among the alternatives.

² The simulation reported in Kaplan, *et al.* (2013b) tests different management scenarios. Catch is driven by fleet dynamics incorporated into the simulation as affected by management constraints, using constant annual quotas based on 2005 limited entry trawl fishery commercial harvest guidelines. In this case the simulation period is 30 years.

Workshop Questions

Would it be appropriate to use the CCAM to evaluate the impacts of the alternatives?

The stock assessment projections being requested as part of the impact evaluation could be used as inputs to a CCAM simulation. (These projections provide results both in the policy dimension and “state of nature” dimension suggesting $3 \times 3 = 9$ scenarios). The workshop should consider the following points:

- Can the stock assessment projections be used as inputs for a CCAM simulation? If so, how would they need to be adapted for use in the simulation?
- Is it appropriate to use the catch streams based on different states of nature as inputs to the CCAM (given that stock dynamics are internal to the CCAM)?
- Is the CCAM sensitive enough to detect meaningful differences, in terms of effects (changes in abundance due to species interactions rather than just fishery removals), given the range of catch streams that would be provided?
- Is further peer review of the CCAM necessary before it is appropriate to use in this context?
- Are there other practical constraints to the use of the CCAM in this context (e.g., deadlines for results, interpretation of results)?
- Aside from the CCAM are there other ecosystem models that should be considered for the impact evaluation (e.g., Ecosim-NCC)?

How should the impacts of the proposed action on the California Current ecosystem evaluated?

Workshop participants have been provided a preliminary draft of the sections of the Groundfish Harvest Specifications EIS dealing with ecosystem impacts. Section 3.2 describes the affected environment or baseline conditions. In environmental impact assessment the baseline is used as a benchmark against which to judge the future impacts of taking action (under the different approaches described by the action alternatives) or not going forward with the proposed action (the no action alternative). Section 4.2 is the impact evaluation. The workshop should consider the following points:

- Given a qualitative evaluation, is it reasonable to conclude that the effects of the alternatives are indistinguishable (see section 4.2)?
- Is a qualitative assessment of the effect on other trophic groups of changes in abundance of groundfish due to fishing (the proposed action) reasonable/feasible (section 4.2.2)?
- Are there other metrics/indicators that could be used to evaluate the impacts of the alternatives?

CONSIDERATIONS FOR DECIDING THE OVERFISHING PROBABILITY (P^*) WHEN SPECIFYING AN ACCEPTABLE BIOLOGICAL CATCH

Background

West coast groundfish stocks are managed under a harvest specification framework that considers scientific and management uncertainties. The first specification decided is the overfishing limit (OFL), which is the maximum sustainable yield (MSY) estimated for the stock and the legal harvest limit beyond which constitutes overfishing. The OFL is determined either by applying the harvest rate estimated to result in a biomass capable of sustaining MSY (i.e., F_{MSY}) recommended by the Council's Scientific and Statistical Committee (SSC) to an estimate of exploitable biomass in the case of assessed stocks or through an approved data-poor method (e.g., depletion-corrected average catch (DCAC) or depletion-based stock reduction analysis (DBSRA)) in the case of unassessed stocks. Regardless of the method or data informing the calculation of an OFL, there is scientific uncertainty in the estimation of an OFL. The Pacific Coast Groundfish Fishery Management Plan (FMP) mandates a precautionary buffer to address this uncertainty by prescribing an acceptable biological catch (ABC) harvest level that is less than the OFL. A further reduction from the ABC can be specified when setting an annual catch limit (ACL) that accounts for management uncertainty, socioeconomic considerations, ecological considerations, conservation objectives, and/or other considerations the Council and NMFS wish to address. Since the ACL can be set equal to the ABC, the ABC is the highest harvest level that can be considered for west coast groundfish stocks.

Under the FMP harvest specification framework, scientific advice that is relatively uncertain will result in ABCs that are relatively lower, all other things being equal (i.e., a precautionary reduction in catch will occur due purely to scientific uncertainty in estimating the OFL). The SSC has recommended a two-step approach referred to as the overfishing probability (P^*) approach for determining ABCs. In the P^* approach, the SSC determines the amount of scientific uncertainty associated with estimating the OFL in stock assessments, referred to as the sigma (σ) value. Since the OFL is estimated by applying the harvest rate estimated or assumed to produce MSY (i.e., F_{MSY}) to the exploitable biomass and since assumed proxy F_{MSY} harvest rates by taxa are currently used to estimate the OFL, the variance in estimating biomass is the metric used for determining sigma. The Council chooses its preferred level of risk of overfishing, which is designated as the P^* . The scientists then apply the P^* value to the sigma value to determine the amount by which the OFL is reduced to establish the ABC.

The SSC assigns each species in the groundfish fishery to one of three categories based on the level of information available about the species. The SSC's recommended sigma value for category 1 stocks is based on a statistical analysis of the variance within and among stock assessments. The meta-analysis used stock assessments from 17 data-rich stocks to determine the proxy sigma value for category 1 stocks. The general methodology used by the SSC subcommittees to assess among-assessment uncertainty was to compare previous stock assessments and stock assessment updates and consider the logarithms of the ratios of the

biomass estimates for each pair of assessments and their reciprocals using the last 20 years from an assessment. This provides a distribution of stock size differences in log-space and, if this variation is averaged over species, provides a general view of total biomass variation (represented as sigma - σ) that emerges among repeat assessments of stocks, while embracing a wide range of factors that affect variability in results. The SSC indicated that biomass is most likely the dominant source of uncertainty; however, it is anticipated that other factors will need to be considered in the future.

Based on this analysis, the SSC recommended using the biomass variance statistic of $\sigma = 0.36$ for category 1 stocks. In cases where the stock biomass estimated in the most recent assessment has a variance greater than the variance estimated for that stock's category, the assessment's estimated biomass variance is used instead. For instance, the stock biomass estimated in the 2011 widow rockfish assessment was judged to have a greater variance than the sigma of 0.36 used for other category 1 stocks. In this case, the SSC recommended using a sigma value of 0.41 for deciding the widow rockfish ABC. The 2013 assessment cycle produced another category 1 stock with an estimated biomass variance greater than 0.36; aurora rockfish had an estimated sigma of 0.39. Each P^* is mapped to its corresponding buffer fraction. The Council then recommends an appropriate P^* value. When the P^* approach is used, the upper limit of P^* allowed by the FMP is 0.45.

Since there is greater scientific uncertainty for category 2 and 3 stocks relative to category 1 stocks, the scientific uncertainty buffer is generally greater than that recommended for category 1 stocks. The SSC recommended sigma values for category 2 and 3 stocks of 0.72 and 1.44, respectively (i.e., two and four times the sigma for category 1 stocks). The specific values of 0.72 and 1.44 were recommended by the SSC and considered to be the best available scientific information; however, the values are not based on a formal analysis of assessment outcomes and could change substantially when the SSC reviews additional analyses in future management cycles.

Considerations for Deciding P^*

The overfishing probability metric (P^*) is technically defined in the National Standard 1 guidelines as the probability of overfishing a stock based on the scientific uncertainty in estimating the OFL. There is always scientific uncertainty in estimating both the exploitable biomass and the harvest rate associated with maximum sustainable yield; the product of which is the OFL. This technical definition has generated a level of confusion in the Council's harvest specification decision-making process (further, there are those that take the "overfishing probability" term literally, believing it incorporates all sources of uncertainty that affect the probability that the estimated OFL is too high). There are those that maintain the technical or literal definition of the overfishing probability. The functional definition is that P^* is the Council's level of risk tolerance that the OFL will be exceeded due to error in the biomass estimate. The latter argument is more tractable in the Council process and is a more accurate representation of how the P^* value is decided.

One problem with the technical definition of P^* is that not all assessments are alike. The SSC recognizes this and has recommended a proxy value of sigma (0.36) for category 1 stocks, which are stocks that have assessments with estimated recruitment deviations (i.e., the strength of

individual year classes is estimated). However, the SSC acknowledges that the proxy sigma for category 1 stocks may not represent the relative uncertainty of all category 1 stocks. For this reason, sigma is estimated in new category 1 assessments. If the estimated sigma is greater than the proxy value of 0.36, then the estimated sigma is used rather than the proxy value. However, the true scientific uncertainty is not estimated well in this process. Assessments vary greatly in the amount of uncertainty that is characterized in the assessment model. It is common that one or more parameters are either estimated outside the model or assumed based on the assessment scientist's best judgment. In such cases, the uncertainty associated with that parameter is also not estimated nor characterized in any way within the assessment. For instance, the 2011 sablefish assessment (Stewart, Thorson et al. 2011) appears to estimate current biomass with significant uncertainty. However, within that assessment many of the key parameters that affect the estimated biomass such as growth and natural mortality are explicitly estimated within the model¹. The confidence interval associated with the ending year biomass estimate appears quite large relative to other assessments since the uncertainties associated with estimated growth and natural mortality are included within the overall assessment uncertainty. This compares to many other assessments, such as splitnose rockfish in 2009 (Gertseva, Cope et al. 2009) or longspine thornyhead in 2013 (Stephens and Taylor 2013) where many parameters are assumed and fixed (e.g., natural mortality and steepness) and the estimated biomass variance appears smaller. However, this is not necessarily the case; more of the true uncertainty in estimated biomass is characterized in the sablefish assessment.

The spectrum of assessment approaches vary between fully Bayesian models with most key parameters estimated (e.g., sablefish in 2011) to deterministic models with most parameters fixed (e.g., longspine thornyhead in 2013). Within the spectrum are parameter estimations using informed or diffuse priors, where parameters are estimated within either tight bounds (informed priors) or estimated with a much wider distribution (diffuse priors). Given this variety of approaches and the degree to which uncertainty is characterized, it is hard to pursue a formulaic approach where the P* decision hinges on the scientific uncertainty associated with estimating the OFL. For the most part, the relative uncertainty in estimating the OFL is addressed with the SSC's sigma specification. The Council's P* decision is therefore most appropriately considered as a risk assessment given many sources of uncertainty regarding the true state of nature or true OFL for a stock. The risk of overfishing a stock as contemplated in a P* decision therefore needs to consider the cost of being wrong. Such costs may weigh the socioeconomic importance of the stock, the attainment rate of a stock's harvest limit, the relative vulnerability of a stock to overfishing based on its relative productivity and susceptibility of the stock to be impacted by the fishery, and a host of other factors. Many of these same considerations are made when deciding the ACL. Since the ACL is the effective total catch limit used to manage fisheries, the absolute risk of overfishing is ultimately made when deciding this limit. Therefore, it does not matter whether these considerations are made in deciding the P*/ABC or the ACL for the stock. What does matter is that these considerations are made in deciding harvest limits and having the ability through effective management measures, inseason monitoring of catches and adjustments to management measures specified for fisheries to keep harvest within prescribed limits. The Council's track record on this is quite good and the precautionary principles that underlie the

¹ Stock-recruitment steepness (h), another parameter that affects the estimate of biomass, is fixed at an assumed 0.6 in the 2011 sablefish assessment.

FMP harvest specification framework effectively address the risk of overfishing by considering scientific and management uncertainties.

THE USE OF HARVEST GUIDELINES FOR ASSESSED STOCKS MANAGED IN A STOCK COMPLEX

The Pacific Fishery Management Council (Council) requested a white paper explaining the use of harvest guidelines (HGs) to manage west coast groundfish stocks in a stock complex at their September meeting. The context for this request was consideration of management measures, such as specification of HGs, for managing rougheye rockfish and other stocks in a complex in lieu of specifying stock-specific harvest specifications. This white paper was prepared by Council staff in response to this request.

The Council has made it a priority to increase the number of assessments for groundfish stocks managed under the Pacific Coast Groundfish Fishery Management Plan (FMP). Most unassessed stocks managed under the FMP are managed in stock complexes or aggregations of stocks managed under shared harvest specifications and management measures. In some cases, the Council has decided to remove a newly assessed stock from a stock complex and manage that stock under stock-specific harvest specifications and management measures. However, this has not been universally done for every newly assessed stock. There have been cases when a newly assessed stock managed in a complex, for which trawl individual fishing quotas (IFQs) are specified, are not removed from the complex because of the difficulty in estimating catch history at the permit level for allocating IFQ quota share (e.g., splitnose rockfish managed in the Minor Slope Rockfish complex north of 40°10' N lat.). There have been other cases where the Council elected to continue to manage a newly assessed stock in a complex to avoid changing a formal, long-term allocation that would require an FMP amendment (e.g., blackgill rockfish managed in the Minor Slope Rockfish complex south of 40°10' N lat.). In such cases, where a newly assessed stock remains in the stock complex and there are conservation concerns, other strategies, such as specification of an HG and accompanying management measures, are considered.

The use of an HG to manage a stock in a complex needs to be considered on a stock-by-stock basis. As the Scientific and Statistical Committee noted in their April 2012 statement on 2013-2014 biennial specifications and management measures ([Agenda Item I.3.b, Supplemental SSC Report, April 2012](#)), “no two stocks are exactly alike, and in establishing stock complexes there will always be tradeoffs between management practicality and concerns about individual species”. First, a conservation concern for the stock is the usual driver for considering an HG and other management measure to manage a stock in a complex. It would not likely be prudent to continue to manage a stock in a complex if a newly assessed stock is declared overfished. While rebuilding of an entire stock complex is allowed in the National Standard 1 guidelines, rebuilding plans around the country are usually stock-specific and, in the history of west coast groundfish management, there has never been a rebuilding plan specified for a stock complex nor a rebuilding plan specified for a stock that remained in a stock complex. The Council has never considered managing a rebuilding plan for a stock in a complex since rebuilding plans typically contemplate strategic measures to significantly reduce the harvest rate on an overfished stock without being unnecessarily punitive to the fishery. Implementing rebuilding measures at the complex level would not likely achieve that objective since the other stocks in the complex

would be similarly affected by rebuilding measures. Further, the FMP allows a suspension of a formal allocation for an overfished stock once it is so declared and through the course of implementing a rebuilding plan.

The second consideration for managing a component stock in a complex with an HG is how effective management measures would be to maintain total catches within a specified HG. For instance, it may not be effective to manage a trawl-dominant stock of concern in a complex with an HG since IFQs cannot be allocated at this level. IFQs are only allocated at the management unit level where annual catch limits (ACLs) or annual catch targets (ACTs) are specified (i.e., the individual stock level for those stocks managed outside of complexes or at the stock complex level). However, managing a stock within a complex using an HG may very well be effective for stocks that are not trawl-dominant since stock-specific management measures such as cumulative landing limits can be specified that can influence the amount of targeting done on the stock in non-trawl fisheries.

There are two cases where the Council and NMFS has specified an HG for stocks managed in complexes – blue rockfish in waters off California and blackgill rockfish south of 40°10' N lat. Both of these stocks were assessed and both assessments indicated a conservation concern for these stocks that were not as dire as an overfished status (both stocks were estimated to be in the precautionary zone). Both of these stocks are also not trawl dominant. Blue rockfish are caught primarily in nearshore commercial and recreational fisheries and are rarely caught in trawl fisheries. Blackgill rockfish south of 40°10' N lat. are caught in the trawl fishery and in the limited entry fixed gear (LEFG) fishery, with the bulk of the historic harvest in the LEFG fishery south of Pt. Conception at 34°27' N lat.

Blue rockfish was assessed for the portion of the stock occurring north of 34°27' N lat. to the California-Oregon border at 42° N lat. (Key, MacCall et al. 2008). The assessment indicated the stock was at 29.7% depletion at the start of 2007 and hence in the precautionary zone. The Council elected to continue to manage blue rockfish in the minor nearshore rockfish complexes north and south of 40°10' N lat. To address the blue rockfish conservation concern, the Council has elected to establish an HG for California fisheries every year since 2009. This HG is calculated from the 2007 assessment by first using the year-specific OFL projected in the assessment. The ABC is derived using an overfishing probability (P^*) of 0.45 for category 2 stocks, which is then adjusted using the 40-10 default ACL harvest control rule, as specified in the FMP for species in the precautionary zone. The HG contribution for the unassessed portion of the stock south of Pt. Conception is calculated by first estimating an OFL using the depletion-corrected average catch (DCAC) methodology and then applying an ABC adjustment (using a P^* of 0.45 for a category 3 stock). The HG contribution for the unassessed area is set equal to the ABC under the assumption that this portion of the stock is above the biomass target (B_{MSY}). The blue rockfish HG contributions for the assessed and unassessed areas are then summed to determine the HG. Annual management measures for California nearshore fisheries have been designed to stay within the HG. This management strategy has worked well as evidenced by the fact that estimated annual total catches of blue rockfish in California fisheries have been within the specified HGs.

The 2011 assessment of blackgill rockfish south of 40°10' N lat. indicated the stock was at a 30% depletion at the start of 2011 and hence in the precautionary zone (Field and Pearson 2011). Blackgill rockfish is part of the minor slope rockfish complex south of 40°10' N. latitude and

subject to an Amendment 21 allocation (63 percent to trawl and 37 percent to non-trawl). To improve inseason tracking of blackgill rockfish south of 40°10' N lat. and to address the conservation concern, the Council recommended HGs for 2013 and 2014 of 106 mt and 110 mt, respectively. These HGs were derived using the OFLs projected from the 2011 assessment and then applying an ABC buffer derived using an overfishing probability (P^*) of 0.45 for category 2 stocks, which is then adjusted using the 40-10 default ACL harvest control rule, as specified in the FMP for species in the precautionary zone. Since an HG is implemented, processors must sort and report blackgill south 40°10' N lat. prior to the first weighing after offload. Further, the Council provided guidance that the commercial non-trawl apportionment of blackgill should be 60 percent to the LEFG sector and 40 percent to the open access (OA) fixed gear sector. This apportionment reflects the historical distribution of catch between the limited entry and open access fixed gear sectors from 2005-2010. The Council then adopted significantly lower cumulative landing limits of blackgill rockfish for the LEFG and OA sectors designed to reduce targeting, especially for those fisheries south of 34°27' N lat. where the bulk of the blackgill rockfish catch has historically occurred. Landings to date this year through September have been 8 mt, compared to 84 mt at the same point in time last year. Coupled with anecdotal reports from fishermen who had been targeting blackgill prior to this year that fishermen are not fishing the blackgill grounds south of 34°27' N lat., it is anticipated that total catches this year will be within the specified HG. This indicates that significant targeting of blackgill rockfish is not occurring and this management strategy appears to be working well.

It is likely a similar management strategy would work well with managing rougheye rockfish since this is a slope rockfish that is not trawl-dominant and a significant catch has historically occurred in the LEFG non-trawl fishery. However, unlike blackgill rockfish south of 40°10' N lat., rougheye rockfish do not have the same conservation concerns as blackgill. The 2013 rougheye assessment indicates the stock is healthy with an estimated depletion of 47% at the start of 2013 (Hicks, Wetzel et al. 2013). Further, the stock is projected to remain healthy in the next ten years even under the less likely low state of nature assuming a lower natural mortality rate (and therefore lower relative productivity) than the most likely base case model. However, if the Council wants to address the risk of future catches exceeding the component OFL, an HG strategy coupled with lower cumulative landing limits for non-trawl fisheries should reduce catches associated with slope rockfish targeting in the LEFG and OA sectors. Since the Council has elected to continue to manage rougheye rockfish in the minor slope rockfish complexes north and south of 40°10' N lat. and since IFQs are allocated at the slope rockfish complex levels, strategies such as requesting trawl fishermen to avoid rougheye or area closures where rougheye most often occur may be the best strategies to consider for reducing trawl catches of rougheye rockfish.

Deriving estimates of OFL for species in the “Other Fish” complex or potential alternative complexes

Ian Taylor, Jason Cope, Owen Hamel, and Jim Thorson
NMFS, NWFSC, FRAM

The current “Other Fish” complex and proposed alternatives include a number of species for which estimates of OFL contributions are not available from stock assessments or data-poor methods. Four of the species had OFL contributions for the 2013–2014 management cycle calculated by applying approximate MSY harvest rates to estimates of stock biomass from the NWFSC West Coast Bottom Trawl Survey (Bradburn et al., 2012). This approach is described in detail in Cope et al. (2012). This document expands the set of species to those associated with proposed alternatives to the Other Fish complex described in [Agenda Item H.4.b, GMT Report, November 2013](#) and updates those species previously considered to account for more recent biomass estimates. Species for which OFL estimates were available from other methods or for which the survey did not have adequate coverage of their depth range were not included in the calculations presented here.

This survey-based approach to setting OFLs is based on the calculation

$$OFL = F_{MSY} B_w$$

where F_{MSY} is the fishing mortality rate that maximizes long-term yield, and B_w is an inverse-variance weighted average of recent survey biomass estimates. To account for uncertainty in this OFL estimates, one million samples of F_{MSY} and B_w were drawn from assumed distributions for these quantities (Table 1, Figure 2) and the median of the products of these values is presented here as the estimated OFL (Table 3, Figure 2). In general, the estimated OFL values are similar to the 2014 OFL based Cope et al. (2012) for the four species that had the same methods applied (Table 1).

Following Cope et al. (2012), the most recent 3 years of the survey were used in the calculation of B_w . For most species, a longer, 6-year average was found to be very similar to the recent years (Table 1, Figure 1). For long-lived, but infrequently encountered species, a longer range would likely be a better estimate of abundance. Aleutian skate only occur in an average of only 2 survey tows per year (out of an average of 645 tows per year over the past 10 years), so their survey estimate are more variable than the other species considered here. In this case, a preferable option might be grouping Aleutian skate with “all other skates” to reduce the sampling variability associated with this contribution to a complex that included skates.

The F_{MSY} values are based on the product of values for natural mortality (M) and the ratio F_{MSY} / M . The estimates of M were obtained from a variety of published sources (listed in Table 1) or in some cases assumed to be the same as those estimated for similar species (all grenadiers were

assumed to have the same M). Two values for F_{MSY} / M were used based on the estimates in Zhou et al. (2012). Samples of these two quantities were generated from assumed distributions and multiplied together to get a distribution of F_{MSY} values. For two species, roughtail/black skate and ratfish, two estimates of M were available. In Cope et al. (2012), the M values for ratfish were drawn from a uniform distribution bounded by the two values. However, using the uniform distribution resulted in less uncertainty for these species with multiple estimates than the distributions assumed for those species with a single estimate. To avoid this contradiction, the previously applied methods were extended so that samples from the uniform distribution were used as the expected values for a second stage of sampling from a lognormal distribution. The resulting distributions are compared in Figure 2. In all cases, the lognormal distributions for M were assumed to have a log-scale standard deviation of 0.4 ($CV = 0.417$; Dick and MacCall, 2011).

These methods depend on the both the accuracy of the parameters contributing to F_{MSY} as well as a large set of assumptions about the survey. The population is assumed to not have significant trends in abundance and the survey is assumed to have catchability equal to 1.0. Furthermore, survey selectivity and fishery selectivity are assumed to be equal. In benchmark stock assessments, these assumptions are typically not met. In the future, meta-analytic methods could be considered to refine the values presented here by estimating the relationship between this survey-based estimation of biomass and OFL with values developed in benchmark assessments.

OFL estimates from other sources

Cartilaginous Fish

Among the cartilaginous fish, leopard shark and soupfin shark have 2014 OFL estimates based on DB-SRA and DCAC, respectively, which may be used again in 2015–2016. Spiny dogfish has a benchmark assessment conducted in 2011 which has been used to derived OFL values for 2015–2016.

Shallow Water Roundfish

The NWFSC West Coast Bottom Trawl Survey does not sample depths shallower than 55 meters (30 fathoms). This prevents it from being a good sampling method for any of the species that might be considered in a Shallow Water Roundfish group, including kelp greenling, all other greenlings, or cabezon (WA). Kelp greenling in California has an OFL estimate from DB-SRA but additional analyses would be needed to get estimates for Oregon and Washington. All other greenlings and cabezon off Washington could have OFL estimates based on recent average catch or some other data poor method, but such calculations are not included in this document.

Acknowledgements

We thank Beth Horness for providing survey data, and E.J. Dick and Alec MacCall for their contributions to the methods applied here. We further thank all members of the GMT for their wisdom, insight, and endless discussions of the complexities of “Other Fish”.

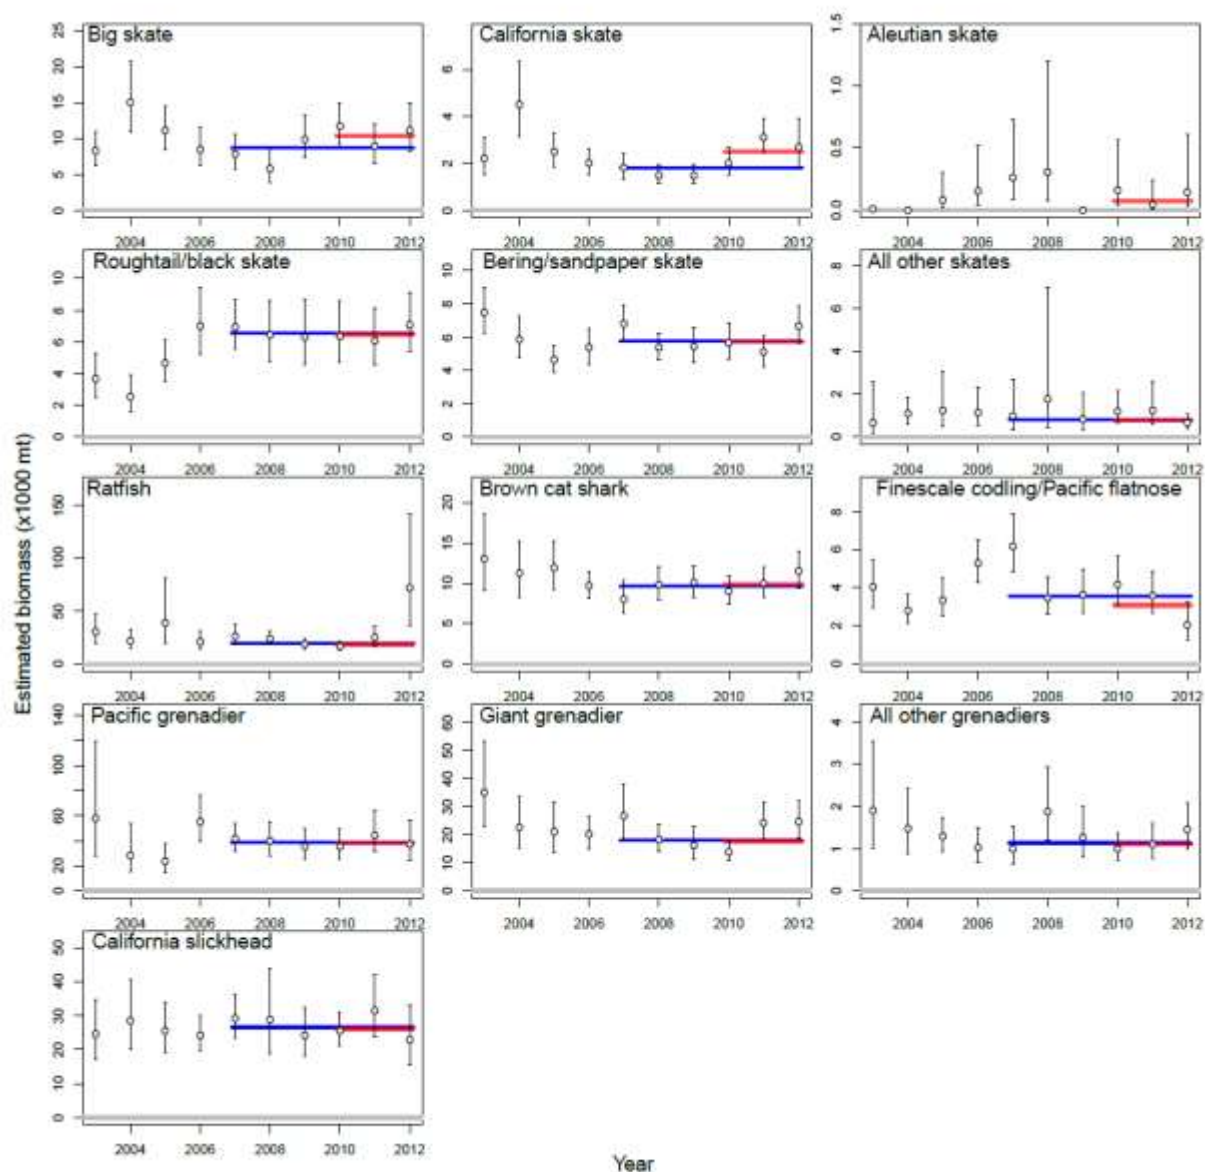

Figure 1. Time series of estimated survey biomass (mt), 2003-2012, with estimated 95% confidence intervals. Horizontal lines indicate weighted average value over most recent 6-year and 3-year periods. No 6-year average for Aleutian skate is reported because they were not encountered in the 2009 survey.

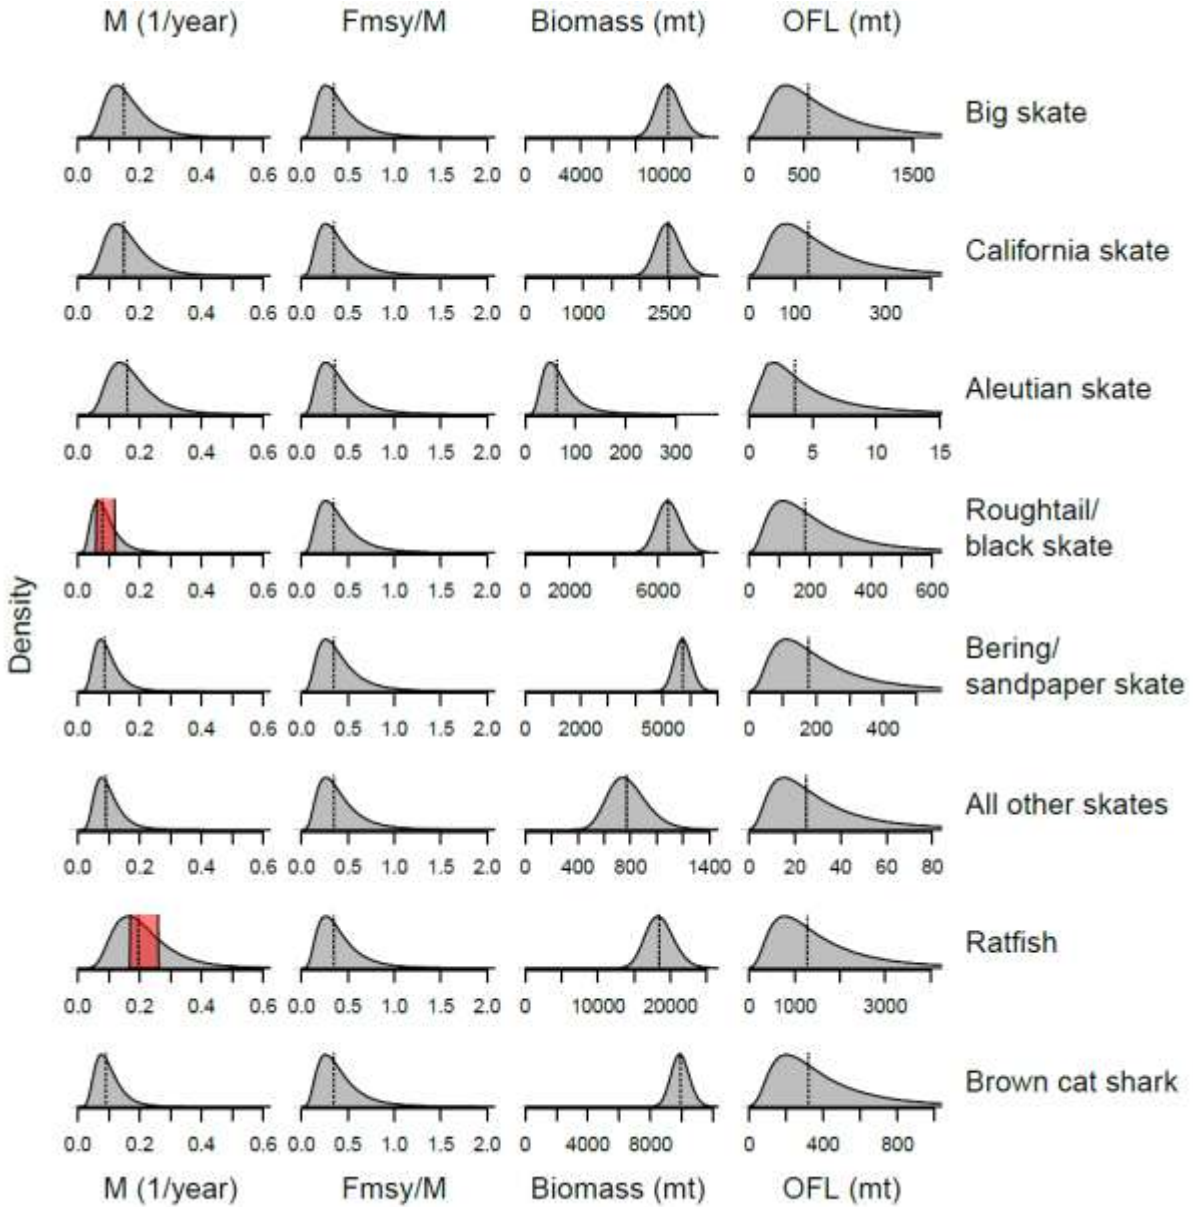

Figure 2a. Assumed distributions for M (first column) and F_{MSY}/M (second column), weighted average survey biomass for the years 2010–2012 (third column) and resulting OFL (fourth column) for 8 species of cartilaginous fish. Vertical lines indicate medians of each distribution. Shaded boxes in the first column for roughtail/black skate and Bering/sandpaper skate indicate the uniform distribution of M values used as expected values in sampling from lognormal distributions for these species.

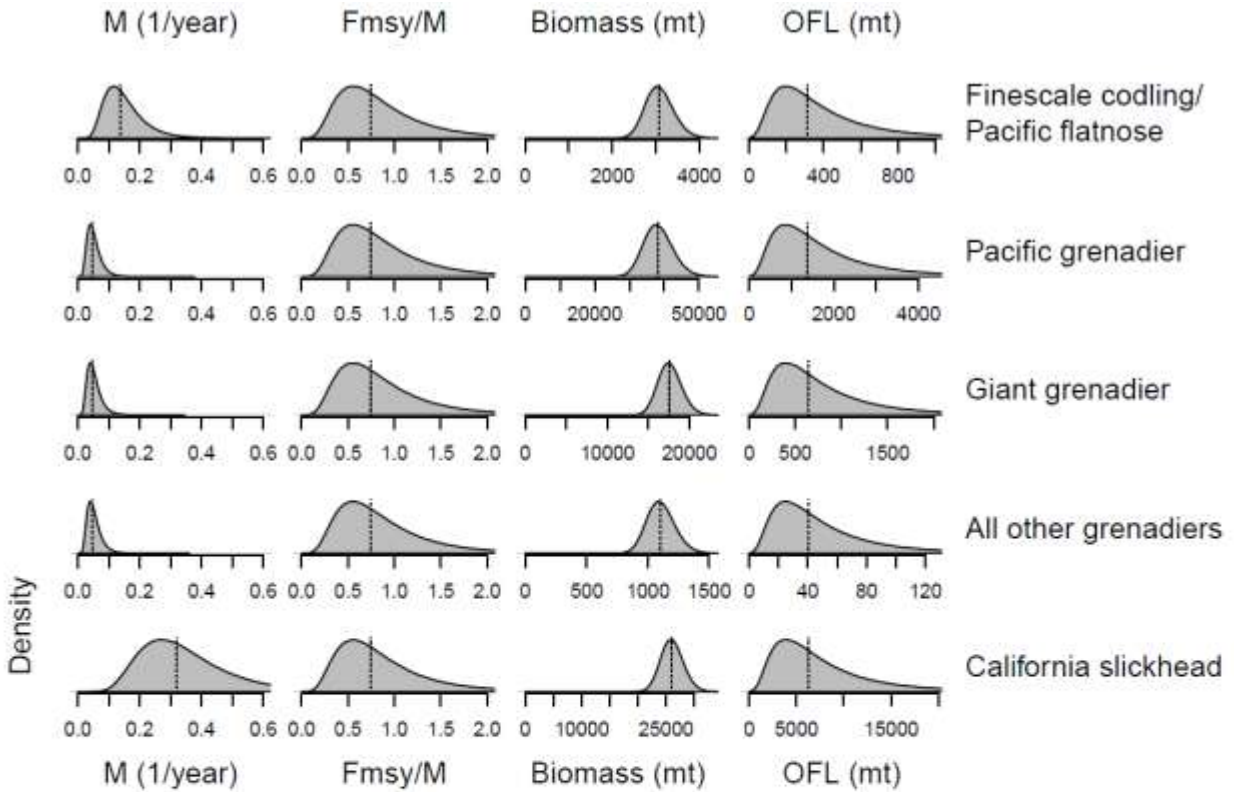

Figure 2b. Assumed distributions for M and F_{MSY}/M (left two columns), weighted average survey biomass (third column 2010–2012) and resulting OFL (fourth column) for 5 species of round fish.

PROPOSED OVERFISHING LIMITS, ACCEPTABLE BIOLOGICAL CATCHES, AND PRESUMPTIVE ANNUAL CATCH LIMITS FOR 2015 AND 2016 GROUNDFISH FISHERIES

Tables provided in this attachment:

- Table 1. 2014 OFLs (mt) and SSC-endorsed 2015 and 2016 OFLs (mt) for west coast groundfish stocks (overfished stocks in CAPS; stocks with new assessments in bold; component stocks in status quo stock complexes in *italics*, OFLs yet to be decided in highlight).
- Table 2. The basis for SSC-endorsed 2015 and 2016 OFLs for west coast groundfish stocks.
- Table 3. Relationship between the overfishing probability (P^*) and the percent reduction of the OFL for deciding the 2015 and 2016 ABCs for category 1, aurora rockfish, widow rockfish, category 2, and category 3 stocks based on sigma (σ) values (i.e., biomass variances) of 0.36, 0.39, 0.41, 0.72, and 1.44, respectively.
- Table 4. SSC-endorsed stock categories and a range of alternative 2015 ABCs (mt) varied by the probability of overfishing (P^*) for west coast groundfish stocks.
- Table 5. SSC-endorsed stock categories and a range of alternative 2016 ABCs (mt) varied by the probability of overfishing (P^*) for west coast groundfish stocks.
- Table 6. Presumptive 2015 and 2016 annual catch limits (ACLs in mt) for west coast groundfish stocks and stock complexes assuming the default harvest control rules (HCRs) specified for 2013 and 2014 (stocks with new assessments in bold).
- Table 7. The basis for presumptive 2015 and 2016 annual catch limits (ACLs in mt) for west coast groundfish stocks and stock complexes assuming the default harvest control rules (HCRs) specified for 2013 and 2014.
- Table 8. 2015 and 2016 annual catch limits for longspine and shortspine thornyheads based on alternative harvest control rules, including a test of whether the sum of the ACLs north and south of 34°27' N lat. are within specified coastwide ABCs.
- Table 9. SSC-endorsed alternative assessment models varied by area stratification for brown, China, and copper rockfish.
- Table 10. Cumulative historical removals of brown, China, and copper rockfish, 1916-2012.
- Table 11. Alternative SSC-endorsed 2015 and 2016 OFLs and ABCs for brown, China, and copper rockfish.
- Table 12. SSC-endorsed stock categories and a range of alternative 2015 ABCs (mt) varied by the probability of overfishing (P^*) for brown, China, and copper rockfish.

- Table 13. SSC-endorsed stock categories and a range of alternative 2016 ABCs (mt) varied by the probability of overfishing (P^*) for brown, China, and copper rockfish.
- Table 14. SSC-endorsed OFLs (mt) for cartilaginous stocks considered for a new complex or complexes.
- Table 15. The basis for SSC-endorsed OFLs (mt) for cartilaginous stocks considered for a new complex or complexes.
- Table 16. SSC-endorsed stock categories and a range of alternative 2015 ABCs (mt) varied by the probability of overfishing (P^*) for cartilaginous stocks considered for a new complex or complexes.
- Table 17. SSC-endorsed stock categories and a range of alternative 2016 ABCs (mt) varied by the probability of overfishing (P^*) for cartilaginous stocks considered for a new complex or complexes.
- Table 18. SSC-endorsed OFLs (mt) for roundfish stocks considered for a new complex or complexes.
- Table 19. The basis for SSC-endorsed OFLs (mt) for roundfish stocks considered for a new complex or complexes.
- Table 20. SSC-endorsed stock categories and a range of alternative 2015 ABCs (mt) varied by the probability of overfishing (P^*) for roundfish stocks considered for a new complex or complexes.
- Table 21. SSC-endorsed stock categories and a range of alternative 2016 ABCs (mt) varied by the probability of overfishing (P^*) for roundfish stocks considered for a new complex or complexes.

Table 1. 2014 OFLs (mt) and SSC-endorsed 2015 and 2016 OFLs (mt) for west coast groundfish stocks (overfished stocks in CAPS; stocks with new assessments in bold; component stocks in status quo stock complexes in *italics*, OFLs yet to be decided in **highlight).**

a/ Values for these specifications are the sum of known contributions of component stocks.

b/ No OFL contribution for these stocks given the lack of an approved method.

c/ No OFL recommended pending decisions on restructuring this complex.

Table 2. The basis for SSC-endorsed 2015 and 2016 OFLs for west coast groundfish stocks.

Stock	Comments
OVERFISHED STOCKS	
BOCACCIO S. of 40°10' N. latitude	Projected using a 50% SPR from the 2013 update stock assessment with a 6% reduction to subtract the portion of the assessed stock north of 40°10' N. lat.
CANARY	OFL projections not yet available pending a review of the 2011 rebuilding analysis, which may have had a mis-specification
COWCOD S. of 40°10' N. latitude	Sum of Conception and Monterey OFLs.
<i>COWCOD (Conception)</i>	Projected using a 50% SPR from the 2013 stock assessment.
<i>COWCOD (Monterey)</i>	Not yet available. Revised DB-SRA estimate calculated in 2011.
DARKBLOTCHED	Projected using a 50% SPR from the 2013 stock assessment
PACIFIC OCEAN PERCH	Projected using a 50% SPR from the 2011 rebuilding analysis
PETRALE SOLE	Projected using a 30% SPR from the 2013 stock assessment
YELLOWEYE	Projected using a 50% SPR from the 2011 rebuilding analysis
NON-OVERFISHED STOCKS	
Arrowtooth Flounder	Projected using a 30% SPR from the 2007 full assessment.
Black Rockfish (OR-CA)	Projected using a 50% SPR from the 2007 full assessment with the addition of 3% of the northern OFL to account for the portion of the stock estimated between Cape Falcon and the Columbia River.
Black Rockfish (WA)	Projected using a 50% SPR from the 2007 full assessment with a 3% reduction to account for the portion of the stock estimated between Cape Falcon and the Columbia River.
Cabazon (CA)	Projected using a 45% SPR from the 2009 full assessment.
Cabazon (OR)	Projected using a 45% SPR from the 2009 full assessment.
California scorpionfish	Projected using a 45% SPR from the 2005 full assessment.
Chilipepper S. of 40°10' N. latitude	Projected using a 50% SPR from the 2007 full assessment. The portion of the coastwide stock south of 40°10' N. lat. (93%) is based on average historical landings.
Dover Sole	Projected using a 30% SPR from the 2011 full assessment.
English Sole	Projected using a 30% SPR from the 2013 data-moderate assessment.
Lingcod N. of 40°10' N. latitude	Projected using a 45% SPR from the 2009 full assessment with 48% of the OFL S. of 42° N. latitude added to account for line shift.
Lingcod S. of 40°10' N. latitude	Projected using a 45% SPR from the 2009 full assessment with 48% of the OFL S. of 42° N. latitude subtracted to account for line shift.
Longnose skate	Projected using a 50% SPR from the 2007 full assessment. 2015 and 2016 OFLs projected using the status quo 45% SPR rate are 2,745 and 2,686 mt, respectively.
Longspine Thornyhead (coastwide)	Projected using a 50% SPR from the 2013 full assessment.

Stock	Comments
Pacific Cod	Status quo OFL.
Sablefish (coastwide)	Projected using a 45% SPR from the 2011 full assessment.
Shortbelly	MSY estimated from 2007 assessment.
Shortspine Thornyhead (coastwide)	Projected using a 50% SPR from the 2013 full assessment.
Splitnose S. of 40°10' N. latitude	Projected using a 50% SPR from the 2009 full assessment. The portion of the coastwide stock south of 40°10' N. lat. (64.2%) is based on average historical (1916-2008) landings.
Starry Flounder	Projected using a 30% SPR from the 2005 full assessment.
Widow	Projected using a 50% SPR from the 2011 full assessment.
Yellowtail N. of 40°10' N. latitude	Projected using a 50% SPR from the 2013 data-moderate assessment.
STOCK COMPLEXES	
Minor Nearshore Rockfish North	Sum of OFL contributions of component stocks in the complex.
<i>Black and yellow</i>	<i>DB-SRA estimate calculated in 2011 calculated in 2011</i>
<i>Blue (CA)</i>	<i>Projected using a 50% SPR from the 2007 full assessment. The portion of the assessed stock in CA north of 40°10' N. lat. (12.7%) is based on average historical landings.</i>
<i>Blue (OR & WA)</i>	<i>DCAC estimate.</i>
Brown	Projected using a 50% SPR from the 2013 data-moderate assessment.
<i>Calico</i>	<i>No harvest contribution (3a stock). Max. landings <2 mt, 1928-2008; mainly a discard species</i>
China	Projected using a 50% SPR from the 2013 data-moderate assessment.
Copper	Projected using a 50% SPR from the 2013 data-moderate assessment.
<i>Gopher</i>	<i>No harvest contribution (3a stock).</i>

Stock	Comments
Other Flatfish	Sum of OFL contributions of component stocks in the complex.
Butter sole	Based on the average catch during 1994-1998 + a 60% discard rate estimated from the EDCP study.
Curlfin sole	Based on the average catch during 1994-1998 + a 60% discard rate estimated from the EDCP study.
Flathead sole	Max. catch = 35 mt in 2005
Pacific sanddab	DB-SRA estimate calculated in 2011. Only status determined from 2013 full assessment, so presumed to remain a cat. 3 stock.
Rex sole	Projected using a 50% SPR from the 2013 data-moderate assessment.
Rock sole	DB-SRA estimate calculated in 2011.
Sand sole	DB-SRA estimate calculated in 2011.
Other Fish a/	No analytical basis for the status quo OFL.
Big skate	Derived from survey biomass and MSY harvest rate estimates
Cabazon (WA)	
California skate	Derived from survey biomass and MSY harvest rate estimates
Finescale codling	
Kelp greenling (CA)	DB-SRA estimate calculated in 2011.
Kelp greenling (OR & WA)	
Leopard shark	DB-SRA estimate calculated in 2011.
Pacific grenadier	Derived from survey biomass and MSY harvest rate estimates
Ratfish	Derived from survey biomass and MSY harvest rate estimates
Southern shark	DCAC estimate.
Spiny dogfish	Projected using a 50% SPR from the 2011 full assessment. 2015 and 2016 OFLs projected using the status quo 45% SPR rate are 2,921 and 2,893 mt, respectively.

Table 3. Relationship between the overfishing probability (P*) and the percent reduction of the OFL for deciding the 2015 and 2016 ABCs for category 1, aurora rockfish, widow rockfish, category 2, and category 3 stocks based on sigma (σ) values (i.e., biomass variances) of 0.36, 0.39, 0.41, 0.72, and 1.44, respectively.

P*	Assessment Uncertainty (σ)				
	Cat. 1 0.36	Aurora 0.39	Widow 0.41	Cat. 2 0.72	Cat. 3 1.44

GROUND FISH MANAGEMENT TEAM REPORT ON REVISING COUNCIL OPERATING PROCEDURE 9

In September 2013 we suggested that the Council consider the criteria proposed to determine whether a “new” management measure should be included for analysis alongside the harvest specifications or be held off for the separate process ([Agenda Item G.7.b, Supplemental GMT Report 2](#)). For ease of reference, we excerpt the relevant portions of that report below.

Our main message in September was that the Council should recognize the purpose of the criteria and have some discussion about the framework and alternatives to it. The criteria will play an important role in shaping discussions on workload management and priority each cycle. We also laid out the fundamental choice between using restrictive criteria that are simpler to apply and a more flexible approach that could involve more intensive workload planning. Under either approach the Council will want to consider whether the right criteria are listed—any criteria listed imply that law (e.g., regulation) or some other preference (e.g., Council policy) would give priority to some management measures over others. The Council discussed a desire to craft the criteria to allow for a more flexible, case-by-case consideration of management measures each cycle but made no final recommendations.

We discussed the COP 9 criteria again at our October meeting. If the Council remains interested in a flexible approach, we think the GMT’s suggested language would work. The language wouldn’t open the door fully but would instead prompt proponents to put forth, and the Council to consider, reasons why a particular management measure would be more efficiently considered alongside the harvest specifications than in the separate process.

Lastly, we also discussed the proposed criteria in the context of the actual proposed list of management measures for this cycle (Agenda Item H.10.b, GMT Report). In looking at that list, our thoughts turned to the total workload of all the management measures that could qualify to be analyzed with the harvest specifications. It struck many of us that criteria like “new” or “routine” are rarely perfect and will be less important to achieving improvements in this process than will be the assessment of how much analysis is necessary for each item and of how many items can be analyzed, reviewed, and implemented at one time. Nonetheless we continue to support the COP 9 approach and believe it will make such exercises more direct and transparent.

Relevant Excerpts from September 2013 [Agenda Item G.7.B, Supplemental GMT Report 2](#)

In June, the GMT expressed concern with the portion of the COP that is being proposed as criteria for determining whether management measures should be considered in the biennial harvest specification and management measures analysis or analyzed in a separate process considered by the Council at the June meeting in even years. . . . The GMT thinks the revised COP 9 criteria in the September briefing book ([Agenda Item G.7.a, Attachment 3](#)) which states “Council will provide initial fishery management guidance, including a preliminary range of new

management measures necessary to keep catch within the annual catch limits (ACL) or address a habitat or protected resource concern” is an improvement.

The Council may wish to fashion these criteria more as strict rules, or more as a flexible standard. The latter would involve the Council having more direct consideration of how a particular item fits within the analysis, timing, workload, etc. Such discussions might take more time, and it can be difficult to apply standards consistently and fairly. A stricter rule, on the other hand, could be more quickly and consistently applied, with the downside that it might be overly restrictive in certain cases.

If the Council wishes to go with a stricter set of criteria, we recommend there be some discussion of what the criteria would be. For instance, it was unclear to some of us why habitat issues would be included. Some habitat issues might require extensive analysis. As it is now, the proposed criteria imply that by law or some policy that certain issues receive priority. The Council may want to discuss these criteria.

If the Council wishes to go with a more flexible approach, then additional language might be added to this section to allow the Council to have additional discussion on what management measures could be analyzed in the biennial process on a case by case basis. Some items may be better evaluated within the suite of alternatives in the biennial analysis but might not fit into the proposed criteria. The Council could consider adding more flexible language such as, “the Council may include other management measures if the timing or information presented in the harvest specifications would improve the efficiency of the analysis, implementation, or otherwise aid the Council’s consideration.” As it is now, one major limitation on what could be included comes from the scope of what has been previously and adequately analyzed in the Tier 1 Environmental Impact Statement (EIS) or elsewhere. And like now, consideration of additional analysis workload would be a major consideration in deciding whether to include a specific management measure in the analysis.

If the Council decides to adopt the proposed language in COP 9, the Council may wish to consider the language “... keeping catch within the ACL...” and whether it might be better to revise the language to “... keeping catch within a specification.” The term, specification, is defined in groundfish regulations (50 CFR 660.10) and includes annual catch targets, fishery harvest guidelines (ACL less tribal, research, groundfish mortality from non-groundfish fisheries, and EFPs), allocations, area apportionments, harvest guidelines (e.g., recreational HG for overfished species), etc. New management measures may be needed to keep catch within these specifications, which are broader than simply ACLs, and should be included for analysis during the harvest specification and management measures process.

GROUND FISH ADVISORY SUBPANEL REPORT ON BIENNIAL HARVEST SPECIFICATIONS FOR 2015-16 GROUND FISH FISHERIES

The Groundfish Advisory Subpanel (GAP) was briefed by Mr. John DeVore about the 2015-16 biennial specifications and offers the following comments and recommendations.

Range of Acceptable Biological Catches (P*s/ABCs)

The GAP reviewed [Agenda Item H.6.a, Supplemental Attachment 7](#) and recommends adopting a P* of 0.45 for all stocks and stock complexes to determine 2015 and 2016 ABCs. For some stocks (e.g., sablefish and arrowtooth flounder), this is a departure from the default ABC harvest control rules (HCRs) adopted for the 2013-2014 management cycle.

Range of Annual Catch Limits (ACLs)

The GAP reviewed Tables 6 and 7 in [Agenda Item H.6.a, Supplemental Attachment 7](#) to consider 2015 and 2016 annual catch limits (ACLs). The GAP process for recommending 2015 and 2016 ACLs was to first deliberate whether application of the status quo ACL HCRs used to determine 2013 and 2014 ACLs would serve to optimize the socioeconomic benefits to the fishery and affected fishing communities, while minimizing any biological risks to groundfish stocks. For most stocks and stock complexes, the GAP is recommending the default HCRs be applied for the next management cycle. Those stocks where the GAP is recommending a departure from the default ACL HCRs are listed below.

- **Cowcod:** The GAP is not prepared to recommend a preferred cowcod ACL pending provision and adoption of a final 2013 cowcod rebuilding analysis. The GAP reviewed the draft cowcod rebuilding analysis ([Agenda Item H.5.a, Supplemental Attachment 2](#)) and the advice of the Scientific and Statistical Committee to develop their cowcod ACL recommendation. The GAP recommends analyzing a range of cowcod ACLs from 3 mt, in the 2014 ACL in regulation, to 16 mt, the ACL determined by applying the default harvest rate in the current rebuilding plan (i.e., SPR of 82.7%). The GAP notes the 16 mt ACL is predicted to rebuild the stock by 2020, one year longer than the minimal time to rebuild if all harvest were eliminated starting in 2015 (i.e., $T_{F=0}$).
- **Arrowtooth flounder:** The GAP recommends setting the ACL equal to the ABC. However, the GAP recommends the ABC (and ACL) be specified using a P* of 0.45, which is a departure from the status quo P* of 0.4. The West Coast arrowtooth stock is healthy and increasing in abundance. They are a top level predator on the shelf and compete with Pacific halibut. Further, this is a trawl-dominant stock and targeted by some members of the fleet, some of whom are close to attaining their vessel cap for arrowtooth.
- **Dover sole:** While the GAP is not prepared to recommend a preferred ACL for Dover sole, we do recommend analyzing higher ACLs than the default 25,000 mt ACL. The GAP recommends analyzing ACLs ranging from 25,000 mt to the ABC set at a P* of 0.45 (i.e., 63,929 mt and 56,615 mt in 2015 and 2016, respectively). This is a healthy

stock with an abundance much higher than the target B_{MSY} level; the stock is projected to remain above target at a level of removals higher than the ABC. The potential of developing a more robust Dover market depends on a certainty of potential higher volume of landings enabled with higher ACLs.

- **Lingcod south of 40°10' N lat.:** The GAP recommends setting the ACL equal to the ABC. However, the GAP recommends the ABC (and ACL) be specified using a P^* of 0.45, which is a departure from the status quo P^* of 0.4. This is a healthy and well managed stock targeted by every sector of the West Coast groundfish fishery. The slight increase in yield afforded by a higher ACL will directly benefit the industry and affected fishing communities in California.
- **Longspine thornyhead:** The GAP recommends maintaining the Point Conception management line at 34°27' N lat. for managing this stock. Further, the GAP recommends a departure from the default HCR, which apportioned the coastwide OFL north and south and specified a further scientific uncertainty adjustment to determine the default ACLs. The new longspine thornyhead assessment conducted this year explicitly recommended this further scientific uncertainty adjustment was no longer needed since the Northwest Fisheries Science Center bottom trawl survey has been conducted in the Southern California Bight for a long enough period to develop an informative abundance index. Therefore, the GAP recommends setting the longspine ACLs by apportioning the ABC, determined using a P^* of 0.45, using the survey biomass estimates recommended by the stock assessment team (see [Table 7 of Agenda Item H.6.a, Supplemental Attachment 7](#)). The recommended ACLs for north and south of 34°27' N lat. are 3,474 mt and 1,097 mt, respectively in 2015 and 3,305 mt and 1,044 mt, respectively in 2016. While coastwide management of longspine thornyhead was considered by the GAP, it was not recommended due to concerns it would potentially open an Amendment 21 allocation battle, especially for other stocks such as shortspine thornyhead.
- **Sablefish north of 36° N lat.:** The GAP recommends setting the ABC using a P^* of 0.45 rather than the status quo P^* of 0.4. We note the P^* of 0.4 was used only for the 2013-14 biennial specifications and a P^* of 0.45 was the expected default at the time. The GAP further recommends application of the default 40-10 ACL HCR to determine the ACL to manage this important stock. Sablefish is a critically important stock to west coast commercial fisheries. It is the main target in offshore limited entry (LE) and open access (OA) fixed gear fisheries, as well as the bottom trawl fishery. Ex-vessel prices for sablefish are increasing and a higher ACL directly benefits the industry and affected fishing communities. Further, the LE trawl fleet needs a higher quota of sablefish to optimize their Dover/thornyheads/sablefish (DTS) complex and shelf fishing strategy. A higher sablefish quota allows trawlers to better attain their Dover sole quota, a stock that, along with sablefish, is the subject of developing markets. A higher sablefish quota would also benefit fixed-gear fisheries that, in recent years, have also been significantly constrained by lower catch limits.
- **Sablefish south of 36° N lat.:** The GAP makes the same recommendation for this stock as made for sablefish north of 36° N lat.

- **Shortspine thornyhead:** The GAP has the same recommendation as that made for longspine thornyhead: to depart from the default HCR and specify ACLs north and south of 34°27' N lat. by apportioning the ABC using a P^* of 0.45. The GAP-recommended ACLs for north and south of 34°27' N lat. are 1,913 mt and 1,012 mt, respectively, in 2015 and 1,892 mt and 1,001 mt, respectively, in 2016. The GAP does not recommend setting a coastwide ACL for shortspine thornyhead. This stock is targeted almost exclusively by fixed gear, non-trawl sectors in the south and the bottom trawl sector in the north. Therefore, the Amendment 21 allocations are much different north and south. A reallocation process for shortspine would be contentious and a needless distraction from other, more important priorities that are contemplated for 2015 and 2016.
- **Starry flounder:** The GAP recommends setting the ACL equal to the ABC. However, the GAP recommends the ABC (and ACL) be specified using a P^* of 0.45, which is a departure from the status quo P^* of 0.4. This is a healthy stock far above its B_{MSY} target and is caught in nearshore commercial and recreational fisheries. There are no biological risks associated with a higher ACL.
- **Widow rockfish:** The GAP recommends a higher ACL than the default 1,500 mt ACL specified for 2013 and 2014. Specifically, the GAP recommends setting the ACL equal to the ABC determined with a P^* of 0.45 (i.e., 3,929 mt and 3,790 mt in 2015 and 2016, respectively). The trawl fishery needs a higher widow ACL to gain greater access to the healthy yellowtail rockfish resource. Further, this is a constraining stock for the at-sea whiting sectors. A higher widow quota will allow greater flexibility to target whiting while avoiding other species of concern such as canary and roughey rockfish. This is a healthy stock above its target B_{MSY} harvest level. The GAP notes that annual average widow landings in the three years immediately prior to the 2002 widow shutdown (1999 to 2001) were below 3,900 mt. It is hoped the regulations for 2015-16 will allow midwater gear to be used outside of the whiting season; specifically, a 12-month non-whiting midwater fishery to target yellowtail. Increased widow rockfish would be needed to prosecute this fishery.
- **Minor Slope Rockfish north and south of 40°10' N lat.:** The GAP recommends setting the ACL equal to the ABC using a P^* of 0.45 for both of these complexes. This recommendation applies regardless of the Council's final decision on restructuring these complexes.
- **Minor Nearshore Rockfish north and south of 40°10' N lat.:** The GAP does not recommend changing the management line from 40°10' N lat. to the California-Oregon border at 42° N lat. This consideration is driven by the request to explore moving to the new management line through revised assessments for brown, China, and copper rockfishes. The GAP believes these three stocks cannot be effectively managed with a different management line used to manage the other minor nearshore rockfish stocks. Further, the GAP does not recommend removing these three stocks from the minor nearshore rockfish complexes. While the GAP does not oppose eventual consideration for changing the nearshore management line to the California-Oregon border, the GAP

believes this should be a more deliberative process that should start next year for consideration in the 2017-2018 management cycle. The GAP believes considering this change for the 2015-2016 management cycle would provide a needless distraction from other, higher priority tasks contemplated for the next management cycle.

- **Other Fish:** The GAP recommends setting the ACL equal to the ABC using a P* of 0.45 for this complex. This recommendation applies regardless of the Council's final decision on restructuring this complex.

Table 1. Summary of GAP recommendations for ranges of ABCs

Species	GAP recommendation	Comments
Cowcod	Analyze a range of ACLs between 3 and 16 metric tons	
Arrowtooth	$ABC = ACL/P^*$ of 0.45	
Dover sole	ACL range: 25,000 mt to $ABC = ACL/P^*$ of 0.45	At $ABC = ACL/P^*$ of 0.45, the high range would be 63,929 mt in 2015 and 56,516 mt in 2015
Lingcod S. of 40°10'	$ABC = ACL/P^*$ of 0.45	Departure from status quo P* 0.4
Longspine thornyhead	For ACLs, apportion ABC using P* of 0.45 using survey biomass estimates	Maintain management line at 34°27'
Sablefish N. of 36°	Set ABC using P* of 0.45; use 40-10 HCR to determine ACL	Departure from status quo P* of 0.4, which was established for the 2013-14 spex cycle; P* of 0.45 was assumed to be the default at the time
Sablefish S. of 36°	Same as sablefish north of 36°	
Shortspine thornyhead	For ACLs, apportion ABC using P* of 0.45 using survey biomass estimates	Maintain management line at 34°27'
Starry flounder	$ABC = ACL/P^*$ of 0.45	Departure from status quo P* of 0.4
Widow rockfish	$ABC = ACL/P^*$ of 0.45	Higher ACLs than status quo of 1,500 mt
Minor slope rock, N. and S. of 40°10'	$ABC = ACL/P^*$ of 0.45	Applies regardless of decision on restructuring complexes
Minor nearshore rock, N. and S. of 40°10'	Do not change management line to 42°; consider for 2017-18 biennial specifications process	
Other fish	$ABC = ACL/P^*$ of 0.45	Applies regardless of decision on restructuring complexes

The Tier 1 Environmental Impact Statement (Amendment 24 process)

The GAP strongly recommends proceeding with the Amendment 24 (Tier 1) Environmental Impact Statement (EIS) for the 2015-2016 management cycle and beyond. This analysis, which provides a longer term outlook on the potential environmental impacts of the groundfish fishery,

should serve to provide relief from the detailed National Environmental Policy Act (NEPA) analyses done every year to specify new harvest specifications and management measures. Any future NEPA workload relief will free up resources to devote to other important priorities that are currently being neglected. The GAP further offers that delaying this analysis makes no sense. New information is always emerging. Future supplementation or tiering off the Amendment 24 (Tier 1) EIS would address a narrower scope of issues and is a much more sound process that will provide workload relief sooner than delaying the Amendment 24 (Tier 1) analysis.

PFMC

11/04/13

GROUND FISH MANAGEMENT TEAM REPORT ON THE BIENNIAL HARVEST SPECIFICATIONS FOR 2015-2016 GROUND FISH FISHERIES

The Groundfish Management Team (GMT) reviewed and discussed the materials under this agenda item. In the event the Council does not complete all tasks under Agenda Item H.6 or if additional analyses are requested, the remainder of the harvest specifications decisions can be made under Agenda Item H.10.

Overfishing Levels, Stock Categories, Sigma Values

The GMT reviewed the tables in Agenda Item H.6.a, Attachment 1 and Agenda Item H.6.a, Supplemental Attachment 7 on the proposed overfishing limits (OFL), acceptable biological catches (ABC), and presumptive annual catch limits (ACL) for 2015-2016 groundfish fisheries. It is the purview of the Scientific and Statistical Committee (SSC) to determine and recommend OFLs and ABCs; however we did review them, and have no additional comments or recommendations.

Based on the SSC Groundfish Subcommittee Report (Agenda Item H.6.b, Supplemental SSC Report), it is our understanding that an effort will be made to develop proposed OFLs for kelp greenling off of Washington and Oregon and cabezon off of Washington in December 2013. If the OFLs and associated ABCs, based on the range of overfishing probabilities (P^*) adopted by the Council in September (0.25 to 0.45), are proposed during that time frame, the GMT could review them at our January work session and evaluate any necessary management measures. Any related concerns would be brought to the Council in either March or April. Since these species are currently subject to both state and federal management measures, the delay to specify the OFL, and resulting allowable biological catch (ABC), annual catch limits (ACL) for these species should not delay analysis for the biennial harvest specifications and management measures draft environmental impact statement (DEIS).

P^* and Allowable Biological Catches

The GMT reviewed the staff white paper (Agenda Item H.6.a, Supplemental Attachment 4) on the considerations for deciding the P^* when specifying ABCs. While it generally provides good information on the state of the science against which P^* is applied and advice on how to incorporate risk tolerance against uncertainty, we did not have time to discuss the white paper in detail. Some on the Team think that there may be further guidance that we can give to help the Council understand the ramifications of various scenarios and P^* amounts, so we may provide additional comment under Agenda Item H.10.

Currently, there are no status quo P^* values (values used in 2013-2014) for application to some species in the cartilaginous and other roundfish complexes for which OFL values have recently been derived using swept area estimates of biomass from the trawl survey. The status quo P^* value applied to the Other Fish complex components was 0.4, recognizing a need to acknowledge the greater risk of overfishing component stocks with disparate life histories in contrast to the default P^* of 0.45 applied to the *Sebastes* complexes with more uniform life histories. Now that stocks have been separated into groupings with more similar life histories and co-occurrence, the Council may consider applying P^* values that reflect other stocks with similar characteristics. In line with the Council's preliminary P^* decision for a spiny dogfish P^*

of 0.3, a similar value might be applied to the cartilaginous fishes in recognition of the lower productivity of such stocks and the longer expected period to rebuild such stocks should they become overfished. As for the other roundfish, they have life histories imparting higher productivity and are more similar to the remaining teleost species, thus the concomitant P^* of 0.45 may be more appropriate.

In September, the Council adopted a range of P^* of 0.45 to 0.25. For most species, the presumptive P^* (i.e., that set during the last biennial cycle) set by the Council is 0.45 (the upper limit of P^* ; Table 1). Sablefish, spiny dogfish shark, arrowtooth flounder, starry flounder, and lingcod south of 40°10' N. lat. were assigned preliminary P^* lower than 0.45 (Table 1). Additionally, there are a number of species with new assessments for which the Council may wish to consider a P^* other than the presumptive P^* . For example, the GMT requested a run for the petrale sole assessment that would stabilize the stock at about $B_{30\%}$. Those runs give catches of 2,367 mt in 2015 and 2,533 mt in 2016 for the base case (Agenda Item F.5.a, Attachment 6, June 2013, Table h) which roughly correspond to a P^* of 0.25 in 2015 for 2,310 mt and 0.3 in 2016 for 2,520 mt. The rebuilding year did not change between the two scenarios. However, one reason to consider a lower P^* for petrale sole would be to reduce the risk of it ending up in another rebuilding plan in the future. Natural variability in recruitment always has some potential to cause the stock to fall to a low level even when managed well. The GMT cautions that use of P^* to account for risk tolerance will be explored further and over longer time scales under the Tier 1 Environmental Impact Statement (EIS) that the Council is embarking on. It would be worthwhile to consider that analysis prior to trying to contemplate all possible uses of P^* or developing a more comprehensive policy for its use.

Range of Annual Catch Limits

The GMT reviewed the presumptive ACLs in Table 6 of Agenda Item H.6.a, Supplemental Attachment 7 for 2015 and 2016. In most instances the presumptive ACL was determined by setting the ACL equal to the ABC.

Table 2 summarizes those species or species complexes for which the ACL does not equal the ABC. For black rockfish (OR-CA), Dover sole, longnose skate, and widow rockfish rather than setting the ACL equal to the ABC, a constant catch scenario was chosen; in all four cases, the ACL was then less than the ABC. For several complexes, the component species had a range of P^* that influenced the complex ABC and hence influenced the maximum possible ACL for the complex.

Additionally, the GMT notes that there are several species for which the presumptive ACLs are considerably higher than those for 2014: English sole; longspine thornyhead; shortspine thornyhead; and yellowtail rockfish north of 40° 10' N latitude (Table 3). All of these species had new assessments in 2013, which is the reason for the change. The GMT will briefly explore the potential management implications relative to the changing ACLs under Agenda Item H.10 and in greater detail in the DEIS analysis that will occur over winter.

For overfished species, except for cowcod, there are no new rebuilding plans this cycle. Therefore the GMT anticipates the ACL will be determined by applying the status quo harvest control rule, which is constant spawning potential ratio (SPR), except for petrale sole which is based on the 25-5 rule.

For cowcod, once a rebuilding plan is approved, the harvest control rule will need to be verified. The presumptive ACL for cowcod is over 5 times higher than the 2014 ACL (3 mt vs. 16 mt; see Agenda Item H.6.a, Supplemental Attachment 7, Table 6). Given the new assessment for cowcod, the Council may wish to choose a more precautionary ACL or annual catch target (ACT). Table 4 provides some recent historical information on catch by sector and total mortality for cowcod.

The 2015 and 2016 harvest specification alternatives for cowcod south of 40°10' N. latitude are based on the 2013 assessment (Dick, et al. 2013) and 2013 rebuilding analysis (Dick and MacCall 2013). A new 2013 cowcod assessment was conducted to evaluate new information available to inform the stock assessment and rebuilding analysis in a data-moderate framework. The current SPR harvest rate ($F_{82.7\%}$) implies that the stock will rebuild by 2020 with a 50 percent probability, so rebuilding is ahead of schedule. The catches of cowcod have been lower than the cumulative ACL during the period of rebuilding. The SSC concluded that progress towards rebuilding is ahead of schedule.

The 2015 and 2016 cowcod OFL and ABCs will be determined using the 2013 newly developed rebuilding analysis method recently reviewed by the SSC at the November Council meeting. The results will be forthcoming once the SSC has had the opportunity to deliberate on the methodology for arriving at values for each portion of the stock at their December meeting. Adoption of the OFL and ABC will be finalized at the March Council meeting.

The 2015 and 2016 ACL alternatives range from 3 mt, which is the status quo ACL to 16 mt based on applying the SPR harvest rate of 82.7 percent specified in the current rebuilding plan, which was the basis for setting the 2013 ACL. Since 2000, catch has not exceeded 3 mt, though impacts within sectors have varied (Table 4). In the past, the Council discussed a higher ACL with an ACT to provide a buffer against management uncertainty. Given the greater range of ACL values available in this biennium, a higher ACL with an ACT may be beneficial. Constraints posed by bocaccio may prevent adjustments to management measures that could be considered under higher ACLs for cowcod in any event. The range of ACLs between 3 mt and 16 mt is sufficient to examine what opportunities may be possible given potential constraints from overfished species limits. In addition, a higher ACL would allow a greater set aside for scientific research such as an extension of the Northwest Fisheries Science Center hook and line survey and trawl survey into the Cowcod Conservation Area to better inform future assessment efforts. Analysis of ACL alternatives from 3 mt to 16 mt would allow evaluation of the potential for additional fishing opportunity, buffers for management uncertainty and research.

Use of Harvest Guidelines

The GMT reviewed the staff white paper (Agenda Item H.6.a., Supplemental Attachment 5) on the use of harvest guidelines (HG) for assessed stocks managed in a stock complex. As mentioned in the Council staff white paper, the use of a HG to manage a stock in a complex needs to be considered on a stock by stock basis. In addition, the GMT provides the following additional thoughts when considering the effectiveness of a HG to address conservation concerns. As described in the Code of Federal Regulations under “General Definitions” at 50 CFR 660.11, “Harvest guideline means a specified numerical harvest objective that is not a quota. Attainment of a harvest guideline does not require closure of a fishery.” As such, regulations do not establish a maximum limit that could be established relative to the harvest specifications (e.g., equal to the OFL or ABC).

After establishing the HG, the Council should state whether they are setting a hard catch limit or simply a harvest target. If implemented, it would be important to consider how to evaluate the performance of a HG over time and whether reaching this HG on average over a particular time period is acceptable.

The next question to be considered is what tools are necessary to be effective; HGs must be linked to other management tools such as landing limits, sorting requirements, or area closures to adequately address conservation concerns. Once the Council identifies the species in which they would like to apply a HG and whether the HG is to be treated as a limit or a target, the GMT can briefly weigh in on the efficacy of management measures under Agenda Item H.10 and in greater detail in the analysis completed for the DEIS.

Ecosystem Workshop

The Council has expressed interest in the Tier 1 EIS approach and in advancing ecosystem based fisheries management through the Fishery Ecosystem Plan (FEP) and related initiatives, especially Initiative 9. The gist of our reports to the Council has been that there is much in common between the two in terms of the analyses involved¹. The Ecosystem Workshop was the first opportunity attempt to explore those connections with invited experts and members of the SSC.

Two members of the GMT attended the workshop. Based on their reports, the discussion was very productive. We thank the Workshop participants and thank Council staff for arranging our participation in and input to the discussion. We had submitted a discussion document for the Workshop (available on the FTP site included under Agenda Item H.6) laying out a view of the long-term road map the team has had in mind. In brief, there are three main pieces to that:

1. Using ecosystem models and other analysis to guide our understanding of the ecosystem and the relative magnitude and importance of the effects the groundfish fisheries are having on the ecosystem (and other components of the ecosystem on the groundfish fisheries). It is envisioned that this information could be an important part of the framework that could be one focal point for guiding discussions on impacts analysis in the future.
2. Using indicators to help focus the discussion on how changes in the science or in the fisheries or elsewhere may or may not affect our understanding of the relationships between the groundfish fisheries and various components of the ecosystem.
3. A “research and data needs” approach for the Tier 1 EIS to help guide research and management on where improvement to the next iteration of Tier 1 EIS and other National Environmental Policy Act (NEPA) documents could be made. This would also help direct science resources to highest conservation and management needs and help the Council understand where the ecosystem science suggests those needs might be. And importantly, this step combined with the indicators allow look to the science to guide the question about the appropriate timeline for updating or supplementing portions of the EIS analysis.

¹June 2013, [Agenda Item F.7.b, Supplemental GMT Report](#); November 2012, [Agenda Item I.2.b, Supplemental GMT Report](#), [Agenda Item K.1.c, Supplemental GMT Report](#), [Agenda Item K.2.c, Supplemental GMT Report](#), and http://www.pcouncil.org/wp-content/uploads/K3c_SUP_GMT_NOV2012BB.pdf; and March 2013, [Agenda Item H.4.b, Supplemental GMT Report](#).

These three steps are the core structure of many ecosystem-based management efforts. The Workshop and the analysis that will come out of it will help with the beginning of step one. To best integrate NEPA analyses into the ecosystem-based effort, would likely involve gradual, iterative pursuit of the three steps through FEP Initiative 9 and similar efforts. We believe this first step, which largely involve translation of what ecosystem models can say about the connections between the groundfish fisheries and the ecosystem, is very important for the Council, its advisors, and the public. When the results are presented in the March Briefing Book, we would like to hear and be involved in the discussion with the SSC to the extent that schedules and budgets allow. We will request such participation again during Future Meeting Planning.

Table 1. Species or Species Complexes where the Council adopted P* values lower than 0.45, the upper limit of P* values contemplated in the FMP, and species with new assessments and additional considerations for setting of P* may be warranted for 2015-2016.

Species/Complex	2014 P*	Rationale for 2014 P* Decision	Additional considerations (if any)
Sablefish (coastwide)	0.40	Uncertainty in steepness and decline in stock status.	
Spiny dogfish	0.30	Uncertainty in SPR	
Starry flounder	0.40	Category 2	
Lingcod S. of 40° 10' N. lat.	0.40	Category 2	
English sole*	0.45	Category 1	Moved from a Category 1 to a Category 2
Longspine thornyhead*	0.40	Category 2	Currently a Category 2
Shortspine thornyhead*	0.45	Category 1	Moved from a Category 1 to a Category 2
Yellowtail N. of 40 10' N. lat.*	0.45	Category 1	Moved from a Category 1 to a Category 2
Stripetail rockfish*	N/A		Shelf RF Complex P* was 0.45 both N. and S.
Brown rockfish*	N/A		Nearshore RF Complex P* was 0.45 both N. and S.
China rockfish*	N/A		Nearshore RF Complex P* was 0.45 both N. and S.
Copper rockfish*	N/A		Nearshore RF Complex P* was 0.45 both N. and S.
Aurora*	N/A		Slope RF Complex P* was 0.45 both N. and S.; Currently a Category 1
Rougheye*	N/A		Slope RF Complex P* was 0.45 both N. and S.; Moved from a Category 1 to a Category 2
Sharpchin*	N/A		Slope RF Complex P* was 0.45 both N. and S.; Currently a Category 2
Pacific sanddab*	N/A		Other flatfish Complex P* was 0.4; Currently a Category 3
Rex sole*	N/A		Other flatfish Complex P* was 0.4; Currently a Category 2

* new/updated assessments for the 2015-2016 biennial cycle

Table 2. Excerpt from Table 7, Agenda Item H.6.a, Supplemental Attachment 7, November 2013 for species or stock complexes where the ACL was not set equal to the ABC.

Stock	Default HCR	Comment
Non-overfished stocks		
Black rockfish (OR-CA)	Constant catch strategy	ACL < ABC (P*0.45)
Dover sole	Constant catch strategy	
Longnose skate	Constant catch strategy	ACL < ABC (P*0.45)
Widow rockfish	Constant catch strategy	
Stock complexes		
Minor Shelf Rockfish North	ACL = status quo ACL; ACL < ABC (under P* range of 0.25-0.45)	
Minor Slope Rockfish North	ACL = status quo ACL; ACL < ABC (under P* range of 0.25-0.45)	
Minor Shelf Rockfish South	ACL = status quo ACL; ACL < ABC (under P* range of 0.25-0.45)	
Other Flatfish	ACL = status quo ACL; ACL < ABC (under P* range of 0.25-0.45 in 2015 and under P* range of 0.3-0.45 in 2016)	

Table 3. Species with ACLs different for 2015 than for 2014, taken from Table 6 in Supplemental Attachment 7.

Species	2014 ACL	2015 ACL	Difference
English Sole	5,646	11,040	5,394
Longspine thornyhead N of 34° 27' N lat.	1,958	2,854	866
Longspine thornyhead S of 34° 27' N lat.	347	601	254
Shortspine thornyhead N of 34° 27' N lat.	1,525	2,095	570
Shortspine thornyhead S of 34° 27' N lat.	393	554	161
Yellowtail north of 40° 10' N latitude	4,382	11,213	6,831

Table 4. Historical catch information by sector and total mortality for cowcod in mt.

Year	Non-Whiting Trawl	CA Rec	Research/ Other	Total Mortality	OY/ACL (mt)	% OY/ACL	%ABC
2004	0.9	1.0	0.5	2.4	4.8	50%	10%
2005	1.5	0.4	0.1	2.0	4.2	47%	8%
2006	0.9	0.2	0.0	1.1	4.2	26%	5%

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON
BIENNIAL HARVEST SPECIFICATIONS FOR 2015-2016 GROUND FISH FISHERIES

Estimating OFL for Species in the “Other Fish” Complex

The SSC reviewed Agenda Item H.6.a, Supplemental Attachment 6 that describes a procedure for calculating overfishing limits (OFLs) for some species for which OFLs were requested. The method applies F_{MSY} harvest rate proxies to estimates of stock biomass from the NWFSC West Coast Bottom Trawl Survey. This method was used during the previous biennial harvest specification cycle to provide OFLs for big skate, California skate, ratfish, and Pacific grenadier. The SSC endorses the approach, but notes that the method makes the strong assumption that the survey catchability coefficient is 1.0 and likely results in a conservative OFL for species such as grenadier whose geographic range extends into depths beyond the survey area. Also, the OFLs for these species should be updated as additional survey data become available.

OFL Values for Kelp Greenling and Cabezon

There are no OFLs for kelp greenling off Oregon and Washington or for cabezon off Washington in the current table of proposed OFL values (Agenda Item H.6.a, Attachment 1). It may be possible to develop DB-SRA estimates for these stocks. The SSC was informed that (time permitting) Dr. E.J. Dick would: (a) assemble the needed catch history data; (b) send it to agency staff in Oregon and Washington to confirm the acceptability of the catch histories; and then (c) derive the DB-SRA estimates by early December 2013. However, his top priority would be to complete the rebuilding analysis for cowcod. The SSC will review the DB-SRA estimates of OFL values for these species during a conference call that will be scheduled for December.

Category Designation for the Rougheye / Blackspotted Rockfish Assessment

The SSC revisited the decision that was made at the September meeting to designate the new stock assessment for rougheye rockfish as a category 1 assessment. Given that the assessment is for a complex of two species (rougheye and blackspotted rockfish) and given that there is insufficient information available to confirm that these species have similar vulnerability to the fishery and rates of biological productivity, the SSC recommends that the assessment be classified as a category 2 assessment. Both the ABCs and decision table will be updated to reflect this change.

OFLs for Canary Rockfish

The OFLs for canary rockfish originally included in the September briefing book were not endorsed by the SSC in its September statement because of concerns that they may have been incorrect (Agenda Item G.7.b, Supplemental SSC Report, September 2013). Subsequent investigation of the calculations found that the values originally presented in the September briefing book are correct and the SSC recommends these values.

OFLs for Cowcod

The OFL for cowcod in the Conception area will be derived from the completed rebuilding analysis. The OFL for the Monterey area will be derived from an application of DB-SRA using a distribution for depletion for cowcod in the Conception area as a prior to estimate the OFL.

These OFL decisions will be a part of the SSC Groundfish Subcommittee conference call discussions planned for December.

OFL Recommendations

The SSC recommends the OFLs and assessment category assignments that are presented in the revised table of harvest specifications for 2015 and 2016 (Agenda Item H.6.a, Supplemental Attachment 7). The OFLs for brown, China and copper rockfish will be determined by the Council's decision regarding the management boundaries. The table includes some species that are not currently included in the FMP but are under consideration with regard to revisions to the stock complexes (e.g., Aleutian skate).

Ecosystem Considerations in Tier 1 Environmental Impact Statement

The SSC discussed the findings of the SSC's Ecosystem-Based Fishery Management Subcommittee (SSC-ES), which met on October 30 with members of the California Current Integrated Ecosystem Assessment Team and the Groundfish Management Team, to discuss the use of ecosystem models to inform the Tier 1 Environmental Impact Statement (EIS) (see attached). The Atlantis model was deemed the only ecosystem model currently capable of contributing to the Tier 1 EIS. Atlantis covers the area from Point Conception to Cape Flattery and thus excludes the Southern California Bight. The model can be used to evaluate ecosystem effects associated with harvest but not the effects of fishing on habitat. Some groundfish stocks are modeled individually while others are grouped into larger functional groups. Three west coast applications of Atlantis have been published in the peer-reviewed literature.

The SSC recommends that published findings from Atlantis regarding ecosystem effects of groundfish harvest be considered for their relevance to the Tier 1 EIS. Atlantis should also be used directly in the Tier 1 EIS to evaluate the ecosystem effects of a limited number of catch projections representing low and high states of nature. Because ecosystem effects may not be fully realized until after the 10-year Tier 1 projection period, the SSC recommends that Atlantis extend the catch projections for at least another 20 years based on the fishing mortality rates experienced in the tenth year of the projection period. The SSC requests that the Atlantis modelers consult informally with the SSC-ES this winter regarding the types of ecosystem indicators that they anticipate providing for the Tier 1 analysis.

The use of Atlantis in the Tier 1 EIS represents a first exploratory use of ecosystem models for Council decision making. Atlantis outputs should be interpreted qualitatively rather than quantitatively. Although Atlantis is also capable of evaluating economic and social effects, in the interest of time and pending further review of the model, the SSC recommends that its use for this Tier 1 analysis be limited to ecosystem effects. The SSC recommends a thorough review of Atlantis to more fully understand its capabilities and limitations. Dr. Isaac Kaplan (NWFSC) is expected to complete the documentation needed for such a review by June 2014. Results of the review would not be available in time to inform the Tier 1 analysis but could be useful for future specifications cycles.

Report of the Ecosystem Subcommittee Meeting on Ecosystem Considerations in the Groundfish Harvest Specification EIS Analysis

The SSC Ecosystem-Based Management Subcommittee met on October 30 with members of the NOAA California Current IEA Team (Drs. Phil Levin and Isaac Kaplan of the NWFSC, Drs. John Field and Brian Wells of the SWFSC), Mr. John DeVore, and Messrs. Corey Niles and Dan

Erickson (Groundfish Management Team) to discuss the general analytical approach to be used in the Tier 1 Environmental Impact Statement (EIS) and the potential ecosystem effects that could be incorporated into that analysis.

The Tier 1 EIS is being prepared as part of the 2015-2016 harvest specifications process to help alleviate the arduous analytical and procedural workload that currently occurs in each biennial cycle. The Tier 1 EIS will analyze the effects of a range of plausible catch streams over the next 10 years, although ecosystem impacts may be assessed over longer timeframes. Beginning in 2017-2018, catch alternatives that fall within this range could be evaluated by reference to the Tier 1 analysis. The Tier 1 EIS could be modified before the end of the 10-year period, should new information become available that substantively changes the catch projections or the data and methods used to analyze the effects of those projections. The Subcommittee supports the general approach being proposed for the Tier 1 EIS.

Dr. Isaac Kaplan provided a summary of existing ecosystem models which could potentially inform future Council actions, and outlined features of the Atlantis model. The Subcommittee then considered these presentations in the context of the needs for the Tier 1 EIS analysis.

Apart from the Atlantis model, there are four models which have been applied to the US West Coast:

- The Ecosim model of the California Current was originally developed by Dr. John Field. This model covers the US West Coast north of Point Conception, and represents 63 functional groups, including 17 groundfish species. This model, unlike Atlantis, is not spatially-structured, but could form the basis for an evaluation of the impacts of future catch series on ecosystem characteristics. A concern with this model is that it was parameterized in the early 2000s. Substantial changes to our understanding of the biomass and dynamics of species off the West Coast have occurred since then. Although work is underway to update the model, a reparameterized model will not be available in time for the Tier 1 EIS analysis.
- EcoTran is a model for Oregon which includes more than 80 functional groups, and focuses on lower trophic level processes. Like Ecosim, EcoTran is non-spatial. However, it does account for uncertainty due to parameterization and input data. This model is not currently set up to conduct projections so is not suitable for a Tier 1 EIS analysis.
- ROMS-COSINE is a model which can be used to represent benthic habitat based on physical features. This model could provide input for other models. However, as it does not currently include groundfish, it is not suitable for a Tier 1 EIS analysis.
- NEMURO-SAN is a fine-scale model which represents the dynamics of the lower trophic levels. However, it currently focuses on the coastal pelagic food web, and only includes two fish species making it unsuitable as the basis for Tier 1 EIS analysis.

These models each include features which may be useful as the Council moves forward to take ecosystem considerations into account. However, none of these models is immediately useful nor could they be suitably modified in time for use in the Tier 1 EIS analysis. In contrast, the Atlantis model for the West Coast has been developed specifically to conduct evaluations of fisheries management policy. Atlantis is capable of representing multiple trophic levels spatially and includes modules which allow fisheries and fisheries management actions to be modeled. Atlantis can be used to obtain a better understanding of fisheries, management systems, social and economic behavior and climate impacts on entire ecosystems. The model has been

implemented for a number of ecosystems worldwide. Three implementations for the west coast of North America and one for Northeast U.S. have been published in the peer-reviewed literature.

The Atlantis model for the U.S. West Coast covers the region from Cape Flattery to Point Conception and models 51 biological functional groups, including 21 fish groups. It can allow for multiple fisheries and a variety of management controls. The Atlantis model is best suited of the models reviewed for conducting analyses for the Tier 1 EIS. The Subcommittee recommends that the Atlantis model be incorporated into the Tier 1 EIS by discussing the results of published research using the Atlantis model, and by a limited set of model runs that evaluate the ecosystem impact of catch projections from single species models. The SSC EBFM subcommittee has the following recommendations in relation to the analyses for evaluating the impact of catch streams on ecosystem characteristics.

- The results should be reported largely qualitatively (for example as changes which are near zero, small and negative, large and negative) and the focus should be on between-scenario variation in results rather than the results as predictions of the future.
- The focus for the evaluation should be on ecosystem impacts even though Atlantis can provide social and economic outputs, due to the added workload of providing these latter outputs and the short time frame for completing the Atlantis runs. Social and economic effects will be included as usual in the biennial specifications analysis.
- Atlantis is not designed to evaluate fisheries impacts on habitat; other analytical methods would be needed to evaluate those impacts in the Tier I EIS.
- Analysts should consult with Council Advisory Groups including the SSC to ensure the set of model outputs reflect Council issues and concerns.
- The number of scenarios should be kept to a minimum. Atlantis can implement the control rules used for managing West Coast species, or can be run with a pre-specified series of catches. However, the control rule option has not been tested for the West Coast. It would therefore be advisable to run the model for pre-specified series of catches.
- The impacts on the ecosystem may only occur well after ten years. Projections should therefore be undertaken in which the catches for the first ten years of the projection period are based on the catch streams reported in decision tables and the catches for the eleventh and subsequent years determined by setting the fishing mortality by species equal to that for the tenth year of the projection period.
- Catches should be assigned spatially rather than using a model of fleet dynamics under catch shares.
- The number of catch scenarios should be minimized, for example by creating a “high” catch scenario in which the catches by species are set to those for high state of nature and a high P^* , and another “low” catch scenario in which the catches by species are set to those for low state of nature and a low P^* . If the results are qualitatively the same for these two scenarios, there is confidence that they will be robust across a range of future catch series.
- Atlantis requires the specification of spatial closure scenarios. Projections should be conducted for existing spatial closures and the extreme scenario of no spatial closures.

The results from ecosystem models are often sensitive to their specifications. Ideally therefore, projections should be conducted for as many ecosystem models as is possible to assess which results are consistent across ecosystem models. The only alternative model which is sufficiently well developed to allow robustness of results to be evaluated is the Ecosim model. However, this model would need to be updated before it could be used for comparative studies, and it is unlikely that this will be possible before March 2014.

The Subcommittee recommends that a full review of the Atlantis model be conducted. This will not be possible before the March 2014 Council meeting when results are needed to support the Tier 1 EIS. This review could be organized by the NWFSC, or under the existing Council process for methodology reviews. The SSC and CIE experts could be involved in the review irrespective of how it is undertaken. However, a Council-sponsored review would allow for more involvement of the public as well as Council Advisory Bodies, and would foster a better understanding of the appropriate use of ecosystem models in the Council process.

11/04/13

ESSENTIAL FISH HABITAT (EFH) REVIEW PHASE 2 REPORT AND PROPOSALS TO MODIFY EFH

The Pacific Coast groundfish essential fish habitat (EFH) review was initiated in December 2010. The Essential Fish Habitat Review Committee (EFHRC) met in person or via conference call several times since then, and compiled a report summarizing new and newly-available information regarding physical and biogenic habitats, habitat models, trophic interactions, and fishing and non-fishing activities that may affect groundfish EFH.

At its September 2012 meeting, the Council considered the EFHRC's Phase 1 Report, which included substantial new and newly-available information regarding Pacific Coast groundfish habitat associations, fishing activities, prey species, and many other elements of groundfish EFH. At its April 2013 meeting, the Council received and considered a National Marine Fisheries Service (NMFS) synthesis document that provided additional analysis and interpretation of the information and data compiled in the Phase 1 Report. At that point, the Council elected to issue the RFP for potential changes to elements of groundfish EFH. Eight proposals were received by the July 31, 2013 deadline, and those were summarized in a September Council meeting Informational Report (September 2013 Informational Report 3). The proposals and supporting materials are included in the November Briefing Book materials as electronic-only attachments (Agenda Items H.7.a, Attachments 1-8). Three letters from the National Ocean Service Office of Marine Sanctuaries West Coast Region, Cordell Bank National Marine Sanctuary, and the Channel Islands National Marine Sanctuary are included as agency reports under Agenda Item H.7.c.

The EFHRC met in September 2013 to evaluate the eight proposals and initiate completion of the Phase 2 Report, which will provide information regarding the evaluation of the proposals, as well as recommendations from the EFHRC to the Council. These recommendations are intended to answer the general question of whether there is new or newly-available information that warrants changes to current groundfish EFH. In its meeting, the EFHRC discussed whether the Council should move forward in considering modifications in all nine EFH subject areas:

- Identification and Description
- Magnuson Act fishing activities that may adversely affect EFH
- Non-MSA fishing activities that may adversely affect EFH
- Non-fishing activities that may adversely affect EFH
- Cumulative effects
- Conservation and enhancement
- Prey species
- Habitat areas of particular concern
- Research and information needs

The EFHRC also discussed whether each of the eight proposals should remain in consideration and available to inform the development of alternatives subsequent to the November 2013 meeting.

At the time of the Briefing Book deadline, the Phase 2 Report had not been fully reviewed by all members of the EFHRC due to the Federal government shutdown. Therefore, the Phase 2 Report and associated recommendations are anticipated to be submitted supplementally for Council, Advisory Body, and public review.

Council Action:

- 1. Consider the Phase 2 Report.**
- 2. Establish a process to consider changes to groundfish EFH.**

Pacific Fishery Management Council. 2013. Pacific coast groundfish review of essential fish habitat. Draft Report to Pacific Fishery Management Council. Phase 2: Recommendations and potential modifications to essential fish habitat, September 2013. Portland, OR.

This document is published by the Pacific Fishery Management Council; current National Oceanic and Atmospheric Administration Award Number NA05NMF441008.

FOREWORD

This draft Phase 2 Report of the Essential Fish Habitat Review Committee (EFHRC) was drafted by Council staff to reflect the relevant preparatory information and analysis that occurred during the September 4-5, 2013 meeting of the EFHRC, as well as committee recommendations agreed to at that meeting. However, the report has not been fully reviewed by the Federal members of the EFHRC, due to the lapse in Federal funding and resulting Federal Government shutdown. Because of this incomplete review, the draft recommendations language has been removed from the draft report.

1.0 INTRODUCTION

The Magnuson-Stevens Fishery Conservation and Management Act (MSA)(16 USC 1801 et seq) defines essential fish habitat (EFH) as “those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity,” and requires Regional Fishery Management Councils (RFMCs) to describe and identify EFH in fishery management plans (FMPs). The FMPs should identify EFH based on current distribution, habitat components, historical presence, or other factors, and should also identify habitat requirements at each life stage and research needs. FMPs must evaluate potential adverse impacts from both fishing and non-fishing activities, as well as minimize adverse effects of fishing to the extent practicable. FMPs should identify habitat areas of particular concern (HAPC) within EFH based on the habitat’s ecological function, sensitivity to human-induced disturbance, rarity, or whether development activities may stress a particular habitat. The National Marine Fisheries Service (NMFS) has approval authority for the designations provided by the RFMCs. For fishing activities managed under the MSA, RFMCs and NMFS may implement management measures designed to minimize impacts to EFH. The Pacific Coast Groundfish FMP includes such measures.

The Pacific Fishery Management Council (Council) has, in Amendment 19 of the Groundfish FMP (Amendment 19) (PFMC 2008), identified EFH for over 80 species of Pacific Coast groundfish. In estuarine and marine areas, groundfish EFH extends from the nearshore and tidal submerged environments within state territorial waters out to the limits of the exclusive economic zone (EEZ) offshore of Washington, Oregon, and California, or to depths of 3,500 m, whichever is nearer shore, plus some seamounts in depths greater than 3,500 m. As recommended by the Council, the Secretary of Commerce (Secretary) designated Pacific Coast groundfish EFH as all waters out to the limit of the EEZ in 1998 (FMP Amendment 11, Appendix B) (64 FR 6597), then made major revisions under FMP Amendment 19 (71 FR 27408; PFMC 2006).

This Phase 2 Report summarizes the eight proposals that were received in response to the Council’s request for proposals (RFP), summarizes the information compiled during the EFH review process, and makes recommendations to the Council for each of nine EFH subject areas. This report does not repeat the great quantities of information that was presented in the Phase 1 Report, the NMFS Synthesis Document, and available via the Data Catalogue (<http://efh-catalog.coas.oregonstate.edu/overview/>). This information is available on the Council’s website, in Briefing Books for the September 2012 and April 2013 Council meetings. This report does

briefly summarize each of the eight proposals, which are also available in the Council's November 2013 Briefing Book.

Table 1. List of groundfish species and stocks managed under the Pacific Coast Groundfish Fishery Management Plan (species added to the FMP since 2005 marked with **).

Flatfishes	Other rockfishes
Arrowtooth flounder, <i>Atheresthes stomias</i>	Aurora rockfish, <i>Sebastes aurora</i>
Dover sole, <i>Microstomus pacificus</i>	Bank rockfish, <i>Sebastes rufus</i>
English sole, <i>Parophrys vetulus</i>	Black-and-yellow rockfish, <i>Sebastes chrysomelas</i>
Petrale sole, <i>Eopsetta jordani</i>	Blue rockfish, <i>Sebastes mystinus</i>
	Bronzespotted rockfish, <i>Sebastes gilli</i>
Other flatfishes	Brown rockfish, <i>Sebastes auriculatus</i>
Butter sole, <i>Isopsetta isolepis</i>	Calico rockfish, <i>Sebastes dallii</i>
Curlfin sole, <i>Pleuronichthys decurrens</i>	California scorpionfish, <i>Scorpaena guttata</i>
Flathead sole, <i>Hippoglossoides elassodon</i>	**Chameleon rockfish, <i>Sebastes phillipsi</i>
Pacific sanddab, <i>Citharichthys sordidus</i>	China rockfish, <i>Sebastes nebulosus</i>
Rex sole, <i>Glyptocephalus zachirus</i>	Copper rockfish, <i>Sebastes caurinus</i>
Rock sole, <i>Lepidopsetta bilineata</i>	Dusky rockfish, <i>Sebastes ciliatus</i>
Sand sole, <i>Psettichthys melanostictus</i>	**Dwarf-red rockfish, <i>Sebastes rofinanus</i>
Starry flounder, <i>Platichthys stellatus</i>	Flag rockfish, <i>Sebastes rubrivinctus</i>
	**Freckled rockfish, <i>Sebastes lentiginosus</i>
Rockfishes	Gopher rockfish, <i>Sebastes carnatus</i>
Black rockfish, <i>Sebastes melanops</i>	Grass rockfish, <i>Sebastes rastrelliger</i>
Blackgill rockfish, <i>Sebastes melanostomus</i>	Greenblotched rockfish, <i>Sebastes rosenblatti</i>
Bocaccio, <i>Sebastes paucispinis</i>	Greenspotted rockfish, <i>Sebastes chlorostictus</i>
Canary rockfish, <i>Sebastes pinniger</i>	Greenstriped rockfish, <i>Sebastes elongates</i>
Chilipepper, <i>Sebastes goodie</i>	**Halfbanded rockfish, <i>Sebastes semicinctus</i>
Cowcod, <i>Sebastes levis</i>	Harlequin rockfish, <i>Sebastes variegatus</i>
Darkblotched rockfish, <i>Sebastes crameri</i>	Honeycomb rockfish, <i>Sebastes umbrus</i>
Longspine thornyhead, <i>Sebastolobus altivelis</i>	Kelp rockfish, <i>Sebastes atrovirens</i>
Pacific ocean perch, <i>Sebastes alutus</i>	Mexican rockfish, <i>Sebastes macdonaldi</i>
Shortbelly rockfish, <i>Sebastes jordani</i>	Olive rockfish, <i>Sebastes serranoides</i>
Shortspine thornyhead, <i>Sebastolobus alascanus</i>	Pink rockfish, <i>Sebastes eos</i>
Splitnose rockfish, <i>Sebastes diploproa</i>	**Pinkrose rockfish, <i>Sebastes simulator</i>
Widow rockfish, <i>Sebastes entomelas</i>	**Puget Sound rockfish, <i>Sebastes emphaeus</i>
Yelloweye rockfish, <i>Sebastes ruberrimus</i>	**Pygmy rockfish, <i>Sebastes wilsoni</i>
Yellowtail rockfish, <i>Sebastes flavidus</i>	Quillback rockfish, <i>Sebastes maliger</i>
	Redbanded rockfish, <i>Sebastes babcocki</i>
Other groundfishes	Redstripe rockfish, <i>Sebastes proriger</i>
Cabezon, <i>Scorpaenichthys marmoratus</i>	Rosethorn rockfish, <i>Sebastes helvomaculatus</i>
Lingcod, <i>Ophiodon elongatus</i>	Rosy rockfish, <i>Sebastes rosaceus</i>
Pacific cod, <i>Gadus macrocephalus</i>	Rougeye rockfish, <i>Sebastes aleutianus</i>
Pacific hake, <i>Merluccius productus</i>	**Semaphore rockfish, <i>Sebastes melanosema</i>
Sablefish, <i>Anoplopoma fimbria</i>	Sharpchin rockfish, <i>Sebastes zacentrus</i>
Big skate, <i>Raja binoculata</i>	Shortraker rockfish, <i>Sebastes borealis</i>
California skate, <i>Raja inornata</i>	Silvergray rockfish, <i>Sebastes brevispinis</i>
Kelp greenling, <i>Hexagrammos decagrammus</i>	Speckled rockfish, <i>Sebastes ovalis</i>
Leopard shark, <i>Triakis semifasciata</i>	Squarespot rockfish, <i>Sebastes hopkinsi</i>
Longnose skate, <i>Raja rhina</i>	Starry rockfish, <i>Sebastes constellatus</i>
Pacific flatnose, <i>Antimora microlepis</i>	Stripetail rockfish, <i>Sebastes saxicola</i>
Pacific grenadier, <i>Coryphaenoides acrolepis</i>	**Swordspine rockfish, <i>Sebastes ensifer</i>
Spiny dogfish, <i>Squalus acanthias</i>	Tiger rockfish, <i>Sebastes nigrocinctus</i>
Spotted ratfish, <i>Hydrolagus coliei</i>	Treefish, <i>Sebastes sericeus</i>
Tope, <i>Galeorhinus galeus</i>	Vermilion rockfish, <i>Sebastes miniatus</i>
	Yellowmouth rockfish, <i>Sebastes reedi</i>

1.1 Essential Fish Habitat Consultation

Federal agencies must consult with NMFS on activities that may adversely affect EFH, regardless of whether or not those activities occur within designated EFH. In other words, an activity can adversely affect EFH without occurring within EFH. An adverse effect means any

impact that reduces either the quantity or quality of EFH (50 CFR 600.810). For those activities that would adversely affect EFH, NMFS then provides EFH conservation recommendations to the Federal agency to avoid, minimize, or offset those adverse effects. The Federal agency must respond to NMFS within 30 days of receiving EFH conservation recommendations, including a description of measures proposed for avoiding, mitigating, or offsetting the impact to EFH. For responses that are inconsistent with the EFH conservation recommendations, the Federal agency must explain its reasons for not following the recommendations, including the scientific justification for any disagreements with NMFS over the anticipated effects of the action and the measures needed to avoid, minimize, mitigate, or offset such effects. RFMCs may also comment on proposed actions that may adversely affect EFH of a fishery resource currently within an FMP. Although state agencies are not required to consult with NMFS on activities that may adversely affect EFH, NMFS is obligated to provide conservation recommendations to state agencies if NMFS receives information that an activity will adversely affect EFH. Whenever possible, NMFS utilizes existing coordination procedures to transmit EFH conservation recommendations.

The designations and detailed descriptions of EFH in the FMPs are used during the EFH consultation process to determine where and for what species EFH has been designated in the project area. The analyses of the adverse effects from the proposed action, and potential conservation measures that avoid, minimize, or offset those effects, are informed by the information contained in the FMP.

1.2 Essential Fish Habitat Periodic Reviews

The regulatory guidelines for implementing the EFH provisions of the MSA state that RFMCs and NMFS should periodically review the EFH provisions of FMPs and revise or amend EFH provisions as warranted, based on available information (50 CFR 600.815(a)(10)). The reviews should include evaluating published scientific literature and unpublished reports, soliciting input from interested parties, and searching for previously unavailable information. The Council may develop changes to existing EFH if the information warrants modification. Upon approval by NMFS, those changes would become final. The regulatory guidance states that a complete review should be conducted periodically, at least once every five years. Pacific Coast groundfish EFH was first designated in 1998 by the Council as part of Amendment 11 to the Pacific Coast Groundfish FMP, and was modified substantially in 2005 as part of Amendment 19. The current review was initiated in 2010.

Since EFH for Pacific Coast groundfish was first designated, NMFS has taken steps to clarify the process for designating and refining EFH. In 2002, NMFS published final rules to implement the EFH provisions of the MSA (50 CFR Part 600), and, in 2006, issued a memo providing additional guidance to refine the description and identification of EFH (NMFS 2006). The periodic review process was guided by these two clarifying documents.

The primary purpose of an EFH review is to examine new or newly available information, especially as it relates to the information that was used as the basis for the current EFH designations. The review should focus on the components of EFH identified in the regulatory guidance (50 CFR 600.815):

1. EFH description and identification
2. MSA fishing activities
3. Non-MSA fishing activities
4. Non-fishing activities
5. Cumulative impacts analysis
6. Conservation and enhancement
7. Identification of major prey species
8. Identification of HAPCs
9. Research and information needs

The periodic review provides RFMCs and NMFS with the information that may lead to improvements in the identification and description of EFH. For this review, the Council adopted a phased approach. The first phase consisted of issuing a data call and compiling new and newly available information and comparing it with the suite of information that was available at the previous review. The second phase considered potential changes to EFH, based on the new information produced in the Phase 1. As part of Phase 2, the Council issued an RFP to all interested parties for changes to the identification and description of EFH that are based on the information in the Phase 1 report, the NMFS Synthesis document. This information is included in the phase 2 Report and presented to the Council, along with any recommendations from the Essential Fish Habitat Review Committee (EFHRC). If the Council determines that changes to EFH identification and descriptions are warranted, it will proceed to the third phase that utilizes the appropriate management tool to revise EFH. Depending on the nature of the changes, the appropriate management tool could be in the form of an FMP amendment, summarizing the reports in the SAFE document, or other vehicle.

1.3 Methods/Approach

The Southwest Fisheries Science Center (SWFSC) and Northwest Fisheries Science Center (NWFSC) received funding from the NMFS Office of Habitat Conservation to support two part-time researchers through NOAA cooperative institutes. These contractors assisted NMFS in identifying, gathering, summarizing, reporting, and serving data that are relevant to this review of Pacific Coast groundfish EFH. This included data that were identified in response to a NMFS data request issued in February 2011. These researchers, along with NMFS researchers and the EFHRC identified and summarized new and updated information on:

- Distribution and extent of seafloor maps of bathymetry and interpreted Pacific Coast groundfish habitat types;
- Distribution and extent of groundfish fishing effort;
- Distribution of biogenic habitat;
- Spatial management boundaries;
- Prey species for groundfish; and
- Associations of groundfish with habitats of different types.

In addition to the contractors, NMFS researchers, and members of the EFHRC, significant contributions to Phase 1 of the review were received from the Deep Sea Coral Status Report and the NOAA-led effort for Integrated Ecosystem Assessment of the California Current. The NWFSC and SWFSC, in collaboration with the NMFS Regions and the Council's EFHRC, provided assistance and direction in accomplishing the overall task of identifying and

summarizing new and updated information and data relevant to the periodic review of Pacific Coast groundfish EFH.

Subsequent to the September 2012 Council meeting, NMFS, led by the NWFSC, initiated development of a separate report designed to synthesize the significant volume of data that had been generated during the review during Phase 1. NMFS reported back to the Council in April 2013, and delivered the synthesis document as well as substantial appendices and a user guide to assist in reading and interpreting the document.

A schedule to complete the EFH review, while subject to modification as necessary, was approved by the Council at its April 2012 meeting (Table 2).

Table 2. Working schedule for the Pacific Council groundfish EFH review.

Timing/Due Date	Action
April 2011	Council approves the process, and solicits for information and data (deadline: July 1, 2011)
Summer 2011	NMFS Science Center (or contractor) compiles and synthesizes data and information, initiates review. EFHRC starts reviewing interim products
Dec 31, 2011	NMFS Science Center (or contractor) product due
April, 2012	EFHRC provides progress update to Council
Jan-August 2012	EFHRC drafts report summarizing new data and information; including how it compares with existing information, maps, etc.
September 2012	Council adopts interim report and considers revised RFP
Sept -March 2013	NMFS NWFSC synthesizes information in Phase 1 Report
April 2013	NMFS NWFSC presents synthesis report to Council; Council decides whether or not to issue an RFP for any changes to existing GF EFH, HAPCs, etc. (END PHASE I)
May 2013	Council issues RFP for potential changes to groundfish EFH. Eight proposals received by deadline of July 31, 2013
September 2013	EFHRC evaluates proposals, submits summary of proposals in September Council meeting briefing book
November 2013	Council considers EFHRC Phase 2 Report and recommendations for moving forward with modifications to EFH. (END PHASE 2)
Post-November 2013	If Council determines that changes to EFH are warranted, Phase 3 begins, with development of alternatives for potential changes

1.3.1 Phase 1

Phase 1 of the groundfish EFH review was intended primarily to inform the Council of significant changes in knowledge since the last EFH review was completed in 2006. Phase 1 was not intended to develop alternatives to groundfish EFH for Council consideration. Some issues to consider when evaluating new information used to support existing EFH designations include changes in the number of species in the Groundfish FMP, fishery status of the species (e.g., overfished or rebuilt), and errors to current EFH descriptions or identifications. While Phase 1 will not include a comprehensive analysis of data to develop alternatives, examples of applications of new information are provided to demonstrate their utility, inform development of proposals, and set priorities for modification of EFH components.

1.3.2 Phase 2

The Council solicited proposals to modify EFH components, based on the new and newly available information presented to the Council, its advisory bodies, and the public during Phase 1. The Council will consider the proposals, public comment, and advisory body

recommendations, and decide whether new information warrants further consideration of changes to groundfish EFH. Should the Council recommend changes to existing EFH elements, it will determine an appropriate process (e.g., FMP amendment, management measure specifications, SAFE Report, etc.) for further analysis and consideration of proposals. At that point, the periodic review is effectively concluded.

1.3.3 Phase 3

If the Council determines that changes to groundfish EFH are warranted, Phase 3 is initiated, which will include a process to identify relevant issues, develop and analyze alternatives in a NEPA document, and take final action to amend the Groundfish FMP. Identification of relevant issues will be based largely on the Phase 1 EFH Review, the Phase 2 proposals, and Phase 2 Report. Selection of alternatives will be based on Phase 2 proposals and additional input from agencies, advisory bodies, and the public. Analysis of alternatives may use information from Phase 1 and 2, but will also include more specific and detailed analysis of biological, economic, and cumulative effects.

1.4 EFHRC's Approach to Recommendations

The EFHRC was tasked with evaluating the information compiled during Phase 1, including the NMFS Synthesis Document and the eight proposals received in response to the RFP. This report is primarily intended to 1) summarize the eight proposals and the evaluation process, and 2) present the EFHRC's recommendations regarding whether there is enough new information to warrant moving forward with Phase 3 of the process. The EFH subject areas described in the EFH regulations are:

1. Identification and Description
2. MSA fishing activities that may adversely affect EFH
3. Non-MSA fishing activities that may adversely affect EFH
4. Non-fishing activities that may adversely affect EFH
5. Cumulative effects
6. Conservation and enhancement recommendations
7. Prey species
8. Habitat areas of particular concern
9. Research and information needs

The EFH regulations identify a tenth subject area, *Review and Revision* that summarizes a periodic review process and suggests that FMPs should describe a process for reviewing and updating EFH components as warranted, based on available information. The EFHRC did not make a recommendation on this subject area, opting instead to leave that decision to the Council.

For each of the nine EFH subject areas, the EFHRC discussed (at the September 4-5, 2013 meeting) whether the Council should consider modifying it. For example, regarding subject area #1, the question was phrased as "should the Council consider modifying the overall identification and description of groundfish EFH?" The EFHRC discussed additional information regarding resources that could best inform alternatives, should the Council decide to move forward with

modifying EFH. These resources may include specific proposals that address the topic, the Phase 1 Report, the Synthesis Report, or other resources.

It is important to note that the EFHRC does not make any recommendations regarding specific modifications to EFH. Rather, the EFHRC addresses the question of whether the Council should move ahead with developing alternatives for consideration, and in most cases, suggests resources that should be used to develop those alternatives.

DRAFT

2.0 CURRENT GROUNDFISH EFH

The Pacific Coast Groundfish FMP manages 90-plus species over a large and ecologically diverse area. Information on the life histories and habitats of these species varies in completeness, so while some species are well-studied, there is relatively little information on certain other species. Information about the habitats and life histories of the species managed by the FMP will certainly change over time, with varying degrees of improvement in information for each species. For these reasons, it was impractical for the Council to include descriptions identifying EFH for each life stage of the managed species in the body of Amendment 19. Therefore, the FMP included a description of the overall area identified as groundfish EFH and described the assessment methodology supporting this designation. Life histories and EFH identifications for each of the individual species are provided in Appendix B to Amendment 19.

2.1 Overall Identification and Description

The overall extent of groundfish EFH for all FMU species (Figure 1) is identified as all waters and substrate within the following areas:

- Depths less than or equal to 3,500 m (1,914 fathoms) to mean higher high water level (MHHW) or the upriver extent of saltwater intrusion, defined as upstream and landward to where ocean-derived salts measure less than 0.5 ppt during the period of average annual low flow.
- Seamounts in depths greater than 3,500 m as mapped in the EFH assessment Geographic Information System (GIS).
- Areas designated as HAPCs not already identified by the above criteria.

This EFH identification was precautionary because it was based on the then-known maximum depth distribution of all life stages of FMU species (50 CFR 600.815(a)(1)(B)). This precautionary approach was taken because uncertainty existed about the relative value of different habitats to individual groundfish species/life stages, and thus the actual extent of groundfish EFH. This approach incorporated all areas for which the habitat suitability probability (HSP) values were greater than zero percent for any species or life stage. The HSP model characterizes habitat in terms of three variables: depth, latitude, and substrate (both physical and biogenic substrate, where possible). For the purposes of the model, these three characteristics provide a reasonable representation of the essential features of habitat that influence the occurrence of fish.

Depending on these characteristics and the observed distributions of fish in relation to them, each location (a parcel or polygon of habitat in the GIS) is assigned a suitability value between zero and 100 percent. The higher the HSP, the more likely the habitat is suitable for the habitat needs of a given groundfish species (see Amendment 19 for a more detailed discussion of the HSP model).

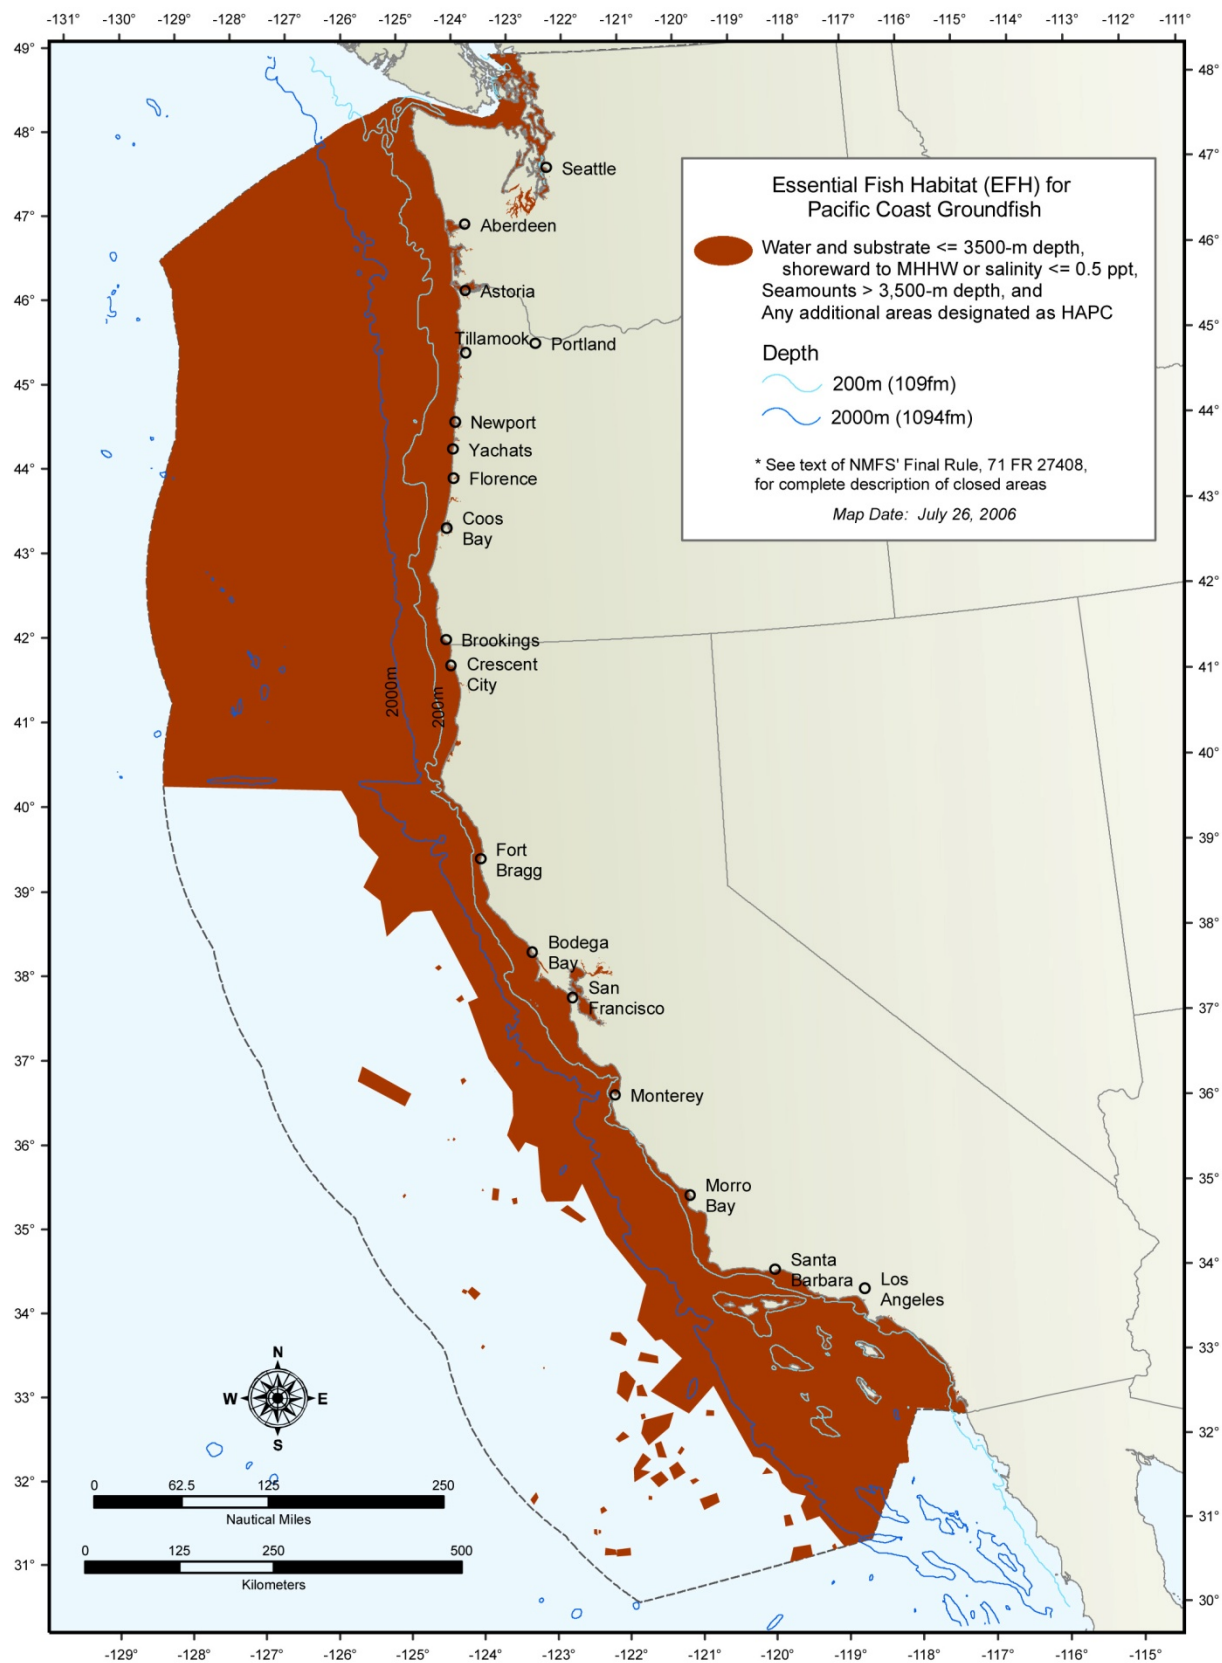

Figure 1: Pacific Coast groundfish Essential Fish Habitat.

2.2 Habitat Areas of Particular Concern and Ecologically Important Areas

The EFH identification and description in Amendment 19 also includes HAPCs which are subsets of EFH, and based on one or more of the following considerations described in the EFH regulations (50 CFR 600.815(a)(8)):

- The importance of the ecological function provided by the habitat.
- The extent to which the habitat is sensitive to human-induced environmental degradation.
- Whether, and to what extent, development activities are or will be stressing the habitat type.
- The rarity of the habitat type.

Based on these considerations, the Council designated spatially discrete areas as well as habitat types, as groundfish HAPCs. In some cases, HAPCs identified by means of specific habitat type may overlap with the designation of a specific area. The HAPC designation covers the net area identified by habitat type or area. Designating HAPCs facilitates the consultation process by identifying ecologically important, sensitive, stressed or rare habitats that should be given particular attention when considering potential fishing and nonfishing impacts. Their identification is a valuable tool the Council can use to address these impacts.

HAPCs based on habitat type may vary in location and extent over time. For this reason, the mapped extent of these areas offers only a first approximation of their location. Defining criteria of habitat-type HAPCs are described in the Phase 1 Report and in Amendment 19, and these descriptions may be applied in specific circumstances to determine whether a given area is designated as a groundfish HAPC. Groundfish HAPCs include estuaries, rocky reefs, canopy kelp, and seagrass. In addition, there are several spatially distinct “areas of concern” that are also designated as HAPCs. And finally, there are spatially distinct ecologically important habitat areas that are not designated as HAPCs, but have fishing prohibitions applied to them to protect habitat. Figure 2 depicts Pacific Coast groundfish HAPCs.

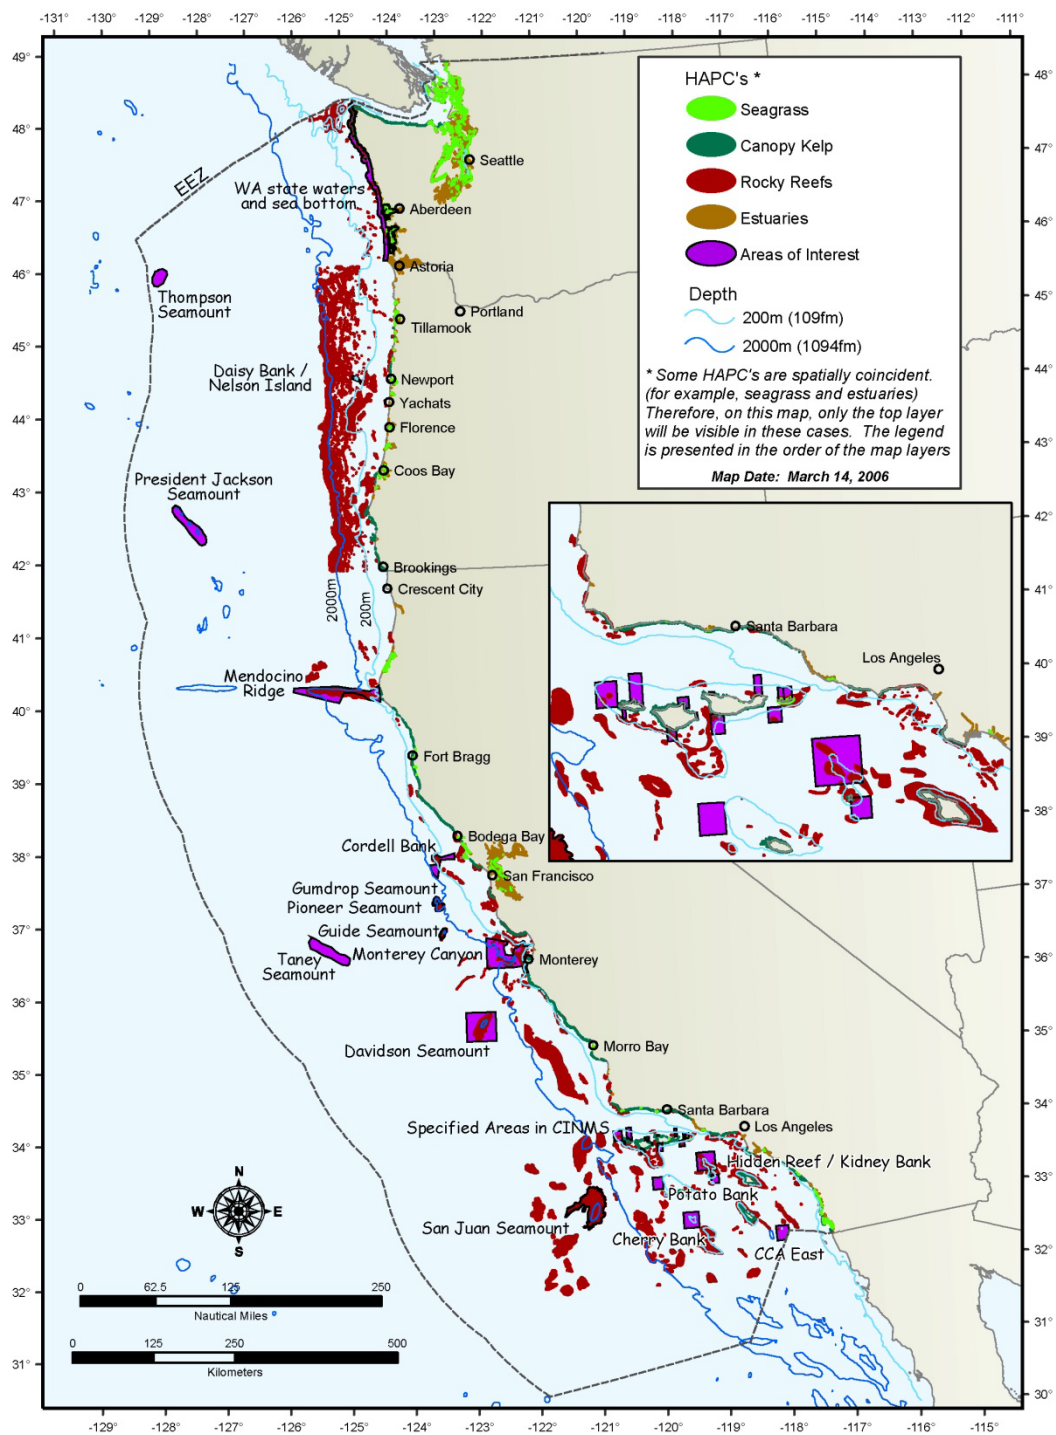

Figure 2: Pacific Coast groundfish Habitat Areas of Particular Concern.

3.0 SUMMARY OF PROPOSALS

The Council issued a request for proposals to modify provisions of Pacific Coast groundfish EFH, with proposals due July 31, 2013. Eight proposals were received, representing a wide substantive and geographic range. Two proposals were from National Marine Sanctuaries (NMS), four were from conservation organizations, one from a commercial fishing-related group, and one was co-sponsored by a NMS and the Washington State Department of Fish and Wildlife. All eight proposals and supporting documentation are available on the Council's ftp site: ftp.pccouncil.org/pub/GF_EFH_Review_2011-2012. The RFP and other primary documents related to the EFH review can be found at <http://www.pccouncil.org/2013/05/25450/rfp-gf-efh-may2013/>. Figure 3 indicates the approximate location of the proposals. Five are confined to limited geographic areas, and three are essentially coastwide. Following is a brief summary of each proposal.

The proposals primarily focused on protecting discrete areas from fishing and fishing gear impacts. In many cases, proposed closed (or restricted) areas were somewhat coincident with existing closed areas. In other cases, proposals include spatially distinct areas for consideration of various levels of restricted fishing activity. Some proposals include recommendations to open up parts of currently closed areas.

The EFHRC's evaluation included a determination regarding the EFH subject areas described in the regulations (listed in Section 1.4). Table 2 below shows which proposals contain elements of those EFH subject areas.

Table 2: Proposal contents by EFH subject area

Proposal	EFH Subject Area								
	1	2	3	4	5	6	7	8	9
A	√	√	√		√		√		
B	√	√			√			√	
C	√	√			√				
D	√	√			√			√	
E	√	√							
F	√	√			√			√	
G	√	√			√			√	√
H		√

7 = Prey Species

8 = Habitat Areas of Particular Concern

9 = Research Recommendations

Figure 3: Approximate locations of the eight groundfish EFH proposals.

3.1 Proposal Summaries

Fishermen's Marketing Association (FMA)

The FMA proposal is to modify the existing bottom trawl closed area known as Eel River Canyon, such that the eastern boundary of the closure would align with the 75 fathom contour. This also aligns with the eastern boundary of the trawl RCA. The proponents state that the existing eastern boundary extends into sandy bottom habitat that is outside of the canyon area, and it divides historic tow locations into two sections that are too small to trawl individually. The proposers contend that while the modification would benefit a few local fishermen, it would not have a great impact on the value of the entire fishery. The proposal was considered by the Council in 2008, under an interim proposal process, but the Council made the decision at that time to forego any EFH changes until the upcoming periodic review was completed.

Oceana/Natural Resources Defense Council/Ocean Conservancy (Oceana/NRDC/OC)

Oceana also submitted a proposal in 2008 under the interim proposal process, but on a much more limited scale than the current proposal. As with the Eel River Canyon proposal, the Council chose to forego making any changes to EFH until the periodic review was completed. The current Oceana/NRDC/OC proposal is to create or modify 66 bottom trawl closed areas, open nine areas to bottom trawling that are currently closed, improve enforcement of EFH Conservation Areas, implement new management measures related to midwater trawl gear in EFH Conservation Areas, improve the identification of major prey species for groundfish, and add all West Coast waters deeper than 3500 meters, as EFH.

Monterey Bay National Marine Sanctuary (MBNMS)

The MBNMS proposal is to create three and modify seven discrete areas that would be closed to bottom trawling (except demersal seine gear), and to open five areas that are currently closed to bottom trawling. The proposal also includes conceptual "Voluntary Management Areas" as a pilot project that would involve voluntary agreements to avoid bottom trawling in three areas and proposes added enforcement provisions related to location and deployment of trawl gear.

Gulf of the Farallones National Marine Sanctuary (GFNMS)

The GFNMS proposal is to modify one existing bottom trawl closed area and add two additional areas, based on presence of biogenic habitats including rocky reefs and canyons, which are currently included in groundfish EFH descriptions as habitat elements of HAPCs. The proposal offers options for one of the new closed areas to be closed to bottom trawl gear (except demersal seine), or to all bottom contact gear. The other two areas are proposed as closed to bottom trawl gear (except demersal seine).

Greenpeace

Greenpeace proposes identifying nine submarine canyon areas as EFH, applying protective measures to freeze the existing footprint of fishing activities, and beginning a process to phase out some fishing gear types such as drift gill nets and bottom trawls. In many cases, the proposed canyon areas co-occur with existing HAPCs or other management or Conservation Areas. The nine proposed areas are distributed between the Washington coast and (approximately) Morro Bay, California.

Environmental Defense Fund (EDF)

EDF proposes eliminating the small footprint requirement south of 40° 10' N. latitude, to provide greater protection to shelf soft bottom habitats. The requirement was designed to decrease effort over rocky reef habitats, but EDF notes that greater impact to soft bottom habitat has been a trade-off. The proposal suggests that rocky reef habitats and species will still be protected because of the risk of catching rebuilding species and exceeding individual quota pounds.

Olympic Coast National Marine Sanctuary (OCNMS) and Washington State Department of Fish and Wildlife (WDFW)

This proposal offers three options for modifying the existing Olympic 2 bottom trawl closed area. All three options include extending the current prohibition on bottom trawl gear to include all bottom contact gear. Option 1 maintains status quo spatial boundaries, while Options 2 and 3 propose expanding the spatial boundaries. The proposal would apply only to non-tribal fisheries.

Marine Conservation Institute (MCI)

The MCI uses predictive habitat modeling to identify areas likely to have highly suitable deep sea coral habitat and proposes 29 new areas for additional habitat protections, based on modeling results. Most areas proposed for closure to bottom contact gear are adjacent to existing closed areas, although several are spatially distinct from existing areas closed to various types of bottom fishing gear. Seven areas would be closed to all bottom contact gear 22 of the new areas are proposed to be closed to bottom trawl gear and the proposed closed areas are distributed along the entire West Coast.

Process

The proposals were posted to the Council's ftp site on August 5, 2013, and are available to Council members, Council Advisory Bodies (ABs), and the public who wish to read them. If the Council chooses to consider changes to groundfish EFH, it will initiate an FMP amendment process and may use recommendations from the EFHRC, ABs, the public, and the proposals to frame the overall scope of the amendment. Under that scenario, the proposals, the Phase 1 and Phase 2 Reports, the data catalogue, and the NMFS Synthesis document will provide important resources in establishing alternatives for the Council to consider during the amendment process.

4.0 PROPOSAL EVALUATION

4.1 EFHRC's Approach to Proposal Review and Evaluation

EFHRC members reviewed the eight proposals between early August and the two-day EFHRC meeting September 4-5, 2013. During that one-month review period, EFHRC members were asked to provide qualitative evaluations of each proposal, against a background of the review criteria in the RFP. The EFHRC also had access to the Bayesian Analysis for Spatial Siting (BASS) tool, described in Section 4.2 below.

Although the short time period coupled with the volume of information contained in many of the proposals precluded a full technical analysis, the EFHRC was able to evaluate the suite of proposals qualitatively. The EFHRC expressed two other points relative to proposal evaluation and the Council's consideration of potential changes to existing EFH. First, the EFHRC's charge

did not include a thorough analysis of the effectiveness of existing EFH, and therefore, the Committee did not conduct such analysis. The NMFS Synthesis did evaluate habitat coverages of existing habitat protection measures, however, it did not assess effectiveness. A more thorough evaluation of existing closures could be helpful to the Council in determining whether EFH designations and associated fishing closures have protected habitat to the degree anticipated. Second, the EFHRC anticipates that a full analysis of potential changes to EFH (including areas closed to various types of fishing activities) embodied in the eight proposals would be conducted during an FMP amendment process and in conjunction with NEPA requirements for alternatives analysis before Council decisions are made regarding these proposals.

The EFHRC's primary tasks were to evaluate the information compiled during Phase 1 and Phase 2, and make recommendations to the Council as to whether new and newly-available information warrant further consideration of changes to existing groundfish EFH.

4.2 BASS Survey Tool

To collect committee input on how each of the eight proposals addressed the questions in the RFP, the EFHRC used the Bayesian Analysis for Spatial Siting (BASS) tool. Ten EFHRC members participated, evaluating 18 proposal "measures" included in the BASS system, at the Portland EFHRC meeting September 4-5, 2013. The BASS system (Ullman et al., 2013; Erhardt 2013) collects stakeholder input via an online web portal where each committee member enters their satisfaction and uncertainty for each of the selected criteria for each proposal. There were 18 measures used that were taken directly from the EFH Phase II RFP, and approved by the EFHRC members. However, it should be noted that there were other criteria included in the RFP that were not included in the 18 measures employed in this BASS evaluation.

It is important to note that the BASS system provided a mechanism for the EFHRC to evaluate proposal elements, helped EFHRC members organize their verbal evaluation of proposals, and served to stimulate discussion about the proposals. The scoring was not based on any quantitative analysis by the EFHRC. Therefore, the scores should not be used and should not be interpreted as a quantitative indicator of proposal preference or analysis based on available data. The evaluation of the proposals by the EFHRC was qualitative in nature, and the results of the BASS system should be considered as a preliminary, qualitative exercise by the EFHRC. The Committee noted that some of the measures were interpreted differently by EFHRC members, so it was not clear that EFHRC members were answering the same question, or which criteria members were using. For example, Question 12 addressed "Stakeholder Impacts", however it was not clear which stakeholders, whether beneficial impacts were included or what information EFHRC members used to create their scores. The BASS scores therefore may not fully reflect Committee members' views.

Evaluation measures used for the EFH Proposal Evaluation in BASS are qualitative measures. For our purposes during the EFHRC's evaluation of Proposals we found that examining the degree of satisfaction was useful to the task of describing proposal strengths and weaknesses across evaluation measures. Thus we present results additionally processed outside of BASS

here by computing the mean probability of committee satisfaction for each proposal against each decision measure as a method to estimate how the committee viewed each proposal.

Several models may be used to aggregate Stakeholder Probability of Satisfaction estimates into a “Team Satisfaction” score. In other contexts, the BASS system can utilize a model that is best suited to select the preferred alternative (proposal). This could be helpful and could be considered in the context of selecting competing actions/modifications during subsequent phases of EFH Review. For the current review of EFH Proposal Measures presented here, however, we found that calculating and exploring the mean satisfaction better addressed the problem of examining the degree of satisfaction. Our modified BASS analysis method looked across the EFHRC membership to compute an aggregate (mean) satisfaction while also incorporating or adjusting for evaluator confidence. That is, we modified the method of evaluation combination across the group to better reveal the degree to which each proposal satisfied a decision measure. Table 1 summarizes the team’s mean probability of satisfaction for each proposal (columns) against each decision measure (rows).

Table 1. BASS (Bayesian Analysis for Spatial Siting) results from the September 4-5 EFHRC meeting. Scores reflect the mean probability of satisfaction across the 10 stakeholder evaluations collected.

Proposal Evaluation Measure	Mean Probability of Satisfaction							
	EDF	FMA	GFNMS	GP	MBNMS	MCI	OCEANA	OCNMS
01 Proposal Completeness	0.5795	0.7585	0.8395	0.577	0.854	0.7345	0.857	0.849
02 Proposal Consistency	0.582	0.6435	0.7905	0.4715	0.7505	0.599	0.789	0.7525
03 Proposal Spatial Accuracy	0.6715	0.8005	0.7885	0.606	0.816	0.7145	0.807	0.7385
04 Proposal Data Sufficiency	0.299	0.602	0.7475	0.344	0.74	0.41	0.7205	0.568
05 Data and Info. Supports Proposal	0.292	0.624	0.735	0.342	0.7425	0.512	0.6445	0.566
06 Habitat Important To GF FMP Stocks	0.621	0.682	0.752	0.704	0.751	0.612	0.633	0.674
07 Habitat Vulnerable	0.55	0.41	0.662	0.556	0.678	0.547	0.628	0.636
08 Habitat Unique/Rare	0.44	0.304	0.63	0.634	0.715	0.543	0.5455	0.6025
09 Change in Fishing Location and Effort	0.556	0.656	0.54	0.564	0.654	0.525	0.552	0.506
10 Collaboration	0.401	0.522	0.6	0.27	0.79	0.3335	0.6375	0.5085
11 Best Available Models	0.468	0.5	0.56	0.524	0.614	0.419	0.5965	0.542
12 Stakeholder Impact Potential	0.484	0.662	0.572	0.2965	0.694	0.361	0.457	0.405
13 Impact on Tribal Usual and Accustomed	0.476	0.5	0.5	0.332	0.5	0.338	0.485	0.436
14 Impact on Overfished Stocks	0.51	0.514	0.586	0.733	0.632	0.54	0.5885	0.56
15 State, Tribal, Federal Coordination	0.331	0.5265	0.63	0.288	0.742	0.302	0.6175	0.4905
16 Improves Knowledge/Gaps for EFH	0.301	0.315	0.454	0.329	0.6925	0.376	0.4725	0.435
17 Knowledge of Habitat Use	0.344	0.354	0.48	0.353	0.522	0.4	0.48	0.456
18 Identifies Existing Deficiencies	0.678	0.632	0.768	0.452	0.679	0.532	0.7145	0.7185

The following section presents bar charts derived directly from Table 2 and may make it easier to speak specifically to a unique measure or proposal if needed. For each BASS measure, we include a brief summary reflecting the EFHRC’s discussion and notes regarding the proposals. Again, these are not conclusive indicators of the EFHRC’s preference regarding proposals as they are subjective and not based on quantitative analysis. However, the notes do reflect

observations of the EFHRC that are relevant to the suite of proposals and future decision making regarding any changes to Pacific groundfish EFH.

In summary:

- The BASS tool was only intended for internal use by the Committee to aid in the development of the report text.
- The meaningfulness of the numerical scores is highly uncertain due to difficulties implementing the tool, lack of standardized scoring criteria or analysis on which to base the scores, and different understandings of the meaning of various questions by committee members.
- For these reasons, the scores themselves should not be used as the basis for Council action.
- For all the measures, a satisfaction score of 0.50 is equivalent to “neither satisfied nor dissatisfied,” i.e., neutral.

Measure 1: Proposal Completeness, EFHRC Mean Satisfaction Score

All proposals were considered complete however, the MCI and GP proposals would benefit from additional work. The EFHRC noted that the MCI proposal presents a model to be considered, rather than explicit management measures. The Greenpeace proposal lacks details and supporting information.

Measure 2: Proposal Consistency, EFHRC Mean Satisfaction Score

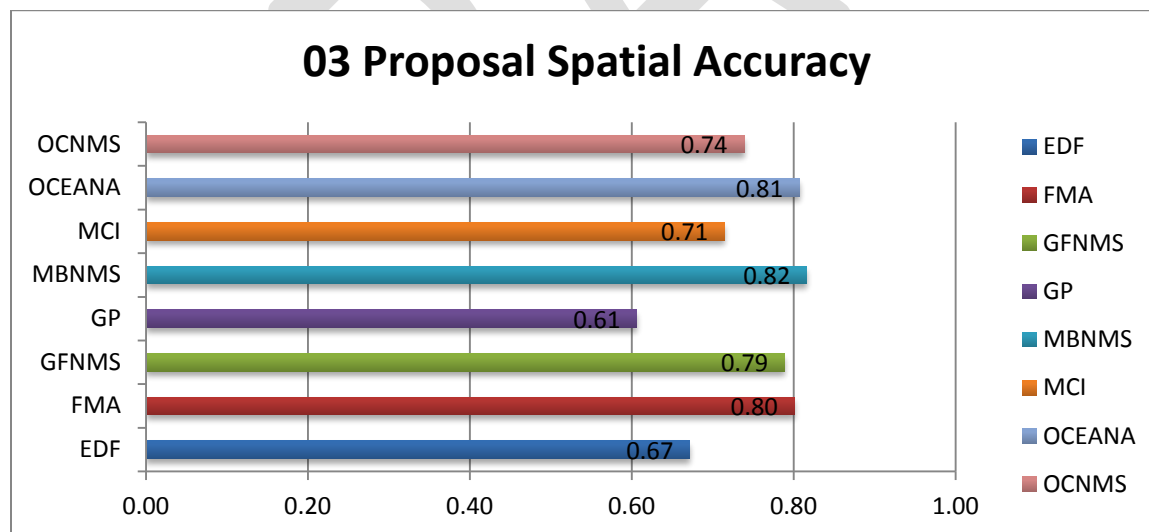

All proposals were considered consistent with EFH provisions with the exception of certain aspects of the Greenpeace (GP) proposal. In this proposal the EFHRC felt that the identification of canyons along the entire west coast was very generalized and that feature combined with the discussion on pelagic habitat without further analysis does not provide connection to EFH

management areas and regulations. In addition Greenpeace proposes moving forward on the concept of removal or phasing out of all gear types in these canyon areas.

Measure 3: Proposal Spatial Accuracy, EFHRC Mean Satisfaction Score

The proposals generally appeared to be accurate. The EFHRC did not identify any inaccuracies, but a detailed analysis of the coordinates was not performed.

Measure 4: Proposal Data Sufficiency, EFHRC Mean Satisfaction Score

The MCI, GP, EDF proposals did not provide data analysis that could be reviewed. The other proposals provided sufficient data to review.

Measure 5: Data and information Supports the Proposal, EFHRC Mean Satisfaction Score

There were concerns with the predictive accuracy (e.g., the taxonomic resolution utilized) of the model that was the basis of the MCI proposal, because the proposal did not include the data supporting the model results. Regarding the EDF proposals, there was some uncertainty regarding whether a footrope change would reduce impacts to soft substrate and whether there would be continued incentive to stay off rocky habitat. The Greenpeace presented rationale for their proposal but did not provide data from the synthesis report.

Measure 6: Habitat is Important to Groundfish FMP Stocks, EFHRC Mean Satisfaction Score

All proposals addressed habitat important to GF FMP stocks.

Measure 7: Habitat is Vulnerable, EFHRC Mean Satisfaction Score

All proposals provided for vulnerable habitats except FMA asserted there are not vulnerable habitats in areas proposed to reopen.

Measure 8: Habitat is Unique or Rare, EFHRC Mean Satisfaction Score

All proposals except FMA and EDF provided for unique and rare habitats. Regarding EDF's proposal, there was a lack of certainty of the outcome. The FMA proposal is also uncertain as it did not have an objective that addressed unique and rare habitats.

Measure 9: Change in Fishing Location and Effort, EFHRC Mean Satisfaction Score

For all of the proposals except FMA there is a lot of uncertainty in the EFHRC as to how they will affect fishing location and effort outside the areas proposed for closure. Further analysis will be required to understand these effects.

Measure 10: Collaboration, EFHRC Mean Satisfaction Score

The MBNMS proposal provided a high level of collaboration across a broad stakeholder spectrum, by reference and by incorporating community input in the proposal. Several others demonstrated significant collaboration, but are still continuing dialogue with their respective communities (Oceana, OCNMS, GFNMS). The remainder (MCI, GP) did not present evidence of an outreach effort. FMA is a stakeholder group itself, and it wasn't clear whether this measure applied adequately to the FMA proposal.

Measure 11: Best Available Models, EFHRC Mean Satisfaction Score

The MCI proposal presents a model that could be used in determining likely high value biogenic habitats in unsurveyed areas, but the EFHRC was not able to conduct a thorough review of the model, and therefore had significant concerns about its applicability to the EFH process.

Measure 12: Stakeholder Impact Potential, EFHRC Mean Satisfaction Score

It was difficult to analyze this feature in the proposals, as impacts likely vary for different stakeholder groups and the EFHRC did not conduct an analysis of the overlap of proposed areas with current fishing grounds. A full analysis of each proposal overlaid with fishing effort information in the EFH data portal should be conducted before any conclusions are made regarding stakeholder impacts, displaced revenue, etc. The MBNMS proposal addressed stakeholder impact potential to a significant degree as evidenced by the consensus support of stakeholders. The EFHRC agreed that the Greenpeace proposal would have a significant impact on a wider suite of fishing stakeholders than other proposals, and MCI proposes to close some areas that are highly trawled, thus also having an impact on the fishing community.

Measure 13: Impact to Tribal Usual and Accustomed Areas (U&A), EFHRC Mean Satisfaction Score

Half the proposals only address areas that are outside the tribal U & A areas: MBNMS, GFNMS, EDF, and FMA. The other four (Greenpeace, MCI, OCNMS, and Oceana) include modifications to EFH Conservation Areas within tribal U & As, and will require collaboration and consultation with the treaty tribes, should they go forward.

Measure 14: Impact on overfished stocks, EFHRC Mean Satisfaction Score

All proposals except the FMA and EDF may have a positive impact to overfished groundfish FMP stocks.

Measure 15: State, Tribal, and Federal Coordination, EFHRC Mean Satisfaction Score

MBNMS, Oceana, and GFNMS all demonstrated coordination with the appropriate resource managers, while MCI, Greenpeace, and EDF did not. The NMS representative felt that the OCNMS demonstrated coordination, while the Tribal representative disagreed.

Measure 16: Improves Knowledge/Gaps for EFH, EFHRC Mean Satisfaction Score

Most of the proposals did not call out a research component specifically, except MBNMS. The EFHRC recognized this does not mean that research is not ongoing in some circumstances. There is a research component that is part of the Phase I and NMFS Synthesis Reports, and this was used by many of the proposers.

Measure 17: Knowledge of Habitat Use, EFHRC Mean Satisfaction Score

It was not clear to the committee how any of the proposals would improve the information needed to improve knowledge of habitat use.

Measure 18: Proposal identifies existing deficiencies, EFHRC Mean Satisfaction Score

The EFHRC discussed the fact that most of the proposals identified deficiencies.

5.0 SUMMARY OF NEW INFORMATION AND RECOMMENDATIONS

The EFHRC discussed whether the Council should move forward with further consideration of changes to each of nine EFH subject areas. Due to the lapse in Federal Government funding, the EFHRC was not able to finalize recommendations.

5.1 Identification and Description

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report and NMFS Synthesis document together provide a great amount of new information relative to the identification and description of Pacific coast groundfish EFH. The EFHRC and NMFS collaborated to issue a data and information call which resulted in 39 sources of data that had become available since 2006. The new data and information related to seafloor maps, seafloor data, habitat types, fishery-independent data on groundfish and habitats; and the distribution of fish, physical structures, and biogenic habitats (including corals, estuaries, and visual surveys).

New information also included bathymetry and seafloor maps (available on the OSU Data Catalogue), information on habitat associations, an updated habitat use database, and a new approach to modeling the predicted distribution of seafloor habitat types.

The EFHRC finds that the new information included in the Phase 1 report and the NMFS Synthesis document is generally consistent with the current identification and description of groundfish EFH provided in Amendment 19. The current extent of EFH for the 91 species of groundfish in the FMP includes all waters and substrata within depths less than or equal to 3,500 m. This identification of EFH is considered precautionary because it is based on the known maximum depth distribution of all life stages of the 91 FMP species. The maximum depth of the deepest-dwelling fishes in the Pacific coast groundfish FMP (e.g., Pacific grenadier and Pacific flatnose) is no more than 3,300 m (Pearcy et al. 1982; Love et al. 2005; Love 2011; Scripps Institute Oceanography, Oceanographic Collections: Marine Vertebrates, <https://scripps.ucsd.edu/collections/mv>). The usual occurrence of these deep-dwelling species is much shallower than their maximum depth of distribution, and therefore habitat for FMP species is fully encompassed in the current EFH description. One proposal would provide NMFS the authority to restrict fishing in areas deeper than 3500m by extending groundfish EFH to encompass all West Coast EEZ waters greater than 3500m in depth. Although the proposal documents presence of deep water corals in depths greater than 3500m, the EFHRC notes that no FMP groundfish species are known to occur at such depths.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.2 Magnuson Act fishing activities that may adversely affect EFH

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report and NMFS Synthesis document provide significant amounts of new information relative to the MSA fishing activities that may adversely affect groundfish EFH.

This includes information on effort, location, and intensity. However, there are limitations to the availability of data, due to confidentiality rules that apply.

Most of the proposals offer a range of information and options relative to MSA fishing activities. The Council should be cognizant of the policy issues and trade-offs relative to the catch share system, gear switching to fixed gear, and other behaviors and outcomes that can result from the application of management measures designed to protect EFH.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.3 Non-MSA fishing activities that may adversely affect EFH

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report, NMFS Synthesis document, and some proposals provide new information relative to non-MSA fishing activities that may adversely affect groundfish EFH. This new information includes effort and location information for state-managed fisheries such as shrimp and California halibut, that should be considered in the context of impacts to groundfish EFH resulting from non-MSA fishing activities.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.4 Non-fishing activities that may adversely affect EFH

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report and NMFS Synthesis document provide new information relative to the non-fishing activities that may adversely affect groundfish EFH. This includes four activities in addition to the 31 non-fishing activities identified in Appendix D to the groundfish FMP. The Phase 1 Report includes detailed descriptions of the potential adverse effects.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.5 Cumulative effects

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report and NMFS synthesis document present sufficient information, when considered in the context of the groundfish FMP and Amendment 19, to evaluate the potential cumulative effects of activities that affect groundfish EFH.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.6 Conservation and enhancement

Summary of new information, proposals, and EFHRC contributions

The Phase 1 Report and NMFS synthesis document present sufficient information, when considered in the context of the groundfish FMP and Amendment 19, to develop measures geared toward the conservation and enhancement of groundfish EFH.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.7 Prey species

Summary of new information, proposals, and EFHRC contributions

The EFH Final Rule¹ states that “FMPs should list the major prey species for the species in the fishery management unit” and indicates that “actions that reduce the availability of a major prey species, either through direct harm or capture, or through adverse impacts to the prey species’ habitat that are known to cause a reduction in the population of the prey species, may be considered adverse effects on EFH if such actions reduce the quality of EFH”. Further, subsequent NMFS guidance² clarified that “prey should be included in EFH descriptions as a component of EFH”. However, the definition of “major prey species” has yet to be defined by NMFS or the PFMC and no criteria currently exist for determining which prey species to list.

Amendment 19 provided general lists of prey categories for various FMP groundfish, typically at broad levels of taxonomic specificity (general prey types or families, e.g., “Clupeids”). The EFHRC suggests that higher levels of specificity (ideally at the species level) would be more useful than broad prey categories for EFH management purposes. For example, species-specific prey identification would enable NMFS and the Council to clearly identify which groundfish prey species are currently under Council management.

There is not a large body of literature on Pacific groundfish diets that has become available subsequent to 2006. However, there are some resources that have become available, and the EFHRC notes that Amendment 19 did not include significant amounts of information that were available prior to Amendment 19. Several stock assessments have been completed since 2006, and a synthesis of diet information was completed in 2009. The Phase 1 Report, NMFS Synthesis document, and one proposal present new information on prey species that could form the basis for a more robust approach to identifying major prey species of groundfish.

The proposal that addressed prey species (Oceana/Ocean Conservancy/NRDC) includes recommendations for identifying major prey species for FMP groundfish at a more specific level based on a new proposed “Major Prey Index” and using the newly available data from the Phase 1 Report and NMFS Synthesis.

1 CFR 600.815(a) (7)

2 NMFS Memorandum by P. Montanio: Guidance to Refine the Description and Identification of Essential Fish Habitat. October 30, 2006.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.8 *Habitat areas of particular concern***Summary of new information, proposals, and EFHRC contributions**

Amendment 19 includes many HAPCs that form the basis for the areas that are currently closed to various types of bottom contact fishing activities (e.g., trawl and fixed gear). The HAPCs include seagrass, estuaries, rocky reef habitat, canopy kelp, and areas of interest. The Phase 1 Report, NMFS Synthesis document, and several proposals contain information that is relevant to the establishment of HAPCs.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

5.9 *Research and information needs***Summary of new information, proposals, and EFHRC contributions**

The EFHRC developed recommendations that were included as an addendum to the Phase 1 Report.

Recommendations

{Draft language removed from the report pending additional review by the EFHRC}.

31 July 2013

Mr. Dan Wolford, Chairman
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Chairman Wolford:

Cordell Bank National Marine Sanctuary (CBNMS or sanctuary) appreciates the opportunity to respond to the request for proposals issued by the Pacific Fishery Management Council (Council) to modify Pacific coast groundfish essential fish habitat (EFH) designations.

CBNMS was designated in 1989 to protect a vibrant marine community located on the continental shelf and slope, west of Point Reyes. The sanctuary is situated in the California Current ecosystem and benefits from intense coastal upwelling generated at Point Arena, one of the strongest and most persistent upwelling centers on the west coast of North America. The nutrients from upwelling are carried to the sanctuary by prevailing currents and form the foundation for productivity at all trophic levels. In addition to resident fishes, seabirds and marine mammals, migratory animals of all these species travel to CBNMS to feed in the summer and fall when annual productivity is peaking. In addition to the Bank, the sanctuary protects soft sediment habitats on the continental shelf and soft and hard bottom areas on the continental slope west of the Bank. The combination of these habitats and their biological communities creates an area of high biological diversity in a relatively confined geographic area.

The unique quality of these habitats was recognized by the Council in 2006 when areas representing each of these habitats were identified as habitats worthy of additional protection under EFH Conservation Area designation. The substrate shallower than 50 fathoms on Cordell Bank was designated as Cordell Bank Conservation Area (50 fm (91 m) isobaths) and the use of bottom contact gear was prohibited. In addition, areas of the continental shelf and slope were designated as Cordell Bank/Biogenic Conservation Areas and the use of bottom trawls was prohibited. Since 2006, the sanctuary and partners have conducted several research cruises and published results from earlier work characterizing the ecological qualities and importance of these habitats. Many of these findings were submitted to the National Marine Fisheries Service in 2011 as part of their Groundfish EFH data call and are captured in the Council's September 2012 Phase 1 report. Among the findings:

- 1) Cordell Bank continues to be an important recruitment site for settling young of the year (YOY) rockfishes (*Sebastes* spp.). Observations from 2010

indicate that the offshore location and depth of the Bank may provide favorable recruitment habitat for yelloweye rockfish (*S. ruberrimus*), in addition to several other rockfish species. Initial survey results show 2013 as another good recruitment year and we will be conducting additional surveys in the fall.

- 2) There are areas in the no bottom trawl Cordell Bank/Biogenic Conservation Area on the shelf, east of the Bank that support large stands of sea whips (*Halipteris californica*) that provide structure and habitat for other invertebrates and fishes.
- 3) On the slope west of the Bank, outside of the Cordell Bank/Biogenic Conservation Area, condition of the habitat and the presence of a derelict trawl net and cables raised questions about the impact of bottom trawling on the substrate and corals. Work by partners inside the EFH Biogenic Conservation Area west of the Bank indicated that after three years of protection, abundance of epifaunal macro-invertebrates was significantly higher within the EFH area compared with sites outside the Conservation Area.

In summary, CBNMS finds that the EFH conservation measures currently in place are consistent with EFH provisions as outlined in the Magnuson-Stevens Act (MSA); and further finds that important EFH habitat is protected from adverse impacts from fishing in a practicable manner. We request that current protections remain in place. The EFH Conservation Areas in the sanctuary provide a continuity of protection that span habitat areas on the shelf, the Bank, and on the shelf and slope west of the Bank. This protection allows these benthic substrates and biological communities to develop in an undisturbed environment within the sanctuary.

We will continue to study areas inside and outside of the EFH Conservation Areas and work with our NOAA partners and others to better understand habitats and communities that are developing in these different environments, and their contribution to groundfish populations. If there are deliberations with the fishing community or others on how to improve the configuration of the EFH Conservation Area to facilitate management and fishing operations, we would be interested in participating in that conversation.

Thanks to the Council for its past actions to protect important habitats within CBNMS , and to Council staff and others for their hard work during the groundfish EFH review process. Please direct any future questions to me at dan.howard@noaa.gov or 415-663-1456.

Sincerely,

Dan Howard
Superintendent

Channel Islands National Marine Sanctuary
University of California Santa Barbara
Ocean Science Education Building 514, MC 6155
Santa Barbara, CA 93106-6155

July 31, 2013

Mr. Dan Wolford, Chairman
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Chairman Wolford:

Channel Islands National Marine Sanctuary (CINMS or sanctuary) is submitting this letter in response to a request for proposals (RFP) issued by the Pacific Fishery Management Council (Council) on May 1, 2013. The RFP was issued as a result of Council's 5-year review of EFH for Pacific Coast groundfish, consistent with the Magnuson-Stevens Act (MSA) and the National Marine Fisheries Service (NMFS) regulatory guidance (50 CFR §600).

Designated in 1980, Channel Islands National Marine Sanctuary consists of an area of approximately 1,110 square nautical miles (nmi) of coastal and ocean waters, and the submerged lands, off the southern coast of California. CINMS is a special place for species close to extinction, sensitive habitats, shipwrecks and maritime heritage artifacts. Many valuable commercial and recreational activities, such as fishing, shipping, and tourism occur in the sanctuary. A comprehensive ecosystem-based management approach is used to promote long-term conservation of sanctuary waters, wildlife, habitats (including benthic habitats), and cultural resources, while allowing compatible human uses.

The Council and NMFS, through implementation of Amendment 19, designated several groundfish EFH provisions that fall within the boundaries of CINMS. Specifically, the EFH Conservation Area designations are detailed in 50 CFR Part 660.79(r –cc, and gg) and prohibit all bottom contact gear. In addition, National Marine Sanctuary Act regulations prohibit the take of resources from the zones, thus complementing the MSA provisions and establishing comprehensive marine reserves (i.e. no take) and a marine conservation area (i.e. limited take) in the federal waters part of CINMS (71 FR 27408 and 72 FR 29208).

CINMS does not propose adjusting or modifying the existing groundfish EFH designations in the sanctuary. Although we have participated in recent seafloor mapping and ROV expeditions, such as this year's deep sea coral cruise within the sanctuary (as part of NOAA's Deep Sea Coral Research and Technology Program), we have not yet completed the analyses needed to determine whether there are additional areas that might warrant consideration for EFH designation or protection. As the Council process to modify groundfish EFH unfolds, we remain interested in and willing to review any suggested changes to EFH designations within or near CINMS. Please direct any questions to Sean Hastings at sean.hastings@noaa.gov.

Sincerely,

Chris Mobley

July 31, 2013

Mr. Dan Wolford, Chairman
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Chairman Wolford:

NOAA's Office of National Marine Sanctuaries (ONMS), West Coast Region submits the enclosed package of proposals and letters from the five national marine sanctuaries on the west coast in response to the request for proposals issued by the Pacific Fishery Management Council (Council) to modify essential fish habitat (EFH) designations of Pacific coast groundfish.

ONMS serves as trustee for the nation's system of marine protected areas. Through active research, management and public engagement, national marine sanctuaries sustain healthy environments that are the foundation for thriving communities and stable ocean-dependent economies. The primary objective of the National Marine Sanctuaries Act (NMSA) is resource protection of marine areas (Great Lakes included) of special national significance, including protection of biodiversity and ecosystem health. As such, protection of groundfish EFH from adverse impacts from fishing is aligned with sanctuary goals of protecting benthic habitat and associated communities and ecosystems.

As part of Amendment 19 to the Pacific Coast Groundfish Fishery Management Plan, in 2006 the Council and NOAA Fisheries implemented several EFH Conservation Areas that prohibit all bottom contact gear within the boundaries of Channel Islands, Monterey Bay and Cordell Bank national marine sanctuaries. ONMS applauds the Council for addressing sanctuary requests to implement fishing regulations that meet EFH provisions of the Magnuson-Stevens Act (MSA), while also addressing sanctuary goals. We find that these Council actions exemplify similarities in goals and purposes of the MSA and NMSA and hope that we can continue to collaborate to find opportunities of synergy in marine resource management. Furthermore, we appreciate Council staff have reached out to ONMS to offer sanctuary staff a seat on the EFH Review Committee (EFHRC) and Habitat Committee to foster meaningful collaborations.

The 5-year review of groundfish EFH offers an additional opportunity for collaboration in managing our nation's important resources. Staff from the five west coast sanctuaries have worked diligently to characterize the status of benthic habitat and EFH designations within sanctuary boundaries. At two national marine sanctuaries, Channel Islands and Cordell Bank, sanctuary managers are not proposing any changes to EFH designations. At the other three, sanctuary managers have collaborated earnestly with local partners to develop proposals that modify EFH designations within sanctuary boundaries. Because national marine sanctuaries are

responsive to local management conditions and community needs, each sanctuary submission should be viewed as a stand-alone proposal that is not linked to considerations in a proposal from another national marine sanctuary on the west coast.

We acknowledge that the package of sanctuary proposals and letters represent an initial consideration in what will subsequently be a multi-phased and public process with opportunities to deliberate about the trade-offs of particular boundary configurations for benthic habitat protection and access to valuable fishing grounds. To ensure appropriate and adequate input, we request the lead sanctuary staff (as indicated on the individual proposals and letters) are included during any future deliberations that may modify either the proposed actions as outlined in the sanctuary proposal, or the EFH Conservation Areas that prohibit all bottom contact gear within sanctuary boundaries.

If you or other Council members have any questions please direct them to my staff, Dr. Lisa Wooninck at lisa.wooninck@noaa.gov. Thank you for consideration of national marine sanctuary proposals in the Council's 5-year review of groundfish EFH.

Sincerely,

A handwritten signature in black ink, appearing to read "William J. Douros".

Portland, OR 97220-1384

OCT 24 2013

PFMC

Dear Mr. Stelle, Chair Lowman and Members of the Council:

I urge the Pacific Fishery Management Council (Council) to move forward with Phase 3 of the Groundfish Essential Fish Habitat (EFH) review and initiate the process to amend the Groundfish Fishery Management Plan (FMP). I also write in strong support of the proposal submitted by Monterey Bay National Marine Sanctuary (Sanctuary) to include areas one through thirteen in the FMP. This innovative, collaborative process was developed by representatives from local government, the fishing industry and environmental organizations from my District. Given the diverse support for these thirteen areas, the Council should adopt the Sanctuary's proposal as a package without making substitutions.

This proposal would add new areas for protection as EFH while simultaneously re-opening historically trawled areas that were of importance to trawl fishermen. If implemented, this proposal would further minimize adverse impacts of bottom trawl fishing to groundfish EFH and simultaneously enhance economic opportunities for local fishermen. It is founded on sound science from the National Oceanic and Atmospheric Administration (NOAA), the Monterey Bay Aquarium Research Institute (MBARI) and the California State University Monterey Bay (CSUMB). The datasets and analysis from these institutions clearly demonstrate that these unique and sensitive habitats along California's Central Coast are worthy of protection.

I would like to praise the Sanctuary staff for organizing and facilitating the negotiation process, and commend all the stakeholders for taking the risk to sit down at the table and, over the course

of many months, review the science together and discuss various scenarios in an open and thoughtful manner. My hope is that all the National Marine Sanctuaries will follow this model and not shy away from such a critical task.

Habitat protection, based on sound science and active stakeholder and community participation, is a fundamental management tool that the Council is authorized to employ as it works to restore and sustainably manage our nation's fish populations. The Monterey Bay National Marine Sanctuary is one of the prized gems of our ocean. NOAA is authorized to protect and provide for multiple uses of the resources within the Sanctuary. To do so, they must continue to facilitate similar negotiations, bringing stakeholders to the table to work collaboratively from the beginning. This will not only foster trust and understanding between all parties, but also provide a forum to make the hard decisions about how to protect and use the most valued areas in our ocean.

In my view, habitat protection is a critical tool of fishery management and we must encourage all stakeholders to review the best science, work collaboratively to build trust and identify areas for protection that will help us sustainably protect and manage our fish populations. I call on the Council to endorse the outcome of the Sanctuary-facilitated negotiation, thereby empowering the Sanctuary staff, local officials, fishermen and NGOs to continue the challenging work by returning to the negotiating table. There is much more work they must do together.

Sincerely,

SAM FARR
Member of Congress

*Thank you for your
good work!*

Mr. Paul Michel, Superintendent, Monterey Bay National Marine Sanctuary

SF/NC

GROUND FISH ADVISORY SUBPANEL REPORT ON ESSENTIAL FISH HABITAT

The Groundfish Advisory Subpanel (GAP) heard a presentation by Mr. Kerry Griffin regarding the current essential fish habitat (EFH) agenda item. Mr. Griffin indicated the primary decision before the Council is whether to move forward with what is known as “Phase 3,” which is a process that includes a fishery plan amendment to possibly change current groundfish EFH designations.

The GAP heard a presentation from Mr. Steve Copps, Dr. Waldo Wakefield and Dr. John Stadler, of the National Marine Fisheries Service (NMFS), seeking input about the direction NMFS is considering at this time. This includes:

1. Initiating the Phase 3 of the process and create a working group of NMFS and Council staff to develop alternatives for altering EFH designations;
2. Incorporating consideration of deep sea corals in the Phase 3 process;
3. Adopting six of the eight proposals for consideration in the Phase 3 process; and
4. Directing the workgroup to work with the Tribes to ensure their concerns are addressed in the alternatives.

Lastly, the GAP heard a presentation from Mr. Geoff Shester and Mr. Ben Enticknap of Oceana, Mr. Seth Atkinson of the Natural Resources Defense Council, and Mr. Greg Helms of Ocean Conservancy, describing their joint proposal to alter EFH designations.

Foremost, The GAP has several concerns regarding the current EFH process and the absence of a final EFH Review Committee (EFHRC) report with specific recommendations. Mr. Griffin explained the EFHRC report does not contain any actual recommendations, due in part to the partial government shutdown. The GAP feels having those recommendations in hand would have been very helpful and informative to our discussion. Instead of those recommendations, we spent a lot of time confused about how exactly to proceed, whether to consider the individual proposals, and exactly what we should recommend.

The ensuing discussions centered around four things: 1) the process for reviewing changes to EFH, 2) questions for which we could not obtain answers, 3) the ultimate impacts to both tribal and non-tribal fleets, and 4) suggestions for improving the process moving forward.

Process

As mentioned earlier, the lack of formal EFHRC recommendations is a huge stumbling block. It would appear that the primary reason the EFHRC report is unfinished is due to the partial government shutdown and the inability of the committee’s Federal employees to review and respond to the internal draft report. However, it appears a decision may have been made about what the path forward should be, absent the formal input from the EFHRC as well as the Council and its stakeholders.

The GAP believes that if Phase 3 does move forward – a situation we wish had been vetted more thoroughly prior to the Council’s determination to keep it on schedule – is contingent on the following conditions:

1. **Analyze the effectiveness of current EFH protections and fisheries’ effect on EFH.** Much has changed since EFH areas were first designated under Amendment 19. The fisheries have changed over the years (e.g. the number of vessels in the trawl fleet has decreased significantly) and fishing behavior has changed (e.g., some areas have been closed, gear modifications have been imposed). Environmental conditions have changed as well.

The GAP agrees with the SSC statement on this topic specifically:

“Should the Council decide to proceed with Phase 3, it would greatly facilitate the process, especially the analysis of alternatives, if the Council evaluated the effectiveness of the current EFH designations and conservation areas relative to meeting its objectives. Without such an evaluation it may be difficult to gauge whether proposed changes to EFH are likely to be improvements.”

2. **Clearly define the process moving forward.** Since it was unclear to the GAP during this meeting, we request the Council establish a timeline and clear guidelines and/or sideboards for evaluating EFH proposals and any potential Fishery Management Plan (FMP) amendments.
3. **Ensure there is adequate funding and staff time.** If a separate workgroup will be created, how will it be funded? There was no mention of establishing or funding this kind of team during the Council’s Budget Committee meeting this week. Will the process stop if there is no budget for it? Do NMFS and Council staff have the time to facilitate this process without sacrificing work on much more immediate issues? Would something else have to drop off the list, and if so, what?

Questions

The GAP had several questions, most of which could not be answered. Some of these may be answered as the process moves forward, but they are questions that should be answered nonetheless.

- How and when will the Tribes be consulted?
- Is the original EFH definition still valid?
- What tests and research are being done now?
- Were baseline studies done?
- What specific stocks are in decline due to loss of EFH?
- We don’t know the relationship between coral and groundfish; is coral really EFH?

Impacts to fishing fleets

One of the GAP's main concerns is the ultimate effect on fishing fleets. This may be a bit premature, as any proposals would still be vetted through the Council process, should the Council determine a viable method of doing so moving forward.

Still, the GAP recommends any proposal elements that include extending EFH conservation area closures to mid-water trawl gear and to areas beyond 3,500 meters in depth should not move forward.

The proposers argue that bottom contact with mid-water trawl gear is likely occurring within EFH Conservation Areas because information in the Phase I report estimated that 25 percent of mid-water trawl tows had contact with the bottom that occurs "predominantly in soft sediment habitats." EFH Conservation Areas are located in hard bottom habitats where bottom contact by mid-water trawl gear is not reasonably likely to occur. This is corroborated by observer reports and logbook data.

The proposers argue that fishing in waters deeper than 3,500 meters should be prohibited as a precautionary measure, yet provide no new scientific information that would link that area to management of FMP species, which is required in the development of EFH management measures. This proposal was rejected by NMFS last time EFH measures were considered. There has been no new information presented for it to be treated any differently at this time.

Areas in Tribal usual and accustomed areas (U & As) that would be closed to non-tribal fishermen could affect Tribal communities, as those fishermen would change areas and not access ports and facilities operated by the tribes. Closing EFH in tribal areas also creates a conundrum: Tribal fishing may not be restricted unless intergovernmental agreements and consultation are completed, yet non-tribal fishermen *would* be restricted. So is there really any point to propose protections in Tribal U&As?

Recommendations

After a thorough discussion, the GAP believes information provided to the GAP does not provide us a basis for determining whether it is warranted to move to Phase 3. Ultimately it is the Council's decision to move to Phase 3. Some on the GAP felt there was sufficient information to move to Phase 3; others felt that for a variety of reasons, there was insufficient information to move forward.

With these thoughts in mind, the GAP offers these recommendations:

1. If the proposals move forward at all, we recommend they clearly state what the GAP can and cannot do, and only when the conditions listed under "Process," above, are met.
2. Don't mix coral initiatives with the EFH process; it's a completely different section of the Magnuson-Stevens Act and coral is not an FMP species.

3. Consider other options to increasing EFH designation: work collaboratively with the fishing industry through gear modification, fleet behavior changes, trawl industry co-op management.
4. If the Council proceeds to Phase 3 and adopts the suggestion by NMFS to form a working group, then the Council should also appoint an advisory body to review and consider work products developed by the working group. This would ensure stakeholder input in the process.

PFMC

GROUND FISH MANAGEMENT TEAM REPORT ON ESSENTIAL FISH HABITAT (EFH) REVIEW PHASE 2 REPORT AND PROPOSALS TO MODIFY EFH

Introduction

The Groundfish Management Team (GMT) appreciated receiving a briefing from Mr. Kerry Griffin of Council staff and others from the Essential Fish Habitat Review Committee (EFHRC) and offers the following thoughts and advice. We cursorily reviewed the seven remaining proposals to modify essential fish habitat (EFH) designations and management measures. The proposals range from small boundary changes to large suites of new closures. There are also some other regulatory changes proposed and a proposal that includes designating major prey species. However, given other workload priorities (stock complexes, biennial harvest specifications and management measures, etc.) and the impact of the federal government shutdown the full Team was unable to devote time for a thorough discussion of the details of any of the proposals. Therefore we do not have specific recommendations or comments on any of the proposals.

Review of the EFH designations and management measures is primarily the purview of the EFHRC ([COP 22](#)); however we are providing comment here, as the primary body for technical review of groundfish management measures. Should Phase 3 be initiated, the GMT foresees having a role in analyzing any proposed modifications to EFH areas and the fishery management plan (FMP) amendment, as needed. We are concerned that such an analysis will be difficult without first clearly understanding the policy objectives of the Pacific Fishery Management Council (Council) with regard to EFH.

Many of the proposals rely on the availability of new and/or improved habitat data such as high-resolution sonar, mapping, visual data, etc. as justification that the proposal should be considered (i.e. based on the best available science). Though new data may inform any given proposal, it is difficult to prioritize the various proposals without clear guidance on the efficacy of measures to “minimize the effects of fishing on EFH to the extent practicable.” It remains unclear to the GMT: 1) the extent to which changes to EFH need to be made and 2) whether a given proposal, part of a proposal, or combination of some aspects of several proposals will accomplish any needed or desired changes.

Program review

As we pointed out in our September statement on the sablefish permit stacking program review ([Agenda item G.2.b, Supplemental GMT Report](#)), the first step in any program review is to determine whether the program is working as intended. Revisiting the stated goals and objectives of the program is necessary to see if they have been met. However, in order to perform such a review, the objectives or policy goals of the program must be stated such that there are metrics against which they can be measured. As mentioned in our statement on stock complexes at this meeting (Agenda Item H.4) our analytical work is smoothest when the policy goals are clear and the metrics against which performance is measured are clear. With EFH, the GMT recognizes that only limited clarity may be achievable. What science can measure for groundfish habitat is

limited and the question of how much habitat to protect will remain one mostly within the realm of policy judgment.

In this first periodic EFH review, exploring modifications to the program or expanding its scope has begun prior to a complete synthesis of whether the program is working as intended. The GMT suggests that prior to exploring modification to the program (or indeed any program) it is useful to know how that program is performing. Yet again, the ability to measure that performance may be limited in this case.

Need for Metrics

We know that the purpose of Amendment 19 to the groundfish FMP was to update the EFH designations, including habitat areas of particular concern (HAPCs) as well as designating ecological closures to minimize the adverse effects of fishing on EFH, to the extent practicable. We do not, however, have performance metrics to determine whether this program is achieving its goals.

It is our understanding that the review of proposals being put forward by the EFHRC is based on the individual scoring of how satisfied each member of the committee was that a given proponent had satisfied the requirements of the request for proposals. The proposals were not judged specific to individual sites or habitats within those sites. While this scoring may be a useful metric for considering completeness of a proposal, it does not answer the question of whether the current designations or management measures are adequate, and the EFHRC has not been tasked to address that question.

While directly measuring the efficacy of EFH designations and closures would require long-term monitoring that can be resource intensive, such monitoring is not necessary for successful review of the program. Such review can be based on clearly stating our current understanding of habitat quality and mapping (i.e. as was done with the EFH Synthesis Report). That understanding of the state of habitats can then be placed in the context of existing management measures to determine whether that management may still be considered precautionary; however, policy objectives are needed to provide benchmarks for measuring success. Such policy guidance will also make future decisions on EFH designation and management more transparent. In short, we do not need to know exactly what the seafloor looks like or have robust measures of how protections translate into production of a fish stock, but we do need standards that relate our relative understanding to the magnitude of the management measures that are in place as well as new measures that might be contemplated.

Such objectives may take the form of areal coverage goals by habitat type or number of representative habitat types protected. Objectives may even be placed on the understanding of habitat importance for each of the FMP fishery management unit species such as the level 1-4 analysis called for in EFH regulations (50 CFR 600.815). Alternatively, the policy objective could take a broader view and consider changes once scientific evidence showed that the original designations and/or management measures were not working as originally intended. We list these to provide examples of the sorts of objectives that would provide for meaningful benchmarks against which the project team that would scope the issue should Phase 3 go forward (i.e. presumably consisting of the Council and the National Marine Fisheries Service (NMFS))

staff) could gauge new information. Development of such objectives would best be done in coordination with the various Council Advisory Bodies and NMFS Science Centers.

The GMT recommends that Phase 3 should include development of such policy goals for measuring the effectiveness of the EFH designations and management measures. This will markedly improve the analyses for this first review, including development of alternatives if the Council so desires, and facilitate future reviews of the program. It is our understanding that the Council could give guidance and clarification on their policy goals with regard to the program at this meeting. Scoping of the analysis and establishment of an analytic team could be scheduled for a future meeting (e.g. March is identified in the current year at a glance). Then that team could develop action alternatives for the Council's consideration at some point after that (e.g. September). Therefore, we do not have recommendations for picking proposals for inclusion or exclusion at this time. Also, we recommend against crafting alternatives at this meeting; rather we suggest that development and articulation of policy goals will facilitate scoping of the issues and understanding the appropriate range of action alternatives coming from the existing proposals.

PPMC

HABITAT COMMITTEE REPORT ON ESSENTIAL FISH HABITAT (EFH) REVIEW
PHASE 2 REPORT AND PROPOSALS TO MODIFY EFH

Groundfish EFH

The Habitat Committee (HC) believes there is sufficient new information to warrant revision of amendment 19 regarding groundfish essential fish habitat (EFH). This information is well-documented in the Phase I report and National Marine Fisheries Service synthesis document. As such, the HC recommends moving ahead with Phase III while concurrently completing the Phase II report. The HC suggests advancing all proposals into Phase III for further analysis, not limiting the scope of nine EFH subject areas, and considering existing discretionary deep sea coral authorities and protections under the Magnuson-Stevens Act (MSA Section 303(b)(2)(B)).

The HC believes that the final Phase II report will be valuable, and recommends that the report be completed well in advance of the March meeting to allow thorough review by Council advisory bodies and the public, and to inform the scoping process for Phase III.

PFMC
11/01/13

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON
ESSENTIAL FISH HABITAT (EFH) REVIEW PHASE 2 REPORT
AND PROPOSALS TO MODIFY EFH

The Scientific and Statistical Committee (SSC) reviewed the draft Phase 2 report from the Essential Fish Habitat Review Committee (EFHRC) (Agenda Item H.7.b, Supplemental Attachment 1). Mr. Kerry Griffin briefed the SSC on the report and was available to answer questions.

The SSC notes that the EFHRC's Phase 1 report (presented to the Council in September 2012) and the subsequent Synthesis Report developed by NMFS (presented to the Council in April 2013) indicate the availability of extensive amounts of new information relevant to groundfish essential fish habitat (EFH). Should the Council decide to proceed with Phase 3, it would greatly facilitate the process, especially the analysis of alternatives, if the Council evaluated the effectiveness of the current EFH designations and conservation areas relative to meeting its objectives. Without such an evaluation it may be difficult to gauge whether proposed changes to EFH are likely to be improvements.

Tribal Report
November 2013

HOH TRIBE REPORT ON PROPOSALS TO MODIFY EFH

Background

The Hoh Tribe has treaty-reserved rights to the fishery resources in our usual and accustomed fishing grounds and stations (U&A) as well as co-management authority with the state of Washington and the federal government. The Hoh Tribe continues to oppose the establishment of essential fish habitat (EFH) closures, or any other marine protected areas (MPAs), without clear objectives or standards for measuring whether these closures have successfully achieved their intended purpose.

Currently there are several proposals for new or expanded EFH closures in our tribal U&A. These proposals have been developed without tribal consultation or input and incorrectly assume that they will have no impact on our fisheries management, regulations, or treaty rights now or in the future. We have pointed out the flaws in the current Pacific Fisheries Management Council (PFMC) EFH review process, particularly with regard to these closed areas, but have yet to receive a satisfactory response to our concerns from our treaty trustees in the federal government. This reality continues in direct opposition to our stated tribal policy on MPAs.

Without clear objectives and monitoring to ensure that these closures are meeting their objectives the PFMC and National Oceanic and Atmospheric Administration (NOAA) will continue an arbitrary, reactionary, non-transparent process of establishing area closures with unknown, unmeasured and at best speculative benefits to habitat or groundfish populations.

Tribal MPA Policy

Establishment of an EFH closure within the Hoh Tribe's U&A is a severe diminishment of the Hoh Tribe's Treaty Rights and establishing such an EFH within our U&A cannot proceed as a goal unto itself. Such closures need to be established in response to clearly defined management needs and must be monitored for effectiveness. The following elements should be addressed by any MPA or area-based closure.

- 1) *What is the threat, problem, or situation triggering the proposal for a MPA? (The scope of any proposed action must be appropriate to the defined problem.) Describe the affected resource/species.*

While the situation triggering the call for EFH closed areas and "freezing" the trawl footprint was an effort to comply with the Magnuson-Stevens Act mandate to "minimize to the extent practicable the impacts of fishing on EFH", the ongoing "threat, problem, or situation is less clear. What is the scope of fishing impacts to EFH? How much does the Council/NOAA wish to minimize those impacts or conversely how much is allowable (i.e. how is practicable defined in this context)? We also have very little data on which

fishery management unit (FMU) species or life history stages are affected by any given closure.

- 2) *What is the current status and what is the desired future status (goals and objectives) that will result from the proposed management action? Over what period of time is the resource expected to move from the current status to the desired future status?*

We know the areal extent of the current closures, but we do not know the proportion of habitat type protected other than estimates based on models of probable habitat types extrapolated from available mapping. We have even less information on the state or condition of those habitats¹ and how that contributes to or is necessary for the “spawning, feeding, breeding, and growth to maturity” for any FMU or life history stage(s). This is particularly true for so-called “biogenic habitats” such as corals and sponges whose fundamental relationship to groundfish populations has not been clearly defined in the Northwest region. Further, the distribution and abundance of these animals has never been measured. As such there is no information as to whether the populations of corals and sponges are increasing or decreasing or the extent to which any of those populations are impacted by any particular fishery or gear type.

- 3) *What are the specific goals and objectives identified for the proposed affected area (including the anticipated time periods over which the goals and objectives will be achieved)?*

As noted above, the overarching goal of the current closures is to minimize the impact of fishing to EFH to the extent practicable. The question that remains unanswered is how specifically the existing closures are or are not achieving specific, measurable goals for groundfish habitat.

Indeed it seems as though given the lack of available information on groundfish habitat requirements, the PFMC and NOAA have chosen to take a very precautionary approach and freeze bottom trawling and limit other bottom contact gear. What is much less clear is how that precautionary approach is being reviewed. Are the closures under review no longer precautionary? How is that measured?

- 4) *Is the scientific information sufficient to determine need and an appropriate response?*

There is very little information on the habitat needs of the various groundfish. There is even less information on the health, abundance, or distribution of corals and sponges that are used to justify many of these closures. Further there were essentially no efforts to collect the prioritized critical information needs overwhelmingly agreed to as being most important for management during a workshop sponsored by NOAA’s Coral Reef

¹ The EFHRC Phase I Report lists among its Information and Research Needs: 5. Recommendation to improve our understanding of habitat condition, including adverse effects of fishing gear to EFH, across the geographic range of groundfish

Conservation Program in 2010². Three years of funding yielded a compilation of existing snapshots of coral sponge presence.

8) *How will progress be monitored and “success” be measured? Who will conduct these monitoring and evaluation activities?*

We are concerned that during the establishment of these closed areas, the proposed interim review, and now in this review process the, the Coastal Treaty Tribes have called for clear standards and objectives describing what these closures are meant to accomplish and how we will know whether they have been successful. This is discussed in more detail later in this report in the section “Need for Review Criteria”. We, along with a number of others in the PFMC process, have asked NOAA for increased understanding of the role of corals and sponges as EFH. Likewise, we have continually pointed out the need for research and surveys necessary to understand the basic biology and ecology of corals and sponges as well as their abundance and distribution.

To date we have no clear understanding of how much seafloor needs to be closed to accomplish the PFMC’s objectives. We do not know how much of any given habitat type needs to be protected from the impacts of fishing, nor indeed, the extent to which the habitat(s) necessary for the “spawning, feeding, breeding, and growth to maturity” for any FMU or life history stage(s) is actually being protected. It seems that many in the process want to protect corals and sponges from the impacts of fishing as well; however, it is unclear how much these populations are being impacted by current fisheries or the degree to which existing closures are minimizing those impacts.

Effect on Treaty Tribes

The Department of Commerce has published new consultation procedures that are supposed to be “clear and accountable” (78 FR 33331). Likewise, NOAA is currently drafting their own tribal consultation policy that “is intended to improve NOAA’s management of its relations and

² The priority information needs in order:

- 1) Identify deep-sea coral species distribution, abundance, densities, and diversity throughout the California Current Large Marine Ecosystem.
- 2) Determine the ecological roles of deep-sea corals and sponges (nature of associations between deep-sea corals and sponges and other species (invertebrates and fishes)).
- 3) Understand the basic biology of deep-sea corals, including taxonomy, age structure, growth, gender, population connectivity, and life histories.
- 4) Understand abiotic and biotic habitat requirements and suitability (e.g., role of methane seeps); geologic context and drivers of deep-sea coral habitat; variables to be used as habitat proxies; and water-column - physical, chemical, and biological parameters of deep-sea coral habitats.
- 5) Understand anthropogenic and natural impacts on deep-sea coral ecosystems. Develop baseline conditions (indices of health and condition at both species and community level).
- 6) Synthesize and understand existing information on deep-sea corals and develop a deep-sea coral data management plan.
- 7) Understand deep-sea corals’ ability to recover from a variety of stressors.
- 8) Utilize deep-sea corals to discern past climate conditions.
- 9) Evaluate the efficacy of existing management measures.
- 10) Improve tools and methods for studying deep-sea corals (develop new technologies and applications for existing technologies in novel ways and develop best practices for deep-sea coral research).

cooperative activities with Indian Tribes.” These policies are meant to conform with Executive Order 13175, “Consultation and Coordination with Indian Tribal Governments,” which requires federal agencies to have an accountable process to ensure meaningful and timely input by tribal officials in developing policies that have tribal implications.

Several of the proposals state that they do not affect treaty tribes or treaty rights. How this was determined without tribal consultation or direct communication with tribes is a mystery. It is perhaps not surprising that non-governmental proponents of expanded EFH closures within U&As are unaware of whether or how these closures may impact treaty rights or sovereignty; however, we are particularly surprised at the lack of consultation on the proposal put forward by NOAA’s OCNMS and WDFW. This represents a failure of both the consultation requirement and co-management.

These closures do have an impact on treaty rights. Large portions of our U&As are not surveyed by the NWFSC Trawl Survey. Likewise, many of the stocks within the Pacific Groundfish FMP have not been assessed. Should a tribe or tribes wish to develop a fishery for any of these stocks in the future, how will the treaty share (i.e. 50 % of the harvestable surplus in the U&A) be measured when vast swaths of U&A are also closed to commercial fishing? Indeed commercial catch statistics have been vital in determining the treaty share or equitable allocations within the treaty share for a number of important species such as halibut, sablefish, and petrale sole.

Any proposed action that restricts harvest or access will be a diminishment of the Hoh tribes’ treaty rights.

Furthermore, making treaty harvest the only allowable harvest in an otherwise restricted area makes it a direct target of future restrictions. This is particularly exacerbated in situations where the closure is the “goal” (i.e. having more closed area would *likely* further minimizes the impacts of fishing on EFH, so if it is deemed practicable, it should go ahead) and there is no way to measure success other than the existence of the closure.

Need for Review Criteria

In April 2011, as the Council was deliberating on the process for EFH review, the treaty tribes of the NWIFC proposed developing standards and criteria for reviewing the effectiveness of management actions meant to protect EFH ([Agenda Item I.3.b, Supplemental NWIFC PowerPoint, April 2011](#)) we reiterated that need again prior to release of the request for proposals ([Agenda Item I.6.c, Supplemental Tribal Report, April 2012](#)).

Without clear objective criteria to measure the success of EFH closures, the PFMC and the public are left to more subjective reasoning on when to trigger an adjustment to a closure, add a new closure, or remove a closure. While one could argue that a given expansion or new closure would protect more of a known groundfish habitat (e.g. rocky reef) or vulnerable biogenic structure (e.g. corals/sponges), we will never know how much protection is enough. There are no targets for the amount of any habitat type that will be protected from fishery impacts. There is no comprehensive goal for the areal extent of fishing grounds that will minimize the impact of fishing to EFH to the extent practicable while also allowing for the optimum yield from the fishery.

Relying on subjective arguments for protecting particular areas results in a necessarily arbitrary process. In fact, in its [request for proposals](#), the Council mandates that proponents describe their own objectives and how those are consistent with the Council and NOAA's legal responsibilities for managing EFH (see items B.3.a and B.3.b). This leaves habitat protections coastwide to the vagaries of individual proponents' geographic choices and their organizations' goals for habitat protection. There is no comprehensive programmatic objective for how to review the habitat protections in place—how to judge whether they are no longer precautionary, or no longer practicable.

Summary

Without clear measures this process is an open-ended, non-transparent expansion of protected areas every five years. Who can answer the question: how much is enough? The Hoh Tribe maintains that these closures are in direct conflict with our treaty-reserved rights and sovereignty.

The lack of clear objective measures of success leaves the process ripe for closures to achieve allocative purposes (e.g. between states or sectors) by shifting effort or to arbitrarily satisfy groups with a history of suing the agency.

The undefined problem and unclear objectives makes action to change EFH closures a lower priority given the other major groundfish undertakings that the Council and NMFS are embarking on in the near future (e.g. Individual Quota trailing actions, groundfish process improvements for 2015-2016 and beyond under the Tier 1 document, upcoming PIE regulations, the sablefish permit stacking review, etc.). These examples of process improvements represent adaptive management with clear goals designed to remedy specific identified issues.

The existing review process for EFH revisions, having no clear standards by which to measure success, cannot be supported by the Hoh Tribe until the metrics to monitor ecosystem response to any EFH proposal are clearly defined

The Hoh Tribe will continue to oppose EFH closures within our U&A until there are clear, objective, and defensible criteria with regard to intended outcomes and methods.

Sincerely,

 10/9/13
Maria Lopez, Chair
Hoh Tribe

QUINULT INDIAN NATION COMMENTS ON PROPOSALS TO MODIFY EFH

The Quinault Indian Nation has treaty-reserved rights to the fishery resources in our usual and accustomed fishing grounds and stations (U&A) as well as co-management authority with the state of Washington and the federal government. We continue to oppose the establishment of new essential fish habitat (EFH) closures, or any other marine protected areas (MPAs), without clear objectives or standards for measuring whether previous closures have successfully achieved their intended purpose.

Currently there are proposals for new or expanded EFH closures in our tribal U&A. One of the proposers consulted with us during development but all of the proposals have been developed independently from us and incorrectly assume that they will have no impact on our fisheries management, regulations, or treaty rights now or in the future. These closures do have an impact on treaty rights. Large portions of our U&A are not surveyed by the NWFSC Trawl Survey. Likewise, many of the stocks within the Pacific Groundfish FMP have not been assessed. Should a tribe or tribes wish to develop a fishery for any of these stocks in the future, how will the treaty share (i.e. 50 % of the harvestable surplus in the U&A) be measured when vast swaths of U&A are also closed to commercial fishing? Commercial catch statistics have been vital in determining the treaty share or equitable allocations within the treaty share for a number of important species including halibut and sablefish.

Without clear objective criteria to measure the success of EFH closures, the PFMC and the public are left to more subjective reasoning on when to trigger an adjustment to a closure, add a new closure, or remove a closure. While one could argue that a given expansion or new closure would protect more of a known groundfish habitat (e.g. rocky reef) or vulnerable biogenic structure (e.g. corals/sponges), we will never know how much protection is enough. There are no targets for the amount of any habitat type that will be protected from fishery impacts. There is no comprehensive goal for the areal

extent of fishing grounds that will minimize the impact of fishing to EFH to the extent practicable while also allowing for the optimum yield from the fishery.

The lack of clear objective measures of success leaves the process ripe for closures to achieve allocation purposes (e.g. between states or sectors) by shifting effort or to arbitrarily make concessions to environmental NGOs that have a history of suing the agency in an attempt to limit legal liability. We believe that the lack of a measurable problem or clear objectives makes action to change EFH closures a lower priority given the other major groundfish undertakings that the Council and NMFS are embarking on in the near future (e.g. Individual Quota trailing actions, groundfish process improvements for 2015-2016 and beyond under the Tier 1 document, upcoming PIE regulations, the sablefish permit stacking review, etc.). These examples of process improvements represent adaptive management with clear goals designed to remedy specific identified issues. The existing review process for EFH revisions has no clear standards by which to measure success.

For the reasons stated here, the Quinault Indian Nation will continue to oppose EFH closures, particularly within their U&A areas until there are clear, objective criteria for what they are meant to accomplish and methods to measure whether they have done so successfully.

Testimony Quileute Tribe on Agenda item H.7 EFH Review Phase 2 Report and Proposals to Modify EFH

As the National Marine Fisheries Service (NMFS) and Pacific Fisheries Management Council (Council) are considering the information that has been generated as part of the EFH 5 year review, we have the following perspective to provide to the record on this topic.

During the adoption of the multiple EFH protection closure areas in 2006, the Quileute Tribe in conversations with our federal trustees at NMFS expressed our concerns regarding the application of these closures to treaty fishing areas in the Northwest. As stated at that time, the application of rules, regulations and management actions that can affect Tribal Usual and Accustomed Areas ("U & A") can only occur through a consultation dialogue individually with each of the potentially affected tribes, and it must occur during the planning phase of an action. Specific to the 2006 adoption of the West Coast EFH areas, this had not occurred. NMFS responded to our objection and in the Amendment 19 rule-making process removed its application to treaty fisheries.

Since 2006, as you know, Quileute's Natural Resources Department in concert with its Fisheries Committee has been actively developing its management plans to participate in the Pacific Hake fishery. In assessing information such as bycatch impacts for this fishery and others, our knowledge and understanding of other groundfish fisheries in Quileute's U & A has increased, along with concern over potential impacts. We have concerns regarding not only the amount of resource that is being extracted but also the methods and resource implications on the tribal and non-tribal fisheries. It is our understanding that the Quileute Tribe has always reserved the right to up to 50% of the marine resources in our U & A; yet, when we request a complete tally of resources being extracted from our U & A from fishery management entities, we are met with excuses as to why that information is not available (proprietary, confidential, etc.). However, we continue to need this data to inform our management decisions in regards to our internal planning, as well as providing for the development of our recommendations to NMFS on potential management actions along the west coast.

In our view, the creation of management strategies that provide protection for all phases of life history of marine species not only is beneficial, but also critical for wise planning. This can occur through refined definitions of equipment, area, or the timing of fishing activities. Whether through modification of EFH or other regulations, we support clear steps to ensure our fisheries are available to our tribe in years to come. As the EFH review process comes to a close and the Council contemplates its recommendations to NMFS regarding possible FMP amendments and regulatory changes, the Quileute Tribe encourages the Council to consider the need to develop a set of measurable criteria for the following:

- 1) What will be the process for identifying potential consequential impacts to treaty secured fishing rights?
- 2) How will the shifts in non-treaty and Makah tribal fishing efforts in response to management strategies (commercial, sport, sectors) be predicted and measured?
- 3) How and when will an evaluation of the success/failure of Amendment 19 (inclusive of measurable benefits or desired future conditions) be completed?
- 4) What are the procedures for ensuring coordination between Council initiatives (EFH, ESA mandates, trawl trailing actions etc.)?

Thank you Madame Chair and Council for your consideration of the Quileute Tribe's perspective, I would be happy to answer any questions that you may have at this time.

Dear Chair Lowman and PFMC Members:

PFMC

RE: Please Protect Ocean Habitat

I am writing to ask your help to fully analyze, adopt, and implement the Oceana, NRDC, and Ocean Conservancy Comprehensive Conservation Essential Fish Habitat (EFH) proposal through a regulatory amendment to the Pacific Coast Groundfish Fishery Management Plan.

Protecting ocean habitats is a critical part of responsible fishery management. Habitat conservation helps ensure long-term sustainable and productive fisheries, vibrant coastal communities, and healthy marine ecosystems.

New scientific findings about the location and sensitivity of U.S. West Coast seafloor habitats, including cold-water corals and sponges, submarine canyons and rocky reefs, suggest these important habitats can and should be protected from destructive bottom trawling.

These are places on the ocean floor that are just as vibrant, and just as precious, as a rainforest. They are full of corals, sponges, rocky reefs, and underwater canyons that provide homes to millions of creatures. And these precious habitats are at risk of being scraped away by bottom trawls.

Bottom trawls are heavy fishing gear that are dragged across the bottom of the ocean to catch deep-dwelling fish. These nets crush and destroy ancient corals, living sponges, sea anemones and nearly everything else that grows from the seafloor. In this wake of rubble there is nowhere left for bottom-dwelling fish to shelter and find food.

The EFH conservation proposal would ensure significant and valuable protections for sensitive and ecologically important habitats off the coast of California, Oregon and Washington. It is a practical approach that addresses the fact that existing closures are insufficient to protect habitat in light of new information.

The proposal represents a balanced management approach that protects living seafloor habitats while maintaining vibrant fisheries for a healthy, sustainable ocean ecosystem. The proposal also aligns with the approach outlined in the National Oceanic and Atmospheric Administration's Strategic Plan for Deep-Sea Coral and Sponge Ecosystems.

Additionally, the Oceana proposal demonstrates how the Council and NMFS can protect essential fish habitat without placing a major economic burden on the fishing industry. In this regard, it is a practical solution to the challenges of protecting ocean habitats while maintaining fisheries.

Many sponges and corals take hundreds to thousands of years to grow and when ripped from the seafloor or crushed by heavy trawls, they may not recover for centuries, if at all. Corals and sponges provide habitat essential to the survival and recovery of recreationally and commercially important fish species. Research conducted since the last EFH review in 2005 has repeatedly documented this ecological linkage. These scientific findings warrant the establishment of new EFH Conservation Areas as Oceana proposed.

The living seafloor is a public resource and it is important that this habitat and the species it supports are managed and protected to ensure a diverse and healthy ocean ecosystem into the future. I urgently ask that you fully evaluate and adopt the comprehensive EFH proposal presented by Oceana and its partners.

Thank you for your help on behalf of a healthy ocean environment.

Yours truly,

J. Capozzelli

RE: Support for the Collaborative Groundfish EFH Proposal: Protecting Essential Fish Habitat While Balancing Fishing Opportunities in Monterey Bay National Marine Sanctuary, South of Año Nuevo

I am writing to express my support of the proposal to modify the Pacific Coast Groundfish Essential Fish Habitat submitted by the Monterey Bay National Marine Sanctuary. This proposal represents a collaborative effort between conservation groups, local fishing groups and the City of Monterey.

By adding new closures to the Essential Fish Habitat in the Monterey Bay National Marine Sanctuary in exchange for re-opening less environmentally-sensitive waters to trawl fisherman, this proposal protects fragile ocean habitat while benefitting our local economy. This compromise represents a victory in safeguarding precious marine resources, and it provides a positive example of diverse groups coming together to put forward science-driven and innovative policy solutions.

This proposal represents a step in the right direction to help ensure the continued existence of irreplaceable marine habitats for the benefit of generations to come, while continuing to support sustainable and properly-managed fishing.

Thank you for your consideration.

RE: Agenda Item H.7: Groundfish Essential Fish Habitat (EFH) Review Phase 2 Report and Proposals to Modify EFH

Dear Mr. Stelle, Chair Lowman, and PFMC members:

We the undersigned 52,165 individuals (including 10,432 California residents; 1,550 Oregon residents; 2,135 Washington residents; and 196 Idaho residents) write to you to express that protecting ocean habitats is a critical part of responsible fishery management. Habitat conservation helps ensure long-term sustainable and productive fisheries, vibrant coastal communities, and healthy marine ecosystems. New scientific findings about the location and sensitivity of U.S. West Coast seafloor habitats, including cold-water corals and sponges, submarine canyons and rocky reefs, suggest these important habitats can and should be protected from destructive bottom trawling. We are writing to urge you to fully analyze, adopt, and implement the Oceana, NRDC, and Ocean Conservancy Comprehensive Conservation Essential Fish Habitat (EFH) proposal through a regulatory amendment to the Pacific Coast Groundfish Fishery Management Plan.

This conservation proposal would ensure significant and valuable protections for sensitive and ecologically important habitats off the coast of California, Oregon and Washington. It is a practical approach that addresses the fact that existing closures are insufficient to protect habitat in light of new information. This proposal represents a balanced management approach that protects living seafloor habitats while maintaining vibrant fisheries for a healthy, sustainable ocean ecosystem. The proposal also aligns with the approach outlined in the National Oceanic and Atmospheric Administration's Strategic Plan for Deep-Sea Coral and Sponge Ecosystems. What is more, the Oceana proposal demonstrates how the Council and NMFS can protect EFH without placing a major economic burden on the fishing industry. In this regard it is a practical solution to the challenges of protecting ocean habitats while maintaining fisheries.

As you know, many sponges and corals take hundreds to thousands of years to grow and when ripped from the seafloor or crushed by heavy trawls, they may not recover for centuries, if at all. It is undeniable that corals and sponges provide habitat essential to the survival and recovery of recreationally and commercially important fish species. Research conducted since the last EFH review in 2005 has repeatedly documented this ecological linkage. These scientific findings warrant the establishment of new EFH Conservation Areas as Oceana proposed.

The living seafloor is a public resource and it is important that this habitat and the species it supports are managed and protected to ensure a diverse and healthy ocean ecosystem into the future. As such, we request that you fully evaluate and adopt the comprehensive EFH proposal presented by Oceana and its partners.

Sincerely,

Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, OR 97220-1384

RE: General Comments about Groundfish EFH Proposals

Chair Lowman and Council Members,

The Alliance of Communities for Sustainable Fisheries (ACSF) is a twelve-year old 501-c-3 not-for-profit educational organization, founded for the purposes of connecting fishermen with their communities, and to represent fishing interests in state and federal processes. The ACSF is a regional organization, with commercial fishing leader representatives from Port San Luis, and Monterey, Moss Landing, Santa Cruz, and Pillar Point harbors on our Board of Directors. Port communities and several recreational fishing organizations also are represented on our Board. The mission statement of the ACSF is "Connecting Fishermen with their Communities". The ACSF represents a large cross-section of fishing and community interests for the central coast of California.

The ACSF has previously expressed its support for the Monterey Bay National Marine Sanctuary (MBNMS) proposal for modifications to the trawl groundfish EFH boundaries within the Sanctuary. In this proposal, new boundaries were recommended to better capture some areas of high coral abundance, while also allowing for increased fishing opportunities in other areas. The MBNMS collaborated with fishermen, and also several NGO's in developing its EFH recommendations. Economic information was provided regarding the effects of this proposal. We believe, therefore, that the Sanctuary's proposal balances environmental, social, and economic considerations, and stands apart from most of the other west coast groundfish EFH proposals.

The Eel River and Environmental Defense Fund proposals both also stand out as being the result of discussions with affected fishermen. The Eel River proposal also contained a study of the habitat requested to be reopened. It is unclear whether or not other conservation groups support this proposal. The Environmental Defense Fund has proposed a gear modification that is the result of its collaboration with bottom trawl fishermen. Both the NGO and fishermen believe this change will improve the overall environmental performance of the gear.

Regarding five other proposals for groundfish EFH modifications, the ACSF notes that the views and needs of affected fishermen, and their communities, do not appear to have been addressed. In the case of the Olympic Coast NMS, that Sanctuary's management never even

sought the "advice" of its own Sanctuary Advisory Council (SAC) before it submitted its proposal. More importantly, consultation with the Tribes does not appear to have been finalized. For the Gulf of the Farallones NMS, that Sanctuary's proposal was presented to its SAC for comment, but the SAC did not endorse the proposal, as it was felt by the majority of the SAC that sufficient outreach to affected fishermen had not occurred.

In the case of the several NGO proposals (Oceana/NRDC, MCI, GreenPeace), no real engagement with fishermen occurred, nor was there consultation with community leaders for the effects new closures-- and potential reduced groundfish landings-- might have on those communities. Moreover, given the large scope of these NGO-proposed closures, it might be expected that some metric of improvement for the success of groundfish would be provided; it is not.

The ACSF respectfully points out that an ecosystem approach to the management (EBM) of ocean resources necessarily includes human needs. It is our observation that too often ocean advocates directly equate EBM with increased protection, including from trawling or fixed gear impacts. We also note that the EFH proposal guidelines include such questions as

--What is the displacement or loss of revenue from fishing?

--Has there been collaboration with affected fishermen and communities to identify socioeconomic costs and benefits?

A number of the proposals make no apparent attempt to address these questions. Certainly human needs and socioeconomic considerations are not the only factors in evaluating these EFH proposals. We suggest, however, that they are now relatively more important considering (among other factors) the recruitment success that nearly all species of groundfish are now experiencing. There do not appear to be strong quantitative reasons why large amounts of additional groundfish EFH closures are needed, though there may be qualitative reasons to protect certain discreet areas.

Thank you for considering these comments.

Kathy Fosmark

Seattle, WA 98115-0070

Ms. Dorothy Lowman, Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, OR 97220-1384

Dear Mr. Stelle, Ms. Lowman and Council members:

Oceana, the Natural Resources Defense Council and Ocean Conservancy are writing in support of moving forward with Phase 3 of the Groundfish Essential Fish Habitat (EFH) review and beginning the process to amend the Groundfish Fishery Management Plan (FMP) with new EFH designations, enforcement measures, and conservation areas.

Productive commercial and recreational fisheries require healthy marine habitats, and protecting and restoring marine habitats will help support long-term sustainable fisheries for generations to come. Importantly, in Phase 1 and Phase 2 of the EFH review process, new findings and information were brought forward on the location of sensitive marine habitats, the spatial extent of the fishery, and ongoing impacts. These findings establish that management changes are warranted to minimize the adverse effects of fishing on EFH.

Our organizations submitted a comprehensive proposal in response to the Pacific Fishery Management Council's request for proposals (RFP) in July of this year. This comprehensive conservation proposal uses new data and outlines concrete actions to enhance and protect EFH in a manner that is practicable and consistent with the Council and National Marine Fisheries Service (NMFS) approach to EFH.

We urge the Council and NMFS to move forward with Phase 3 of the EFH review process with full analysis and consideration of our comprehensive conservation proposal.

1. The Magnuson-Stevens Act Contains an Ongoing Mandate to Protect EFH and 5-Year Reviews Are the Vehicle for Meeting this Mandate

Congress enacted the EFH provisions of the Magnuson-Stevens Fishery Conservation and Management Act¹ in 1996, through the Sustainable Fisheries Act amendments.² Those amendments required NMFS and the Councils to “describe and identify essential fish habitat for the fishery . . . , minimize to the extent practicable adverse effects on such habitat caused by fishing, and identify other actions to encourage the conservation and enhancement of such habitat.”³ In the Sustainable Fisheries Act, Congress further charged NMFS with “set[ting] forth a schedule for the amendment of fishery management plans to include the identification of essential fish habitat and for the review and updating of such identifications based on new scientific evidence or other relevant information.”⁴ In 2002, NMFS responded with a final rule explaining that a complete review of EFH should be conducted at least once every 5 years, and that Councils should “revise or amend EFH provisions as warranted based on available information.”⁵

The EFH 5-year review process is a vehicle for gathering new data and information—both with respect to the natural environment and the fishery—and updating the designation of EFH as well as the conservation measures used to protect EFH. In particular, the Councils must “evaluat[e] published scientific literature and unpublished scientific reports; solicit[] information from interested parties; and search[] for previously unavailable or inaccessible data.”⁶ After reviewing all relevant information, the Councils and NMFS must update as necessary the designation of EFH and conservation measures intended to protect EFH.⁷ Five-year reviews of EFH are inclusive stakeholder processes, in which the final decisions are made by NMFS “in consultation with Councils, participants in the fishery, interstate commissions, Federal agencies, state agencies, and other interested parties.”⁸

Thus the legal structure for EFH consists of a conservation standard—protecting EFH from the adverse effects of fishing to the extent practicable—coupled with a requirement for periodic review.⁹ As a matter of basic statutory interpretation, this structure indicates a dynamic aspect to the conservation standard, such that determinations of adverse impacts and practicability are made in response to current information, and must be updated as new information emerges in

⁴ *Id.* § 110(a)(3), 110 Stat. at 3588 (codified at 16 U.S.C. § 1855(b)(1)(A)).

⁵ Magnuson-Stevens Act Provisions; Essential Fish Habitat (EFH), 67 Fed. Reg. 2343, 2379 (Jan. 17, 2002) (codified at 50 C.F.R. § 600.815(a)(10)).

⁶ *Id.*

⁷ *Id.* (codified at 50 C.F.R. § 600.815(b)) (explaining that both during the initial designation and in the 5-year reviews, NMFS will work with all stakeholders to “identif[y] EFH, adverse impacts to EFH, and actions that should be considered to ensure the conservation and enhancement of EFH for each FMP”).

⁸ *Id.*

⁹ *See* 16 U.S.C. §§ 1853(a)(7), 1855(b)(1)(A).

each 5-year review. Accordingly, the Magnuson-Stevens Act does not simply create a one-time duty to enact habitat protection measures, but rather provides an ongoing responsibility to NMFS and the Councils to track the best available scientific data and information on EFH, and periodically improve EFH designations and modify regulations so as to promote the conservation and enhancement of EFH.

In discussions about EFH and the task of the 5-year review, the question has arisen: “Haven’t we already done enough to protect EFH?” For the above reasons, this question is inapposite. The question misunderstands the dynamic nature of the EFH mandate as a conservation standard. As new information emerges that is relevant to EFH and the impacts of fishing, NMFS and the Councils may need to take new actions to ensure EFH is being protected to the extent practicable. For example, if information emerges to show that habitat impacts of a gear type are more significant than previously believed, or new areas of sensitive habitat exist that were not previously known, or that certain gear modifications can be made to provide greater habitat protection—all of these could be situations where a response is needed to meet the ongoing legal mandate. Thus while the urge to resolve EFH protection “once and for all” is understandable, it simply is not what Congress created in the statutory structure for EFH management.

From a scientific perspective as well, the question of “Haven’t we already done enough to protect EFH?” is inapposite. The question assumes that a quantitative relationship between habitat and productivity has been established through scientific studies for each managed species, to a degree sufficient to determine targets and thresholds for habitat conservation. In reality, for all species in the Groundfish FMP, the relationship between habitat and productivity remains to be quantified and the current understanding of habitat use remains at “Level 1,” defined in federal regulations as information based on presence/absence alone.¹⁰ While we concur with the EFHRC that further scientific endeavors should prioritize raising the level of information for groundfish habitat use, the Council and NMFS must make decisions based on the existing level of information. Given the current impossibility of quantifying productivity relationships and setting thresholds and targets, habitat conservation becomes an issue of precautionary designation and conservation measures.¹¹ This was explicitly recognized by the Center for Independent Experts, which, upon considering whether existing habitat protections in the North Pacific were enough, concluded: “[A] precautionary approach needs to be applied because of the large uncertainties in our knowledge of the links between habitat and the life stages of the various fish species.”¹² The Center for Independent Experts continued: “Since it is likely difficult to detect an influence on the stock until after the habitat is damaged, perhaps even until much of the habitat is destroyed, the use of the precautionary approach is paramount. This is especially true for those habitats with long recovery times, e.g. hard corals and sponges.”¹³

¹¹ See *id.* § 600.815(a)(1)(iv).

¹² Center for Independent Experts. 2004. Summary Report: Review on Evaluation of Fishing Activities that May Adversely Affect Essential Fish Habitat in Alaska. K. Drinkwater, Chair. Norway.

¹³ *Id.*

We recognize that the Council, NMFS and West Coast states have taken important actions to protect a diverse array of habitats from bottom trawling. In 2005, the Council created Amendment 19 to the Groundfish FMP, which used a “freeze the footprint” approach to bottom trawl impacts along with protecting important ecological areas within the active trawling footprint. Since that time, NOAA has codified this approach as NOAA’s official management strategy for deep-sea coral and sponge protection.¹⁴ Amendment 19 advanced EFH protection while avoiding significant economic impacts, and for those reasons was a milestone in fisheries management and the conservation of healthy ocean ecosystems. Amendment 19, however, was not a once-and-for-all resolution of the Council and NMFS’s EFH duties. As noted above, the Magnuson-Stevens Act contains an ongoing mandate for habitat protection, under which the Council and NMFS must gather new information in each 5-year review of EFH, and respond to it with any practicable changes to EFH designation and management measures that can improve the conservation and enhancement of EFH. This is a long-term process of refinement and adaptive management, and Amendment 19 was always understood as the beginning of groundfish EFH management, not the end.

In the current 5-year review, the Council and NMFS have gathered a significant amount of new data and information. The Council’s task at this point, therefore, is to assess the information arrayed before it, including the Phase 1 Report¹⁵ and its supporting references, the NMFS Synthesis,¹⁶ the eight EFH proposals submitted in response to the RFP, and any further materials provided in the November briefing book. If these materials, taken together, demonstrate that changes to EFH designation or management measures are warranted, then the Council should move forward into Phase 3 of the review process and begin an FMP amendment.

2. The New Information Gathered in This 5-Year Review Warrants Changes to EFH Designation, Conservation and Enforcement

The current 5-year review process has resulted in a tremendous amount of new information about the impacts of fishing on habitat, fishing effort distribution, the location of hard and mixed substrates, groundfish prey species, groundfish-habitat associations, and the existence and location of biogenic habitat features. The EFH Review Committee (EFHRC) highlighted the following key conclusions from the Phase 1 Report and NMFS Synthesis:¹⁷

- There is a significant new understanding of hard substrate shape and distribution in federal waters inside and outside EFH Conservation Areas in Northern

¹⁶ NMFS, NWFSC, NOAA. (March 19, 2013). Groundfish Essential Fish Habitat Synthesis Report. Pacific Fishery Management Council Agenda Item D.6.b, NMFS Synthesis Report, April 2013.

¹⁷ EFHRC Supplemental Report. April 2013. Pacific Fishery Management Council Agenda Item D.6.c.

Washington and throughout Oregon and in the Gulf of the Farallon Islands region off California;

- There are numerous sites outside EFH Conservation Areas where corals and sponges have been observed in higher relative numbers off all three states;
- The existing EFH Conservation Areas resulted in minimal disruption of bottom trawl fishery dynamics;
- Midwater trawl fishing is permissible within all EFH Conservation Areas as it was assumed in 2005 to have no contact with the seafloor. Annually, midwater trawling occurs over 8-31% of EFH Conservation Areas and bottom contact is estimated by the fleet to occur on up to 25% of tows; and
- There is new quantitative and species specific prey information for 11 groundfish species, with implications for the designation of “major prey” for those species.

These conclusions show that the new data sets¹⁸ made available during this 5-year review can be used to identify additional areas where sensitive and important habitat features are located, which were not known to the Council in 2005.

The new data sets gathered for this review also include a critical one that was not available in the 2005 EFH process—the West Coast Groundfish Observer Program (WCGOP) observed coral and sponge bycatch data. This data set represents both new data (i.e., post-2006) and newly available data (i.e., pre-2006 observer data that was not analyzed for Amendment 19). Given that the recovery time of corals and sponges are on the order of decades to centuries, and these organisms play an important habitat role for multiple groundfish species, the WCGOP data on bycatch of corals and sponges is among the most direct indicators of adverse impacts to EFH. The WCGOP bycatch dataset shows areas with significant and disproportionate ongoing impacts to coral and sponge communities. The comparison of data before and after the Amendment 19 closures illustrates that these impacts continue to the present day despite the Amendment 19 EFH measures. For example, off Oregon the WCGOP coral and sponge bycatch data indicates that, the trawl bycatch hotspots continue to occur in the same locations before and after implementation of the Amendment 19 EFH Conservation Areas (see Appendix Fig. 1).

The Phase 1 Report also notes that since 2005, additional studies have been published on the effects of bottom trawling on seafloor habitats.¹⁹ The general conclusions about the effects of bottom trawling remain consistent with the findings of the 2002 National Research Council report,²⁰ with an emphasis that new studies found “significant impacts of trawling on soft sediment habitats.”²¹ Similar to previous studies, new predictive modeling studies presented in the Phase 1 Report show significant impacts to hard corals at low levels of trawling and long-term impacts to soft sediment communities, depending on trawl intensity.

¹⁸ EFH Review Catalog, available at <http://efh-catalog.coas.oregonstate.edu/overview/>.

¹⁹ Phase 1 Report, *supra* note 5, at 394-6.

²⁰ NRC 2002, *supra* note 2.

²¹ Phase 1 Report, *supra* note 5, at 396.

The NMFS Synthesis finds that generally bottom trawls are staying out of existing EFH Conservation Areas but that there may be some enforcement issues, as some bottom trawl effort appears to be occurring inside conservation areas.²² This finding alone warrants consideration of new enforcement measures to ensure conservation areas are effective at meeting their intended objectives of protecting habitat. Furthermore, a recent NOAA appeal found that current Vessel Monitoring System practices are not providing sufficient evidence to enforce closed area boundaries.²³ This adds to the need for revision of enforcement aspects of EFH and Vessel Monitoring Systems regulations.

Also noted in the Phase 1 Report and NMFS Synthesis is the fact that midwater trawls are estimated to contact the seafloor in up to 25% of all tows. Under current regulations, midwater trawling is allowed in EFH Conservation Areas, and it appears to occur there with some frequency. The quantitative estimate of bottom contact by midwater gear raises concern about impacts to EFH from midwater gear—another issue that was not recognized or addressed in the initial 2005 EFH action. By proceeding to Phase 3 and revising the EFH regulations, the Council can ensure any such impacts are minimized by, for example, requiring technology that demonstrates that midwater gear is off-bottom when used inside EFH Conservation Areas.

The NMFS Synthesis also contains a newly available compilation of groundfish diet information for 11 species in the FMP. This is the first time groundfish prey has been quantified in the context of EFH to date and allowing for designation of major prey species as components of EFH as directed by federal regulations.²⁴ This represents better data on groundfish prey than existed during Amendment 19; as noted by the EFHRC, Amendment 19 contained gaps in terms of major prey species.

Overall, the current 5-year review of EFH has produced valuable new information that was not available to the Council when it took its original action in 2005. New data exist on the shape and distribution of offshore reefs, the locations of biogenic habitat features, and the ongoing impacts caused by trawling, among other things. Applying the same standard used in Amendment 19 to the new data, it is clear that there are many important and sensitive habitat areas that remain unprotected, and that new management measures could be implemented to protect these areas in a manner that is practicable. The Council accordingly should move forward into Phase 3, and analyze options for modifying its EFH designation and conservation measures.

3. The Comprehensive Conservation Proposal Is the Result of Significant Work and Outreach and Presents a Complete Package of EFH Revisions that Would Substantially Improve Conservation Performance with Minimal Projected Cost

Eight proposals were submitted in response to the RFP by a range of interested parties. We recommend the Council move forward into Phase 3 with analysis of these proposals based on the

²² NMFS Synthesis Report, *supra* note 6, at 62.

²³ See *In re Robinson (F/V Risa Lynn)*, No. SW1002974 (Aug. 29, 2013) (initial decision and order).

²⁴ See 50 C.F.R. § 600.815(a)(7).

data in the EFH Portal, as no such analysis has currently been done.²⁵ We believe the eight proposals together offer a wide range of alternatives and ideas that should be evaluated. That said, we would like to take this opportunity to highlight in particular the proposal submitted by our organizations—Oceana, NRDC and Ocean Conservancy—and request that the Council fully analyze and consider all its components in Phase 3.

The comprehensive conservation proposal has multiple components, which present a complete and well-designed package of revisions to groundfish EFH and management off the West Coast. Our proposal involves changes to the categories of EFH Designation, EFH Conservation and Management, and Enforcement. Specific changes proposed include the following:

- Sixty-six new and modified EFH Conservation Areas prohibiting bottom trawling off the coasts of Washington, Oregon and California;
- Nine additional areas proposed to be reopened to bottom trawling;
- Proposed improvements to the enforcement of EFH Conservation Areas and other bottom trawl closures;
- New management measures to restrict bottom contact by midwater trawl gear when operating within EFH Conservation Areas;
- Identification of major prey species for groundfish in the description of EFH and its components; and
- Addition of all waters deeper than 3,500 meters in the U.S. West Coast EEZ as groundfish EFH.

These proposed changes are responsive to new information, and will help the Council and NMFS ensure the ongoing mandate for EFH protection is being met.

Responding to New Information

In the NMFS synthesis, an impressive evaluation was provided of the existing set of EFH conservation areas through the lens of the new data compiled in the EFH Phase I report. One of the key results that emerged was that the more sensitive habitat types are relatively rare both regionally and coastwide. For example, according to the new substrate data, hard and mixed bottom are much less common than soft sediments, accounting for less than 10% of the total area in most regions. Similarly, according to the updated coral-sponge database, only 0.5% of the 1x1 km grid cells in the FMP area contain known coral or sponge observations.

In Figures 2 through 15 (included in the Appendix to this letter), we have provided some comparisons of habitat coverage showing the current baseline set of permanent bottom trawl closures along with the additional coverage offered by the area closures in our proposal. On a regional level (for example, the 10 bioregions as defined in the NMFS Synthesis Report), the existing EFH Conservation Areas have significant gaps in terms of overall area, sensitive habitat

²⁵ The only examination of the proposals to date was conducted by the EFHRC, which did not conduct a quantitative analysis, as it was not directed to do so.

features, and groundfish occurrence, which may not be apparent at a coastwide level. This regional discrepancy emerges most strongly when comparing the regions deeper than 700 fathoms with those areas within the 700 fathom “footprint.” We have found that many of these gaps are the result of newly available information showing new records of sensitive habitats in unprotected areas that the Council was not aware of in the initial decision from 2005.

For example, in the Northern Shelf (0-200m) and Upper Slope (200-1300m) regions, 85-92% of the total area is currently open to bottom trawling, including over 60% of the hard substrate according to updated data sets (see Figures 3-4). Much of this unprotected hard substrate was not part of the available data sets in 2005. Our proposal responds directly to this gap by bringing the total area of bottom trawl closures to over 20% and approximately doubling the protections of hard substrate in this region. On the Northern Shelf, fewer than 1% of the coral observations and 2% of the sponge observations are currently protected from bottom trawling, while our proposal would increase the level of protection to 98% of the coral observations and 91% of the sponge observations (see Figure 4).

Another example is that the “mixed” substrate category did not exist in the 2005 analysis. Only 3% of this newly described habitat type is protected from bottom trawling in the Central-Upper Slope region, yet over 90% of this habitat type would be afforded protection by our proposal (see Figure 5). Our proposal would also increase the protection of sponge observations from fewer than 30% to over 95% protected on the Central Shelf (see Figure 6). Additionally, the total area protection of the Southern Upper Slope would increase from 11% up to 99% (see Figure 7). As noted in the NMFS Synthesis report, the majority of coral and sponge records occur in the upper slope region. These examples highlight the gaps in the current suite of EFH conservation measures that emerge with the new data and information gathered in this 5-year review. The Council now has the opportunity to respond to the new data that has come forward by filling those gaps through adoption of our proposal.

Another new development is the re-opening of the Trawl Rockfish Conservation Area (RCA), an area that has provided de facto habitat protection for the past decade or so, and the NMFS Synthesis analyzed the Trawl RCA as a habitat protection measure. Re-opening is already underway, and is anticipated to continue next year. Our proposal would designate key areas within the RCA as EFH Conservation Areas, allowing their habitat conservation value to continue. Specifically, eight of the areas in the comprehensive conservation proposal that would be closed as EFH Conservation Areas overlap with the 150 to modified 200 fathom RCA off Northern California and Oregon (40° 10' N. to 45° 46' N.), which was just approved by the Council for reopening, and coastwide 29 of the areas in our proposal overlap with the year-round trawl RCA closure.

Completing the Deepwater Closure

In 2005, as part of its “freeze the footprint” approach the Council voted to adopt a restriction on bottom trawling on all areas deeper than 700fm out to the EEZ boundary, including areas deeper than 3500m. However, NMFS determined that areas deeper than 3500m could not be closed

through EFH regulations because they were not designated as EFH. The comprehensive conservation proposal provides several pathways for the Council to complete its “freeze the footprint” decision from 2005. We note that the concept of freezing the trawl footprint has been codified by NOAA in its 2010 Strategic Plan for Deep Sea Coral and Sponge Ecosystems²⁶ and is widely regarded as the appropriate precautionary approach to take in light of potential “prospecting” deepwater tows in the future. One pathway outlined in the comprehensive conservation proposal would be to extend the definition of EFH out to the EEZ boundary, either through increasing the precautionary buffer on EFH designation or by adding deepwater species to the FMP. Alternatively, the Council could implement its 2005 decision by relying on other sources of Magnuson-Stevens Act authority.

Proposal Analysis

Our proposal is the result of significant analytical work, noted briefly above and presented in detail in the proposal itself. Working from the data sets provided in the EFH Review Catalog, we examined multiple aspects of performance for our proposal, including conservation benefits and anticipated effort displacement for industry. We encourage Council members to view our full proposal, including detailed maps and analyses, on the Council’s ftp site.²⁷

After submitting our proposal, we conducted several additional analyses using data from the EFH data portal to include more information and correct minor analytic errors.²⁸ The figures included in the Appendix as well as the tables attached to this letter in Excel format represent the updated analysis of our proposal. We have also submitted our updated analyses to the EFHRC.

The following summary points illustrate the results of our analysis. Across the U.S. West Coast Exclusive Economic Zone, the net change resulting from all the proposed EFH Conservation Areas and re-openings in our proposal would be:

- An additional 1,579 square statute miles of hard substrate protected from bottom trawling (36% increase);
- An additional 339 square miles of mixed (hard and soft) substrate protected from bottom trawling (102% increase);
- Inclusion of 12,579 coral observations in EFH conservation areas (14% increase);
- Inclusion of 4,958 sponge observations in EFH conservation areas (78% increase);
- An additional 2,794 square miles of predicted highly suitable coral habitat protected from bottom trawling (45% increase); and
- A total increase of 143,794 square miles protected from bottom trawling overall (99% increase).

²⁶ NOAA Strategic Plan for Deep-Sea Coral and Sponge Ecosystems, *supra* note 14.

²⁷ Pacific Fishery Management Council FTP Website, ftp.pcouncil.org/pub/GF_EFH_Review_2011-2012.

²⁸ Minor errors in the 7-31-2013 analysis included omission of certain state waters areas in our “baseline” calculations and mis-categorizing one proposed “open” area as a proposed closed area. These errors have been corrected in the attached analyses.

This proposal would maintain over 29,000 square miles of the continental shelf and upper slope habitat as open to bottom trawling. Furthermore, we propose re-opening 168 square miles of area that are currently closed to bottom trawling off California, and we present an additional 33 square miles of reopening in the Monterey Bay area as a draft concept for further discussions which will take place at a state management level. These proposed open areas encompass 1.77% of the total coastwide groundfish bottom trawl intensity that took place before the current closures went into effect (2000-2005).

In our analysis of the trawl effort data provided in the EFH Review, the proposed 66 closed areas combined include 2.79% of recent (2006-2010) groundfish bottom trawl effort and 1.14% of shrimp trawl effort as provided by the State of Oregon (2007-2011). With the proposed re-opening areas likely offsetting some of the displaced revenue from new closures, and the trawl spatial data buffered outward so that it encompasses a larger area than is actually trawled, we estimate the net displacement of effort in this proposal to be on the order of 1%, far below the level that NMFS used as its criteria for practicability in the 2005 Record of Decision. This analysis illustrates that the proposed spatial components of our proposal would substantially increase habitat protections on a coastwide and regional basis, as measured by total area protected and sensitive habitat types represented, with minimal projected cost.

Outreach

The final aspect of our proposal we wish to highlight is the outreach that went into it. The comprehensive conservation proposal is the result of substantial outreach to tribal resource managers and fishing communities up and down the West Coast. Our organizations traveled to numerous fishing ports and, using spatial data made available in the EFH data catalog, engaged in in-depth conversations with fishermen about the areas that are important to them, their concerns and views, and ways to minimize any potential impacts that new closures would have on them. We learned a great deal from our conversations and gave significant consideration to maintaining areas important to the bottom trawl fishery. We believe the comprehensive conservation proposal represents a good initial effort in that direction, and we hope to discussions will continue. We participated in the Monterey Bay National Marine Sanctuary's consensus proposal, and we hope to see future collaboration result in additional agreements between conservation groups and fishermen. Outreach will continue into Phase 3 as well and we intend to increase our outreach efforts through the coming months to ensure we contact and solicit feedback from the widest range of stakeholders possible. We are pleased that the EFHRC Report reflects positive feelings about our proposal—on collaboration among other things—and we look forward to continuing to refine the proposal based on feedback from the Council, its committees, NMFS, and other interested parties.

Conclusion

This proposal is a practicable approach to ensure healthy ocean habitats important to groundfish species, and to maintain a productive and vibrant West Coast groundfish fishery for generations

to come. We have used precisely the same approach that was taken in 2005 and simply applied it to the wealth of new information and data available from this 5-year review. The practicability of this approach is validated by recent fishery data. The spatial data provided in this 5-year review indicates that the EFH conservation areas established in Amendment 19 created no discernible effort displacement in the bottom trawl fishery, nor any decrease in catch or revenue. We believe this adaptive management approach based on newly available information is the correct way to proceed with modifications to EFH designation and management measures, and we urge the Council to move to Phase 3 with this in mind.

Thank you for your time and attention, and we will be happy to answer any questions you may have at the November Council meeting.

Agenda Item H.7.d
Public Comment
November 2013

October 22, 2013

Ms. Dorothy Lowman, Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, OR 97220-1384

Dear Ms. Lowman,

EDF would like to formally withdraw its proposal from the Essential Fish Habitat review process to modify the small footprint requirement shoreward of the Rockfish Conservation Area south of 40°10' N. While we continue to believe that this concept could reduce impacts on invertebrates and soft bottom habitats without jeopardizing overfished species or high relief habitat, we believe the time is not right for consideration of this proposal.

Thank you for the opportunity to participate in the process.

Sincerely,

A handwritten signature in black ink, appearing to be "SJ" or "Shems Jud", written in a cursive style.

Shems Jud

7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

**RE: Agenda Item H.7, Essential Fish Habitat (EFH) Review Phase 2 Report and
Proposals to Modify EFH**

Dear Chair Lowman and Council Members:

I am writing on behalf of the Endangered Habitats League (EHL), a non-profit organization dedicated to ecosystem protection and sustainable land use. As Southern California's only regional conservation group, EHL has led the way in establishing an unprecedented, interconnected system of nature reserves. By focusing on science-based priorities, we continue the monumental work of preserving our natural heritage for future generations. We understand the importance of sustainable fishing advocacy and the need to maintain a healthy and productive Pacific Ocean. That is why I write to encourage you to protect seafloor habitat that is essential to healthy fish stocks and the ecosystem upon which they depend. Specifically, we request that you act in November to move to the regulatory portion (phase three) of the five-year groundfish Essential Fish Habitat (EFH) review process and to analyze all eight of the submitted EFH proposals.

As a concerned citizen and a lover of the ocean, I urge you to build upon the great work done through the current EFH review process. The EFH synthesis report and the submitted proposals contain new information on the distribution, location, and types of EFH along the West Coast, including prey species important to groundfish. While the Council has taken significant strides in protecting those areas identified as EFH during the last review, we now have better scientific tools and new information on where those sensitive areas are, how fishing impacts those areas, and what kind of protections need to be implemented.

EFH actions by managers should not merely prevent further degradation, but should seek to enhance the quality and amount of EFH. We must also protect habitats essential to feeding, spawning, and growth. Many species of fish rely on sponges and deep-sea corals as nurseries. We should take care to protect this fragile habitat from the damage caused by fishing nets dragging along the seafloor. At this point, the Council should proceed with reviewing all the submitted proposals and developing an EFH package that both protects critical areas that are important for ecosystem health and provides continued opportunity for sustainable fishing.

Thank you for your time and attention to this matter. We appreciate your stewardship of our marine resources and the work you do to maintain healthy oceans and sustainable fisheries.

Sincerely,

A handwritten signature in blue ink, appearing to read "Dan Silver", is centered on a light gray rectangular background.

October 09, 2013

Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Members of the Council,

Marine Conservation Institute (MCI) would like to thank the Council for the opportunity to present our EFH modification proposal based on deep-sea coral predictive habitat modeling results. The feedback we have received thus far from committee members involved in the EFH review process has been productive. This letter is meant to update the Council on recent developments with our modeling efforts and to clarify (in layman terms) what we hope can be achieved using these new techniques.

MCI has been involved in several regional and global scale deep-sea coral predictive habitat modeling efforts for a number of years. The predictive models examine the environmental conditions of known coral areas and identify similar environmental conditions (suitable for coral survival) across large areas, the vast majority of which has not been surveyed. Models have performed very well overall and field validation has confirmed coral habitat in unsurveyed areas where models predicted it would be off the coasts of Ireland, New Zealand, Australia, and the seamounts of the Southwest Indian Ridge. MCI, in partnership with NIWA, was funded by the New Zealand government to identify coral and sponge areas using predictive habitat modeling for the South Pacific RFMO Competence Area via a 3 year, 3 million dollar project. The model results presented in MCI's current EFH proposal to the Pacific Fishery Management Council was funded by NOAA's Deep Sea Coral Research and Technology Program. Predictive habitat modeling is being taken seriously by many governments as evidenced by their willingness to provide substantial amounts of funding to carry out this work.

MCI model results presented in our EFH review proposal represent the first opportunity to identify potential coral sites in areas that have not been surveyed along the entire US West Coast. Model results extend to the outer boundary of the US EEZ and are at high spatial resolutions. This information was not available for the EFH review in 2005 and represents a major step forward. We have recently submitted a paper (modified version of the Guinotte and Davies (2012) report to NOAA titled “Predicted deep-sea coral habitat suitability for the U.S. West Coast”) for peer-review to the journal PLoS ONE where it is currently under review. We anticipate this paper will be accepted for publication based on past experience. The modeling methods we employed for the US West Coast are very similar to methods we have used and published via peer reviewed journals in other regions.

We are the first to admit that predictive habitat modeling has some limitations and is not a perfect tool for identifying coral habitat. This is clearly articulated in our publications, reports, and proposals. However, it is the best available tool we have for identifying potential coral habitat in unsurveyed areas, including areas on the US West Coast. MCI believes that habitat model results for unsurveyed areas can be used in conjunction with geologic data (where it exists) and trawl survey information to identify high probability coral areas that have not been visited. These are the areas we believe should be considered for future EFH status. MCI is willing to work with the Council to move this effort forward and we look forward to discussing the EFH review at future Council meetings.

Sincerely,

John Guinotte

October 21, 2013

Council Members
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Members of the Council,

Marine Conservation Institute would like to thank the Pacific Fishery Management Council (the Council) for this opportunity to present evidence of public support for our West Coast Essential Fish Habitat (EFH) proposal submitted in August identifying 29 areas that ought to be considered for EFH status. In total, 1147 individuals including 338 from Washington, Oregon and California supported our proposal. Their names, locations and comments are attached to this cover letter.

Marine Conservation Institute's EFH proposal is based on a technique called predictive habitat modeling that looks at environmental conditions of known coral areas and identifies similar environmental conditions (suitable for coral survival) across large areas, the vast majority of which have not been surveyed. Models have performed very well overall and field validation has confirmed coral habitat in un-surveyed areas where models predicted it would be off the coasts of Ireland, New Zealand, Australia, and the seamounts of the Southwest Indian Ridge. The model results presented in our current EFH proposal to the Pacific Fishery Management Council were funded by NOAA's Deep Sea Coral Research and Technology Program.

On behalf of over one thousand petitioners, many from the West Coast, we hope the council will seriously consider our proposals for new EFH protections. As you know, bottom trawlers drag heavy nets across the bottom as they seek to catch fish that live on or near the bottom of the ocean. Since you protected significant areas of deep water habitat in 2005, scientists have identified numerous additional sensitive ocean places and understand better why they should be protected from bottom trawling and other damaging fishing methods.

By its very nature, the designation of an area as Essential Fish Habitat means that it is important to some life stage of one of our fishes, a place where reproduction, growth or continued survival occurs. Our petitioners urge you to use the best available science, including the maps generated by the Marine Conservation Institute, in determining where to protect additional areas of the Pacific coast seafloor for future generations. Your meeting in November to consider this and other Essential Fish Habitat proposals is thus a very important opportunity to restore our oceans to health, retain their resilience in face of the climate threats ahead, and rebuild fish populations and the livelihoods of fishermen.

Thank you,

Michael Gravitz, Director of Policy and Legislation

Attachment

Signatures to Support the West Coast Essential Fish Habitat Proposals

To:

Pacific Fisheries Management Council and National Marine Fisheries Service

Dear Pacific Fisheries Management Council and National Marine Fisheries Service:

I support the Essential Fish Habitat proposal made by the Marine Conservation Institute to you in August 2013 to place up to twenty-nine new areas off limits to bottom destroying fishing, especially bottom trawling. As you know, bottom trawlers and sometimes even mid-water trawlers drag heavy nets across the bottom as they seek to catch fish that live on or near the bottom of the ocean. Since you protected significant areas of deep water habitat in 2005, scientists have identified numerous additional sensitive ocean places and understand better why they should be protected from bottom trawling and other damaging fishing methods. Scientific literature on the value of these seafloor habitats and where they occur has expanded vastly since you last designated Essential Fish Habitat off the West Coast.

The Pacific Fisheries Management Council and National Marine Fisheries Service are required to reconsider areas and measures protecting Essential Fish Habitat every five years; the last review in 2010 ended with no additional areas protected. Now, almost five years later, I urge you to consider the new areas proposed for protected status by Marine Conservation Institute.

By its very nature, the designation of an area as Essential Fish Habitat means that it is important to some life stage of one of our fishes, a place where reproduction, growth or continued survival occurs. I urge you to use the best available science, including the maps generated by the Marine Conservation Institute, in determining where to protect additional areas of the Pacific coast seafloor for future generations. Your meeting in November to consider this and other Essential Fish Habitat proposals is thus a very important opportunity to restore our oceans to health and retain their resilience in face of the climate threats ahead.

Sincerely,

October 21, 2013

Dorothy Lowman, Chair
Pacific Fishery Management Council
1100 NE Ambassador Place, #101
Portland, OR 97220

RE: Groundfish Essential Fish Habitat 5 Year Review

Dear Chair Lowman and Council Members,

We write to express our support for the Pacific Fishery Management Council's ongoing review of the essential fish habitat (EFH) provisions of its Groundfish Fishery Management Plan (FMP). Phases 1 and 2 of the EFH process produced an impressive array of work from Council and agency staff as well as a number of stakeholder groups. It is now time for the Council to analyze and incorporate this new information into the designation and protection of groundfish EFH. At the November Council meeting, we recommend the following next steps:

- Proceed to Phase 3 of the EFH review process.
- Initiate a technical analysis of all eight EFH proposals in their entirety.
- Use core tenets of EFH and an ecosystem-based approach to fisheries management (EBFM) to guide analysis and further action

In accordance with established policy described below, the Council is required to protect habitat areas that are essential to the maintenance of healthy fish stocks, sustainable fisheries, and the overall marine ecosystem. In particular, the Council must protect those areas that are both ecologically important and that may be negatively impacted by fishing activity such as bottom trawling. The EFH synthesis report and the submitted proposals contain new information on the distribution, location, and types of EFH in the California Current Ecosystem. This includes previously overlooked, ecosystem-oriented aspects of EFH, such as new information on the identification, importance, and habitat functions of prey species of groundfish. While the Council has protected many areas identified as EFH during prior reviews, we now have better scientific tools and new information on where other sensitive areas are, how fishing impacts those areas, and what kind of protections are warranted.

The following information provides a more thorough analysis and justification of our requests.

Proceed to Phase 3 of the EFH review process

The 1996 revision of the Magnuson-Stevens Fishery Conservation and Management Act (MSA) ushered into law a requirement that the National Oceanic and Atmospheric Administration's Fisheries Service (NOAA Fisheries) and the regional Councils identify Essential Fish Habitat (EFH) for all Council-managed species, and minimize adverse effects to that habitat caused by

fishing to the extent practicable.¹ Also per this revision to the law, NOAA Fisheries published regulatory guidance (finalized in 2002) providing detailed instructions to managers on how to designate and protect EFH.²

Responding to this mandate, the Council first identified and designated EFH for groundfish (rockfish, cod, lingcod, flounders, etc.) in 1998 through Amendment 11 to the Groundfish FMP, implemented by NOAA Fisheries in 1999.³ However, this action contained no regulatory protections for habitat, so the Council adopted (in 2005) and NOAA Fisheries implemented (in 2006) an update to EFH designations and a suite of EFH protections through Amendment 19 to the Groundfish FMP.⁴

Pursuant to NOAA Fisheries guidelines which call for regional councils to conduct a complete review of their EFH measures at least once every 5 years, the Council has been working on a “3-phase” review process.⁵ Phase 1 consisted of a comprehensive review of new information on groundfish EFH, and was completed in April 2013.⁶ Phase 2 consisted of a formal request for stakeholder proposals, to which 8 proposals were received.⁷ On November 5th, the Council will decide whether the information at hand from Phase 1 and Phase 2 warrant moving on to Phase 3, which would entail initiating a new regulatory amendment to the Groundfish FMP to update EFH designations and protections. This could include modifying existing habitat closures and/or adding new ones, as well as other measures that are not area-based, such as those relating to major prey species, gear modification and enforcement.

We believe the Council has significant new information at hand which warrants a regulatory update to EFH designations and protections. The EFH Synthesis Report shows that since essential fish habitat was last revised under this FMP, scientists have gathered more information that may better guide how and where we should fish in order to minimize adverse impacts on delicate and important areas. The report includes newly available information such as:

*“updated maps of seafloor habitat types and bathymetry; ...a summary of models to predict groundfish distribution relative to habitat types, as well as trophic and ecosystem models useful for groundfish EFH; ... summaries of new information on the life history and habitat requirements of the 91 species in the Pacific Groundfish FMP; ...updated information on threats to groundfish EFH and prey species, both from fishing and non-fishing activities;”*⁸

Initiate a technical analysis of all eight EFH proposals in their entirety

We encourage the Council to undertake a thorough analysis of all eight stakeholder proposals and their contents, and that all remain eligible for consideration in a range of alternatives for management action until such initial analysis is completed. By design, these proposals have not yet received a robust independent technical analysis. The Essential Fish Habitat Review Committee (EFHRC) is not tasked with conducting complete technical analyses of proposed habitat measures.⁹ And at its September 4-5, 2013 meeting in Portland, OR the EFHRC recognized that it lacked the time, mandate, and available expertise to conduct such a technical analysis. Moreover, these proposals “represent a wide, substantive and geographic range,” and include submissions from a wide diversity of interests including the fishing industry, conservation organizations, and governmental entities.¹⁰

In addition to the new information contained in the Phase 1 report and its associated appendices and supporting documents, these new proposals also outline a wide variety of potential regulatory changes which collectively include benefits to groundfish stocks, the fishing industry, and the ecosystem as a whole.

These proposals include precautionary measures the Council itself has previously advanced, such as extending EFH designation and the bottom trawl footprint closure to cover largely un-fished deep-water areas south of the Mendocino Ridge.^{11,12} Some proposals include protection of ecologically sensitive areas now known to harbor important groundfish habitats such as corals and sponges, and to recognize that the abundance and availability of forage fish is a key consideration for groundfish EFH by identifying major prey species of groundfish in the description of EFH.

Specific elements of this initial analysis could include evaluation of the proposals using the data compiled on the EFH data portal, such as their degree of coverage of various habitat types, degree of displaced fishing effort and related cost-benefit analyses, etc.

Use core tenets of EFH and EBFM to guide analysis and consideration

The EFH regulations issued by NOAA Fisheries are a guide for the regional councils in the description and identification of EFH and in the design and implementation of actions to conserve and enhance EFH.¹³ These regulations contain a set of core tenets of EFH conservation and management that collectively support the Council moving to Phase 3, and that should also guide the Council in its analysis of the proposals and development of management measures.

⁹ See Pacific Fishery Management Council, COP 22, April 2011, available at http://www.pcouncil.org/wp-content/uploads/I3a_ATT1_DRAFT_COP22_APR2011BB.pdf

¹¹ See Pacific Fishery Management Council, [Final Amendment 19 to the Pacific Coast Groundfish Fishery Management Plan](#), November 2005

¹² See PPMC, “[GROUND FISH ESSENTIAL FISH HABITAT REVIEW: SUMMARY OF PROPOSALS RECEIVED AND PROCESS FOR COMPLETION](#)”, September 2013

¹³ See 67 Fed. Reg. at 2343

Below we outline five key tenets of identification and protection of EFH, including the importance of utilizing an ecosystem-based approach to fisheries management, which we suggest that the Council apply to its forthcoming decision-making:

Utilize an Ecosystem-Based Approach:

Protecting fish habitat should be done in a holistic way that embraces and applies key principles of an ecosystem-based approach to fisheries management.¹⁴ NOAA Fisheries' EFH regulations call for protecting the habitat required to support a sustainable fishery for a given species and the contribution of that species to a healthy ecosystem.¹⁵ Some of the specific principles called for include a precautionary and risk-averse approach,¹⁶ prioritizing the stability and resiliency of marine ecosystems (as measured by their similarity to comparable undisturbed ecosystems whose basic functions have not been altered),¹⁷ and preserving biodiversity.¹⁸

Seek to Improve on Current Protections:

Fishery managers should strive for improvement. The core statutory and regulatory tenets of habitat protection call for both conservation and enhancement, demonstrating that it is not good enough to simply prevent further degradation. Managers must strive to enhance the amount and quality of EFH as well as restore previously damaged habitats.

Consider all Life Stages of Managed Species:

Protecting a fish's habitat calls for careful consideration of each life stage and everything it needs to thrive, including breeding, spawning, growth to maturity, and feeding.¹⁹ This means protecting not only the fish in question and the places it likes to hide and reproduce, but also its prey and the places where it interacts with that prey.²⁰ For instance, some groundfish rely on kelp forests or sponges as "nurseries" for their young, and all rely on abundant and available prey to ensure they are well-fed.²¹

Develop and Utilize the Best Scientific Information Available:

Habitat protections should be based on the best scientific information available.²² This means that when new information comes to light showing that there is room for improvement, managers must act. It also means that at all stages of decision making, from identifying areas to deciding how best to minimize adverse effects on habitat, to determining what is practicable, a robust analysis must be performed.

²¹ See PFMC, EFH Phase 1 Report [APPENDIX G GROUND FISH SPECIES GROUP LIFE HISTORY SUMMARIES](#), p. 327.

Also see Love and Yoklavich "[Habitat characteristics of juvenile cowcod, *Sebastes levis* \(Scorpaenidae\), in Southern California](#)" Environ Biol Fish (2008) 82:195–202 at p. 199. Also see See 67 Fed. Reg. at 2378 [16 U.S.C. 1801 § 600.815(a)(7)]

²² 2349, 2351, and 2376 [16 U.S.C. 1801 § 600.815(a)(1)(ii)(B)]

Protect a Wide Array of Habitat Types:

EFH is defined as much more than the "classic" interpretation of rocky reefs. While those are extremely important, so are other types of seafloor, or living habitat like corals and sponges.²³ In fact, the entire water column is eligible for consideration and for conservation measures, including the presence and availability of the other fish which live there and constitute important food for the fish in need of protection.²⁴

In conclusion, we appreciate the Council's past work to identify and protect key groundfish habitat, as well as the Council's proactive efforts to review new information and thoughtfully approach the question of whether and how to revise existing EFH measures. This thoughtful approach has now provided the Council with a compelling summary of new insights into the location, importance, and ecological implications of a wide array of groundfish habitat types. It has also provided the Council with eight stakeholder proposals drawing on this information and advancing new ideas for habitat designations and management measures that can conserve and enhance groundfish EFH. We now request the Council move on to Phase 3 and consider new EFH protection measures based on this body of work.

Sincerely,

Tom Rudolph

RE: Agenda Item H.7, Essential Fish Habitat (EFH) Review Phase 2 Report and Proposals to Modify EFH

Dear Chair Lowman and Council Members:

I am writing on behalf of Greenburger's, a restaurant that prides itself on the use of sustainably sourced, local products to create classic American fare. At Greenburger's, we aim to be as eco-conscious as possible, which is why we understand the importance of sustainable fishing advocacy and the need to maintain a healthy and productive Pacific Ocean. I write to encourage you to protect seafloor habitat that is essential to healthy fish stocks and the ecosystem upon which they depend. Specifically we request that you act in November to move to the regulatory portion (phase three) of the five-year groundfish Essential Fish Habitat (EFH) review process and to analyze all eight of the submitted EFH proposals.

As a concerned citizen and a lover of the ocean, I urge you to build upon the great work done through the current EFH review process. The EFH synthesis report and the submitted proposals contain new information on the distribution, location, and types of EFH along the West Coast, including prey species important to groundfish. While the Council has taken significant strides in protecting those areas identified as EFH during the last review, we now have better scientific tools and new information on where those sensitive areas are, how fishing impacts those areas, and what kind of protections need to be implemented.

EFH actions by managers should not merely prevent further degradation, but should seek to enhance the quality and amount of EFH. We must also protect habitats essential to feeding, spawning, and growth. Many species of fish rely on sponges and deep-sea corals as nurseries. We should take care to protect this fragile habitat from the damage caused by fishing nets dragging along the seafloor. At this point, the Council should proceed with reviewing all the submitted proposals and developing an EFH package that both protects critical areas that are important for ecosystem health and provides continued opportunity for sustainable fishing.

Thank you for your time and attention to this matter. We appreciate your stewardship of our marine resources and the work you do to maintain healthy oceans and sustainable fisheries.

Respectfully yours,

Stefanie Nudelman, CEO
Greenburger's

RE: Agenda Item H.7, Essential Fish Habitat (EFH) Review Phase 2 Report and Proposals to Modify EFH

Dear Chair Lowman and Council Members:

I am writing on behalf of Living Sea Images, a multimedia company which publishes all three volumes of the *Wonders of the Sea* series of coffee-table books and manages the sales of my stock photography and fine art prints. My relationship with our beautiful ocean spans over 35 years - from the moment I first learned to dive in 1978, which led to my passion for marine life photography years later, to my work on the Marine Life Protection Act. While my photography began as a way to make the spectacularly colorful images I love persist in time, I quickly learned that it was not only the best way to share my passion with others, but a way I could help life in the ocean communicate to humanity. I hope that my photographs will express some of the fragility and indescribable beauty I experience in our living ocean, and motivate people who might otherwise never know about it to preserve it.

I write this letter to encourage you to protect seafloor habitat that is essential to healthy fish stocks and the ecosystem upon which they depend. Specifically, I request that you act in November to move to the regulatory portion (phase three) of the five-year groundfish Essential Fish Habitat (EFH) review process and to analyze all eight of the submitted EFH proposals.

As a concerned citizen and a lover of the ocean, I urge you to build upon the great work done through the current EFH review process. The EFH synthesis report and the submitted proposals contain new information on the distribution, location, and types of EFH along the West Coast, including prey species important to groundfish. While the Council has taken significant strides in protecting those areas identified as EFH during the last review, we now have better scientific tools and new information on where those sensitive areas are, how fishing impacts those areas, and what kind of protections need to be implemented.

EFH actions by managers should not merely prevent further degradation, but should seek to enhance the quality and amount of EFH. In researching my most recent publication, *Yesterday's Ocean: A History of Marine Life on California's Central Coast*, I learned how much richer Central California's ocean was in the day of our parents and

grandparents and before. We should be managing with an image of that lost abundance as our ultimate goal, not just maintenance of today's *status quo*. We must protect habitats essential to feeding, spawning, and growth. Many species of fish rely on sponges and deep-sea corals as nurseries. We should take care to protect this fragile habitat from the damage caused by fishing nets dragging along the seafloor. At this point, the Council should proceed with reviewing all the submitted proposals and developing an EFH package that both protects critical areas that are important for ecosystem health and provides continued opportunity for sustainable fishing.

Thank you for your time and attention to this matter. I appreciate your stewardship of our marine resources and the work you do to maintain healthy oceans and sustainable fisheries.

Respectfully yours,

RE: Agenda Item H.7 – Essential Fish Habitat Review

Dear Ms. Lowman and Council Members,

The Pew Charitable Trusts has collected 1,820 comments asking the council to move ahead to the regulatory portion of the essential habitat review process.

The petition itself is included with all the names and cities of individual signers who were gathered as of Oct. 18. The council may continue to receive additional comments in the days ahead. Please note that many of the individual petitions included here have been personalized or include additional comments.

Thank you,

Erik Robinson
The Pew Charitable Trusts

Full Version with electronic signatories are available on the November 2013 briefing book website only.

Dear Chair Lowman and council members,

I urge you to take action in November to proceed to the regulatory portion of the Essential Fish Habitat review process. This step is critical to ensuring that we are doing all we can to protect ecologically important areas that are susceptible to damage caused by bottom trawling and other fishing practices.

Although the council took action to protect areas identified as essential habitat during the last review several years ago, we now have better scientific tools and new information on where those areas are located, how fishing affects them, and what kind of protections are needed.

As a concerned citizen and a lover of the ocean, I encourage the council to build upon the work done through the current review process by considering all the submitted proposals and developing a package of management measures that both protects important areas and provides an opportunity for continued sustainable fishing.

Thank you for your stewardship of our marine resources.

Sincerely,

First	Last	City	State	Country	Personal Comment
Brenda Lee	Riley	Long Beach	CA	United States	A healthy seafloor and thriving oceans, THAT'S what I'd like to leave my grandchildren....
Donna	Hamer	Santa Paula	CA	United States	All life depends upon healthy seas and the creatures that inhabit them.
Carol	Dickason	Sonoma	CA	United States	As a Native Californian I have enjoyed our coastal waters and beaches all of my life. Now, as a grandmother I ask that the coasts and waters and sea life be protected for our following generations.
Anne	Tuddenham	El Cerrito	CA	United States	As a native Californian who lives within sight of the ocean, I am extremely concerned about this issue.

Matt	Meier	San Diego	CA	United States	As a professional underwater photographer, I sincerely hope that you will do everything in your power to properly protect our offshore habitats from overfishing and bottom trawlers that destroy the environment. Thank you.
Geoffrey & Linda	Symcox	Pacific Palisades	CA	United States	As a resident of California this concerns me a great deal
Dr. Mha Atma S.	Khalsa	Los Angeles	CA	United States	As a very concerned American citizen and taxpayer I urge you to take strong action!
Christine	Holmes	San Francisco	CA	United States	As new information is gained, so should our protection for a healthy and intact ocean seafloor evolve and improve.
Ellen	Barron	Santa Cruz	CA	United States	As stewards of this planet it is our responsibility to correct any damage humans incur especially to the ocean inhabitants. This is vital for our future.
Sandy	Kasper	Hemet	CA	United States	Be a super-hero and protect our ocean habitats!
Theresa	Sabellico	Foster City	CA	United States	Because its the right thing to do.
Louis	Mccarten	Glendale	CA	United States	Biological resources are crucial to maintaining our standards of living and how we manage them will affect the living conditions of future generations. We owe it to posterity to leave behind a healthy resourceful world-- as it was left to us by previous generations.
Gayle	Spencer	Menlo Park	CA	United States	Bottom trawling doesn't make good sense in areas with a lot of habitat and sea life. Surely there is a better way.
Probyn	Gregory	Tujunga	CA	United States	Bottom trawling is wrong!
Nick	Mcnaughton	Los Angeles	CA	United States	bottom trawling must be carefully controlled to protect our future.

Stephanie	Otoole	San Diego	CA	United States	Continuing our efforts for sustainable fishing is the most important thing we can do to help our oceans. Please help to protect critical seafloor habitat! Thank you!
Terrell	Rodefer	Van Nuys	CA	United States	Death to these habitats means widespread loss of natural sea life. Let's be circumspect and work hard to keep habitats safe and flourishing.
John	Carothers	Aptos	CA	United States	Deep sea organisms are characterized by having very slow reproductive rates because their habitats are very stable. The proposed actions imperil these fragile ecosystems.
Paul	Ramos	Solvang	CA	United States	Do I really need to list all the reasons it should be protected? It just should be.
Elaine	Livesey-Fassel	Los Angeles	CA	United States	Do not allow the ground floor of all our oceans to continue being raped by damaging trawling!!!
Sharie	Foster	Tujunga	CA	United States	Earth's population is exploding. Our ocean feeds the world. We MUST be very, very respectful of our ocean's delicate resources so we can all eat. We can no longer behave as we have in the past. We MUST RESPECT AND PROTECT OUR OCEAN'S HEALTH. Thank you for being reasonable and responsible.
Helen	Dickey	El Cerrito	CA	United States	El Cerrito
Gail	Mcmullen	Los Angeles	CA	United States	Enter your state here
Marie	Henley	Aptos	CA	United States	Even CRITICAL is not a strong enough term. It is our future!
William	Hewes	Simi Valley	CA	United States	Every day action is delayed, untold additional damage is being done.
Sara	Mackusick	Berkeley	CA	United States	Every positive action we take now will help save a livable environment for our children and their children

Barbara	Lafaver	Concord	CA	United States	Everything must be done to protect this delicate ecosystem! The health of the planet depends on it!.
Monicaa	Jackson	Laguna Beach	CA	United States	Everything on and in this planet is precious. Leave the Ocean alone unless you are going to clean it.
William	Josephs	Los Angeles	CA	United States	Everything seems to be running out; including our luck as inhabitants of our planet. How many more generations of open seas fishing is left?
Evalyn	Segal, Phd	Walnut Creek	CA	United States	Fishing and trawling practices must be regulated to insure a healthy sea floor and a healthy ocean and a healthy planet.
Victoria	Holman	Carmel	CA	United States	For the health of the planet, the ocean and ourselves please protect the seafloor habitat.
Lauri	Provencher	Los Angeles	CA	United States	Help ! there is only one...save it !
Dr. George B.	Kauffman	Fresno	CA	United States	Help Protect Critical Seafloor Habitat
Rowena	Vogel	Granada Hills	CA	United States	Help Protect Critical Seafloor Habitat
Uma	Cox	Brentwood	CA	United States	Help protect the ocean. Many living beings depend on it, including humans.
Constance	St. Jean	Riverside	CA	United States	Humans are killing off the other species on this planet. We need a strong organization to stop this.
Susan	Lewitt	San Diego	CA	United States	I am trying to do my part to preserve the ocean by preventing trash from ending up in the ocean. Please do all you can to preserve our marine ecology and the plants and animals who inhabit it. This will mean a better chance to be able to continue fishing into the future.
Marsha	Armstrong	Los Gatos	CA	United States	I could not improve on the statement written below.

Richard	Dimatteo	San Diego	CA	United States	I first dove these coastal waters back in the 60's, when you could free dive for an abalone limit and you could do the same with lobster. Overuse and over fishing and bottom trawling have messed up the ocean floor rather badly.
Scott	Weldon	Encinitas	CA	United States	I have personally seen the damage done by bottom trawling, It leaves a dead wasteland behind. Please protect this essential habitat and limit or eliminate bottom trawling. Thank you.
Marijeanne	Sarraille	Pittsburg	CA	United States	I live near the ocean. The ocean needs your help!
Russell	Blalack	Cupertino	CA	United States	I spent so many wonderful years as a guest in our native seafloor habitat, I would love for that enchantment to be available to the next generation too.
Cleo	Borac	Pacifica	CA	United States	I think this habitat is an essential legacy we leave to our children. Please protect it!
Carolyn	Boor	Rancho Cucamonga	CA	United States	I urge you to protect this unique area. We must continue to be wise stewards of our planet.
William	Manners	Clearlake	CA	United States	If our oceans die, our planet dies!
Evelyn	Ledesma	Rialto	CA	United States	If we do not protect the breeding grounds and nurseries of the fish we depend on where will that leave us in the future? A world without seafood and the beauty of their world gone forever.
Marilyn	Perona	Lake Forest	CA	United States	I'm signing this petition to encourage the PFMC to fully analyze the eight proposals recently submitted for updating protection of coastal fish habitat. We must make sure that any change is change for the better. Thank you.

Peter	Stone	Rancho Santa Fe	CA	United States	Important to protect underwater habitat for biodiversity and maintaining health of ecosystems.
Kurt	Gross	San Diego	CA	United States	Impossible to replace once it's gone.
Peter	Corkey	San Francisco	CA	United States	It is extremely important that we take the necessary steps in protecting our oceans' floors in order to preserve habitats and combat climate change.
Lee	Smith	California Hot Springs	CA	United States	It is terrible what the human species is doing to this planet. If we don't change our minds to be more compassionate and knowledgeable, we will end up with a planet that is not fit for any species.
Tom	Mccarter	San Jose	CA	United States	It's all part of an ecosystem. The whole area needs protection.
Jerrilyn	Ruest	Hayward	CA	United States	Let beautiful things continue to grow! PLEASE!
James	Fairley	Berkeley	CA	Please Select	Let that which is part of us but not represented be saved.
Larry	Lapuyade	San Anselmo	CA	United States	Let us preserve these areas while we still can!!
Jennifer	Bailey	Visalia	CA	United States	Let's make the choice to preserve, rather than to destroy, this part of the planet -- a rather critical one, given our need for what the sea provides.
Tim	Tarbell	Los Angeles	CA	United States	Let's not decrease protections for the seafloor--its health will sustain the fisheries better than anything else.
Barbara	T	Angwin	CA	United States	Like the ancient forests on land, a healthy and intact ocean seafloor is a legacy that we should pass on to future generations.
Michael	Toobert	Grass Valley	CA	United States	Like the ancient forests on land, a healthy and intact ocean seafloor is a legacy that we should pass on to future generations.

Stephanie	Embrey	Long Beach	CA	United States	Maintaining the seafloor habitat is critical to life in the oceans and on land. Survival of the oceans not only means survival of fishing and a food source for humans, but maintenance of the food chain and the environment for generations to come. Please protect our oceans and the seafloor therein.
Terry	Mulroney	San Diego	CA	United States	Most of the healthy soil in this country has been lost or damaged lets not do that to our oceans floor.
Elizabeth	Foree	San Francisco	CA	United States	My front window looks out on the Pacific Ocean and I seriously take my stewardship of this precious part of our planet. Help protect the fishes and their environment.
Sharon	Lacy	Seastopol	CA	United States	oceans are the first life, please protect to continue creation.
Georgia	Knight	San Francisco	CA	United States	Once this first food level is destroyed, commercial fishing, food supplies for most of the world will eventually die off without a food source. It's a loss for all mankind.
Pam	Nelson	Warner Springs	CA	United States	our human habitat is being destroyed by the dead zones and the reduction in habitat for marine life
Virginia	Lee	Half Moon Bay	CA	United States	Our ocean ecosystem holds many undiscovered cures for disease and produces vital nutritious foods that are increasingly hard to find elsewhere.
Lisa	Krausz	Tiburon	CA	United States	Our ocean life is so vital to our entire ecosystem. Because we can not see it on a daily basis, we often don't understand the threats and dangers this vital building block is to our own health and well being. Please carefully analyze all of the proposals you receive and move to protect fish habitats.

Karen	Spiegel	Burbank	CA	United States	Our oceans need every ounce of protection that we can give them.
Mr And Mrs James	Denison	Long Beach	CA	United States	Our seafloor needs protection!
Sarah	Tiers	Crestone	CO	United States	Healthy fish is an important food; unhealthy fish cannot be consumed without danger to our health. Please do your part to protect the oceans. We've had enough damage to our oceans with oil companies and fracking so let's put an end to this.
Andre	Yokers	Cape Coral	FL	United States	Let's preserve our natural heritage!
Thomas	Keenan	Coeur D' Alene	ID	United States	Is anyone paying attention to the rapid pH shift in our earth's oceans? Is anyone concerned about the outbreak" of jelly fish... another red flag? Does anyone do their jobs any more when it comes to protecting our fragile planet for our kids and grandkids and beyond? Greed will see to our end..."
Bruce	Dunn	Jefferson	MD	United States	Listen to the science!
Lee	Pesce	Syracuse	NY	United States	Mankind's greed, arrogance, and ignorance is wrecking havoc on an already fragile planet and is estimated to worsen over the next few years. The land and sea animals don't stand a chance!
Catherine	Dishion	Corbett	OR	United States	A healthy ocean is crucial to life on earth.
Franklin	Kapustka	Aloha	OR	United States	At what point do circular piles need to be dropped into the sea floor to prevent these atrocities.
Marlies	Wessbecher	Brookings	OR	United States	Bottom Trawling is abhorrent.

Emilie	Marlinghaus	Bend	OR	United States	Contemporary fishing practices, such as the terribly destructive & wasteful practice of bottom trawling which destroys whole ecosystems before many of the species they contain have even been identified, are an abomination and must end. The oceans and the once teeming life they harbored are being pressured and threatened in ways once considered unthinkable. Please do all that you can as quickly as you can to preserve and protect are priceless marine heritage.
Walter B.	Willette	Portland,	OR	United States	Everything in this world has a finite factor and must be treated with the respect mandated by Natural Laws. Once gone, forever gone!
Karen	Horton	Independence	OR	United States	Everything plays a part in our ecosystem. All too often we find out too late how big a part. The ocean is where life began
Mark	Wheeler	Portland	OR	United States	Help Protect Critical Seafloor Habitat.
Robert	Miller	Portland	OR	United States	Help protect our oceans.
Jaylen	Schmitt	Portland	OR	United States	I live near the Pacific coast and I see how incredibly important the ocean is to our economy, our ecosystem and our lives. The ocean should be protected in order to protect livelihoods, species, the health of our communities and the environment as a whole. It is all connected.
Brenda	Fugate	Portland	OR	United States	If the ocean ecosystems collapse, we on land will soon follow suit. They are under assault from so many directions --this is a matter of our survival!
Rita	Castillo	Springfield	OR	United States	It is vital that you do this.

Erin	Marshall	Portland	OR	United States	Nothing is more important than protecting our planet and the life that abounds on it!
Vicki	Hood	Roseburg	OR	United States	Our Lord watches----and he waits.
Ryan	Ashby	Harrisburg	PA	Please Select	How difficult is it to support a good cause? Answer: not.
Roberta	Parrish	Springfield	VA	United States	I am writing as I care deeply about protection of the environment and this issue is very important to me.
Stanley	Jones-Umberger	Washougal	WA	United States	All trawlers should be scuttled.
Sandra	Cole	Vancouver	WA	United States	and the folks who make the decisions should actually come out and take a look at the ocean once in a while. It is obvious the people making the rules get most of their knowledge from books and fairy tales. They don't know much about fishing, fish or fishermen
Tim	Durnell	Rice	WA	United States	Bottom trawling is devastating to habitat. We need to do better.
Lynne	Oulman	Brllinham	WA	United States	Climate change, acidification, pollution are killing our oceans. We need to save the critical sea floor habitat, and that means dealing with the first three things I listed. Without action, we shall be killing all life in the sea, and that will threatens humans too!
Diana	Covington	Tacoma	WA	United States	Conservation is essential if we are to keep on.
James	Roberts	Palouse	WA	United States	Current fishing practices are irrevocably harming our ocean ecosystems. We need to take strong, decisive action to prevent further destruction and degradation.
John	Walenta	Seattle	WA	United States	Fishing must be done in a way that does not destroy a vital food resource.

Kathleen	Wolfe	Des Moines	WA	United States	I am encouraging the PFMC to fully analyze the proposals of many organizations as it moves ahead with a process to identify and protect essential fish habitat.
Joan	Bykonen	Lacey	WA	Please Select	I have wanted someone to be honest and stop the very destructive type of fishing and I can only hope that it will happen before I am gone. It should happen right now TODAY before anymore damage can be done.
Glen	Carroll	Seattle	WA	United States	I live on the west coast, but this also affects the whole planet eventually.
Kerry	Logan	Wenatchee	WA	United States	I used to work in the fisheries. I've seen the damage first hand. It can't go on forever.
Mary	Johnson	Seabeck	WA	United States	If the seafloor is not protected, we could lose the vital resource of edible fish that depend on this ecosystem to survive.
John	Ballard	Woodinville	WA	United States	If the seas aren't healthy, we're all dead. Pretty simple really. Huge food source, critical contributor to atmosphere replenishment.
Jerry	Chilson	Enumclaw	WA	United States	If you dont Protect the ecosystem you dont have the fish, it's simple.
Gayle	Janzen	Seattle	WA	United States	It's a no brainer that we need to protect the seafloor habitat from trawlers that destroy everything in their wake. Without a health seafloor, our oceans will collapse. Please make sure this sensitive area is off limits to any kind of destructive fishing activity.
Janice	Holkup	Seattle	WA	United States	Just because we can't see it doesn't mean it isn't important. Look at your own body and think of all the things inside you can't see. Are they important, yes they are!
Mr. Shelley	Dahlgren, Phd	Issaquah	WA	United States	Messing with the ocean floor is never a good idea. SDD

Ernie	Loreen	Point Roberts	WA	United States	Our oceans and all waters need much better care. There is too much pollution being allowed which is so damaging to shell and sea life. We must do better. Dumping of ballast waste is destroying safe water quality.
B	Dobson	Langley	WA	United States	Our oceans are already suffering from our abuse.
Dina	Kovarik	Seattle	WA	United States	Our oceans are critical habitat and should be protected. Once lost, we may never get them back, and may lose ourselves in the process.
Ela	Gotkowska	Lodz		Poland	Be human...
Lara	Ebisuzaki	Toronto		Canada	Don't damage the ocean more than it already has been!!

RE: Agenda Item H.7, Essential Fish Habitat (EFH) Review Phase 2 Report and Proposals to Modify EFH

Dear Chair Lowman and Council Members:

I am a second generation marine ecologist. My father, Garth I Murphy, was the founding coordinator of CALCOFI and instrumental in introducing the word ECOLOGY into fisheries management. He cut his teeth on the unprecedented 18 year ban on fishing the pacific sardine that was required to bring sustainable California Current sardine catches back to a meager 10 percent of their peak production at 600,000 tons. He went on to do pioneering work on the Peruvian anchoveta whose steep decline was hurting the highly profitable local guano industry. No anchovetas no food for birds, no birdshit, nitrogen for armaments and crop fertilizer. There's a pretty little land/sea ecosystem at work screaming for maximum sustainable biomass.

I worked for two years on the Marine Life Protection Act Initiative South Coast project, a labor of intense education in the marine ecology of the complete range of 5000 species we were required to protect. At 68 I have personally witnessed drastic falls in populations of all species, and especially those commercially harvested by seining and other net sets. Land and sea are directly connected, and in order to get the ocean ecosystem responsibly managed, we have to consider the terrestrial interactions and demand pressures. We need immediate cross-ecosystem action in order to halt and reverse the steady, but not inevitable decline of the natural abundance of marine ecosystems and in particular the California Current.

I write to encourage you to protect seafloor habitat that is essential to healthy fish stocks and the ecosystem upon which they depend. Specifically, I request that you act in November to move to the regulatory portion (phase three) of the five-year groundfish Essential Fish Habitat (EFH) review process and to analyze all eight of the submitted EFH proposals.

As a concerned citizen and witness to the capacity of self-perpetuating ocean ecosystems left to do what they do best, which is to engage the widest possible diversity of species in interaction to produce maximum sustainable biomass and maximum sustainable harvests, I urge you to build upon the great work done through the current EFH review process. The EFH synthesis report and the submitted proposals contain new information on the distribution, location, and types of EFH along the West Coast, including prey species important to groundfish. While the Council has taken significant strides in protecting those areas identified as EFH during the last review, we now have better scientific tools and new information on where those sensitive areas are, how fishing impacts those areas, and what kind of protections need to be implemented.

EFH actions by managers should not merely prevent further degradation, but should seek to enhance the quality and amount of EFH. We must also protect habitats essential to feeding, spawning, and growth. Many species of fish rely on sponges and deep-sea corals as nurseries for their young. We should take care to protect this fragile habitat from the damage caused by fishing nets dragging along the seafloor. At this point, the Council should proceed with reviewing all the submitted proposals and developing an EFH package that both protects critical areas that are important for ecosystem health and provides continued opportunity for sustainable fishing.

The stronger an ecosystem management stance you take, the more efficient and productive your management efforts will be, and the quicker the general marine ecosystem will revert to its historic natural state of abundance, which I presume is the goal of the PFMC. and is certainly attainable if the will is there to do so.

Thank you for considering my comments and for your continued commitment to a permanently productive marine fisheries ecosystem.

Sincerely,

Garth Murphy, Founder
Integrated Ecosystems Management
649 South Vulcan Avenue
Encinitas, CA 92024

October 21, 2013

Mr. Will Stelle, Administrator
National Marine Fisheries Service West Coast Region
7600 Sand Point Way NE, Bldg. 1
Seattle, WA 98115-0070

Ms. Dorothy Lowman, Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, OR 97220-1384

Dear Mr. Stelle, Chair Lowman and Members of the Council:

I urge the Pacific Fishery Management Council (Council) to move forward with Phase 3 of the Groundfish Essential Fish Habitat (EFH) review and initiate the process to amend the Groundfish Fishery Management Plan (FMP). I also write in strong support of the proposal submitted by Monterey Bay National Marine Sanctuary (Sanctuary) to include areas one through thirteen in the FMP. This innovative, collaborative process was developed by representatives from local government, the fishing industry and environmental organizations from my District. Given the diverse support for these thirteen areas, the Council should adopt the Sanctuary's proposal as a package without making substitutions.

This proposal would add new areas for protection as EFH while simultaneously re-opening historically trawled areas that were of importance to trawl fishermen. If implemented, this proposal would further minimize adverse impacts of bottom trawl fishing to groundfish EFH and simultaneously enhance economic opportunities for local fishermen. It is founded on sound science from the National Oceanic and Atmospheric Administration (NOAA), the Monterey Bay Aquarium Research Institute (MBARI) and the California State University Monterey Bay (CSUMB). The datasets and analysis from these institutions clearly demonstrate that these unique and sensitive habitats along California's Central Coast are worthy of protection.

I would like to praise the Sanctuary staff for organizing and facilitating the negotiation process, and commend all the stakeholders for taking the risk to sit down at the table and, over the course

of many months, review the science together and discuss various scenarios in an open and thoughtful manner. My hope is that all the National Marine Sanctuaries will follow this model and not shy away from such a critical task.

Habitat protection, based on sound science and active stakeholder and community participation, is a fundamental management tool that the Council is authorized to employ as it works to restore and sustainably manage our nation's fish populations. The Monterey Bay National Marine Sanctuary is one of the prized gems of our ocean. NOAA is authorized to protect and provide for multiple uses of the resources within the Sanctuary. To do so, they must continue to facilitate similar negotiations, bringing stakeholders to the table to work collaboratively from the beginning. This will not only foster trust and understanding between all parties, but also provide a forum to make the hard decisions about how to protect and use the most valued areas in our ocean.

In my view, habitat protection is a critical tool of fishery management and we must encourage all stakeholders to review the best science, work collaboratively to build trust and identify areas for protection that will help us sustainably protect and manage our fish populations. I call on the Council to endorse the outcome of the Sanctuary-facilitated negotiation, thereby empowering the Sanctuary staff, local officials, fishermen and NGOs to continue the challenging work by returning to the negotiating table. There is much more work they must do together.

Sincerely,

SAM FARR

Member of Congress

*Thank you
good
work!*

cc: Mr. Daniel J. Basta, Director, Office of National Marine Sanctuaries
Mr. Paul Michel, Superintendent, Monterey Bay National Marine Sanctuary

October 18, 2013

Ms. Dorothy M. Lowman
Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Chair Lowman:

Consider a glass sponge. This simple creature with a skeletal expression of almost pure silica can rise more than three feet from the sea floor. Off the Pacific Northwest, in the deep cold waters at the edge of the Continental Shelf, some individual sponges may live more than 200 years, anchored on reefs that may be 250,000 years old.

Glass sponges are benthic suspension feeders. Their beautiful form is not just eye candy for scientists watching the video feed from a remotely operated vehicle, it's a functional structure that helps the animal gather the microscopic food that flows its way.

We know that glass sponges build structure to help themselves survive. But how do they contribute to the ecosystem. Is ocean chemistry affected in a small yet essential way by the life of a glass sponge? Do their skeletons provide refuge or other functions important to fish?

The National Oceanic and Atmospheric Administration (NOAA) is currently reviewing the ways that it protects Essential Fish Habitat (EFH) off the Pacific Coast. NOAA is required to protect EFH, and looks to its advisory body, the Pacific Fishery Management Council (Council) to make recommendations. The actual language in the federal fisheries regulations requires the Council to "prevent, mitigate, or minimize any adverse effects from fishing, to the extent practicable, if there is evidence that a fishing activity adversely affects EFH in a manner that is more than minimal and not temporary in nature."

How does this relate to the glass sponge? The first question is whether glass sponges are Essential Fish Habitat.

The aforementioned federal regulations define EFH as “those waters and substrate necessary to fish for spawning, breeding, feeding or growth to maturity.” The regulations define “waters” in this context as “aquatic areas and their associated physical, chemical, and biological properties that are used by fish and may include aquatic areas historically used by fish,” and subsequently define “substrate” as “sediment, hard bottom, structures underlying the waters, and associated biological communities.”

Well, glass sponges both alive and dead are structures. One of the fun parts of all of this is figuring out if fish use the structures. Since the fish won't talk we need to descend in submarines or send cameras down to observe their behavior. Numerous expeditions have confirmed that fish do indeed associate with the sponges.

After taking this walk through the regulations it seems clear that glass sponges are Essential Fish Habitat in ways that we can observe – and perhaps in ways that we have yet to fathom.

In addition to the sponges numerous other habitat-forming creatures inhabit the Northeast Pacific Ocean, notably corals. Often associated with rocky parts of the sea floor, and within submarine canyons, we'll find black, red, bamboo, bubblegum, gorgonian and even Christmas tree corals. On a 2009 cruise off of British Columbia the Living Ocean Society identified over 16 species of coral. Some of the deep-sea corals can live over 1,800 years growing scant millimeters per year.

While we usually associate corals with the hard bodied, reef-forming animals, there are also soft corals. *Octocorallia* such as sea pens, sea fans and sea whips attach to the sea floor and wave their eight tentacles and branched form like feathers in the current.

Okay, we have some amazing habitat on the seafloor off the Pacific Coast. Are we harming it? Does it need protection?

When NOAA took up the subject of EFH in the Pacific Region, in 2006, the federal government concluded that certain areas should in fact be protected. The human activity with the greatest impact on living seafloor habitat is bottom trawling.

Numerous important food fish such as soles and rockfish abound near the seafloor. By far the most efficient way to harvest these fish is to drag nets along the bottom. In deeper waters the nets generally have a large footrope that helps prevent hang-ups in rough terrain, and steel doors to keep the footrope spread and the net wide. Corals and sponges in the path could be torn from their moorage and crushed.

Over 80% of the groundfish landed in Washington, Oregon and California are caught in bottom trawls. A significant part of the economy in many coastal towns is dependent on the trawl fleet. A steady and relatively predictable flow of fish drives a multi-million dollar seafood processing industry.

We have a conflict between bottom trawling for food fish and preventing further destruction of corals and sponges. The conflict expands as we become more aware of the current and historic range of the habitat forming seafloor animals.

The environmental group Oceana and their friends at Ocean Conservancy and Natural Resource Defense Council have proposed modifications to the current EFH protection areas. Their Comprehensive Conservation Proposal closes 66 new areas to bottom trawling, primarily hard substrate and areas highly suitable for coral, as well as waters deeper than 3,500 meters. Although this amounts to an increase of over 137,000 square miles closed to bottom trawling, Oceana calculates that only 8.01 % of recently trawled area would be affected.

The Comprehensive Conservation Proposal also suggests opening certain areas to bottom trawling that were made off-limits in 2006, and exploring upgrades and refinements to enforcement technology that will reduce the need for buffer zones near protected areas.

The Comprehensive Conservation Proposal is well documented with citation to the available studies and observations. It would be reasonable for the Council to take this proposal as a starting point for discussions.

The Marine Conservation Institute has made a significant contribution to this EFH process through predictive deep-sea coral habitat modeling. It is far better to avoid inflicting harm on marine habitat by anticipating where sensitive, slow growing structures are likely to form, than to sweep up the pieces later.

It is interesting to note the overlap with the Marine Conservation Institute work, the Comprehensive Conservation Proposal and a proposal by Greenpeace that focuses on submarine canyons. This strongly suggests that expanded protection for these canyons and their heads should be a part of the EFH revisions.

The ocean is a very large place and there are data gaps, especially direct observations. Experienced fishermen can often provide the missing information with more efficacy than marine scientists. If the Comprehensive Conservation Proposal is the starting point, it is vital that fishermen are closely involved in the refinement of this into what would ideally be a collective proposal.

There will be those who argue that current protection is sufficient and the Comprehensive Conservation Proposal goes way overboard. An aggregate reduction of 8.01% of trawled ground may not seem excessive – unless a large part

of that has been essential to a trawling corporation's business plan.

The Council and NOAA face a difficult decision in how far to go in protecting EFH. They operate under a legal mandate to use the best available science in crafting their decisions. They also consider possible economic effects of their actions.

It's far easier to take a precautionary approach and err on the side of environmental protection if the economic result is benign. Although there is some empirical economic data on the groundfish fishery, the Council will still hear and to some extent rely on anecdotal testimony.

The goal should be to accomplish a win-win. This is expressed in the Comprehensive Conservation Proposal in the discussion of areas acceptable to reopen and in enforcement changes that could prove profitable to the fishery.

This leaves me wondering if this couldn't go a bit further, if unprecedented collaboration between the fishing industry and the environmental community might be realized.

Fishermen with decades of experience on the water know a lot about the seafloor. I'll surmise that some even know of coral hotspots that the environmentalists have missed. They're not going to tell. Where's the incentive?

There is an incentive. Gaining and maintaining a sustainability certification from the Marine Stewardship Council could increase the value of the landed catch of groundfish for fishermen, as well as the market value for processors. Progress has already been made at reducing bycatch and protecting overfished species. An active commitment to protecting habitat would further demonstrate sustainability.

Several years ago trawlers took direct action to protect the nearer shore reefs by use of a small footrope that would hang up if they fished on the rocks. This conservation action was later adopted in regulations still used in the shallower water trawl fisheries. (It is interesting, as Environmental Defense Fund points out in their July 31, 2013 EFH proposal, that fishermen now avoid the rocky areas in order to reduce encounters with rockfish species for which they hold a very low quota. Environmental Defense makes a reasonable suggestion to explore removing the small footrope regulation in order to better protect soft bottom habitat, especially with minimum disc spacing to reduce invertebrate mortality.)

The nearshore trawlers, sometimes called beach draggers, also developed selective flatfish trawl nets that allow rockfish to escape.

Pink shrimp fishermen experimented and developed finfish excluder devices to reduce unwanted catch – and effectively conserved rockfish.

The history is there. Fishermen have taken significant conservation actions before

regulations forced compliance. Environmentalists have offered creative ideas that can improve the profitability of fisheries.

Trawling has been a favored scapegoat for environmentalists. The images of giant nets destroying everything in their path while indiscriminately killing tons of fish and other bycatch are too tempting not to use. And that's the reality in some places some times.

But the West Coast reality is that trawling is a much more precise business. With the new Catch Share system and observers on every trawler, the process is to land the desired quotas and avoid overfished species. Fishing smart pays off. Trawlers don't want to land coral or even leave crushed coral and sponges in their wake. It's bad for business.

Nonetheless bottom trawl gear damages habitat. And in mixed species fisheries, trawling is notoriously non-selective. Greenpeace calls for a progressive shift to less destructive, more selective gear. While that may sound extreme to an industry that has struggled with scales of economic efficiency relative to fleet size and quotas, public perception is likely to drive demand for additional habitat protection.

Those who understand this dynamic will be the real winners in the long run. Resourceful fishermen (with the support of scientists and environmentalists) will test and develop gear modifications and perhaps even new approaches to fishing that are both efficient and habitat friendly. The market will reward these cutting edge efforts.

The Council is expected to use the best scientific information available to revise and refine Essential Fish Habitat designations. No doubt the Council will also encourage good faith negotiations among all parties to help make these tough decisions a little easier.

Respectfully submitted,

Preliminary Report
Oceana Important Ecological Areas Seafloor Habitat Expedition
Off the Central Oregon Coast

Prepared by: Geoff Shester¹, Ben Enticknap², Matthias Gorny³, and Jason Adelaars⁴

November 1, 2013

Background and Summary of Key Results

In August 2013 Oceana conducted a seven day research expedition in the Pacific Ocean waters off central Oregon to document and characterize seafloor habitats and their associated biological communities, ground-truth habitat data that formed the basis of our proposed additional Essential Fish Habitat Conservation Areas closed to bottom trawling, and to help inform and advance the long-term conservation and management of groundfish Essential Fish Habitat (EFH). Using a Remotely Operated Vehicle (ROV) mounted with a high definition camera, we recorded nearly 20 hours of video of the seafloor during the course of 23 dives, across five geographic study areas and in depths ranging from 29 to 365 meters. This summary provides preliminary analysis of the physical and biological structure at each area identified through continuous and interval video analysis techniques totaling 1,577 observations.

Oceana, Natural Resources Defense Council (NRDC) and Ocean Conservancy proposed that the South Nehalem Reef, Siletz Hotspot, North Daisy Bank, North Stonewall Bank and North Heceta Bank areas be designated as EFH Conservation Areas closed to bottom trawling as part of a coastwide Comprehensive Conservation Proposal submitted to the Pacific Fishery Management Council (PFMC) on July 31, 2013 (Oceana, NRDC, Ocean Conservancy 2013). This preliminary analysis provides the PFMC supplemental physical and biological habitat data for these proposal areas, as well as the co-occurrence of these habitats with fish species in the Pacific Coast Groundfish Fishery Management Plan. We also conducted dives inside the existing Daisy Bank and Stonewall Bank EFH Conservation Areas and the Cascade Marine Reserve and Protected Area (Siletz Reef) that will be closed by the Oregon Department of Fish and Wildlife to bottom trawling and other fishing activities in January 2014.

At all areas we confirmed the presence of hard and mixed substrates, documented cold-water corals, sponges and managed groundfish species. We documented gorgonian corals (Gorgonacea), sea whips and sea pens (Pennatulacea, a type of octocoral), soft corals (Alcyonacea), cup corals (Scleractinia) and hydrocorals (Stylasterinia) plus many different sponge types categorized by morphology. Gorgonian corals were identified at 16 of 23 dives and in all five areas. We documented many other invertebrates such as crinoids, anemones, tunicates and bryozoans that add to the biogenic structure of these areas. The physical structure of the habitats surveyed included a mix of hard rocky reef and low relief soft sediment. We identified a strong habitat association between sharpchin rockfish and glass sponges, barrel sponges, and other sponge types at Daisy Bank at 200 m depth.

The nearshore and offshore reefs and banks we surveyed both in state and federal waters are biologically diverse, contain sensitive structure forming invertebrates, and are clearly essential fish habitat for managed fish species. Two of the surveyed areas (Stonewall and Daisy Bank) include areas currently closed to bottom trawling. This data confirms the presence of sensitive physical and biogenic habitat within all five proposed additional EFH Conservation Areas that we surveyed, thus validating the presence of these habitat types in areas recently identified by the PPMC EFH Review Committee in the current 5-year review, which were not identified in the original Amendment 19 process.

Methods

ROV Survey

We collected video of the seafloor using a Mariscope “Commander” ROV equipped with 2 cameras, 4 lights, and paired sizing lasers. One camera was connected by an optical umbilical cable to the surface, feeding the ROV operator and scientists aboard the research vessel real time data, used for steering and navigating the ROV. The second camera, a high definition camera mounted under the ROV, recorded the seafloor in 1080p high definition at 30 frames per second. The high definition video was used for all video analysis. Once arriving at the seafloor, the ROV was operated at a constant speed, attempting to maintain consistent linear transects and a height approximately 1 meter above the seafloor.

Video Analysis

Video data recorded along the ROV transects were analyzed using a method to rapidly assess the benthic ecosystem within the study areas. This method involves two approaches for video analysis: continuous and interval analyses (detailed below). Each approach was utilized for gathering data on the physical and biological aspects of the seafloor ecosystem.

Continuous Analysis

The continuous approach involved the complete analysis of each video from start to finish. This approach allowed for the identification of all fish and structure-forming invertebrate species, resulting in a detailed species list for each transect. Where possible, each species was identified to the lowest taxonomic level. Species listed on the Federal Groundfish Fishery Management Plan (FMP) were grouped in a separate category than those unlisted. Unidentifiable fish species were grouped into sub-categories, such as unidentifiable rockfish, unidentifiable flatfish, young-of-the-year, and unidentifiable fish. The presence of structure-forming invertebrate species - corals, sponges, and large anemones – observed along each transect were logged based on their morphologies or order. Other species of invertebrates were also noted. Wherein a noteworthy species is unidentifiable, outside experts reviewed the video and provided comment.

Interval Analysis

The interval approach sub-sampled the video in 30-second intervals. A video frame from each sample was assessed for the predominant substrate type and level of vertical relief. This approach produced a general overview of the seafloor habitat along each transect. Seafloor characteristics were classified as follows:

- Substrate: characterization of the seafloor composition was achieved by visual assessment and the use of sizing lasers projected into the camera’s view. Substrate can be characterized as mud (no grains visible), sand (grains visible), cobble (<20cm diameter),

boulder (>20cm diameter), or bedrock (continuous reef) based on standardized categories derived by Green et al. (1999). The substrate type which accounted for the greatest proportion of habitat within the frame was recorded.

- Relief: seafloor complexity was classified as low (<1m), medium (1-2m), and high (>2m). Within each frame, the vertical distances between the highest and lowest points were estimated from the sizing lasers.

The habitat data was recorded precisely at the last frame of every 30-second interval throughout the video. If the habitat was indistinguishable within the current frame (i.e., too silty, too high off seafloor, lights on ROV were out) or if the current frame spatially overlapped with the previous 30-second frame, the current frame was rejected from the final results.

RE: Agenda Item H.7.b. Review of Pacific Coast EFH

October 30, 2013

Dear Ms Lowman,

As a longtime participant in the Pacific Coast whiting fishery Arctic Storm asks that the Pacific Council drop from further consideration Oceana et al proposals that seek to extend Essential Fish Habitat (EFH) conservation area closures to mid-water trawl gear and proposals wishing to extend closures to waters beyond 3,500 meters in depth. Greenpeace proposals to create full marine reserves where all commercial and sport fishing is prohibited and to “freeze the footprint” of current fishing locations by closing all other areas is not well documented nor does it provide any new scientific information. We recommend that these proposals should also be dropped from further consideration.

There has been no new scientific information presented during Phase I of this process that would make either of these proposals reasonable options for further consideration in Phase II.

Drop Proposals that Prohibit Mid-Water Trawl Gear in EFH Conservation Areas closed to Bottom Trawl Gear. The EFH proposal submitted by Ocean et al seeks to modify gear restrictions for all EFH conservation areas to prohibit all bottom contact by mid-water trawl gear. The rationale for this measure is contained in an inaccurate, half- page narrative on page 31 of their proposal. The argument is based on a single paragraph taken from a supplemental EFHRC report from April, 2013, Agenda Item D.6.c that reads as follows:

“Midwater trawl fishing is permissible within all Amendment 19 EFH conservation areas since it was assumed to have no contact with the seafloor. Annually, midwater trawling occurs over 8-31% of EFH conservation areas where bottom trawling is prohibited, and bottom contact is estimated by the fleet to occur up to 25% of tows predominately in soft sediment habitats, as referenced in the Phase I Report.”

Unfortunately, this statement mixes apples and oranges that cause inaccurate statements to be made when applied to EFH conservation areas such as the following: *“significant bottom contact occurring by midwater trawls, and that midwater trawl effort has high overlap with EFH Conservation Areas”* that *“compromises the management objectives of protecting seafloor habitats from mobile tending gear.”*

Even if bottom contact estimates used were accurate, EFH conservation areas occur in hard bottom areas where rockfish, corals and sponges may occur. The estimates of bottom contact used by Oceana et al occur in “predominately soft sediment habitats.” So, based on its own rationale, the Oceana proposal grossly misfires when taking aim on the whiting fishery.

However, there is much factual information available to counter their mischaracterization of mid-water trawl gear impact on EFH conservation areas.

- 1) Please find as Attachment 1, observer data from the Mothership and Catcher processor whiting sectors provided from Sea State for the years 2000-2013. The data was sorted by haul to determine how many tows occurred during that time, which ones occurred in areas now identified as EFH conservation areas, and how far off the bottom the net was towed. During those 13 years, 28,486 hauls were made of which only 956 occurred in the EFH conservation areas. Only 6 hauls in 13 years (hauls less than 20 fathoms from the bottom) occurred close enough to the bottom to have had bottom contact. Shoreside whiting observer data is not included because it is not in the Sea State data base but there is no reason that shoreside vessel operators would operate differently than their offshore counterparts in seeking to capture the same fish.
- 2) Also find as Attachment 2, observer bycatch data from the Mothership and Catcher Processor whiting sectors provided by Sea State for the years 2000 – 2013. Observers sort bycatch into hundreds of specie categories. The species listed here are the known bottom-dwelling invertebrates. The data shows that in harvesting 1,554,863 mt of whiting over 13 years, the fleet caught 22 pounds of coral and 64 pounds of sea whips & sea pens. No sponges were taken further supporting the haul data above that shows diminimus bottom contact occurs by mid-water trawl gear in EFH conservation areas.
- 3) The final attachment is a map of closure and advisory areas designated by the Shoreside and Midwater whiting coops. These are voluntary and precautionary efforts by participants in the whiting fishery to avoid bycatch of rockfish species made possible by rationalization of the fishery under Amendment 20. Approximately, 2,000 sq. miles of rockfish habitat has been closed by the whiting coops. The Hecate Band closure alone is as large as Mt. Rainer National Park. In many cases these closures overlap with existing and contemplated EFH conservation areas. The mid-water whiting fishery is already doing its part to conserve these important species and habitats.
- 4) Trawl depth sensor technology is geared to fishing rather than enforcement action. Based on demonstrated diminimus bottom contact of mid-water trawl gear in EFH areas, a regulatory action prohibiting bottom contact seems misguided, unenforceable and unnecessary.

The information provided here is factual. It refutes the ½ page of speculative and misleading assertions made in the Oceana proposal. Further consideration of this proposal does not seem reasonable based on the best scientific information available.

Drop Proposal to Extend EFH Closure Areas to Waters Beyond 3,500 Meters in Depth. The Oceana et al proposal also seeks to add all waters deeper than 3,500 meters within the West Coast EEZ to the

designation of Pacific Coast Groundfish EFH for the purpose of giving NMFS and PFMC the authority to establish the proposed bottom trawl closure. There is no evidence provided in the proposal that either deep sea corals or FMP species inhabit these waters. EFH conservation measures are required to support, in some measure, protection of FMP species. For that reason, NMFS declined to designate this same area as EFH in its Final Rule implementing Amendment 19. No new information has been presented since that time that either corals or FMP species are located in these areas or that they are in need of protection since no fisheries currently exist at these depths. Should FMP species one day be found moving to these waters in numbers that might attract fishing effort, it would be appropriate at that time to consider such scientific information as is available. For now, it does not seem reasonable to further consider such an alternative based on no new FMP species information at those depths.

Greenpeace proposals to create full marine reserves where all commercial and sport fishing is prohibited and to "freeze the footprint" of current fishing locations by closing all other areas is not well documented nor does it provide any new scientific information. For all the reasons cited above, these proposals should also be dropped from further consideration.

Thank you for consideration of our comments.

Sincerely,

A handwritten signature in cursive script that reads "Donna Parker".

Donna Parker

Director of Government Affairs

Attachment 1. Bottom Contact with Mid-Water Trawl Gear in the Offshore Whiting Fishery

Below is a listing of all tows that occurred in the offshore whiting fishery within EFH conservation area boundary locations that were within 30 fathoms of the bottom over a 13 year period, 2000 – July, 2013. The depth off bottom is calculated by subtracting the head rope height from the bottom depth. The overall data set showed 956 tows in EFH conservation areas based on retrieval location, out of 28,486 total hauls. Of these 956: 6 were less than 20 fathoms from the bottom and 42 were less 30 fathoms from the bottom. The remaining 914 hauls were 30 or more fathoms from the bottom.

Attachment 2. Coral and Sponge Bycatch in the Mid-water Offshore Whiting Fishery

Below is a listing of the total numbers and weight of benthic invertebrates taken by the entire offshore whiting fishery from 2000- July, 2013. The observer data set includes 28,486 hauls taken with mid-water trawl gear from the mothership and catcher processor whiting fishery.

Corals and Sponges are highlighted in yellow. During those 13 years, 10 kg or 22 lbs of corals and 29 kg or 64 lbs of sea pens/sea whips were taken as bycatch. No sponges were taken.

ELECTRONIC MONITORING ALTERNATIVES

At its April, 2013 meeting, the Council decided the primary focus of integrating electronic monitoring (EM) into the trawl catch share program would be to achieve the compliance monitoring required for individual accountability of catch and bycatch. At its June, 2013 meeting, the Council established a Groundfish Electronic Monitoring (GEM) Policy Advisory Committee (GEMPAC) to focus on the development of options for EM use in the trawl catch share program and a Groundfish Electronic Monitoring Technical Advisory Committee (GEMTAC) to advise the GEMPC. At the September 2013 meeting, the Council provided guidance to the GEMPAC and GEMTAC to discuss, at the October GEM Committees meeting, a “phased in approach” for implementation of EM, starting with midwater trawl and fixed gear fisheries, then a separate phase for bottom trawl fisheries. The Council also asked the GEMPAC and GEMTAC to discuss the use of data logger systems as a component of the EM program, discuss alternatives for an EM program that includes species that may be discarded under maximum retention fisheries, and to explore ways to minimize discards made for safety reasons. The Council also requested that the Northwest Fisheries Science Center provide a report at the November, 2013 Council meeting on how the West Coast Observer Program would be adjusted to move forward with an EM program in place for midwater trawl, fixed gear, and potentially bottom trawl fisheries. The report is expected from NMFS but was not available at the time of the advance briefing book deadline.

On October 15-16, 2013, both committees met to consider the Council’s requests and develop draft alternatives for an EM program. Prior to the meeting, Council staff provided a draft set of alternatives to the committees (Agenda Item H.8, Draft Alternatives for GEMPAC). The October GEMPC Report will be provided, including recommendations for consideration by the Council (Agenda Item H.8.b, Supplemental GEMPC Report).

Under this agenda item, the Council is scheduled to consider an update of NMFS/PSMFC 2013 field season. Detailed information of the 2013 field season will be presented at the June 2014 Council meeting. At this meeting, PSMFC will provide detailed information of the 2012 field season and provide the Council with some issues of concern regarding an EM program.

Under this agenda item, the Council is also scheduled to adopt a range of alternatives for EM regulations and provide guidance on further analysis. Dependant on Council direction, the GEMPAC or GEMTAC may meet this winter.

Council Action:

- 1. Adopt a range of alternatives for EM regulations.**
- 2. Provide guidance on further analysis.**
- 3. Provide guidance on issues indentified in the GEMPC Report to the Council, as necessary.**
- 4. Provide other guidance as necessary.**

DRAFT ALTERNATIVES FOR GROUND FISH ELECTRONIC MONITORING POLICY
ADVOCACY COMMITTEE (GEMPAC) CONSIDERATION

There appears to be three major decisions needed for all elements of an EM program.

1. Is the element of the program one that should be decided by the Council or can it be left to NMFS to determine implementation?
2. If warranting a Council policy decision, should the element be specified in a prescriptive manner or as a performance standard with some criteria to measure if the standard has been met? For example, only certain species may be allowed to be discarded, therefore those species would be prescribed in regulations. An EM hardware and software system that captures the necessary images and data to document discard events may be implemented through a performance standard to provide opportunities for innovation and improvement.
3. If a performance approach is decided, should the Council specify the performance criteria and if so, what should those criteria be?

Section 1 covers major policy decision topics:

1. EM Participation and eligibility
2. Discard monitoring method
3. Species that may be discarded
4. Individual Vessel Monitoring Plans
5. Implementation of an EM program

Section 2 covers more detailed provisions for an EM program. The section titled “Data Capture and Processing” includes options for an EM system (i.e., hardware, data sources, formats) and how the fishery data would be processed (i.e., data transfer, validation, analysis).

Compliance and enforcement considerations will be discussed throughout development of alternatives. After draft alternatives are developed and a reasonable range of alternatives are selected by the Council, a detailed analysis of impacts will be drafted for further Council consideration.

Over Arching Policy Decision

Under the National Policy Environmental Policy Act, a reasonable range of alternatives must be identified for a federal action, and includes the “no-action” alternative or status quo. Prior to moving forward with an EM program, the Council must decide the level of EM use compared to the status quo of 100 percent observer coverage. Three alternatives for compliance monitoring of the trawl rationalization fishery have been identified:

Alternative 1: No Action – 100 percent industry funded observer coverage, no EM program.

Alternative 2: Use industry funded observers and an EM program.

Alternative 3: Use only an EM program.

After this decision is made, all other major policy decisions can be made to develop an EM program.

1. Major Policy Decisions

1.1 EM Participation and Eligibility

Many constituents believe that EM should be an option and not mandatory, and that participants should need to meet certain criteria to be eligible to use EM in lieu of carrying an industry funded observer. Participation in an EM program could either be mandatory or voluntary.

Alternative 1: EM is mandatory

Alternative 2: EM is voluntary

1) Participants must be eligible

a) Eligibility criteria

i) Must have an approved individual vessel monitoring plan (IVMP) to participate

ii) Must be in “good standing”. Vessels not in good standing would be required to carry an observer. The requirement to be in good standing would provide administrative incentive for compliance.

iii) Criteria for good standing: TO BE SPECIFIED. Need to develop continued eligibility criteria

2) Declaration to NMFS for use of EM (i.e., vessel will opt to use EM for a specified period of time within fishing year)

a) For the coming year, participants must indicate in which months, if any, it will use EM and in which months, if any, it will use an observer.

Discussion:

If the program is mandatory, the program may lack industry “buy-in”. However, a mandatory program would provide a consistent source of discard data. If participation is voluntary or a privilege, the program would provide operational flexibility that allows participants to choose between a human observer or EM. If it’s a privilege to participate then the need to maintain the privilege may provide incentives for compliance. However, it’s possible that industry funded observer monitoring costs may increase if there is less demand for observers, particularly in smaller ports. Eligibility criteria would need to be developed along with a standard for compliance for operators/owners for continued participation under a voluntary program.

1.2 Monitoring for Discards

A discard monitoring method that would adequately account for discard in each fishery is necessary. One method may not work for all so each fishery will need to be examined. However, the decision will need to incorporate options for which species or species groups may be discarded in a fishery; see section 1.3 Discard Alternatives.

Alternative 1: Self-reporting and Audit Approach

EM system is used to validate the vessel’s account for discards. Harvester reports the catch in a logbook and the EM system is used to verify the logbook information through X% of video review for verification. Electronic logbook data will likely be the sole source for discards. (Initial minimum sampling rate to be specified.)

Alternative 2: Video Census Approach

Only EM system is used to account for discards. All video is reviewed for discard events and weight estimates are applied to get total discard accounting.

Alternative 3: Video Sampling for Expansion Approach

EM system is used to account for discards. Estimate discards by the random viewing of some percentage (e.g., X%) of all fishing events across all trips or within a trip and expanding weight estimate for total discard for all trips or by trip. (Initial minimum sampling rate to be specified.)

Sub Alternative for Alternatives 1 through 3: Spatial Management Alternative

This option could be applied to any of the above approaches. Under this option, fishing activity in areas that are likely to have lower bycatch could be monitored with EM rather than using observers. Vessels would declare their fishing area prior to departure and be required to follow the appropriate fishing protocols for that area.

Discussion:

The choice of a discard monitoring method impacts costs, data and vessel turnaround times (the time required to incorporate discard data into the quota tracking system) and certainty about account status, accuracy of estimates, and degree of compliance incentives.

Cost factors include the need for an electronic logbook system, time reviewing video, fishery policy and enforcement costs, and effects on observer costs (Table 1).

Table 1. Relative costs among EM alternatives for discard monitoring.

	Cost Categories		
	Logbook	Video Review	Fishery Policy, Enforcement, & Observers
Alternative 1 (self report/audit)	Cost of E-logbook system	Cost of sampling	Possible higher per day costs than status quo.
Alternative 2 (census)	No impact	Cost of census	Possible higher per day costs than status quo.
Alternative 3 (sampling w/ expansion)	No impact	Cost of sampling	Possible higher per day costs than status quo.
Sub-Alternative (subareas)	Minor impact if paper logbooks are revised/created	Less overall reliance on EM which may result in higher average costs.	More regulatory complexity, higher enforcement costs, and more reliance on observers at higher per day costs than status quo.

Only Alternative 1 requires an electronic logbook system while Alternatives 2 and 3 rely solely on video review for the estimation of discards. Alternatives 1 and 3 both rely on sampling video and so may entail comparable video review costs which are less than the costs of full census, Alternative 2. The main impact on enforcement costs would be the subalternative which would allow the use of videos in place of observers only when vessels are fishing in certain areas. Such a provision would require the establishment of a set of management lines which may be modified over time, increasing the costs of developing fishery policy and the complexity of the regulations that fishermen would have to understand. The additional regulatory complexity would likely add to enforcement costs as well. Finally the subalternative would likely entail greater continued reliance on observers if areas to fish with EM are limited in scope and vessels choose to fish with an observer outside those areas. This would result in lesser reliance on video review compared to alternative 1. Under all alternatives here, a reduction in total demand for observers could result in higher per observer day costs than under status quo and lesser video review could result in higher average video review costs relative to other EM alternatives.

Data turnaround and vessel turn-around times will vary by alternative and depend on other aspects of policy. Longer lags to process the data may lessen certainty in a vessels' account balance prior to departure on the next trip.

Table 2. Impacts to data processing and vessel turnaround time under each discard monitoring method (alternatives 1 through 3).

	Discard Data Turnaround	Vessel Turnaround	Account Balance Certainty
Alternative 1 (validation)	Shortest - Immediate	Immediate ^{a/}	Greatest
Alternative 2 (census)	Longest - Time required for complete census of video	Immediate ^{a/}	In Between
Alternative 3 (sampling)	In Between - Time required for review of sample of video	Immediate ^{a/}	Least (incentive to mitigate by retaining all fish)

a/ Immediate, assuming continuation of current policy under which vessels are allowed to fish until data shows up in the system showing that they are in deficit.

Data turnaround times could be the fastest with Alternative 1 under which the primary source of data would be electronic logbooks. Discard data from logbooks could be transmitted immediately upon the end of a trip. Video would be reviewed later to spot check the logbook reports, validating their accuracy. Current policy allows a vessel to keep fishing until information is recorded that indicates it has incurred a deficit. Since discard information comes from observer reports, such information may come in weeks after the completion of a trip. A continuation of this policy would allow vessels to leave on its next trip with greater certainty about its account status than under status quo, assuming that it is reasonable to expect that accurate logs would be validated by video review with no changes. There has been some discussion that under a video system a vessel might not be able to leave port until after the video is reviewed but at this point that has not been recommended for consideration by the committee or the Council.

Using a video census approach (Alternative 2), and assuming a comparable video review capacity, there would be the greatest time lag between completion of a trip and resolution of the vessel account balances.¹ Vessels could maintain their own estimates of discards but there would likely be some differences with the estimates made through cameras, contributing to uncertainty about account balances until video review is completed.

Using a video sampling approach (Alternative 3) there would likely be a lesser time lag in getting discard data into the system than under Alternative 2 but greater than under Alternative 1. As with the other alternatives, the vessel could leave on its next trip immediately but there would be greater uncertainty regarding its account balance. Because vessels would not likely know which events would be expanded as a result of random sampling, this alternative would entail the greatest uncertainty regarding the vessels' eventual account balances. Vessels might attempt to mitigate this uncertainty by keeping fish they might otherwise discard (e.g. a damaged overfished species or fish for which species identification on camera might be less certain).

Alternative 3 would be the least accurate among the alternatives and could adversely impact the remainder of the fleet. If the video sample picked up some less frequent incidental catch species and expanded that result out to the entire trip or across trips, more quota for a species in low supply might be required to cover the trip, resulting in less availability of quota pounds of that species for the remainder of the fleet. The relative accuracy of Alternatives 1 and 2 would depend on the degree of compliance incentive for accurately filling out the e-logbooks. Assuming good-faith compliance, Alternative 1 would provide two estimates as compared to the single estimate provided by the census approach. Inevitably there would likely be some discrepancy between the two and rules would be needed on which estimate to use. Example rules include: the higher of the two, the camera estimate, or the logbook estimate unless the camera estimate was higher by some threshold amount. The third approach might create an incentive for underreporting. Also required would be a rule for the amount of deviation between camera reports and logbook reports that would have to be observed for a vessel to be considered out of compliance and not in good standing for purposes of being classified as an eligible participant in the EM system (see Section 1.0). However, overall the first approach would provide an ongoing assessment of the performance of the video review for upward bias. If over time the cameras consistently overestimated relative to the logbooks it is likely that such overestimation would stimulate complaints and a response to improve accuracy. If there were consistent underestimation, this might also be detected by video reviewers comparing video estimates to logbooks. For Alternative 2, there would be no separate data stream available to indicate possible biases. On the other hand, Alternative 2 would provide an independent census of the entire trip and not rely on expansions. If video review results in unbiased estimates, the results might be more accurate than Alternative 1 but less information would be available to validate the video estimates (compared to Alternative 1).

Under all alternatives there may be some incentive to frustrate the video monitoring system by discarding off camera or otherwise interfering with camera performance. On the other hand, the chances of payoff from discarding off camera would be lower because the review is sampling

¹ Note: There would have to be some higher level of video review capacity than under Alternatives 1 or 3, otherwise video review would constantly fall behind by longer and longer amounts.

rather than census. Under Alternative 1 there would also be an opportunity to under-report some discard events in hopes that they would not be sampled. Under Alternative 3 on the one hand there might be the greatest incentive to do so, in that, if an event is sampled and some reporting of discard is avoided then the payoff would be greater (the reduced discards reported for the expanded estimates) than would be the case for the video census.

Useful information to gather to inform the analysis:

What are the sampling rates of other systems (or is census used)?

Are there any systems that don't also have logbooks and are they e-logbooks?

Cost estimates for video census vs. sample (will be driven by sampling rates).

1.3 Discard Alternatives

The Council will need to decide which species will be allowed for discard with an understanding that those approved for discard are accurately accounted for or verified through video review under the appropriate discard monitoring method. Currently, under the trawl rationalization program each fishery may discard or is required to discard certain species. Under an EM program, discard events will be documented with video however it may be difficult to identify some species or differentiate between species. There are four alternatives identified that allow for discard (Table 3); they range from full retention (no discard allowed) to discard at will (discard any species). Table 3 provides the species that may potentially be discarded under each alternative. The discard species are grouped by catch share groundfish species, non-catch share groundfish species, non-groundfish species, prohibited species (halibut, salmon and dungeness crab), and ESA/MMPA protected species (turtles, marine mammals, seabirds, etc). The alternatives reference discards of catch share and non-catch share species. These species lists are different for the IFQ and mothership co-op fisheries. Tables 4 and 5 identify which species are considered catch share and non-catch share species for each of these fisheries. Table 6 contains ESA-listed species that may be found in the area of operation for groundfish fisheries.

Discard events are categorized as selective (intentional discard) and non-selective (discard that was not intentional). Under each alternative, different options may be selected for different gear groups; therefore, *options* to selectively discard certain species or species groups, and *requirements* to selectively discard certain species are noted in the table.

Alternative 1: Full retention

1. No selective discard. Retain all catch share species and non-catch share groundfish species for the IFQ and co-op fisheries (see Table 4 and 5, respectively); non-groundfish species; prohibited species; ESA species (Table 6); and MMPA species.
2. No non-selective discard.

Alternative 2: Maximize Retention

1. No selective discard for catch share species, non-catch share groundfish species
2. No selective discard for non-groundfish species (excluding species on the prohibited species or protected species lists.
3. Allow selective discard of trash, mud coral, etc.

4. No selective discards of prohibited species except when midwater trawl IFQ vessels sort at sea; MS processors must discard prohibited species.
5. Require selective discards of ESA and MMPA species (protected species).
6. Allow non-selective discards for safety, "bleeding net", zipper accidentally opened, or fish came off hook. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).

Alternative 3: Retention of Catch Share Species With Options.

1. No selective discard for catch share species with options that allow selective discard of some catch share species; options not mutually exclusive. There must be adequate camera species identification and weight estimates for discard of catch share species. Proposed selective discard list for groundfish (sub-options are noted):
 - a) Catch share species
 - Option a – Allow discard of flatfish
 - Option b – Allow discard of lingcod and sablefish
 - Option c – Allow discard of all non-rockfish groundfish (full retention of rockfish only)
 - b) Non-catch share groundfish species
2. No selective discard for non-groundfish (excluding prohibited or protected species)
 - Option d – Allow discard of all non-groundfish species
2. Allow selective discards of trash, mud, coral, etc.
3. Require selective discards of prohibited species except when midwater trawl IFQ vessels do not sort at sea; MS processors must discard prohibited species.
4. Require selective discards of ESA and MMPA species.
5. Allow non-selective discards for safety, "bleeding net", zipper accidentally opened, or fish came off hook or gilled in net. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).

Alternative 4: Discard At Will (Status Quo)

1. May discard catch share species, non-catch share species (e.g., at-sea whiting set-asides)
2. May discard non-groundfish (excluding prohibited or protected species).
3. Allow selective discard of trash, mud coral, etc.
4. Require selective discards of prohibited species except when midwater trawl IFQ vessels do not sort at sea; MS processors must discard prohibited species.
5. Require discards of ESA and MMPA species (protected species).
6. Allow non-selective for safety, "bleeding net", zipper accidentally opened, or fish came off hook or gilled in net. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).

Table 3. Selective species discard alternatives for catcher vessels only. Key - White: No Discard/must retain species; Gray: May Discard; Black: Discard Required; Crosshatch: No discard with exceptions or options.

Species Discarded	Alt 1. Full Retention					Alt 2. Maximize Retention					Alt 3. Retention of Catch Share Species with suboptions					Alt 4. Discard at will

a/ No regulatory distinction between non-whiting and whiting MWT trips. For example chaffing gear regulations in the MWT fishery apply to both types of activity.

Exceptions:

1. Non-selective discard for safety, "bleeding net", zipper accidentally opened, fish came off hook, gilled in net
2. Unmarketable (e.g., small size, damage, sand fleas)
3. MS CVs must retain halibut, salmon, and crab and MS must discard
4. SS midwater trawl IFQ trip must discard halibut, salmon, and crab if sorting at sea.
5. SS IFQ may discard minor amounts of catch
6. There may be exceptions to retain marine mammals, seabirds, and turtles for necropsy.

Options: (not mutually exclusive)

- a. Allow discard of flatfish
- b. Allow discard of lingcod and sablefish
- c. Allow discard of all non-rockfish groundfish
- d. Allow discard of all nongroundfish species

Table 4. IFQ program and Non-IFQ groundfish species groups that are noted in Table 3 as potential discards. Source regulations are noted in each list.

Catch share species (IFQ program groundfish species, From: 660.140(c)(1))	Non-catch share species (Non-IFQ Groundfish Species From: Table 1 and 2 to Part 660, Subpart D -- Limited Entry Trawl Rockfish Conservation Areas and Landing Allowances for non-IFQ Species and Pacific Whiting North and South of 40°10' N. Lat.)

Table 6. ESA-listed species that may be found in the area of operation for groundfish fisheries.

ESA Species	
Green sturgeon (<i>Acipenser medirostris</i>)	Southern Resident killer whales (<i>Orcinus orca</i>)
Eulachon (<i>Thaleichthys pacificus</i>)	Guadalupe fur seals (<i>Arctocephalus townsendi</i>)
Humpback whales (<i>Megaptera novaeangliae</i>)	Green sea turtles (<i>Chelonia mydas</i>)
Steller sea lions (<i>Eumetopias jubatus</i>)	Olive ridley sea turtles (<i>Lepidochelys olivacea</i>)
Leatherback sea turtles (<i>Dermochelys coriacea</i>)	Loggerhead sea turtles (<i>Carretta carretta</i>)
Sei whales (<i>Balaenoptera borealis</i>)	Short-tailed albatross (<i>Phoebastria albatns</i>)
North Pacific Right whales (<i>Eubalaenajaponica</i>)	Marbled murrelet (<i>Brachyramphus marmoratus</i>)
Blue whales (<i>Balaenoptera musculus</i>)	Southern sea otter (<i>Enhydra lutris nereis</i>)
Fin whales (<i>Balaenoptera physalus</i>)	California least tern (<i>Sterna antillarum browni</i>)
Sperm whales (<i>Physter macrocephalus</i>)	

Discussion

Key aspects of the decision the species for which discards will be allowed include the camera's ability to capture required information, impacts on video review costs, and impacts on the collection of biological information.

With respect to camera ability, for non-IFQ species discards the key is the ability to differentiate the non-IFQ species discards from IFQ species in order to ensure that IFQ species are properly

accounted for. For non-IFQ species, further speciation (beyond ensuring that the discard is a non-IFQ species), weights, or other measures would not be required. For IFQ species, the camera system would need to identify the exact species and also generate a video image with enough quality to estimate weight using a video reviewer or through length weight relationships (but other technologies may develop over time).

The more species are discarded, the more events will likely require more careful video review, possibly increasing costs. The degree of cost increase will depend on the technologies that develop over time to automate the video review and species identification/measurement process.

With full retention, an opportunity is generated for the shoreside collection of biological information which is currently collected by at-sea observers. As the scope of allowed discards increases, the opportunity for shoreside collection of biological data decreases. Such reductions might be inversely related to the amount of biological observer coverage required under the program. Evaluation of this potential impact will require input from the West Coast Groundfish Observer Program.

1.4 Individual Vessel Monitoring Plans (IVMP)

A major policy question is whether to have IVMPs as part of the EM program and, if so, the duration of effectiveness of such plans. It's likely that these plans will be required to facilitate an effective program and serve as a clear plan for discard documentation, installation and maintenance an EM system, protocols for data storage and transfer, among other things. Each vessel operator/owner would be responsible for developing an IVMP for the vessel and acquiring the needed approval. It's likely that NMFS would approve the plan and determine when and how long it would be effective. Vessel specific fish handling protocols may need to be developed to provide clear visuals of species discarded. A general list of the categories to be included in the IVMP is provided here but specifics for these elements and the criteria to be met for approval would be specified in Section 2, Data Capture and Processing.

- 1) Approval of plans:
 - a) Approved by NMFS based on criteria specified in regulation
- 2) Duration of Effectiveness:
 - a) Plan modification provisions
 - b) Monthly, annual, quarterly plan, etc
 - c) Specified by NMFS or IVMP is set between fisher and provider
- 3) Categories of information in an IVMP (specifics identified in Section 2):
 - a) Type of system
 - b) Hardware
 - c) Software
 - d) Emergency protocols
 - e) Back-up equipment use protocols
 - f) Catch handling protocols
 - g) Layout of vessel
 - h) Screen shots of all camera views
 - i) Number of cameras needed with placement specifications

- j) Care and maintenance of the EM system
- k) Types of sensors and data for sensors to capture
- l) Download/maintenance schedule
- m) Logbook format (electronic or paper)

1.5 Implementation

Implementation of an EM program could be done for all fisheries at one time through regulation. However, there may be other options. Implementation of an EM program could be done through a pilot program using an Exempted Fishing Permit (EFP). For example, an EM program may be developed for a fishery then implemented on a temporary basis through an EFP to identify issues and improve the program before it is implemented full scale for a particular fishery or all fisheries. It could also be done through a “phased-in” approach. For example, if development of an EM monitoring program (i.e., regulations, camera system, EM providers, review process, accounting protocols, enforcement, etc.) is ready for use in the midwater trawl fishery then NMFS could implement the program by regulation before other EM programs are fully developed for use in other fisheries such as the bottom trawl. Phasing in could be organized in a number of ways.

Alternative 1: Implement EM program for all fisheries at one time

Alternative 2: Phase in with a pilot program with EFPs

Alternative 3: Phase in by sector/gear

2. Data Capture and Processing

The success of an EM program relies on the ability to capture the data and process it in a timely manner. There are multiple ways to set up a system and many details are absent here; however, some general topics are listed here to begin development of a system.

2.1 Vessel Hardware and Data Maintenance Onboard

1) Data formats:

Alternative 1: Specific format(s)?

Alternative 2: Open source format to utilize the video images using a range of commercially available viewers, without having to purchase licenses from vendors who collected the data. NMFS policy encourages the use of open source code or standards that facilitate data integration and offer long-term cost savings rather than becoming dependent on proprietary software.

2) Video Hardware:

Alternative 1: Analog

Alternative 2: Digital

Alternative 3: Both Alternatives 1 or 2 can be used

Alternative 4: Other?

3) Logbook Data Source: It is assumed that electronic logbooks would be required processed by NMFS for quota pound accounting. Without such logs, the time required for video review would expand and likely make the program cost prohibitive. The fields and data format would be specified by NMFS.

4) Data Storage:

Alternative 1: Only harddrives

Alternative 2: Hard drives in combination with cloud storage.

2.2 Data Transfer Processes

Protocols would need to be established for data transfer. Since the data could potentially be used in enforcement actions, data transfer protocols would have to address chain of custody issues.

Data protocols may vary by sector. For example, mothership catcher vessels may seldom return to port. This may not only affect the volume of data that they would have to store but also the data transfer protocols used. If the data transfer processes are to be included in the Council recommended policy then both generic provision (provisions applying to all vessels or all vessels of a certain class) and individual vessel performance criteria should be specified. Protocols may also vary based on the type of data being transferred (video, electronic log, or data logger).

1) Video transfer

- a) Timing of transfers
- b) Channel for data transfer (possibilities include)
 - i) Hard drive removal/replacement
 - (1) Transmission via internet shoreside
 - (2) Physical transfer of hardware to reviewers
 - ii) Other?
- c) Other necessary provisions?

2) Electronic logbook

- a) Timing of transfers
- b) Channel for data transfer (possibilities include)
 - i) Hard drive removal/replacement
 - (1) Transmission via internet shoreside
 - (2) Physical transfer of hardware to reviewers
 - ii) Wifi or cellular transmittals
 - iii) Thumbdrive submission
 - iv) Through VMS
- c) Other necessary provisions?

3) Data loggers

- a) Timing of transfers
- b) Channel for data transfer (possibilities include)
 - i) Hard drive removal/replacement
 - (1) Transmission via internet shoreside
 - (2) Physical transfer of hardware to reviewers
 - ii) Wifi or cellular transmittals
 - iii) Thumbdrive submission
 - iv) Through VMS
- c) Other necessary provisions?

2.3 Data Processing, Validation, and Analysis

EM data processing would likely involve analysis of EM sensor, video data, and electronic logs. The following is an outline of some of the considerations to be taken up under this topic.

- 1) Video review and log comparison
 - a) Potential reviewers
 - i) Alternative 1: Sustainable Fisheries Division
 - ii) Alternative 2: Pacific States Marine Fisheries Commission
 - iii) Alternative 3: Independent contractor
 - b) Review process:
 - i) Percent reviewed (depends on method chosen to monitor discards)
 - (1) Alt 1: X% of all trips are reviewed, (percentage of review may increase if compliance issue)
 - (2) Alt 2: Census of all trips
 - (3) Alt 3: Random selection of discard
 - ii) Match video segments with logbook discard events; may need to define audit units that match fishing logs units (i.e., fishing events). For some fisheries fishing events are not clearly defined to facilitate an audit.
 - (a) Include sensor data in video to verify time and location of fishing events
 - (b) Use GPS data in logs
 - (c) Use data logger
 - iii) Validation:
 - (1) Use observer data from an EM trip to validate data collected (video and/or logbook)
– on trips for which the biological observers overlap with EM.
 - (2) Species identification capabilities
 - (3) Weight estimation capabilities
 - (4) Protocols for additional video review when non-compliance issues arise;
 - (a) Create incentives to comply (management incentives vs. enforcement action)
 - (a) Look at ways the Alaska co-ops model might be used to implement the program, e.g., self-imposed sanctions within a group or fleet
 - c) Logbooks
 - i) Requirements
 - (1) Require only electronic logs?
 - (2) Option to use either one?
 - ii) Electronic
 - (1) Format
 - (2) Minimum data fields needed (standardize)
 - (3) Submission requirements
 - iii) Paper
 - (1) Minimum data fields needed (standardize)
 - (2) Submission protocol
 - (3) Develop method to enter data and match with video

Agenda Item H.8

Electronic Monitoring Alternatives

Council Action

- 1. Adopt a range of alternatives for EM regulations.**
- 2. Provide guidance on further analysis.**
- 3. Provide guidance on issues indentified in the GEMPAC Report to the Council, as necessary.**
- 4. Provide other guidance as necessary.**

Timeline for Considering EM

Dates	<u>Process Considerations</u>
Oct 2013	<ul style="list-style-type: none"> • GEMPAC and GEMTAC meeting Seattle
Nov 2013	<ul style="list-style-type: none"> • Consider initial results of NMFS/PSFMC 2012 field season • Adopt alternatives for analysis.
April 2013	<ul style="list-style-type: none"> • Check-in
June 2014	<ul style="list-style-type: none"> • Consider full analysis of alternative. • Select preliminary preferred alternative.
Sept 2014	<ul style="list-style-type: none"> • Select final preferred alternative.
Sept 2014 through 2015	<ul style="list-style-type: none"> • Secretarial approval process and implementation, including <ul style="list-style-type: none"> ◦ regulation drafting and paperwork reduction act submissions, ◦ securing contracts for video review, ◦ commercial installation and testing, and ◦ observer program adjustments.

Overview of Draft EM Program

Agenda Item H.8.a, Attach 1

- Over Arching Policy Decision
- Major Policy Decision Topics
- Data Capture and Processing

Over Arching Policy Decision

Page 1

Alternative 1: No Action – no EM program, 100 percent human observer coverage.

Alternative 2: Use human observers and EM program.

Alternative 3: Use only an EM program.

Major Policy Decision Topics

Page 1

1. EM Participation and Eligibility (Sect. 1.1)
2. Discard Monitoring Method (1.2)
3. Species Discard Alternatives (1.3)
4. Individual Vessel Monitoring Plans (1.4)
5. Implementation of an EM program (1.5)

EM Participation and Eligibility

Section 1.1

Alternative 1: EM is mandatory

Alternative 2: EM is voluntary

- Initial Eligibility (need to develop criteria)
- Continued Eligibility (need to develop criteria)

Monitoring for Discards

Section 1.2

Alternative 1: Self-reporting and Audit

- use logbook discard but review X% video

Alternative 2: Video Census

- use video discard data, 100% video review

Alternative 3: Video Sampling for Expansion

- use video discard data and expand discard rates

Monitoring for Discards cont.'

Spatial management sub-alternative for Alts 1 through 3

- Use EM in low bycatch areas

Discard Alternatives

Section 1.3

Alternatives are based on retention activity

Applies to catcher vessels only

Operational discard

- Selective discard: intentional
- Non-selective: generally not intentional

Discard Categories

Table 3, p. 8

- Catch share groundfish species (IFQ and Allocated, Table 4 and 5)
- Non-catch share species (Table 4 and 5)
- Non-FMP (non-groundfish)
- Other (trash, mud, coral)
- Prohibited: Halibut
- Prohibited: Salmon, Dungeness crab OR/WA
- ESA/MMPA (Table 6)

Discard Alternatives

Section 1.3

Alternative 1: Full retention

- Keep it all, no discards are allowed, no exceptions for things like safety discard

Alt 1. Full Retention

		IFQ Program Fisheries			
		SS MWT (whiting and Non-whiting) ^{a/}	BTW	Fixed Gear (LL)	Fixed Gear (POT)
Species Discarded	MS CVs MWT CO-OP				
Catch share species					
Non-catch share species					
Non-FMP/Not Prohibited					
Other (trash, mud, coral)					
Prohibited: Halibut					
Prohibited: Salmon, Dungeness crab OR/WA					
ESA/MMPA					
Exceptions					

Discard Alternatives

Section 1.3

Alternative 2: Maximized Retention

- Keep all but prohibited species; allowed to discard trash and mud;
- Some non-selective discard exceptions for safety, "bleeding net", zipper accidentally opened, fish came off hook, gilled in net
- Some exceptions for prohibited species

Alt 2. Maximized Retention

Species Discarded	MS CVs MWT CO-OP	IFQ Program Fisheries			
		SS MWT (whiting and Non-whiting)	BTW	Fixed Gear (LL)	Fixed Gear (POT)
Catch share species					
Non-catch share species					
Non-FMP/Not Prohibited					
Other (trash, mud, coral)					
Prohibited: Halibut	3	4			
Prohibited: Salmon, Dungeness crab OR/WA	3	4			
ESA/MMPA					
Exceptions	1, 6	1, 6	1, 6	1, 6	1, 6

Discard Alternatives Cont'

Alternative 3: Retention of Catch Share Species with Options.

- Keep all IFQ and COOP allocated species; some discard exceptions
- Includes options for discard

Options under Alternatives

Options: (not mutually exclusive)

- a. Allow discard of flatfish
- b. Allow discard of lingcod and sablefish
- c. Allow discard of all non-rockfish groundfish
- d. Allow discard of all non-groundfish species

Alt 3. Retention of Catch Share Species with suboptions

Species Discarded	MS CVs MWT CO-OP	IFQ Program Fisheries			
		SS MWT (whiting and Non-whiting)	BTW	Fixed Gear (LL)	Fixed Gear (POT)
Catch share species		c	a, b, c	a, b, c	a, b, c
Non-catch share species		a, b, c	c	c	c
Non-FMP/Not Prohibited		d	d	d	d
Other (trash, mud, coral)					
Prohibited: Halibut	3	4			
Prohibited: Salmon, Dungeness crab OR/WA	3	4			
ESA/MMPA					
Exceptions	1,5,6	1,5,6	1,5,6	1,5,6	1,5,6

Discard Alternatives Cont'

Alternative 4: Discard At Will (Status Quo)

Alt 4. Discard at will

Species Discarded	MS CVs MWT CO-OP	IFQ Program Fisheries			
		SS MWT (whiting and Non- whiting) ^{a/}	BTW	Fixed Gear (LL)	Fixed Gear (POT)
Catch share species					
Non-catch share species					
Non-FMP/Not Prohibited					
Other (trash, mud, coral)					
Prohibited: Halibut	3	4			
Prohibited: Salmon, Dungeness crab OR/WA	3	4			
ESA/MMPA					
Exceptions	1,2,6	1,2,6	1,2,6	1,2,6	1,2,6

Individual Vessel Monitoring Plans (IVMP)

Section 1.4

- Approval of plans
- Duration of effectiveness
- Potential categories in an IVMP
 - Example: hardware, software, catch handling

Implementation

Section 1.5

Alternative 1: Implement EM program for all fisheries at one time

Alternative 2: Phase in with a pilot program with EFPs

Alternative 3: Phase in by sector/gear

Data Capture and Processing

Section 2.0

- Vessel Hardware, Data Maintenance, and Onboard Procedures
- Data Transfer Processes
- Data Processing, Validation, and Analysis

Example of Performance Standard

From Department of Fisheries and Oceans Fishery Management Plan – Canada

Any electronic monitoring system must be approved by the Department and must include the following minimum specifications and component requirements:

- a) a video and sensor data-logging engine (control box), equipped with monitor and keyboard...equipped with an external control to allow the user to manually insert time stamped event markers into the sensor record;
- b) operating software to record imagery during fishing events

Agenda Item H.8.b
Supplemental GEMPAC Report

Responses to Council Direction

1. Recommendations for phased-in approach:
 - Implement through retention rules; start with maximized retention fishing
 - Council consider out-of-cycle EFP to use EM in lieu of human observer;

Responses to Council Direction

2. Data loggers are a useful tool
3. Species that may be discarded under a maximum retention fishery (Table 3, p.14)
4. Discard for safety reasons may have been reduced through trawl rationalization program, limit tows time not viable solution

GEMPAC Recommendation for Modifying Alternatives

Remove from further consideration alternatives that require mandatory use of EM.

- Alternative 3: Use Only an EM Program
- Alternative 1: EM is Mandatory

Additions to Alternatives

Section 1.2 Monitoring for Discard p. 6:

- GEMPAC added a sub-alternative: if in high bycatch area, higher level of video review

Discard Alternatives

Section 1.3

Exceptions and Options revisions, p. 15:

- Revised exception 3 to enumerate all catch on a MS CV that is discarded by CV
- Deleted exception 5
- Added option to allow discard if species are verifiable

Individual Vessel Monitoring Plan

Section 1.4

GEMPAC modified alternatives for Duration of Effectiveness, p. 18:

- No expiration unless the plan is changed
- Annual or if modifications are made

Individual Vessel Monitoring Plan

Section 1.4

Clarified Declaration of EM Use, p. 19:

➤ GEMPAC added “No Declaration”

Implementation

Section 1.5

GEMPAC added Alternative 4, p. 20:

Implement by retention rules; start with maximize retention fisheries and move to other retention rules as reliable technologies for speciation are developed.

Data Capture and Processing

Section 2

Leave most of the details for development during implementation

- Develop performance standards to capture and process the data.

GEMPAC Recommendations

Section 3

1. Remove from further analysis Alt 1 and 3 regarding mandatory EM
2. Consider out-of-cycle EFP for max retention fisheries
3. Phase in EM with max retention fisheries
4. Create performance standards for data capture and processing

ENFORCEMENT CONSULTANT REPORT ON ELECTRONIC MONITORING ALTERNATIVES

The Enforcement Consultants (EC) has reviewed the documents associated with Agenda Item H.8 Electronic Monitoring Alternatives and has the following comments.

As stated in our September EC report, electronic monitoring (EM) is a high priority issue for the EC. Primary issues for the EC are the use of cameras as a component to achieving compliance monitoring objectives, development of an electronic logbook, and expanded use of the Pacific States Marine Fisheries Commission E-Fish Ticket Program.

We appreciate the work done by the Groundfish Electronic Monitoring Policy Advisory Committee (GEMPAC) in drafting alternatives for Council consideration listed in Agenda Item H.8.b Groundfish Electronic Monitoring Policy Advisory Committee Report, November 2013. Working from the GEMPAC Committee report, we endorse the following alternatives for further analysis.

Over Arching Policy Decision:

The EC endorses both the No Action Alternative (Alternative 1) and Alternative 2. Alternative 1 maintains the status quo, which for enforcement is viable. Alternative 2 allows use of both observers and cameras as compliance monitoring tools. Maintaining both compliance monitoring options will be more costly to administer, but we believe the different nuances of the trawl rationalization catch shares program inclusive of geography, gear type, targeted species, marketing strategies, and compliance incentives require both options (observers and EM) to be in play.

1. Major Policy Decisions

1.1 EM Participation and Eligibility:

The EC endorses Alternative 2, EM is Voluntary. We believe to properly incentivize EM, the use of cameras in lieu of human observers should be a privilege, not a requirement. The declaration for use of EM should be “conservative” in allowing how often and when EM participants can switch from EM to observers and back. Our conclusions on this issue are influenced by concerns for cost, industry confusion, and regulatory complexity.

1.2 Monitoring for Discards:

The EC endorses Alternative 1 Self-reporting and Audit Approach. Alternative 1 has the shortest discard data turnaround, vessel turnaround is immediate, and it projects the greatest account balance certainty. We do not endorse application of the sub options under any alternative for the stated reasons: more regulatory complexity and higher enforcement costs.

We believe all the alternatives may increase cost for enforcement relative to status quo. Overall cost may not in fact be reduced, but rather shifted, with that portion of the industry using EM being the beneficiary of reduced costs. Observer cost will likely increase because of the economy of scale, and enforcement and administrative costs may increase as some costs of monitoring shift from industry to government. But, we also believe that a properly incentivized compliance program which employs the lessons learned in the at-sea coop sectors may lessen the burden on enforcement and fisheries management.

1.3 Discard Alternatives:

The EC endorses Alternative 2, Maximized Retention. Under this alternative only non-selective and prohibited species discards would be allowed, but all discards would be analyzed for catch accounting and debited from the vessel's individual fishing quota (IFQ) account.

It is our belief that Alternative 1, Full Retention is not viable. The *no non-selective discard option* does not reflect the reality inherent in the trawl fishery. There will always be some level of discard: accidental, operational, or because of legitimate safety concerns. Implementation of this option would violate the legal standard of "what is reasonable" and place the industry in a "gotcha" situation. For this reason, we recommend Alternative 1 be considered, but rejected, with no further analysis.

Alternative 3: Retention of Catch Shares Species with Options may have some future merit, but the EC is not prepared to endorse this option at this time. We await further analysis and information that would better inform us on the viability of this alternative.

Alternative 4: Discard at Will. The EC does not endorse this option. Intuitively, we believe this option to be the most costly, with the greatest impact on timely and accurate reporting of said discards, and fraught with opportunities to undermine the management objective of 100% accountability.

1.4 Individual Vessel Monitoring Plans (IVMP)

Approval and Duration of Effectiveness: The EC endorses the use of IVMPs inclusive of these elements: *Approval* (1) approval by NMFS based on criteria specified in regulation; and *Duration of Effectiveness* (2b) annual or if modifications are made (NMFS to determine process). Annual application and approval allows for administrative review of performance standards record(s) and adjustments to the IVMP based on previous year's compliance.

IVMP Information Categories: We believe the IVMP information categories listed in the GEMPAC Committee Report (page 19) are a good start but should not be viewed as all inclusive and should be left open for additions/modifications.

Declaration of EM use: We believe an EM declaration should be required as "best practice" for clarifying what monitoring process is being used by a given vessel throughout the fishing year. Enforcement, NMFS, state agencies, Science Centers and providers will need this information for planning and administering various program aspects. As such, we recommend Section 4a of the GEMPAC Report, No Declaration, be considered but rejected.

Our preference is for a declaration to appropriate agencies and contractors for use of EM (as identified in Section 4b of the GEMPAC Report), inclusive of Option 1: for the coming year participants must indicate in which months EM will be used. We do not endorse Option 2 (trip by trip basis) believing it is overly burdensome to administer while not allowing proper planning by agencies, Science Centers, and providers. Option 3, Emergency Situation seems appropriate.

Furthering the analysis of Declaration of EM Use, we request inclusion of an Option 4: Annual Declaration of Intent to Use EM (year-round). Inclusion of this option will, at a minimum, allow for a more robust cost analysis of the declaration options, inclusive of the enforcement costs and costs associated with administrative and implementation responsibilities assumed by agencies and contractors.

1.5 Implementation

The EC endorses Alternatives 2 and 3. These alternatives allow for a phased-in approach that will provide opportunity to test “proof of concept” of the many nuances of this proposed compliance monitoring program. Make no mistake, this undertaking is complicated. Testing components of the trawl catch shares program prior to the January 1, 2011 full implementation date was a good strategy. We recommend that strategy be employed here as well.

2. Data Capture and Processing

2.1 Vessel Hardware and Data Maintenance Onboard

2.2 Data Transfer Process

The EC endorses the elements as described under 2.1 and 2.2. And we endorse the GEMPAC Committee recommendation that development of performance standards and the ultimate implementation of those standards be left to NMFS, PSMFC, the states, and contractors-to include video hardware, onboard operations, and transfer of data (video, electronic logbooks, data logger, and sensor). It is imperative that these standards meet evidentiary standards during initial data capture, on vessel storage, data transfer, analysis, and post analysis storage.

2.3 Data Processing, Validation, and Analysis

At this point in the development of the alternatives, the EC has the most confidence in Alternative 2; the video review and log comparison analysis is done by Pacific States Marine Fisheries Commission (PSMFC). Consider:

- (1) The list of interested, responsible, and impacted parties involved in this program development and subsequent implementation is long, inclusive of state agencies, NMFS (SFD, Science Centers, and OLE), the fishing industry, communities, NGOs, PSMFC, and contractors, and observer providers. For this program to succeed, a level of trust must be achieved with all parties. PSMFC is the best opportunity for achieving that trust.
- (2) PSMFC is fully engrained in the various West Coast catch accounting systems and is the end receiver and keeper of the data for all West Coast fisheries, both state and federal.
- (3) The current EM study underway by PSMFC further demonstrates their ability to carry out the data processing, validation and analysis function.

Bottom-line: PSMFC is a trusted partner with demonstrated experience and expertise.

Inclusion of an Additional Alternative

Prior to the government shutdown and at the request of Council staff, Dayna Matthews was preparing Agenda Item H.8 Supplemental NMFS Report November 2013, *Electronic Monitoring Compliance Program: Electronic Monitoring System (EMS) Criteria*, to be presented for consideration at the GEMPAC meeting held October 15 and 16, 2013. Unfortunately, with the government shutdown, Mr. Matthews was unable to attend. The EC endorses inclusion of this report in the range of alternatives for further analysis.

EC Recommendations

1. Recommend the GEMPAC Report H.8.b be forwarded for further analysis with these modifications:
 - a. Recommend 1.1 EM Participation and Eligibility Alternative 1 EM is mandatory, be considered, but rejected, with no further analysis.
 - b. Recommend 1.3 Discards Alternative 1 Full Retention be considered but rejected with no further analysis.
 - c. Recommend 1.4 Individual Vessel Monitoring Plan (IVMP), Declaration of EM use: Option 4 No Declaration to appropriate agencies and contractors be considered, but rejected with no further analysis.
2. Recommend an Option 5 be added to 1.4 Individual Vessel Monitoring Plan (IVMP), Declaration of EM use: Annual Declaration of Intent to Use EM (year around).
3. Recommend Agenda Item H.8 Supplemental NMFS Report November 2013, *Electronic Monitoring Compliance Program: Electronic Monitoring System (EMS) Criteria*, be included in the range of alternatives moved forward for further analysis.

GROUND FISH ADVISORY SUBPANEL REPORT ON ELECTRONIC MONITORING ALTERNATIVES

The Groundfish Advisory Panel (GAP) heard a report from Mr. Brett Wiedoff describing the electronic monitoring (EM) alternatives development framework and timeline, as well as an update from the most recent Groundfish Electronic Monitoring Policy Advisory Committee (GEMPAC) meeting.

Before commenting on the GEMPAC report, the GAP offers the following overarching comments and recommendations. As highlighted in our past statements, and as reinforced most recently by the moving testimony from Jiri Nozicka, skipper of the F/V San Giovanni, the GAP believes that the high costs and reduced operational flexibility of human observer coverage could force many participants out of the fishery. In addition to hardship on the trawl sector, loss of trawl vessels could cause ripple effects for other fisheries as the high volumes landed in the trawl sector are often what anchors infrastructure in a port. With that in mind, the GAP is deeply concerned with the regulatory timeline presented in the report. Implementation in September 2015 or January 2016 is simply too late.

The industry intends to submit an off cycle electronic fishing permit (EFP) application at the next council meeting. We request that the council make room on the March agenda to discuss this critical action. The overarching consideration for the GAP is that an EM program for those willing to conduct their fisheries under “maximized retention” protocols should be implemented and on the water by January 1, 2015.

The whiting sector operated under an EFP based EM program for many years. The industry and the government have the talent, experience, and governing structure to do this.

GEMPAC Report

The GAP supports the GEMPAC committee recommendations with one exception. The GAP believes the initial range of alternatives should be narrowed to include only two alternatives, the no action 100 percent human observer coverage option, and an option that authorizes observers or EM. The GAP does not support option three which would have required mandatory use of EM with no observer option.

In addition to our strong interest in the EFP described above, the GAP believes it is important that the regulatory process continue to develop for that segment of the fishery that cannot or is not interested in participating under maximized retention rules.

Self-governance concept

The GAP also received a report from Mr. Dayna Matthews about a self-governance concept for EM. Enforcement believes that this option, authorizing groups or individuals to be exempt from the one hundred percent observer coverage requirement in exchange for complying with certain criteria as laid out in his report, will allow for a much quicker response to potential rulebreakers than could occur under an enforcement action. Experience in numerous co-operatives in the

North Pacific and here on the West Coast under the whiting EFP suggest that this approach can be quicker and more effective than typical enforcement actions at reduced cost. The industry intends to incorporate many components of this concept into its EFP application.

GROUND FISH ELECTRONIC MONITORING POLICY ADVISORY COMMITTEE REPORT November 2013

Report to the Council

At the September 2013 meeting, the Council provided guidance to the Groundfish Electronic Monitoring (GEM) Policy Advisory Committee (GEMPAC) and the Groundfish Electronic Monitoring Technical Advisory Committee (GEMTAC) for the October GEM Committees' meeting:

1. discuss, a "phased-in approach" for implementation of electronic monitoring (EM), starting with midwater trawl and fixed gear fisheries, then a separate phase for bottom trawl fisheries
2. discuss the use of data logger systems as a component of the EM program,
3. discuss alternatives for an EM program that includes species that may be discarded under maximum retention fisheries, and
4. explore ways to minimize discards made for safety reasons.

On October 15-16, 2013, the GEMPAC and GEMTAC met in Seattle, Washington to consider the Council's requests and develop draft alternatives for an EM program. National Marine Fisheries Service staff was not able to attend the meeting because of a shutdown of government operations. This report provides the GEMPAC's recommendations for the Council, responses to the Council's September requests, and the Committee's revisions to the draft alternatives.

Summary of Recommendations and Responses

Response to Council Direction

1. The GEMPAC considered the "phased-in" approach as suggested by the Council. This alternative is included under Section 1.5 "Implementation". In addition to phasing in by fishery, the GEMPAC also recommends an alternative that would phase in implementation through retention rules whereby those fisheries that are willing to fish under a maximized retention regulatory system would be allowed to use EM in lieu of an observer. As methodologies and technological advances for speciation are developed, other retention rules could be implemented to allow discards of specific species or species groups.

Section 1.5 includes an alternative which would phase in EM through the use of Exempted Fishing Permits (EFPs). While a long-term policy is being developed by the Council, as an immediate step, the GEMPAC recommends that the Council initiate an out-of-cycle process whereby EFPs would be used to allow some vessels to commence

- using EM in the near-term. For example, any vessel that is willing to fish under maximum retention rules might be allowed to use EM in lieu of observer coverage.
2. The GEMPAC discussed the use of data loggers as a tool to document the position of a fishing vessel while using EM. The GEMPAC believes this is a useful tool, and if used, should be integrated into the EM hardware system. Data loggers are covered in Section 2.2 of the attached alternatives document.
 3. The GEMPAC discussed alternatives for an EM program that includes species that may be discarded under maximum retention fisheries. Council staff developed Table 3 (Section 1.3) to compare four alternatives with different levels of discard by catcher vessels. It also includes the species groups that may be discarded under each of the alternatives (Tables 4, 5 and 6). The GEMPAC made minor changes to Table 4 to clarify certain discard options and exceptions. The committees also discussed that Alternative 1, “Full Retention”, may not be practical or achievable for all fisheries since statutory management measures such as the Endangered Species Act (ESA) or the Marine Mammal Protection Act (MMPA) may prevent vessel operators from fully retaining those species, and that discards for safety reasons are necessary in most fisheries.
 4. Lastly, the GEMPAC discussed ways to minimize discards made for safety reasons.

One approach suggested by the Council was to consider limiting tow times. Vessels typically use net sensors to monitor catch in the cod end and tow times vary based on densities of fish. Occasionally sensors may fail, resulting in too much fish at haulback and the need for releasing fish for safety reasons. However, most fishermen can monitor their catch and begin haulback when the cod end is nearly full or at a level of catch needed to fill the vessel. Tow times that catches the same amount of fish can vary greatly based on fish density and may range from 15 minutes to 6 hours, so limiting tow times is not a feasible option to prevent overfilling nets and reducing instances of non-selective discards for safety reasons.

The GEMPAC discussed the general issue of whether measures might be needed to reduce the occurrence of non-selective discards. Under the whiting electronic monitoring program and maximized retention regulations in place prior to the trawl rationalization program, instances of non-selective discards justified based on safety concerns were considered problematic. There are important differences between pre-trawl rationalization and trawl rationalization conditions such that non-selective discard problems would be expected to be substantially diminished in the rationalized trawl fishery. Specifically, prior to trawl rationalization, the fishery was managed as a derby; the primary incentive for vessels was to maximize revenue and catch history by maximizing the poundage in their deliveries; and discarding did not diminish vessel gross revenue. Attempts to maximize revenues resulted in overfilling nets and topping of holds (for vessels delivering shoreside).

Under the trawl rationalization program, the incentive is to maximize the value for a given amount of quota that a vessel has available to it. Non-selective discards are estimated by observers and deducted from quota accounts, making such discards costly for a vessel. Such estimates and deductions would continue under an EM program. Additionally, while under derby management, any diminishment of product quality from

overfilling a net might be offset by increased volume. Under the trawl rationalization program there is no opportunity for such offsets and any diminished product quality diminishes the value a vessel derives from its available quota. Inversely, improved product quality through shorter or smaller tows may increase total revenue from a given amount of quota.

Finally, operational costs associated with non-selective discards provide another disincentive for such discards. Net bleeding and handling of excess fish takes time and effort, adding to operational costs and reducing net revenue. Thus, under trawl rationalization, making larger tows does not increase a vessels revenue and the incentive may be for shorter or smaller tows in order to reduce lost revenue opportunity from discards, increase product quality, and limit operational costs associated with the handling of excess fish.

Recommendations for Modifying the Alternatives

The GEMPAC reviewed the alternatives provided to the Council in Agenda Item H.8.a, Attachment 1(November 2013). It recommends a number of revisions to these alternatives, as identified by the underline and strikeout in the version of the alternatives attached in this report. The full list of recommendations is in Section 3. A few of the more significant recommendations are provided here.

Remove from further consideration alternatives which would require mandatory use of EM. The GEMPAC believes that participation in an EM program should be voluntary; therefore, they recommend removing Alternative 1, “EM is Mandatory” (Section 1.1) from further consideration in any future detailed environmental analysis. To be consistent with this recommendation, the GEMPAC also recommends removing Alternative 3, “Use only an EM program” (Section “Overarching Policy Decision”). At this time, both alternatives remain in the document for consideration by the Council.

Leave most of the details in Section 2 for development during implementation. The GEMPAC recommends that performance standards for regulations be developed during implementation by the National Marine Fisheries Service (NMFS), working in consultation with the Pacific States Marine Fisheries Commission (PSMFC), the states, and contractors for some items identified in Section 2, “Data Capture and Processing,” including video hardware, onboard operations, and transfer of data (video, electronic logbooks, data logger information). The Council would review the draft regulations during the deeming process.

GEMPAC Recommended Revisions to Agenda Item H.8.a, Attachment 1.

Prior to the meeting, Council staff provided a draft set of alternatives to the committees and the Council (November 2013, Agenda Item H.8.a, Draft Alternatives for GEMPAC). These alternatives were revised at the October GEM meeting and are included in this report. Changes to the original version under Agenda Item H.8 are noted throughout Sections 1 and 2 of this report. Underlined text is new text; strikethrough text indicates the text was revised or removed by the GEMPAC.

There appears to be three major decisions needed for all elements of an EM program.

1. Is the element of the program one that should be decided by the Council or can it be left to NMFS to determine implementation?
2. If warranting a Council policy decision, should the element be specified in a prescriptive manner or as a performance standard with some criteria to measure if the standard has been met? For example, only certain species may be allowed to be discarded, therefore those species would be prescribed in regulations. An EM hardware and software system that captures the necessary images and data to document discard events may be implemented through a performance standard to provide opportunities for innovation and improvement.
3. If a performance approach is decided, should the Council specify the performance criteria and if so, what should those criteria be? See Appendix A for an example.

Section 1 covers major policy decision topics:

1. EM Participation and eligibility
2. Discard monitoring method
3. Species that may be discarded
4. Individual Vessel Monitoring Plans
5. Implementation of an EM program

Section 2 covers more detailed provisions for an EM program. The section titled “Data Capture and Processing” includes options for an EM system (i.e., hardware, data sources, formats) and how the fishery data would be processed (i.e., data transfer, validation, analysis).

Compliance and enforcement considerations will be discussed throughout development of alternatives. After draft alternatives are developed and a reasonable range of alternatives are selected by the Council, a detailed analysis of impacts will be drafted for further Council consideration.

Over Arching Policy Decision

Under the National Environmental Policy Act, a reasonable range of alternatives must be identified for a federal action, and includes the “no-action” alternative or status quo. Prior to moving forward with an EM program, the Council must decide the level of EM use and compare it to the status quo of 100 percent observer coverage. Three alternatives have been identified to provide 100% coverage of the fleets for compliance monitoring in the trawl rationalization fishery:

Alternative 1: No Action – 100 percent ~~industry-funded~~ human observer coverage, no EM program.

Alternative 2: Use ~~industry-funded~~ human observers ~~and or~~ an EM program.

Alternative 3: Use only an EM program. (GEMPAC does not support Alternative 3 for mandatory use of EM and suggest removal of this alternative; see Recommendation 1 in Section 3)

After this decision is made, all other major policy decisions can be made to develop an EM program.

1. Major Policy Decisions

1.1 EM Participation and Eligibility

Many constituents believe that EM should be an option and not mandatory, and that participants should need to meet certain criteria to be eligible to use EM in lieu of carrying an industry funded observer. Participation in an EM program could either be mandatory or voluntary.

Alternative 1: EM is mandatory (GEMPAC does not support Alternative 1 for mandatory use of EM and suggest removal of this alternative; see Recommendation 1, Section 3)

Alternative 2: EM is voluntary

1) Participants must be eligible

a) Eligibility: ~~criteria~~

i) Initial eligibility: Must have an approved individual vessel monitoring plan (IVMP) to participate, no IFQ deficits, all permits have been acquired, (TO BE SPECIFIED).

ii) Continued eligibility: Must be in compliance ~~“good-standing”~~ with IVMP, demonstrate proper documentation of the discards, etc.

(1) Example: Vessels not in compliance ~~good-standing would~~ may be required to carry an observer. The requirement to be in ~~good-standing~~ compliance would provide administrative incentive for compliance. Others ideas: Allow continued use of EM; however, data must be provided on a trip by trip basis or review of video must be increased above current levels.

(2) Criteria for ~~good-standing compliance~~: TO BE SPECIFIED. Need to develop continued eligibility criteria

Discussion:

If the program is mandatory, the program may lack industry “buy-in”. However, a mandatory program would provide a consistent source of discard data. If participation is voluntary or a privilege, the program would provide operational flexibility that allows participants to choose between a human observer or EM. If it’s a privilege to participate, then the need to maintain the privilege may provide incentives for compliance. However, it’s possible that industry funded observer monitoring costs may increase if there is less demand for observers, particularly in smaller ports. Eligibility criteria would need to be developed along with a standard for compliance for operators/owners for continued participation under a voluntary program.

1.2 Monitoring for Discards

A discard monitoring method that would adequately account for discard in each fishery is necessary. One method may not work for all so each fishery will need to be examined. However, the decision will need to incorporate options for which species or species groups may be discarded in a fishery; see section 1.3 Discard Alternatives. For each of these alternatives, where an observer is used for monitoring, the observer would follow the status quo for monitoring procedures.

Alternative 1: Self-reporting and Audit Approach

EM system is used to validate the vessel's account for discards. Harvester reports the catch in a logbook and the EM system is used to verify the logbook information through random sample (X%) of video review for verification. Electronic logbook data will likely be the sole source for discards. (Initial minimum sampling rate to be specified.)

Alternative 2: Video Census Approach

Only EM system is used to account for discards. All video is reviewed for discard events and weight estimates are applied to get total discard accounting.

Alternative 3: Video Sampling for Expansion Approach

EM system is used to account for discards. Estimate discards by the random sample ~~viewing~~ of some percentage (e.g., X%) of all fishing events across all trips or within a trip and expanding weight estimate for total discard for all trips or by trip. (Initial minimum sampling rate to be specified.)

Sub Alternative for Alternatives 1 through 3: Spatial Management Alternative

This option could be applied to any of the above approaches. Under this option, fishing activity in areas that are likely to have lower bycatch could be monitored with EM rather than using observers. Vessels would declare their fishing area prior to departure and be required to follow the appropriate fishing protocols for that area.

- i. Sub Alternative - if you chose to fish in a high bycatch area, a higher level of EM review may be required

Discussion:

The choice of a discard monitoring method impacts costs, data and vessel turnaround times (the time required to incorporate discard data into the quota tracking system), and certainty about account status, accuracy of estimates, and degree of compliance incentives.

Major cost factors include the need for an electronic logbook system, time reviewing video, fishery policy and enforcement costs, and effects on observer costs (Table 1).

Table 1. Relative costs among EM alternatives for discard monitoring. Note: This is not a comparison between costs for observers and EM; this is not a complete listing of all costs.

	Cost Categories		
	Logbook	Video Review	Fishery Policy, Enforcement, & Observers
Alternative 1 (self report/audit)	Cost of E-logbook system	Cost of sampling (less than alt 2 but more than alt 3)	Possible higher per day costs for observers than current costs per day for observers status quo .
Alternative 2 (census)	No impact	Cost of census (most expensive)	Possible higher per day costs for observers than current costs per day for observers status quo .
Alternative 3 (sampling w/ expansion)	No impact	Cost of sampling (least expensive)	Possible higher per day costs for observers than current costs per day for observers status quo .
Sub-Alternative (subareas)	Minor impact if paper logbooks are revised/created	Less overall reliance on EM which may result in higher average costs. <u>If higher level of review is needed for sub alternative cost may increase.</u>	More regulatory complexity, higher enforcement costs, and more reliance on observers at <u>higher per day costs for observers than current costs per day for observers</u> than status quo .

Only Alternative 1 requires an electronic logbook system while Alternatives 2 and 3 rely solely on video review for the estimation of discards. Alternatives 1 and 3 both rely on sampling video and so may entail comparable video review costs which are less than the costs of full census, Alternative 2. The main impact on enforcement costs would be the subalternative which would allow the use of videos in place of observers only when vessels are fishing in certain areas. Such a provision would require the establishment of a set of management lines which may be modified over time, increasing the costs of developing fishery policy and the complexity of the regulations that fishermen would have to understand. The additional regulatory complexity would likely add to enforcement costs as well. Finally, the subalternative would likely entail greater continued reliance on observers if areas to fish with EM are limited in scope and vessels choose to fish with an observer outside those areas. This would result in lesser reliance on video review compared to alternative 1. Under all alternatives here, a reduction in total demand for observers could result in higher per observer day costs than under status quo and lesser video review could result in higher average video review costs relative to other EM alternatives.

Data turnaround and vessel turn-around times will vary by alternative and depend on other aspects of policy. Longer lags to process the data may lessen certainty in a vessel's account balance prior to departure on the next trip.

Table 2. Impacts to data processing and vessel turnaround time under each discard monitoring method (alternatives 1 through 3).

	Discard Data Turnaround	Vessel Turnaround	Account Balance Certainty
Alternative 1 (validation)	Shortest - Immediate	Immediate ^{a/}	Greatest
Alternative 2 (census)	Longest - Time required for complete census of video	Immediate ^{a/}	In Between
Alternative 3 (sampling)	In Between - Time required for review of sample of video	Immediate ^{a/}	Least (incentive to mitigate by retaining all fish)

a/ Immediate, assuming continuation of current policy under which vessels are allowed to fish until data shows up in the system showing that they are in deficit.

Data turnaround times could be the fastest with Alternative 1 under which the primary source of data would be electronic logbooks. Discard data from logbooks could be transmitted immediately upon the end of a trip. Video would be reviewed later to spot check the logbook reports, validating their accuracy. Current policy allows a vessel to keep fishing until information is recorded that indicates it has incurred a deficit. Since discard information comes from observer reports, such information may come in weeks after the completion of a trip. A continuation of this policy would allow vessels to leave on its next trip with greater certainty about its account status than under status quo, assuming that it is reasonable to expect that accurate logs would be validated by video review with no changes. There has been some discussion that under a video system a vessel might not be able to leave port until after the video is reviewed but at this point that has not been recommended for consideration by the committee or the Council.

Using a video census approach (Alternative 2), and assuming a comparable video review capacity, there would be the greatest time lag between completion of a trip and resolution of the vessel account balances.¹ Vessels could maintain their own estimates of discards but there would likely be some differences with the estimates made through cameras, contributing to uncertainty about account balances until video review is completed.

Using a video sampling approach (Alternative 3) there would likely be a lesser time lag in getting discard data into the system than under Alternative 2 but greater than under Alternative 1. As with the other alternatives, the vessel could leave on its next trip immediately but there would be greater uncertainty regarding its account balance. Because vessels would not likely know which events would be expanded as a result of random sampling, this alternative would entail the greatest uncertainty regarding the vessels eventual account balances. Vessel might attempt to mitigate this uncertainty by keeping fish they might otherwise discard (e.g. a damaged overfished species or fish for which species identification on camera might be less certain).

Alternative 3 would be the least accurate among the alternatives and could adversely impact the remainder of the fleet. If the video sample picked up some less frequent incidental catch species

¹ Note: There would have to be some higher level of video review capacity than under Alternatives 1 or 3, otherwise video review would constantly fall behind by longer and longer amounts.

and expanded that result out to the entire trip or across trips, more quota for a species in low supply might be required to cover the trip, resulting in less availability of quota pounds of that species for the remainder of the fleet. The relative accuracy of Alternatives 1 and 2 would depend on the degree of compliance incentive for accurately filling out the e-logbooks. Assuming good-faith compliance, Alternative 1 would provide two estimates as compared to the single estimate provided by the census approach. Inevitably there would likely be some discrepancy between the two and rules would be needed on which estimate to use. Example rules include: the higher of the two, the camera estimate, or the logbook estimate unless the camera estimate was higher by some threshold amount.

The third approach might create an incentive for underreporting. Also required would be a rule for the amount of deviation between camera reports and logbook reports that would have to be observed for a vessel to be considered out of compliance and not in good standing for purposes of being classified as an eligible participant in the EM system (see Section 1.0). However, overall the first approach would provide an ongoing assessment of the performance of the video review for upward bias. If over time the cameras consistently over estimated relative to the logbooks, it is likely that such overestimation would stimulate complaints and a response to improve accuracy. If there were consistent underestimation, this might also be detected by video reviewers comparing video estimates to logbooks. For Alternative 2, there would be no separate data stream available to indicate possible biases. On the other hand, Alternative 2 would provide an independent census of the entire trip and not rely on expansions. If video review results in unbiased estimates, the results might be more accurate than Alternative 1 but less information would be available to validate the video estimates (compared to Alternative 1).

Under all alternatives there may be some incentive to frustrate the video monitoring system by discarding off camera or otherwise interfering with camera performance. On the other hand, the chances of payoff from discarding off camera would be lower because the review is sampling rather than census. Under Alternative 1 there would also be an opportunity to under-report some discard events in hopes that they would not be sampled. Under Alternative 3 on the one hand there might be the greatest incentive to do so, in that, if an event is sampled and some reporting of discard is avoided then the payoff would be greater (the reduced discards reported for the expanded estimates) than would be the case for the video census.

Useful information to gather to inform the analysis:

- What are the sampling rates of other systems (or is census used)?

- Are there any systems that ~~don't also~~ have logbooks and are they e-logbooks?

- Cost estimates for video census vs. sample (will be driven by sampling rates).

1.3 Discard Alternatives

The Council will need to decide which species will be allowed for discard with an understanding that those approved for discard are accurately accounted for or verified through video review under the appropriate discard monitoring method. Currently, under the trawl rationalization program each fishery may discard, or is required to discard, certain species. Under an EM program, discard events will be documented with video; however, it may be difficult to identify some species or differentiate between species. There are four alternatives identified that allow for discard (Table 3); they range from full retention (no discard allowed) to discard at will (discard any species). Table 3 shows the species groups that may potentially be discarded under each

alternative. The discard species are grouped by catch share groundfish species, non-catch share groundfish species, non-groundfish species, prohibited species (halibut, salmon and Dungeness crab), and ESA/MMPA protected species (turtles, marine mammals, seabirds, etc.).

The alternatives reference discards of catch share and non-catch share species. These species lists are different for the IFQ and mothership co-op fisheries. Tables 4 and 5 identify which species are considered catch share and non-catch share species for each of these fisheries. Table 6 contains ESA-listed species that may be found in the area of operation for groundfish fisheries.

Discard events are categorized as selective (intentional discard of certain species) and non-selective (generally, discard that ~~was~~ is not intentional). Under each alternative, selective discard options may be chosen for different gear groups; therefore, *options* to selectively discard certain species or species groups, and *requirements* to selectively discard certain species are noted in the table.

The GEMPAC discussed whether measures might be needed to reduce the occurrence of non-selective discards for safety. Under the whiting electronic monitoring program and maximized retention regulations in place prior to the trawl rationalization program, instances of non-selective discards justified by safety concerns were considered problematic. There are important differences between pre-trawl rationalization and trawl rationalization conditions such that non-selective discard problems would be expected to be substantially diminished in the rationalized trawl fishery. Specifically, prior to trawl rationalization the fishery was managed as a derby; the primary incentive for vessels was to maximize revenue and catch history by maximizing the poundage in their deliveries; and discarding did not diminish vessel gross revenue. Attempts to maximize revenues resulted in overfilling nets and topping of holds (for vessels delivering shoreside). Under the trawl rationalization program, the incentive is to maximize the value for a given amount of quota that a vessel has available to it. Non-selective discards are estimated by observers and deducted from quota accounts, making such discards costly for a vessel. Such estimates and deductions would continue under an EM program. Additionally, while under derby management any diminishment of product quality from overfilling a net might be offset by increased volume, under the trawl rationalization program there is no opportunity for such offsets and any diminished product quality diminishes the value a vessel derives from its available quota. Inversely, improved product quality through shorter or smaller tows may increase total revenue from a given amount of quota. Finally, operational costs associated with non-selective discards provide another disincentive for such discards. Net bleeding and handling of excess fish takes time and effort, adding to operational costs and reducing net revenue. Thus, under trawl rationalization, making larger tows does not increase a vessels revenue and the incentive may be for shorter smaller tows in order to reduce lost revenue opportunity from discards, increase product quality, and limit operational costs associated with the handling excess fish.

Vessels typically use net sensors to monitor catch in the coded and tow times vary based on densities of fish. Occasionally sensors may fail, resulting in too much fish at haulback and the need for releasing fish for safety reasons. However, most fishermen can monitor their catch and begin haulback when the coded is nearly full or at a level of catch needed to fill the vessel. Tow times that catches the same amount of fish can vary greatly based on fish density and may range from 15 minutes to 6 hours so limiting tow times is not a feasible option to prevent overfilling nets and reducing instances of non-selective discards for safety reasons.

The following is a description of possible alternatives however some statutory management measures such as the Endangered Species Act (ESA) or the Marine Mammal Protection Act (MMPA) may restrict the consideration of some discard scenarios. For example, under a full retention fishery whereby all catch is retained, the retention of species listed under the ESA or MMPA would prevent vessel operators from retaining those species unless exceptions were made. Such exceptions have been made for the catcher vessels in the at-sea whiting mid-water trawl fishery that do not sort at sea and deliver their catch to at-sea and shoreside processors.

Alternative 1: Full retention

1. No selective discard. Retain all catch share species and non-catch share groundfish species for the IFQ and co-op fisheries (see Table 4 and 5, respectively); non-groundfish species; prohibited species; ESA species (Table 6); and MMPA species.
2. No non-selective discard.

Alternative 2: Maximize Retention

1. No selective discard for catch share species, non-catch share groundfish species
2. No selective discard for non-groundfish species (~~excluding prohibited or protected species~~ Non-FMP and not prohibited species).
3. Allow selective discard of trash, mud coral, etc.
4. Require selective discards of prohibited species; see exceptions for mothership and shoreside catcher vessels below and in Table 3. ~~except when mid-water trawl IFQ vessels sort at sea MS processors must discard prohibited species.~~
5. Require selective discards of ESA and MMPA species (protected species).
6. Exceptions:
 - Allow non-selective discards for safety, "bleeding net", zipper accidentally opened, or fish came off hook. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).
 - Mother ship (MS) catcher vessels (CV) may discard from the CV minor amounts of catch that were not in the net and not delivered to MS. All discards must be enumerated and reported.
 - Shoreside (SS) mid-water trawl IFQ trip must retain halibut, salmon, and crab unless sorting at sea.
 - There may be exceptions to retain marine mammals, seabirds, and turtles for necropsy.

Alternative 3: Retention of Catch Share Species with Options.

1. No selective discard for catch share species. It's possible to add fishery specific options that allow selective discard of some catch share species; options here are not mutually exclusive; however, there must be adequate camera species identification and weight estimates for discard of catch share species.

Options: Proposed selective discard options for groundfish by all catcher vessels except those midwater trawl vessels delivering to motherships (sub-options are noted):

- a) For catch share species
 - Option a – Allow discard of flatfish
 - Option b – Allow discard of lingcod and sablefish

- Option c – Allow discard of all non-rockfish groundfish (full retention of rockfish only)
- Option d – Allow discard if species that are verifiable with EM
- b) For non-catch share groundfish species
- Option c – Allow discard of all non-rockfish groundfish (full retention of rockfish only)
- Option d – Allow discard if species that are verifiable with EM
2. No selective discard for non-groundfish (~~excluding prohibited or protected species~~ Non-FMP and not prohibited species)

Option d – Allow discard if species that are verifiable with EM

Option e – Allow discard of all non-groundfish species
 2. Allow selective discards of trash, mud, coral, etc.
 3. Require selective discards of prohibited species; see exceptions for mothership and shoreside catcher vessels below and in Table 3. ~~except when mid-water trawl IFQ vessels do not sort at sea. MS processors must discard prohibited species.~~
 4. Require selective discards of ESA and MMPA species.
 5. Exceptions:
 - Allow non-selective discards for safety, "bleeding net", zipper accidentally opened, or fish came off hook. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).
 - Mother ship (MS) catcher vessels (CV) may discard from the CV vessel minor amounts of catch that were not in the net and not delivered to MS. All discards must be enumerated and reported.
 - Shoreside (SS) mid-water trawl IFQ trip must discard halibut, salmon, and crab if sorting at sea.
 - There may be exceptions to retain marine mammals, seabirds, and turtles for necropsy.

Alternative 4: Discard At Will (Status Quo)

1. May discard catch share species, non-catch share species (e.g., at-sea whiting set-asides)
2. May discard non-groundfish (~~excluding prohibited or protected species~~ Non-FMP and not prohibited species).
3. Allow selective discard of trash, mud coral, etc.
4. Require selective discards of prohibited species; see exceptions for mothership and shoreside catcher vessels below and in Table 3.
5. Require discards of ESA and MMPA species (protected species).
6. Exceptions:
 - Allow non-selective for safety, "bleeding net", zipper accidentally opened, or fish came off hook or gilled in net. Non-Selective discards will be debited from IFQ vessel accounts and co-op allocations where appropriate (fish gilled in the net are not currently counted in observer estimates).
 - Allow discard of unmarketable species (e.g., small size, damage, sand fleas)
 - Mother ship (MS) catcher vessels (CV) may discard from the CV vessel minor amounts of catch that were not in the net and not delivered to MS. All discards must be enumerated and reported.

- Shoreside (SS) mid-water trawl IFQ trip must retain halibut, salmon, and crab unless sorting at sea.
- There may be exceptions to retain marine mammals, seabirds, and turtles for necropsy.

Table 3. Selective species discard alternatives for catcher vessels only. Key - White: No Discard/must retain species; Gray: May Discard; Black: Discard Required; Crosshatch: No discard with exceptions or options.

Species Discarded	Alt 1. Full Retention					Alt 2. Maximize Retention					Alt 3. Retention of Catch Share Species with suboptions					Alt 4. Discard at will

a/ No regulatory distinction between non-whiting and whiting MWT trips. For example chaffing gear regulations in the MWT fishery apply to both types of activity.

Exceptions:

1. Non-selective discard for safety, "bleeding net", zipper accidentally opened, fish came off hook, gilled in net
2. Unmarketable (e.g., small size, damage, sand fleas)
3. MS CVs must enumerate all catch ~~discard halibut, salmon, and crab~~ on the vessel and not in the net that are not delivered to MS and are discarded by CV.
4. SS mid-water trawl IFQ trip must retain halibut, salmon, and crab unless sorting at sea.
- ~~5. SS IFQ may discard minor amounts of catch~~
5. 6. There may be exceptions to retain marine mammals, seabirds, and turtles for necropsy.

Options: (not mutually exclusive)

- a. Allow discard of flatfish
- b. Allow discard of lingcod and sablefish
- c. Allow discard of all non-rockfish groundfish
- d. Allow discard if species are verifiable with EM
- e. Allow discard of all nongroundfish species

Table 4. IFQ program and Non-IFQ groundfish species groups that are noted in Table 3 as potential discards. Source regulations are noted in each list.

Table 6. ESA-listed species that may be found in the area of operation for groundfish fisheries.

ESA Species	
Green sturgeon (<i>Acipenser medirostris</i>)	Southern Resident killer whales (<i>Orcinus orca</i>)
Eulachon (<i>Thaleichthys pacificus</i>)	Guadalupe fur seals (<i>Arctocephalus townsendi</i>)
Humpback whales (<i>Megaptera novaeangliae</i>)	Green sea turtles (<i>Chelonia mydas</i>)
Steller sea lions (<i>Eumetopias jubatus</i>)	Olive ridley sea turtles (<i>Lepidochelys olivacea</i>)
Leatherback sea turtles (<i>Dermochelys coriacea</i>)	Loggerhead sea turtles (<i>Carretta carretta</i>)
Sei whales (<i>Balaenoptera borealis</i>)	Short-tailed albatross (<i>Phoebastria albatns</i>)
North Pacific Right whales (<i>Eubalaenajaponica</i>)	Marbled murrelet (<i>Brachyramphus marmoratus</i>)
Blue whales (<i>Balaenoptera musculus</i>)	Southern sea otter (<i>Enhydra lutris nereis</i>)
Fin whales (<i>Balaenoptera physalus</i>)	California least tern (<i>Sterna antillarum browni</i>)
Sperm whales (<i>Physter macrocephalus</i>)	

Discussion:

Key aspects of the decision for which species or species group discards will be allowed include the camera's ability to capture required information, impacts on video review costs, and impacts on the collection of biological information.

With respect to camera ability, for non-IFQ species discards the key is the ability to differentiate the non-IFQ species discards from IFQ species in order to ensure that IFQ species are properly accounted for. For non-IFQ species, further speciation (beyond ensuring that the discard is a non-IFQ species), weights, or other measures would not be required. For IFQ species, the camera system would need to identify the exact species and also generate a video image with enough quality to estimate weight using a video reviewer or through length weight relationships (but other technologies may develop over time).

The more species are discarded, the more events will likely require more careful video review, possibly increasing costs. The degree of cost increase will depend on the review method chosen, the frequency of occurrence for certain species, and the technologies that develop over time to automate the video review and species identification/measurement process.

With full retention, an opportunity is generated for the shoreside collection of biological information which is currently collected by at-sea observers. As the scope of allowed discards increases, the opportunity for shoreside collection of biological data decreases. Such reductions might be inversely related to the amount of biological observer coverage required under the program. Evaluation of this potential impact will require input from the West Coast Groundfish Observer Program.

1.4 Individual Vessel Monitoring Plans (IVMP)

A major policy question is whether to have IVMPs as part of the EM program and, if so, the duration of effectiveness of such plans. It's likely that these plans will be required to facilitate an effective program and serve as a clear plan for discard documentation, installation and maintenance an EM system, protocols for data storage and transfer, among other things. Each vessel operator/owner would be responsible for developing an IVMP for the vessel and acquiring the needed approval. It's likely that NMFS would approve the plan and determine when and how long it would be effective. Vessel specific fish handling protocols may need to be developed to provide clear visuals of species discarded. A general list of the categories to be included in the IVMP is provided here but specifics for these elements and the criteria to be met for approval would be specified in Section 2, Data Capture and Processing.

- 1) Approval of plans: (NMFS to decide how this is done)
 - a) Approved by NMFS based on criteria specified in regulation
- 2) Duration of Effectiveness:
 - a) ~~Monthly~~ No Expiration unless modifications are made
 - i) Plan modification provisions: (NMFS to decide how this is done)
 - (1) EM Provider and vessel operator provisions – changes that do not need re-approval (MODIFICATION DESCRIPTION NEEDED)
 - (2) NMFS provisions - changes that trigger the need for re-approval (e.g. operator will use a different vessel)
 - b) Annual or if modifications are made ~~quarterly plan, etc~~
 - i) Plan modification provisions: (NMFS to decide how this is done)
 - (1) EM Provider and vessel operator provisions – changes that do not need re-approval (MODIFICATION DESCRIPTION NEEDED)

(2) NMFS provisions - changes that trigger the need for re-approval (e.g. operator will use a different vessel)

~~e) Specified by NMFS or IVMP is set between fisher and provider~~

3) Potential categories of information in an IVMP (specifics identified in Section 2):

- a) Type of system
- b) Hardware
- c) Software
- d) Emergency protocols
- e) Back-up equipment use protocols
- f) Catch handling protocols
- g) Layout of vessel
- h) Screen shots of all camera views
- i) Number of cameras needed with placement specifications
- j) Care and maintenance of the EM system
- k) Types of sensors and data for sensors to capture
- l) Download/maintenance schedule
- m) Logbook format (electronic or paper)

4) Declaration of EM use:

- a) No Declaration to appropriate agencies and contractors
- b) Declaration to NMFS appropriate agencies and contractors for use of EM (i.e., vessel will opt to use EM for a specified period of time within fishing year)
 - i) Option 1 - For the coming year, participants must indicate in which months, if any, it will use EM and in which months, if any, it will use an observer. (e.g. quarterly)
 - ii) Option 2 -Trip by trip basis (to provide the option for the vessel and the observer provider to work out when observers may be available on a per trip basis).
 - (1) IVMP lays out the responsibility for vessel operator to notify NMFS, EM provider, and Observer program when EM will be used and when observer will be used.
 - iii) Option 3 - Emergency situation – camera broke so need an observer tomorrow, vice versa
 - (1) IVMP lays out the responsibility for vessel operator to notify NMFS, EM provider, and Observer program when EM will be used and when observer will be used.

1.5 Implementation

Implementation of an EM program could be done for all fisheries at one time through regulation (Alternative 1). However, there may be other options. Implementation of an EM program could be done through a pilot program using an Exempted Fishing Permit (ESP.) (Alternative 2). For example, an EM program may be developed for a fishery, and then implemented on a temporary basis through an ESP. to identify issues and improve the program before it is implemented full scale for a particular fishery or all fisheries. It could also be done through a “phased-in” approach. For example, if development of an EM monitoring program (i.e., regulations, camera system, EM providers, review process, accounting protocols, enforcement, etc.) is ready for use in the mid-water trawl fishery then NMFS could implement the program by regulation before other EM programs are fully developed for use in other fisheries such as the bottom trawl (Alternative 3). Another approach would be to implement an EM program based on retention rules (Alternative 4),

starting with any gear types that are willing to fish under a maximized retention type fishery (See Alternative 2 in Section 1.3 for a description of a maximize retention fishery). For example, bottom trawl and non-whiting mid-water trawl vessels that are willing to retain and land all fish (excluding prohibited species and ESA/MMPA species) would be allowed to use EM. Then, as EM capabilities improve to provide verifiable species identification (for example distinguishing aurora rockfish from rough eye rockfish), the EM program could be expanded to include other discard options (See Alternative 3 in Section 1.3). A list of species that are shown to be verifiable with EM would need to be developed over time.

Phasing in Implementation could be organized in a number of ways.

Alternative 1: Implement EM program for all fisheries at one time

Alternative 2: Phase in with a pilot program with EFPs

Alternative 3: Phase in by sector/gear (MWT whiting may be ready first)

Alternative 4: Implement by retention rules; start with maximize retention fisheries and move to other retention rules as reliable technologies for speciation are developed.

2. Data Capture and Processing

The success of an EM program relies on the ability to capture the data and process it in a timely manner. There are multiple ways to set up a system and many details are absent here; however, some general topics are listed here to begin development of a system.

2.1 Vessel Hardware, ~~and~~ Data Maintenance, and Onboard Procedures

1) Data formats:

~~Alternative 1: Create a standardized format that can be used by multiple users. (NEED TO BE SPECIFIED BY OTHER TECH ADVISORS during implementation of what format would be best to use)~~ Specific format(s)?

~~Alternative 2: Open source format to utilize the video images using a range of commercially available viewers, without having to purchase licenses from vendors who collected the data. NMFS policy encourages the use of open source code or standards that facilitate data integration and offer long term cost savings rather than becoming dependent on proprietary software.~~

5) Video Hardware: (performance standards to be developed during implementation between NMFS, PSMFC, states, and contractors; similar to British Columbia fisheries, See appendix A) Image quality must be sufficient to allow clear identification of species or species categories being discarded.

~~Alternative 1: Analog~~

~~Alternative 2: Digital~~

~~Alternative 3: Both Alternatives 1 or 2 can be used~~

~~Alternative 4: Other?~~

6) Logbook Data Source: It is assumed that electronic logbooks would be required processed by NMFS for quota pound accounting. Without such logs, the time required for video review

~~would expand and likely make the program cost prohibitive. The fields and data format would be specified by NMFS.~~

Allow either paper or electronic logbooks; however, electronic logbooks should be encouraged to increase efficiencies in the EM analysis.

- 7) On Vessel Data Storage: (video hardware, sensor data, vessel location data, logbook data) integrated and in a secure format
~~Alternative 1: Only harddrives~~
~~Alternative 2: Hard drives in combination with cloud storage.~~
- 8) Onboard operations (performance standards to be developed during implementation between NMFS, PSMFC, states, and contractors) Topic examples:
 - a) Self check system to ensure proper functioning of EM system (“functionality test” within the EM system with a record that the test was performed)
 - b) EM system is powered on during entire trip, however cameras could be triggered to turn on at first hydraulic event and remain on for the duration of the trip.
 - c) Back-up equipment use protocols if EM unit or portions of it fail

2.2 Data Transfer Processes

Protocols would need to be established for data transfer. Since the data could potentially be used in enforcement actions, data transfer protocols would have to address chain of custody issues.

Data protocols may vary by sector. For example, mothership catcher vessels may seldom return to port. This may not only affect the volume of data that they would have to store but also the data transfer protocols used. If the data transfer processes are to be included in the Council recommended policy then both generic provision (provisions applying to all vessels or all vessels of a certain class) and individual vessel performance criteria should be specified. Protocols may also vary based on the type of data being transferred (video, electronic log, or data logger).

- 1) Video transfer, Electronic logbook, Data loggers (performance standards developed during implementation between NMFS, PSMFC, states, and contractors)
 - a) Secure transfer – chain of custody requirements
 - b) Possibly allow captain and crew to transfer data to EM provider
 - ~~c) Timing of transfers~~
 - ~~d) Channel for data transfer (possibilities include)~~
 - ~~i) Hard drive removal/replacement~~
 - ~~ii) Transmission via internet shoreside~~
 - ~~iii) Physical transfer of hardware to reviewers~~
 - ~~iv) Other?~~
 - ~~e) Other necessary provisions?~~
- 2) Electronic logbook
 - ~~a) Timing of transfers~~
 - ~~b) Channel for data transfer (possibilities include)~~
 - ~~i) Hard drive removal/replacement~~
 - ~~(1) Transmission via internet shoreside~~
 - ~~(2) Physical transfer of hardware to reviewers~~
 - ~~ii) Wifi or cellular transmittals~~

- iii) ~~Thumbdrive submission~~
- iv) ~~Through VMS~~
- e) ~~Other necessary provisions?~~

3) ~~Data loggers~~

- a) ~~Timing of transfers~~
- b) ~~Channel for data transfer (possibilities include)~~
 - i) ~~Hard drive removal/replacement~~
 - (1) ~~Transmission via internet shoreside~~
 - (2) ~~Physical transfer of hardware to reviewers~~
 - ii) ~~Wifi or cellular transmittals~~
 - iii) ~~Thumbdrive submission~~
 - iv) ~~Through VMS~~
- e) ~~Other necessary provisions?~~

2.3 Data Processing, Validation, and Analysis

EM data processing would likely involve analysis of EM sensor, video data, and electronic logs. The following is an outline of some of the considerations to be taken up under this topic.

Allow state and federal enforcement access to data

- 1) Video review and log comparison
 - a) Potential reviewers for discard events (not mutually exclusive)
 - i) Alternative 1: Sustainable Fisheries Division NMFS
 - ii) Alternative 2: Pacific States Marine Fisheries Commission
 - iii) Alternative 3: Independent contractor
 - b) Review process:
 - i) Percent reviewed (depends on method chosen to monitor discards in section 1.2)
 - (1) ~~Alt 1: X% of all trips are reviewed, (percentage of review may increase if compliance issue)~~
 - (2) ~~Alt 2: Census of all trips~~
 - (3) ~~Alt 3: Radom selection of discard~~
 - ii) Match video segments with logbook discard events; may need to define audit units that match fishing logs units (i.e., fishing events). For some fisheries fishing events are not clearly defined to facilitate an audit. (developed during implementation between NMFS, PSMFC, and contractors)
 - (a) ~~Include sensor data in video to verify time and location of fishing events~~
 - (b) ~~Use GPS data in logs~~
 - (c) ~~Use data logger~~
 - iii) Validation: (developed during implementation between NMFS, PSMFC and contractors)
 - (1) ~~Use observer data from an EM trip to validate data collected (video and/or logbook) —on trips for which the biological observers overlap with EM.~~
 - (2) ~~Species identification capabilities~~
 - (3) ~~Weight estimation capabilities~~
 - (4) ~~Protocols for additional video review~~

- ~~(5)-~~
- ~~(6) when non-compliance issues arise;~~
 - ~~(a) Create incentives to comply (management incentives vs. enforcement action)~~
 - ~~(a) Look at ways the Alaska co-ops model might be used to implement the program, e.g., self-imposed sanctions within a group or fleet~~
- e) ~~Logbooks~~
 - i) ~~Requirements~~
 - ~~(1) Require only electronic logs?~~
 - ~~(2) Option to use either one?~~
 - ii) ~~Electronic~~
 - ~~(1) Format~~
 - ~~(2) Minimum data fields needed (standardize)~~
 - ~~(3) Submission requirements~~
 - iii) ~~Paper~~
 - ~~(1) Minimum data fields needed (standardize)~~
 - ~~(2) Submission protocol~~
 - ~~(3) Develop method to enter data and match with video~~

3. GEMPAC Recommendations

Recommendation 1: The GEMPAC does not support Alternative 1 that would make EM mandatory and suggest removal of this alternative listed under Section 1.1 “EM Participation and Eligibility. To be consistent with this recommendation, the GEMPAC also recommends removal of Alternative 3, “Use only an EM program,” and that both alternatives should not be analyzed in detail in any future environmental analysis.

Recommendation 2: Provide option for an out-of-cycle ESP. for Council consideration. Example, allow any vessel any gear that wants to fish under a maximized retention type fishery program to be exempt from observer coverage while using EM.

Recommendation 3: The GEMPAC considered the “phase-in” approach as suggested by the Council. In lieu of phasing in by fishery, the GEMPAC recommends an alternative that would phase in implementation through retention rules; start with maximize retention alternative and move to other retention rules as methodologies for speciation are developed.

Recommendation 4: GMEPAC recommends that performance standards for regulations be developed during implementation between NMFS, PSMFC, the states, and contractors for some items identified in Section 2, “Data Capture and Processing,” including video hardware, onboard operations, and transfer of data (video, electronic logbooks, data logger information).

Appendix A

Department of Fisheries and Oceans – Canada

PACIFIC REGION INTEGRATED FISHERIES MANAGEMENT PLAN GROUNDFISH, EFFECTIVE FEBRUARY 21, 2013 (April 11, 2013 – Version 1.1)

Appendix 2: Groundfish Hook and Line/Trap Monitoring Requirements (At- Sea and Dockside), Mortality Rates, and Size Limits

3.2. Systems Requirements

Any electronic monitoring system must be approved by the Department and must include the following minimum specifications and component requirements:

- a) a video and sensor data-logging engine (control box), equipped with monitor and keyboard to verify correct power supply and EM system software and hardware performance, equipped with an external control to allow the user to manually insert time stamped event markers into the sensor record;
- b) operating software to record imagery during fishing events;
- c) peripheral sensor devices suitable for fishing-deck work environment, including GPS, an electronic hydraulic pressure transducer, and a winch rotation sensor;
- d) a minimum of two closed circuit television cameras, suitable for fishing-deck work environment, configured with an adjustable focal length lens to provide a clear view of the catch retrieval process and the measurement of released fish.
- e) have the sensor box connected to a monitor and keyboard to allow the user to view recorded EM imagery and conduct system checks to test system functionality.

GROUND FISH MANAGEMENT TEAM REPORT ON ELECTRONIC MONITORING ALTERNATIVES

The Groundfish Management Team (GMT) received a presentation from Mr. Brett Wiedoff (Council staff) regarding the draft alternatives, a presentation from Mr. Dayna Matthews (National Marine Fisheries Service [NMFS], Office of Law Enforcement), and reviewed and discussed the materials under this agenda item. The GMT would like to thank Mr. Wiedoff and Mr. Matthews for their time to present and answer questions from the GMT.

The GMT supports the full range of alternatives for electronic monitoring (EM) regulations described in [Agenda Item H.8.a, Attachment 1](#). We offer the following additional thoughts:

- The alternative to phase in the EM program using maximized retention first should be included for further consideration, acknowledging that there must be a clear and appropriate definition of what “maximized retention” means; and
- EM should be considered for both individuals and groups (e.g., EM co-ops) for now, as there are tradeoffs that still need to be further explored.

One of the biggest implications with EM for management of the catch shares fisheries is verifying discard. As part of development of an EM program, methods for estimating discards that EM misses are essential. The GMT is supportive of programs to gather additional information.

Regarding the exploration of programs designed to gather additional information to inform the development of an EM program, the GMT discussed two possible paths:

- If designed properly, an exempted fishing permit (EFP) will collect information that can inform an evaluation of the most effective methods to achieve objectives over a wide range of conditions, prior to implementing a full-scale EM program.
- Alternately, implementation of EM could be achieved by continuing ongoing field trial research currently underway, while dedicating staff time toward the required National Environmental Policy Act (NEPA) analysis (also necessary in an EFP process), the proposed and final rulemaking process.
- Whether an EFP or a proposed and final rulemaking process were to occur, the design of either path should be developed and planned by various entities knowledgeable about information needed from the EFP (e.g., NMFS, Groundfish Electronic Monitoring Policy Advisory Committee [GEMPAC], Council advisory group members and Council Staff, State, non-government organizations [NGOs], members of the fishing industry, etc.). Industry interested in the program would then apply, with some incentive, to evaluate the most effective methods.

The GMT supports continued work by the GEMPAC and the Technical Advisory Committee (TAC) at their next meeting, currently scheduled for January of 2014.

ELECTRONIC MONITORING COMPLIANCE PROGRAM

Electronic Monitoring System / Observer Exemption Criteria

Over Arching Regulation: 100% Human Observer Required

- In lieu of an observer applicant can seek an observer exemption using an EMS alternative

Application Elements

- Electronic Monitoring System (EMS) / Observer Exemption Application detailing how EMS criteria will be met
- Schematic and Description of Individual Vessel Monitoring Plan (IVMP)
 - IVMP unique for each vessel
 - Multiple IVMPs included if submitted by group of vessels
- Self-Governing Plan
 - Data Delivery and Analysis (DDA) specifications
 - submitted by either a group of vessels or an individual vessel

Electronic Monitoring System Application Elements Specified in Regulation:

- Operational Information
- Data Sources
- EM Data Standards
- Self-Governing Plan Elements
- As appropriate, regulations may be specific or performance bases

Operational Information (not inclusive of all elements)

- Installation by certified EMS Provider
- EMS service provider responsibilities
- Data Confidentiality Standards
- Data Storage and Delivery Standards
- EMS Coverage Requirements
- Monitoring Requirements
- Vessel Responsibilities

Data Sources (not inclusive of all elements)

- Digital Camera(s)
- Winch Sensors
- Hydraulic Sensors
- Log Book

- VMS
- GPS

EM Data Standards (not inclusive of all elements)

- Secure Watertight Control Box Data Storage
- Encrypted Data
- Storage Standards
- Date and Time Stamp and Counter
- Digital File Format
- Minimum Frame Rate
- Minimum Resolution
- Accepted Delivery Methods
- Time Frames
- Color Optics
- Lighting Standards
- Power Supply Standards

Self-Governing Plan Elements:

Group Self-Governing Agreement (not inclusive of all elements)

- Comply with all Federal and State Regulations
- Retention / Discard Requirements
- Time and Area Restrictions
- Data Collection Equipment Criteria
- Data Collection Requirements
- Data Analysis Agreement Clause
- Discard Assessment Protocols and Procedures
- Vessel / Operator Performance Standards
- Vessel / Operator Responsibility
- *Compliance Criteria*
 - *By Example: escalation of consequences (to be defined by group)*
- *No Further use of Camera Use Alternative Criteria*
- Escape Clause

Individual Self-Governing Agreement (not inclusive of all elements)

- Comply with all Federal and State Regulations
- Retention / Discard Requirements
- Time and Area Restrictions
- Data Collection Equipment Criteria
- Data Collection Requirements
- Data Analysis Agreement Clause
- Discard Assessment Protocols and Procedures
- Vessel / Operator Performance Standards
- Vessel / Operator Responsibility
- *Compliance Criteria*
 - *By Example: fail to demonstrate compliance, vessel must use observer for rest of the year.*
- Escape Clause

IVMP Details (not inclusive of all elements)

- Tamper Resistant/Taper Evident
- Number and Location of Digital Cameras
- Lighting Locations
 - Stern, Deck, Discard Shoot, etc.
- Bridge Mounted Computer Interface/Monitors
- GPS Receiver
- Winch Sensors
- Hydraulic Pressure Transducers
- Power Supply / Backup
- Wire Runs
- Geo Fencing
 - NMFS supplied
- System's Check Certification

Data Delivery Standards (not inclusive of all elements)

- Comply with all Federal and State Regulations
- DDA
- Data Accessibility
 - on the vessel and after delivery to analysis provider
- Data Retrieval
 - who, how often, delivery mechanism
- Means of ensuring forensically sound digital transfer to OLE

Data Delivery and Analysis (DDA) Standards (not inclusive of all elements)

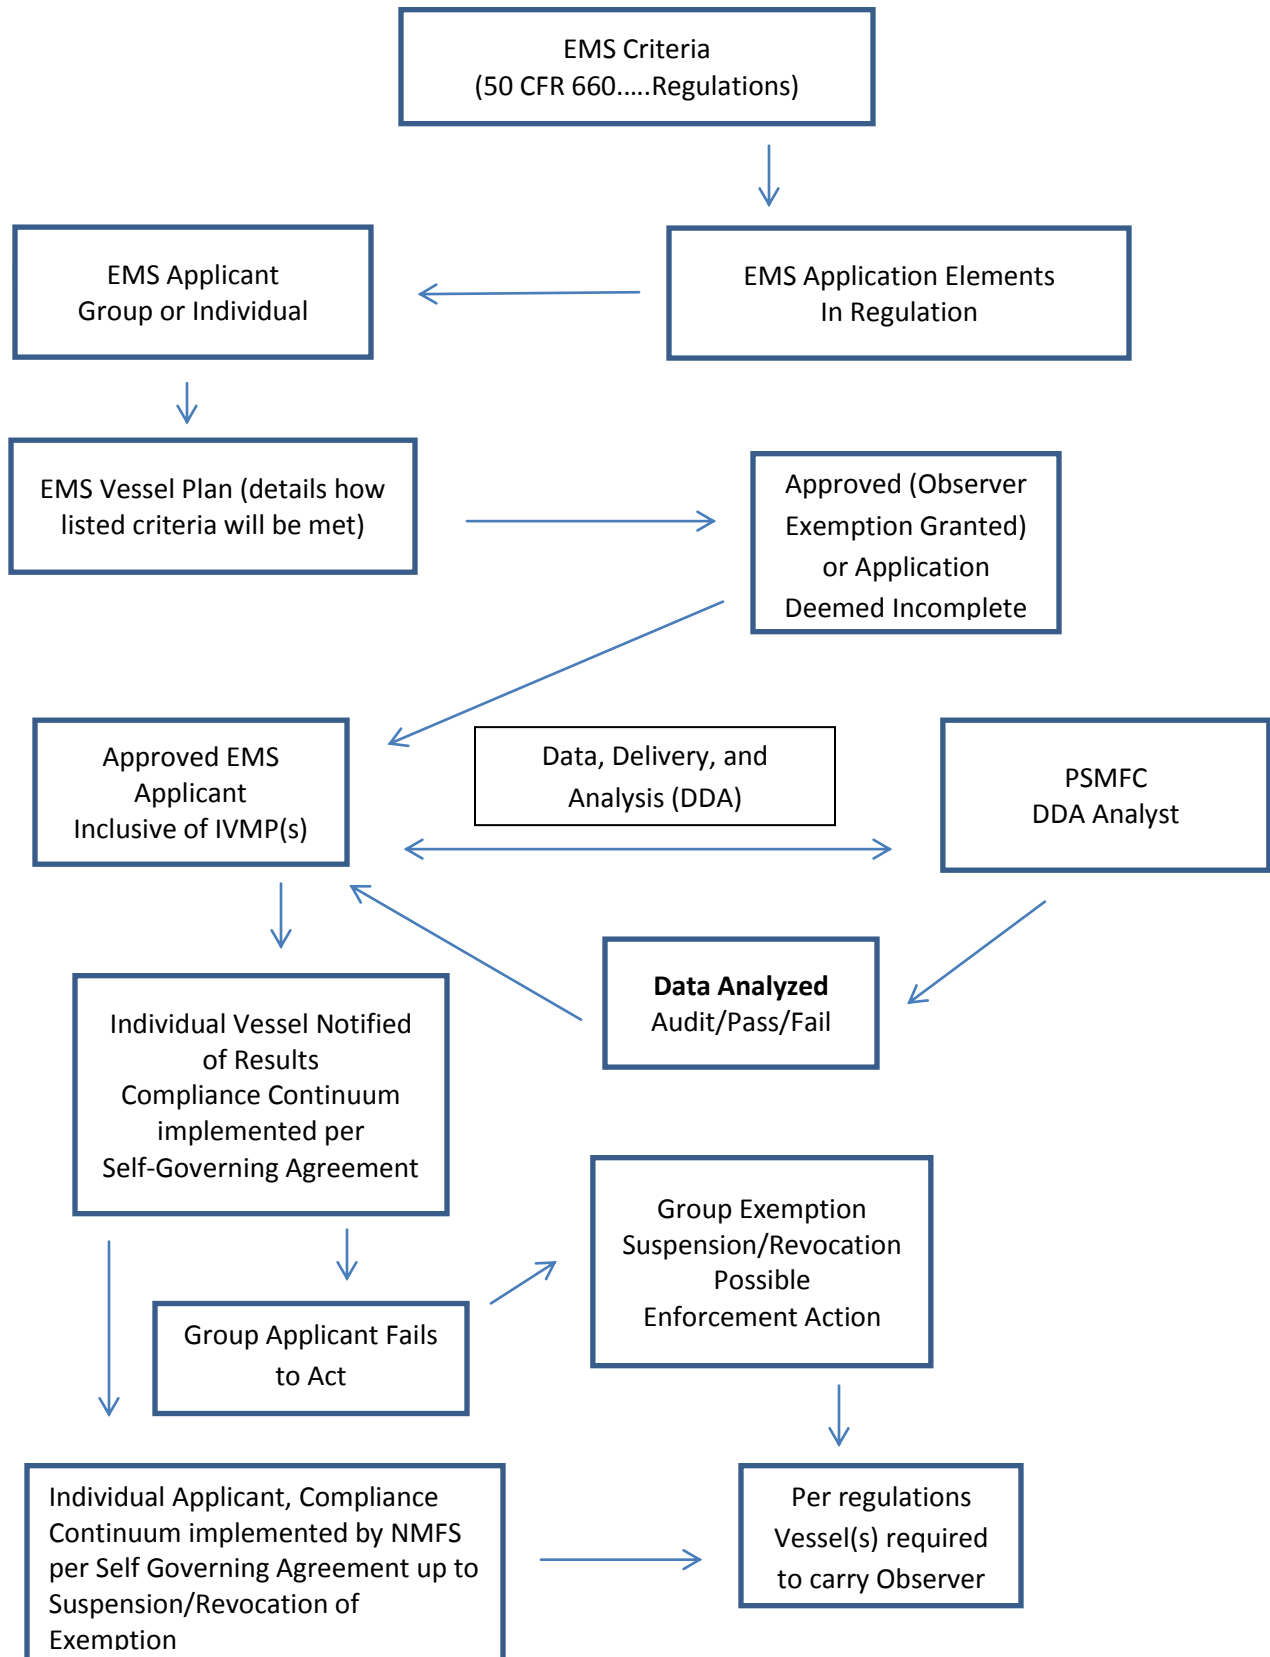

- Comply with all Federal and State Regulations
- Maximum Retention (non selective discard) (example)
- Data Collection Equipment Criteria
- Data Collection Requirements
- Vessel / Operator Responsibility
- Video Audit (by example)
 - Percentage of review
 - Pass / Fail of Self-Reported Data
 - Discard Assessment Definitions/Protocols/Procedures
 - Scale for Assessing Deductions
- Vessel / Operator Performance Standards
- Escape Clause

Flow Chart Explanation

1. Electronic Monitoring System (EMS) Criteria is established by rule
2. Application Elements Established by Rule
3. Electronic Monitoring System Application inclusive of
 - a. Operational Information
 - b. Data Sources
 - c. EM Data Standards, Self-Governing Plan
 - d. completed and submitted to NMFS

- i. by group (i.e. Coop, Risk Pool, Marketing Asso., Process Group),
 - ii. or individual vessel.
- 4. Application approved with issuance of an observer exemption or deemed incomplete by NMFS/SFD and returned to Applicant.
- 5. Applicant engages PSMFC per Data Delivery and Analysis Standards (DDA).
- 6. PSMFC conducts data analysis and delivers trip results to applicant per DDA.
- 7. Applicant notifies vessel of analysis results and takes actions as prescribed in the Self-Governing Plan Compliance Continuum.
- 8. Failure to act by the applicant as prescribed in Self Governing Agreement results suspension/revocation of Observer exemption.
- 9. Vessel must carry observer during IFQ trips.

Electronic Monitoring Systems (EMS) Observer Exemption Application Process

Electronic Monitoring Program

Pacific States Marine Fisheries Commission

66th Annual Meeting

September 23, 2013

Coeur d'Alene, Idaho

Dave Colpo

Why are we here?

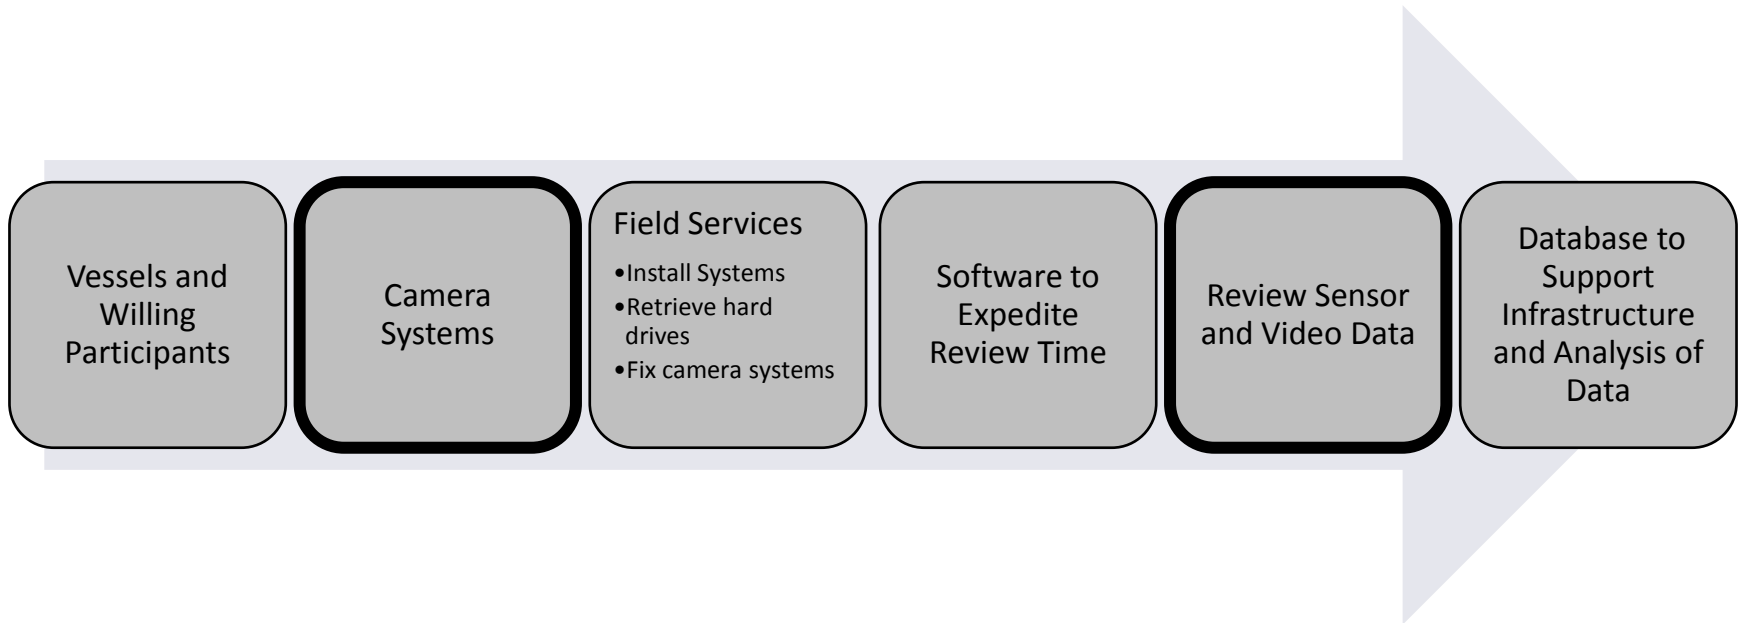

To test the viability of Electronic Monitoring (EM) as a source of data to document individual accountability of catch and bycatch in the Pacific Trawl Rationalization Program.

Is it Science or Compliance?

Pacific Fisheries Management Council
Decision from April 2013 Council Meeting

“The Council indicated their desire to move ahead with consideration of electronic monitoring (EM) by stating that **compliance monitoring, rather than the collection of biological data, would be the primary focus for EM in the trawl catch share program**[...]”

Moving parts of an EM Program

Issue

Working Solutions

Accurate Speciation	Digital cameras, full retention/discard chute study
Obtaining weights of catch and bycatch	Volumetric density, length/weight relationships with measurement strips, and full retention studies
Changes in fisher behavior needed for clear camera views	Feedback forms and direct contact
Defining catch and discard	NMFS working to develop clear definitions
Data review time / Cost	Logbooks as data source and audit a percentage of the video data
Data security	Encryption

How Close Is Close Enough?

2012 Shoreside IFQ (Hake and Non-Hake)

Issue – 3. Changes in Fishing Behavior to Accommodate Cameras

2012 Results – Hake Sector

Issue – 4. Definitions of Catch and Discard

Issue – 5. Data review time / Cost

- Data collection mechanism (affects % review of video)
 - Video data (100% Review)
 - Self-reported catch and discard (logbook) (< 100% Review?)
 - Trawl: Mirrored retained federal logbook for discard reporting
 - Fixed gear: Used Oregon FG logbook as a template
 - At-sea Catcher Vessel: New logbook to capture location of haul, retained and discarded weights.
- Speed results are needed
 - Frequency of data retrievals
 - Will a shoreside CM, tech, or the skipper be allowed to pull own drive?
 - Confidentiality concerns (encryption)
 - % review of video

Vision

- I. Logbooks as data collection mechanism
 - I. PSMFC receives Logbook at landing
 - II. Logbook catch data into a database within 72 hours
 - III. Vessel Account System hits logbook database for discard debits

So far, 100% self-reported

Vision

I. Logbooks as data collection mechanism

II. Video for auditing

Video is reviewed to confirm accurate reporting on the logbook

Still to be addressed:

I. Frequency of hard drive retrievals

II. % of video to be reviewed

III. Speed of video review

Vision

- I. Logbooks as data collection mechanism
- II. Video for auditing
- III. Emulate CM/eTix protocols to check haul and species level reporting
 - I. Trip passes if logbook record is “good enough”
 - II. Trip gets flagged if not

Unanswered questions

1. What is the data source? Logbooks or Video?
 - If logbooks:
 - What % of video is audited?
 - What is a “good enough” match?
 - What happens if the match is not good enough?
2. How fast are the reviewed data needed?
3. What are the definitions of terms (maximized retention, catch, discard, etc)?
4. Quantifying discards only or both retained and discarded?
5. What about halibut mortality?

SCIENTIFIC AND STATISTICAL COMMITTEE REPORT ON
ELECTRONIC MONITORING ALTERNATIVES

The Scientific and Statistical Committee (SSC) reviewed the draft set of alternatives developed by Council staff for integrating electronic monitoring (EM) into the trawl catch share program's compliance monitoring (Agenda Item H.8.a, Attachment 1). The Groundfish Electronic Monitoring Policy Advisory Committee (GEMPAC) and the Groundfish Electronic Monitoring Technical Advisory Committee (GEMTAC) met in October to review the draft alternatives. Mr. Brett Wiedoff briefed the SSC on the report from this meeting (Agenda Item H.8.b, Supplemental GEMPC Report).

The alternatives identified under the five policy topics are reasonable. However, the SSC notes that the objectives of using EM as a compliance monitoring tool are not clearly defined, which makes risk analysis challenging. The SSC did not receive updates on the current pilot study conducted by the Pacific States Marine Fisheries Commission; therefore, the SSC is unable to provide any feedback. The SSC expects to see a detailed study design that addresses the management measures identified in the alternatives. Also, in order to provide scientific guidance for future analyses, such as video sampling rate and cost analysis, the SSC encourages the collection of information from a variety of vessels and from existing EM programs, such as British Columbia's program.

CONSIDERATION OF INSEASON ADJUSTMENTS

Management measures for groundfish are set by the Council with the general understanding that these measures will likely need to be adjusted within the biennium to attain, but not exceed, the annual catch limits. This agenda item will consider inseason adjustments to remaining 2013 fisheries and 2014 fisheries. Potential actions include adjustments to rockfish conservation area boundaries and changes to commercial and recreational fishery catch limits. Adjustments are, in part, based on catch estimate updates and the latest information from the West Coast Groundfish Observer Program.

The Council is also expected to receive an update from the National Marine Fisheries Service (NMFS) regarding the issuance of 2012 petrale sole surplus carryover quota pounds into the 2013 shorebased individual fishing quota fishery. In September, the Council considered inseason projections for petrale and recommended that NMFS issue carryover since the annual catch limit was not projected to be attained or exceeded ([Agenda Item G.5.b, Supplemental GMT Report, September 2013](#)).

Council Action:

- 1. Consider information on the status of 2013 fisheries and adopt inseason adjustments for 2013 and 2014, as necessary.**
- 2. Consider the NMFS decision regarding surplus carryover for petrale sole and make recommendations, as necessary.**

GROUND FISH ADVISORY SUBPANEL REPORT ON CONSIDERATION OF INSEASON ADJUSTMENTS

The Groundfish Advisory Subpanel (GAP) met with the Groundfish Management Team (GMT) to discuss possible inseason adjustments for the 2014 season. The GMT discussion was led by Mr. Bob Leos. The GAP offers the following recommendations and comments on proposed inseason adjustments to ongoing groundfish fisheries.

The Southern California Charter Boat fleet and Sportfishing Association of California (SAC) have withdrawn their requests for inseason changes to season and areal restrictions, thus these requests were not reviewed by the GAP.

A request from the fixed gear open access (OA) sector north of 36° N. Lat. to open the 2014 fishing season with a larger sablefish trip limit than the “no action” alternative was discussed. The open access fishermen are requesting a weekly limit of 800 lb. and a bi-monthly limit of 1,600 lb. The “no action” trip limits would leave fishermen with very narrow profit margins. Dr. Sean Matson has analyzed the 800 lb. weekly/1,600 lb. bi-monthly limits and the model estimates a 99 percent attainment. The higher attainment figure is due to an improving market for sablefish which the GMT statement will provide greater detail on. The GAP and GMT will be able to look at reducing the trip limits through inseason actions next year, should there be an issue with excessive catch.

To keep things simple at this point, the GAP is recommending going with the GMT Alternative 1 for all fixed gear sablefish sectors both north and south of 36° N. Lat. to start the 2014 fishing season. Those limits are as follows:

Limited Entry Fixed Gear Sablefish Fishery North of 36° N. Latitude

The GAP supports **GMT Alternative 1, (1 landing per week of up to 950 lb., not to exceed 2,850 lb. per 2 months).**

Open Access Fixed Gear Sablefish Fishery North of 36° N. Latitude

The GAP supports **GMT Alternative 1, (300 lb. per day, or 1 landing per week of up to 800 lb., not to exceed 1,600 lb. per 2 months).**

Limited Entry Fixed Gear Sablefish Fishery South of 36° N. Latitude

The GAP supports **GMT Alternative 1, (2,000 lb. per week)**

Open Access Fixed Gear Sablefish Fishery South of 36° N. Latitude

The GAP supports **GMT Alternative 1, (300 lb. per day, or 1 landing per week of up to 1,600 lb., not to exceed 3,200 lb. per 2 months).**

San Francisco Fishermen's Cooperative-Dan Platt/midwater vertical hook and line gear
exempted fishing permit (EFP)

The EFP sponsors are requesting an increase in the yelloweye set-asides for 2014, from 0.01 metric tons (22 pounds), to 0.03 metric tons (66 pounds). The GAP supports this request.

The GAP also reviewed the public comment received for a request to increase the open access trip limits for bank rockfish (slope rockfish component). This was a unique request, as it involved the use of set gillnet fishing gear. The GAP has concerns about the potential impacts to blackgill rockfish, as this fishery would be taking place in similar habitats and water depths that blackgill inhabit. After further discussion with the GMT, the GAP believes this request needs more analysis and that analysis should be put off until the March or April meetings in 2014 due to GMT workload planning.

PFMC
11/05/13

THE GROUNDFISH MANAGEMENT TEAM REPORT ON CONSIDERATION OF INSEASON ADJUSTMENTS

Action items:

- Proposed trip limit increases for the limited entry and open access fixed-gear sablefish DTL sectors north and south of 36° N. latitude for 2014.
- Request to increase the open access slope rockfish complex bimonthly trip limits for south of 40°10' N. latitude for 2014.
- California recreational request to open the Southern Management Area during the January/February period and/or to change the current depth restriction in this area.

Informational items:

- IFQ snapshot
- OFS Scorecard update

The Groundfish Management Team (GMT) considered the most recent information on the status of ongoing fisheries, research, and requests from industry and provides the following recommendations for 2014 inseason adjustments.

The GMT also received guidance from the National Marine Fisheries Service (NMFS) West Coast Region (WCR) regarding timing of implementation of inseason recommendations from this meeting.

1. ACTION ITEMS

1.1. 2014 Fixed Gear Sablefish, Daily-Trip-Limit (DTL) Fisheries

This section discusses 2014 inseason considerations for the four fixed gear daily trip limit (DTL) fisheries, including both limited entry (LE) and open access (OA), north and south of 36° N. latitude. Hereafter, they will be referred to as follows: LE North, LE South, OA North, and OA South.

1.1.1. Current status and Alternatives

Alternative trip limits under the No Action Alternative and Alternative 1 for the sablefish DTL fisheries in 2014 are shown in Table 1. Current projections under the alternatives are shown in Table 2. The 2014 projection for the LE North fishery assumes a uniform seasonal ex-vessel price throughout 2014, at the 2013 bimonthly average ex-vessel price of \$2.54 per pound. Ex-vessel price is one predictor in the projection model. Assumptions about ex-vessel price in the LE North fishery in 2014 are shown in Table 3. From 2004 through 2011, the bimonthly price followed a predictable seasonal pattern, but during 2012 and 2013, that pattern has disappeared, and was replaced with one of general decline. However, current landings data, and some market reports tell of a potential recovery of ex-vessel prices and market for sablefish, to an unknown

degree. Thus, a working assumption of a uniform price was assumed in the case of 2014, since the beginning date, and extent of a potential recovery is not known with any certainty. Uncertainty in the landings forecast for 2014 in this fishery is bracketed by using the lowest and highest bimonthly price during 2013.

Projected attainment for the four sablefish DTL fisheries under Alternative 1 is within the range generally recommended by the Council, of between 90 and 95 percent, with the exception of the OA North fishery, which has a projected attainment of 99%, and the OA South fishery, which has been maintained at a lower level in recent years, partially to allow some buffer for the LE South fishery. The reason for the higher than usual projected attainment in the OA North fishery under Alternative 1 is that actual landings have been running much lower than projected for the past two years. The risk associated with beginning the year with this projection is low, given that adjustment could be made as early as March, when the average bimonthly landings are only one third of their typical peak (Period 5), over the historical period since 2004. Members of the GAP have related in the past that this alternative contains the minimum weekly limit that is necessary in order to maintain reasonably profitable operations.

Table 1. Trip limits (pounds per vessel) under the alternatives for the fixed gear sablefish DTL fisheries in 2014.

Fleet	Area	Period	2014 No action trip limits			2014 Alt. 1 trip limits		
			Bimonthly	Week	Day	Bimonthly	Week	Day
LE	North	1	2,850	950	na	2,850	950	na
		2	2,850	950	na	"	"	na
		3	2,850	950	na	"	"	na
		4	3,300	1,110	na	"	"	na
		5	3,300	1,110	na	"	"	na

Table 2. Forecasted landings (mt) and attainment under the alternatives, for the fixed gear sablefish DTL fisheries in 2014.

2014 No Action	LE N	OA N	LE S	OA S	South sum
Projected landings	249.6	326.9	399.7	266.7	666.5
Landing target	214	319	483	393	876.0
Difference	-35.6	-7.9	83.3	126.3	209.5
Percent attainment	117%	102%	83%	68%	76%
2014 Alternative 1					
Projected landings	201.7	316.7	437.8	279.7	717.5
Landing target	214	319	483	393	876.0
Difference	12.3	2.3	45.2	113.3	158.5
Percent attainment	94%	99%	91%	71%	82%

Table 3. Forecasted landings (mt) and attainment under the no action alternative and alternative 1, and different assumptions about ex-vessel sablefish price, for the LE North DTL fishery in 2014.

Assumed ex-vessel price >	2014 ave.	2014 low	2014 high
LE N, No Action	2.54	2.37	2.66
Projected landings	249.6	232.5	261.8
Landing target	214	214	214
Difference	-35.6	-18.5	-47.8
Percent attainment	117%	109%	122%
LE N, Alt. 1			
Projected landings	201.7	186.4	212.4
Landing target	214	214	214
Difference	12.3	27.6	1.6
Percent attainment	94%	87%	99%

1.2. Slope Rockfish Complex Trip Limits South of 40°10' N Latitude

The GMT received a request to increase the 2014 bimonthly cumulative trip limits for the open access fixed-gear slope rockfish complex for the area south of 40°10' N. latitude (Agenda Item H.9.c Public Comment, November 2013). The request did not specify a proposed trip limit amount; it only requested that the current 10,000 pound bimonthly trip limits be increased subject to the Council's preference.

Upon further consideration, the GMT concluded that there is not enough time to evaluate and analyze an increase to the slope rockfish complex in time for implementation by January 1, 2014. Linked to that is the team's concern about what the estimated bycatch harvest of blackgill rockfish would be, if such a slope rockfish complex increase were implemented. Another concern is the possibility of an unanticipated sizable increase in the number of participants that would move into this fishery as a result of a trip limit increase. Blackgill rockfish is now managed utilizing a harvest guideline approach and thus has separate bimonthly trip limits for both the limited entry and open access non-trawl fixed-gear sectors. Additionally, bank rockfish (the major target species for this complex) has not been assessed since July 2000, and little is

known of the stock's current status. The GMT, therefore, is requesting Council guidance on its preferences on how to proceed. One suggestion would be to delay further consideration for this proposal until the March 2014 Council meeting. Another suggested option would be to hold off for 2014 altogether and then include this proposal as part of the 2015-2016 SPEX and management measure package. Going with either suggested option, the GMT would have a more reasonable amount of time to analyze the proposal.

1.3 California Recreational Request for Southern Management Area Changes

The Sportfishing Association of California submitted a request to consider opening the California recreational groundfish season in the Southern Management Area in January and February and/or change the RCA shoreward depth restriction from 50 fm to 60 fm in 2014. Preliminary analyses indicate that such actions could not be accommodated without the risk of a harvest guideline overage for bocaccio. As such, the Association withdrew its request and no further analysis was conducted. However, they have requested that these management measures be analyzed for 2015-2016 under the regulatory specification process in addition to a four fish bag limit for bocaccio.

GMT Recommendations:

1. Establish sablefish trip limits for limited entry fixed-gear north of 36° N lat. in 2014 to "950 lb/week, not to exceed 2,850 lb/two months" in periods 1 through 6
2. Establish sablefish trip limits for open access fixed-gear north of 36° N lat. in 2014 to "300 lb/day, or one landing per week of up to 800 lb, not to exceed 1,600 lb/two months" in periods 1 through 6
3. Establish sablefish trip limits for limited entry fixed-gear south of 36° N lat. in 2014 to "2,000 lb/week" in periods 1 through 6
4. Establish sablefish trip limits for open access fixed-gear south of 36° N lat. in 2014 to "300 lb/day, or one landing per week of up to 1,600 lb, not to exceed 3,200 lb/two months" in periods 1 through 6
5. Request guidance on how to proceed with the proposal to increase the slope rockfish complex trip limits for the fixed-gear open access sector south of 40°10' N latitude. The GMT is suggesting two alternative for Council's consideration:
 1. Delay further consideration for this proposal until the March 2014 Council meeting.
 2. Include this proposal as part of the 2015-2016 SPEX and management measure package.

1.3 IFQ Snapshot

Table 4. 2013 IFQ quota species harvest as of November 1, 2013. These data were generated from the NOAA West Coast Groundfish IFQ Application.

IFQ Species	Sector Quota Pounds	Catch to Date	Lnds (mt)	% landed	Quota Pounds Remaining	% Remaining
Arrowtooth flounder	8,479,264	4,627,520	2,099.04	54.57%	3,851,744	45.43%

1.5 Overfished Species Scorecard Update

The November 2013 (Table 5) scorecard has no updates since the September Council meeting. The sectors/fisheries have been examined and all are expected to proceed through the end of 2013 as projected in September. A scorecard for the beginning of 2014 is also presented (Table). This is based on allocations and projected impacts for 2014 from the 2013-2014 Final Environmental Impact Statement, and updates to projected impacts for research for bocaccio and cowcod based on the 2011 and 2012 mortality reports. Additionally, it is the GMT's understanding that the holder of one of the 2014 exempted fishing permits (EFP) may be requesting additional yelloweye rockfish to pursue their project under this agenda item. The annual catch limit for yelloweye rockfish is fully prescribed for 2014. The current projected impacts have a 0.8 mt residual.

From: Louie Zimm, Southern California Charter Representative on the Groundfish Advisory Subpanel

To: Pacific Fisheries Management Council

Re: H.9 Consideration of Inseason Adjustments to the Recreational Groundfish Fishery South of 34° 27' N. Latitude

I would like to inform the council regarding a difficult situation that confronts our Southern California fleet and ask for remedy for the 2014 season.

In March of this year (2013), the CDFW mandated size limit on Spotted Sand Bass, Barred Sand Bass and Calico Bass was increased from 12 inches to 14 inches. This regulatory change immediately forced the fleet to a 95% live discard situation that will continue as the biomass alters its size profile over the next few years. Thousands of bass were discarded with few retained by anglers.

Barred Sandbass and Calico Bass were the primary fall back target of recreational fishing boats during the January and February rockfish closure.

In this present situation, until the size distribution of the bass population alters, recreational anglers are left with very little opportunity during the January/February time frame.

The commercial passenger vessel fleet has been hit especially hard by these combined access restrictions. This January and February, the fleet will be facing layoffs, if passengers have no reasonable opportunity to retain any catches. The CPFV fleet is very concerned about the looming loss of their licensed captains as these trained and highly skilled folks will seek other employment and not return to the fleet.

Access to the rockfish resource is already severely restricted due to existing CCA and RCA area closures. We have also been hit with the movement (by in-season action) of the inshore RCA line from 60 to 50 fathoms.

The primary reason for the Jan./Dec. closure is to restrict the catch of bocaccio. However, we now see that the population of bocaccio is rebounding significantly off Southern California. (See Information Agenda Item G.7.a, Supplemental Attachment 5 from September 2013 Briefing Book). This document shows a projected 2015 OFL of 1,444 tons south of 40 deg., 10 min. latitude with a range of alternative 2015 ABC's from 910 to 1380 tons. This contrasts with the previously proposed 2015 OFL of 881 tons. This substantial increase in recommended OFL is due to greatly increased recruitment.

The scorecard from F9b_SUP_GMT_JUN2013BB shows a projected impact of 125 tons by the California recreational fishery for 2013. This is 23.5% under the allowed attainment of the 163.5 metric ton allocation for this fishery. This ACL is based on a total harvest specification of only 320 tons for the entire bocaccio fishery.

We assert that the impact of a January/February opening of the recreational fishery for rockfish in the Southern California bight would not be sufficient to attain our present ACL and would have no chance of attaining future increased ACLs of this rapidly expanding population of bocaccio.

We also maintain that our present restriction to waters shallower than 50 fathoms greatly restricts our access to the majority of the bocaccio population. This, in conjunction with the bocaccio sub-limit of 3 fish will continue to restrict our impacts.

Please make an in-season adjustment to allow a recreational fishery for groundfish south of 34° 27' N. Latitude, during the months of January and February 2014. If this is not possible, at the very least, please consider weekend openings for recreational anglers to access rockfish off Southern California during January and February. This would allow our fleet to provide some sort of employment to our men and women during January and February of 2014.

October 8, 2013

Pacific Fishery Management Council (PFMC)
7700 NE Ambassador Place, Suite 101

- Portland, Oregon 97220

Dear PFMC,

The Sportfishing Association of California represents the majority of the commercial passenger sportfishing vessels in Southern California. This fleet is an important element to the economic welfare of the harbors they operate from. The purpose of this letter is to bring to your attention a serious issue that is on the horizon for our boats.

This past spring the California Department of Fish and Wildlife changed the length of retainable kelp and sand bass in our state from 12" to 14". This resulted in an almost "no take" situation with thousands of bass released for a handful retained. The end result was the boats had to shift to rockfish or highly migratory species while they wait for the bass population to increase in age and size. This will take several years.

At issue, is in January and February there will be no highly migratory species available, there will be no legitimate bass fishery, and the rockfish closure will be in effect. We are quite concerned that our customers will not have anything to go fishing for and that the boats will be shut down for nine weeks. We stand to lose many of our trained licensed Captains through layoffs and we run the risk of them not returning.

The purpose of the January/February rockfish closure was to assist the rebuilding process for bocaccio. The facts indicate the population has rebounded well and we do not believe there is any concern that we will reach the ACL as the recovery continues. We would therefore respectfully request consideration be given to opening rockfishing in Southern California for the months of January and February. Additionally, we recommend strong consideration be given to moving the RCA lines back into 60 fathoms. The cowcod population is rebounding and through avoidance and descending device use we believe the recovery is safe with little impact by recreational fishing.

Sincerely,

A handwritten signature in dark ink, appearing to read "Ken Franke". The signature is fluid and cursive, with the first name "Ken" being more prominent than the last name "Franke".

Ken Franke
President

October 9, 2013

To Council Chairman Lowman and Council Members,

Dear Members:

My name is Stephen Mintz and I have been a full time commercial fisherman since 1979. I have fished ground fish including halibut, white sea bass, and rockfish, both set gill-net and hook and line since 1984. Presently I fish albacore, swordfish drift-net and set gill-net for bank rock. Most of my set gill-net fishing has been off the central California coast. I have seen the regulations change tremendously, going from no limits to what we have today.

I have been targeting bank rockfish with my set gill-nets since 1998. These nets fish very clean with zero mammal or sea bird interactions. Also zero take on cowl cod, yellow eye, and other species of concern, with minimal interactions of Boccaccio, Chili Pepper, and other rockfish.

The Bank rockfish population appears to be healthy and even a very experienced Hook and Line Fisherman has great difficulty in harvesting any substantial amounts, leaving only the Drag-Net and Set-Gill Net as the harvest tools.

I am requesting for any reasonable increase in catch limits for the Bank Rockfish in open access, That the council would feel comfortable with.

Thank you,

A handwritten signature in black ink that reads "Stephen R. Mintz". The signature is written in a cursive, flowing style.

Stephen Mintz

Agenda Item H.9.c
Public Comment

SFCFA EFP

We would like to thank the Council for forwarding our EFP proposal for further consideration under Agenda Item H.2. Under H.2, the Council included an increase in our allowable catch of yelloweye rockfish from 0.01 mt to 0.03 mt. We would like to request that same increase be considered for our 2014 EFP project.

We understand that the harvest levels in some activities (e.g. tribal fisheries, EFPs, scientific research) come off the ACL as a set-aside. For 2014, that set-aside is 5.82 mt. Looking at the draft overfished species scorecard from the GMT, it looks like that entire set-aside is not anticipated to be harvested in 2014. We would like to request an increase in our allowable catch of yelloweye rockfish for our EFP project in 2014, from 0.01 mt to 0.03 mt to allow us to continue conducting the experiment to target yellowtail rockfish throughout the year in 2014. We understand that this would increase anticipated impacts to yelloweye, but would still be below the "off the top deduction" for 2014.

Thank You for your consideration

BIENNIAL MANAGEMENT SPECIFICATIONS 2015-2016 GROUNDFISH FISHERIES

This is the last of several agenda items at this meeting addressing harvest specifications and management measures for 2015-2016 groundfish fisheries. Under Agenda Item H.2, the Council is scheduled to adopt preliminary exempted fishing permits (EFPs) and the associated yield set-asides for public review. Under Agenda Items H.4, H.5, and H.6, the Council is scheduled to adopt final stock complex aggregations remaining, stock assessments and rebuilding plans, overfishing limits, final preferred overfishing probabilities (P*s)/acceptable biological catches and annual catch limits (ACL) for each stock and stock complex. In the event the Council does not complete all tasks under the previous agenda items or if additional analyses are requested, the remainder of the harvest specifications decisions should be made under Agenda Item H.10. Further, under this agenda item, the Council is scheduled to discuss management measures including guidance on preliminary set-asides, two-year allocations, season structures for commercial and recreational fisheries, and new management measures for detailed analysis in the Environmental Impact Statement (EIS).

Management measures, which are also referred to as accountability measures, are used to meet the goals of the Magnuson-Stevens Act and Groundfish Fishery Management Plan, including attaining but not exceeding the ACL and correcting or mitigating overages of the ACL if they occur. For the 2015-2016 cycle, the first set of management measures are implemented when deductions from the ACL, called set-asides, are made to account for groundfish mortality resulting from Pacific Coast treaty tribal harvest, scientific research, non-groundfish fisheries, and EFPs. Further, set-asides for some species are deducted from the trawl allocation to accommodate bycatch in the at-sea whiting fishery (catcher-processors and motherships). The Groundfish Management Team (GMT) is expected to provide a report at the Council meeting summarizing the recommended set-asides. The Council should adopt or modify the GMT recommendations under this agenda item to facilitate the EIS analysis.

The ACL less the set-asides is called the fishery harvest guideline (HG) or commercial HG (sablefish north of 36° N. latitude and Pacific whiting), which is the amount available for the sector-specific allocations. Sector allocations include formal long-term allocations (e.g., allocations made under Amendments 6 and 21) and short-term allocations implemented for the biennial period. Under this agenda item, the Council should recommend preliminary two-year allocations to facilitate the analysis. Attachment 1 contains information relevant to deciding the allocations.

At the September meeting, the Council adopted a preliminary range of new management measures and adjustments to existing management measures. The GMT has provided the background, relevant factors for the analysis, and an initial workload estimate for Council consideration (Agenda Item H.10.b, GMT Report). The Council should provide guidance on a range of season and area restrictions, trip limits, daily bag limits, and other harvest control measures for key target and constraining bycatch species; a range of geographic or sector-specific harvest guidelines; and a sense of how far fisheries should be restricted in 2015-2016 to rebuild depleted species as quickly as possible given the biological, ecological, social, and economic consequences of doing so.

Under this agenda item, the Council should carefully consider the list of potential management measures proposed by management entities, advisory bodies, and the public when deciding which issues are the highest priorities for more detailed analyses. Results of the detailed analyses will help the Council develop a preliminary preferred suite of 2015-2016 management measures at the April 2014 Council meeting. After a public review period, the Council will take final action at the June 2014 Council meeting.

Council Action:

- 1. Adopt any remaining groundfish harvest specifications for 2015-2016.**
- 2. Adopt set-aside deductions from the ACLs and the trawl allocations, as appropriate.**
- 3. Adopt preliminary two-year allocations as necessary.**
- 4. Adopt a range of management measures for more detailed analysis.**

Reference Materials:

1. Agenda Item H.10.a, Attachment 1: Recent Year Catch Estimates Relevant to Deciding a Range of 2015-2016 Allocations.
2. Agenda Item H.10.b, GMT Report: GMT Report on Management Measures for the 2015-2016 Biennial Harvest Specifications.
3. Agenda Item H.10.c, Public Comment.

Agenda Order:

- a. Agenda Item Overview
- b. Reports and Comments of Advisory Bodies and Management Entities
- c. Public Comment
- d. **Council Action:** Adopt Any Remaining Harvest Specifications, Preliminary Two-Year Allocations, and Management Measures for More Detailed Analysis.

RECENT YEAR CATCH ESTIMATES RELEVANT TO DECIDING A RANGE OF
2015-2016 ALLOCATIONS

Item 1. Attachment 1. September 2013 Groundfish Management Team Scorecard: This is the most recent scorecard, under the 2013 regulations, updated with the latest West Coast Groundfish Observer Data (2011 bycatch rates), tribal impacts, exempted fishing permits impacts, and research impacts. Bocaccio, canary, cowcod, petrale sole, and yelloweye allocations are based on the Council's recommendations for two-year allocations while darkblotched, Pacific Ocean Perch, and widow values represent the Amendment 21 allocations.

Item 2. 2013-2014 Allocation Values and Percentages from Final Council Action in June 2012.

Item 3. 2011-2012 Allocation Values and Percentages from Final Council Action in June 2010.

Item 4. Historical Scorecard Percentages for Overfished Species, After Removing Set-Asides. These are the percentages adopted by the Council during the 2005-2006, 2007-2008, 2009-2010, and 2011-2012 cycles. Percentages for the limited entry whiting trawl fishery are based on bycatch limits analyzed in the Environmental Impact Statement and may not represent the actual values specified in Federal regulation. The canary and yelloweye rockfish percentages for the California recreational fishery are based on the harvest guidelines for specified in regulation for each biennium. The canary and yelloweye rockfish percentages for the Washington and Oregon recreational fisheries represent the informal sharing agreements between the states in order to stay within the federally specified harvest guidelines north of 42° N. lat. In 2005-2006, values for the fixed gear nearshore values, sablefish daily trip limit are included in the open access groundfish directed row.

Item 5. Table 15. Estimated groundfish mortality (mt) of major west coast groundfish species in 2011 by sector. Excerpt from the Estimated Discard and Catch of Groundfish Species in the 2011 U.S. West Coast Fisheries (October 2012).

Item 6. Table 19. Estimated groundfish mortality (mt) of major west coast groundfish species in 2010 by sector. Excerpt from the Estimated Discard and Catch of Groundfish Species in the 2010 U.S. West Coast Fisheries (October 2011).

Item 7. Table 19. Estimated total fishing mortality (mt) of major west coast groundfish species in 2009 by sector. Excerpt from the Estimated 2009 Discard and Total Catch of Selected Groundfish Species (October 2010).

Item 8. Estimated Mortality of Overfished Species in the Recreational Fisheries from 2005-2010. These data were provided by state staff and represent updates and corrections that occurred since the publication of the 2007 & 2008 Estimated Discard and Total Catch of Selected Groundfish Species in the U.S. West Coast Fisheries reports.

ITEM 1

Attachment 1. Scorecard for September 2013. Allocations^a and projected mortality impacts (mt) of overfished groundfish species for 2013.

a/ Formal allocations are represented in the black shaded cells and are specified in regulation in Tables 1b and 1e. The other values in the allocation columns are 1) off the top deductions, 2) set asides from the trawl allocation (at-sea petrale only) 3) ad-hoc allocations recommended in the 2013-14 EIS process, 4) HG for the recreational fisheries for canary and YE.

b/ South of 40°10' N. lat.

c/ EFPs are amounts set aside to accommodate anticipated applications. Values in this table represent the estimates from the 13-14 biennial cycle, which are currently specified in regulation.

d/ Includes NMFS trawl shelf-slope surveys, the IPHC halibut survey, and expected impacts from SRPs and LOAs.

e/ The GMT's best estimate of impacts as analyzed in the 2013-2014 Environmental Impact Statement (Appendix B), which are currently specified in regulation.

f/ Tribal values in the allocation column represent the values in regulation. Projected impacts are the tribes best estimate of catch.

ITEM 2

2013-2014 Allocation Values and Percentages from Final Council Action in June 2012.

2013

Sector	Bocaccio	% of HG	Canary	% of HG	Cowcod	% of HG	Petrals	% of HG	Yelloweye	% of HG

a/ 2015 and 2016 harvest specifications assume the status quo stock complex structure. See "Slope RF" worksheet for stock complex alternatives.

b/ These stocks have been managed in the Other Fish complex and are contemplated for individual stock management or in a new shallow roundfish stock complex in 2015-2016.

c/ No OFL or ABC contribution for these stocks given the lack of an approved method.

d/ No harvest specifications adopted since these species are not currently managed in the FMP.

GROUNDFISH MANAGEMENT TEAM REPORT ON MANAGEMENT MEASURES FOR THE 2015-2016 BIENNIAL HARVEST SPECIFICATIONS

Introduction

At our October work session, the Groundfish Management Team (GMT) had a lengthy discussion about the list of management measures forwarded at the September Council meeting. Based on that discussion, this report provides some background information, the GMT's first cut at what factors would be relevant to the analysis, and an estimate of the anticipated workload for analyzing those management measures. The anticipated workload is ranked qualitatively from low to high, rather than a direct estimate of the time needed to complete the analysis. The workload rankings (low, medium, high) are not intended to be used as a prioritization metric. They are instead just our first-cut estimate of the workload required to conduct the analysis. Otherwise, the GMT does not have any recommendations on prioritization of the list of management measures at this time.

The GMT would like to note that due to National Marine Fisheries Service (NMFS) staff being furloughed by the Federal Government shutdown that began on October 1, the NMFS members of the GMT were unable to provide input on the list of management measures. Once NMFS regional and science center members of the GMT have an opportunity to review the list of management measures, some of the information shown below may be modified. If the Federal shutdown becomes lengthy, the absence of the NMFS members of the GMT will impact what the GMT is able to accomplish (i.e. the quantity and quality of the analysis of the management measures). Additionally, the GMT anticipated having input from National Oceanic and Atmospheric Administration (NOAA) General Counsel (GC) at the October meeting on the management measures analysis and other matters. As with regional and science center staff, GC staff was unavailable to provide their input.

Overarching Measures

Establish Off the Top Set-Asides

Background: Deductions from most groundfish annual catch limits (ACLs) are made to account for groundfish mortality in the Pacific Coast treaty Indian tribal fisheries, scientific research, non-groundfish target fisheries (hereinafter incidental open access fisheries), and, as necessary, exempted fishing permits (EFPs). Set-asides from the sablefish north of 36° N. latitude ACL are slightly different due to the sablefish allocation framework (see Section 2.2.2.1, Amendment 6). Set-asides from the sablefish north of 36° N. latitude ACL include: groundfish mortality in tribal fisheries, research, recreational fisheries, and EFPs. The Pacific Fishery Management Council (Council) and NMFS do not have direct management control over these activities, except for EFPs and recreational fisheries. While NMFS has direct control over the terms and conditions of the EFP permits and recreational fishery management, sufficient yield set-aside must be available to accommodate the anticipated groundfish impacts. Deductions from the ACL to

account for these activities are important accountability measures that increase the probability that catches will remain below the ACLs.

Relevant Factors for Analysis: Review the historical Groundfish Mortality Reports, including 2012 and determine whether updates to the 2014 set-asides are necessary. The GMT will provide tables for overfished and non-overfished species at the November Council meeting.

Workload: low

Two-year allocations

Background: Two-year trawl and non-trawl allocations are decided during the biennial process for those species without long-term allocations, or species where the long-term allocation is suspended. In 2013-2104, two-year allocations were established for: bocaccio, canary rockfish, cowcod, longnose skate, minor shelf rockfish north, minor shelf rockfish south, petrale sole, and yelloweye rockfish.

Species without trawl and non-trawl or limited entry and open access allocations include: black rockfish, cabezon (Oregon and California), California scorpionfish, longspine thornyhead south of 34° 27' N. latitude, minor nearshore rockfish north and south of 40° 10' N. latitude, shortbelly, and the Other Fish complex, including spiny dogfish. The nearshore species, including nearshore rockfish, are managed and allocated by the west coast states. For the remaining species, ACL attainment has historically been low due to the lack of market demand, limited access as a result of the rockfish conservation area (RCA) configurations, or the need to limit overfished species interactions. While there is no need for allocations between sectors, management measures (e.g., trip limits, bag limits, etc.) for these species are proposed to keep total catch within the ACL.

Relevant Factors for Analysis: The GMT will update allocation worksheets with the presumptive ACLs for overfished species and apply historical sector allocations, based on Groundfish Mortality reports and previous cycle allocations (from previous EIS). The GMT will review the historical Groundfish Mortality Reports to determine whether the existing 2-year allocations will work under the 15-16 ACLs. Additionally, the GMT will review the historical Groundfish Mortality Reports to determine whether the species with no 2-year allocations might need 2-year allocations in 15-16 to keep catch within the specifications.

Workload: low

Harvest Guidelines

Background: Historically, the Council has established harvest guidelines (HG) for: A) the recreational sectors for yelloweye and canary rockfish; B) black rockfish between OR and CA; C) blackgill rockfish south of 40°10' N. latitude (in complex); D) blue rockfish south of 42° N. latitude (in complex); and E) sablefish south of 36° N. latitude between the limited entry (LE) and open access (OA) non-trawl fixed-gear sectors. Further, the Council requested, under the stock complex agenda item in September 2013, that a white paper that explores the efficacy of using HGs to keep mortality within the component specifications (see Agenda Item H.5.a.). The GMT will also be providing updated risk analysis tables, updated with the 2012 groundfish mortality estimates, at the November Council meeting to inform this discussion.

Species that the Council may be interested in keeping in the complex and managing with HGs: rougheye N.; shortraker N.; China N. of either 42° or 40°10'; copper N. of either 42°, or 40°10,' or coastwide.

Relevant Factors for Analysis: Council staff is working on a white paper on this subject. The GMT will use the contents of that white paper as the beginning point for our analysis.

Workload: medium

Commercial Management Measures

A. Trawl and Non-Trawl Management Measures

A.1 RCA Coordinates--update RCA coordinates to better approximate depth

Background: A proposal was submitted by industry from the San Diego area to modify a few non-trawl rockfish conservation area (RCA) shoreward waypoints. This request would affect two very small areas: one off Del Mar (six waypoints) and the other off San Diego (two waypoints).

Relevant Factors for Analysis: These waypoint adjustments are intended to better conform to the depth fathom lines. Since these are for “corrections,” it is not known at this time how long it will take for NMFS to make these corrections, should NMFS determines that such corrections are necessary. The GMT has not had to time yet to determine if there are other waypoints that should be added to the list.

Workload: medium

A.2 Area Closure--Rougheye rockfish groundfish closure area (GCA)

Background: The Council is interested in management measures to reduce the catch of rougheye rockfish for all sectors. Rougheye rockfish may be a species of some concern given the current stock assessment¹ and recent catch levels provided by the West Coast Groundfish Observer Program (WCGOP). Groundfish closure areas (GCAs) may represent a viable management measure for reducing mortality of rougheye rockfish for one or more sectors if other measures prove ineffective.

Relevant Factors for Analysis: Geographical Information System (GIS) analyses of commercial data (WCGOP and North Pacific (NORPAC) Fisheries Database) may be useful to identify concentration areas that, if closed to fishing, may reduce catch of rougheye rockfish. These GCAs could be established in regulation (waypoints) and then implemented, if necessary. Preliminary analyses suggest GCAs may be effective for reducing catch; unfortunately, GIS plots were not available in time for the Briefing Book deadline. Plots provided in the Appendix of [Agenda Item G.8.b, Supplemental GMT Report 5, September 2013](#), provide an example of potential “hot spots” or concentration areas for rougheye rockfish. A more detailed GIS analysis

¹ http://www.pcouncil.org/wp-content/uploads/G3a_ATT3_FULL_ROUGHEYE_BLACKSPOT_ASSMNT_2013_postSTAR_SEPT2013BB.pdf

using finer resolution is possible, for better defining the borders of these concentration areas for each sector. Once these GIS plots are developed, then the cost of implementation relative to the benefit will need to be closely analyzed and examined. Costs could include loss of target species, increased time on water, inequity among geographic areas, and others, relative to the benefit (i.e., reductions in catch of rougheye rockfish).

Workload: low for GIS plots, medium/high for analysis

A.3 Area Closure--Spiny dogfish GCA

Background: The Council may be interested in management measures to reduce the catch of spiny dogfish shark. Groundfish closure areas may represent a viable management measure for reducing mortality of spiny dogfish for one or more sectors if other measures prove ineffective.

Relevant Factors for Analysis: GIS analyses of commercial data (WCGOP and NORPAC) may be useful to identify concentration areas that, if closed to fishing, may reduce catch of spiny dogfish. These GCAs could be established in regulation (waypoints) and then implemented, if necessary. Preliminary analyses suggest GCAs may be effective for reducing catch; unfortunately, GIS plots were not available in time for the Briefing Book deadline. Plots provided in the Appendix of [Agenda Item G.8.b, Supplemental GMT Report 5, September 2013](#), provide an example of potential “hot spots” or concentration areas for spiny dogfish. A more detailed GIS analysis using finer resolution is possible for better defining the borders of these concentration areas for each sector. Once these GIS plots are developed, then the cost of implementation relative to the benefit will need to be closely analyzed and examined. Costs could include loss of target species, increased time on water, inequity among geographic areas, and others relative to the benefit (i.e., reductions in catch of spiny dogfish).

Workload: low for GIS plots, medium/high for analysis

A.4 Area Closure--Other Species GCA?

At this time, the GMT offers no additional recommendations for GCA analyses. If the Council decides that GCA analyses are needed for additional species, then a similar approach as that shown for rougheye rockfish and spiny dogfish could be taken. Effort required for each additional analysis would be similar to that shown for rougheye rockfish and spiny dogfish.

B. Limited Entry and Open Access Fixed Gear

B.1 Non-Trawl RCA Adjustment

Background: Mr. Bill James submitted a public comment ([Public Comment, Agenda Item G.7.c., Sept 2013](#)) requesting the shoreward non-trawl RCA be moved from its current 30 fathoms out to 40 fathoms for a small area. This request asks the Council to consider implementing an existing management line at Año Nuevo (37° 07' N. latitude). Then for the area from this line at 37° 07' N. latitude south to 34° 27' N. latitude, move the non-trawl RCA line out to 40 fathoms. The intent is to allow holders of the California's deeper nearshore rockfish permit access to the same deeper area that recreational anglers can utilize. If the Año Nuevo line cannot be accommodated then Mr. James does not want the 40 fathom line change.

Current regulations:

42° to 46°16' : 30 fathoms

40° 10' to 42°: 20 fathom shoreward line

40° 10' to 34°27': 30 fathom shoreward line

Relevant Factors for Analysis: Overfished species impacts by the nearshore fixed gear fishery are currently modeled by the GMT using WCGOP bycatch rates, by depth and area. As noted above, current RCA regulations combine the area south of 40° 10' N. latitude. Likewise, the GMT bycatch model used to project overfished species impacts is currently stratified at 40° 10' N. latitude. Additional stratification (i.e., at 37° 07' N. latitude) of data in the nearshore model would require additional work for WCGOP; the additional time required to re-stratify the data within the nearshore bycatch model is uncertain.

The GMT points out that allowing such a modification in regulation without an accompanying change to the nearshore bycatch model is not unprecedented. Prior to 2009, the fixed gear RCA between 40° 10' N. latitude and 46° 16' N. latitude was 20 fathoms. Likewise, the nearshore bycatch projection model was stratified using the same latitudinal breaks prior to 2009. Nonetheless, the RCA north of 43° N. latitude was moved from 20 fathoms to 30 fathoms from 2009-2012 following an analysis by WCGOP that showed substantially lower bycatch rates of overfished species in the northern area (see “Response to Request for Summarization of Canary and Yelloweye Rockfish Bycatch in Commercial Nearshore Fishery Operations, Northwest Fisheries Science Center, April, 2008”). The bycatch model was never re-stratified (likely due to confidentiality concerns) and was thereafter inconsistent with this differential regulation north and south of 43° N latitude.

The Council may consider putting this task on list for June 2014, depending on WCGOP workload and priorities. In addition, any proposed changes that would add additional management lines for the nearshore fishery could translate into a sizable workload for California staff as it could possibly affect the state’s restricted access for the deeper nearshore rockfish permit system.

Workload: low if no model re-stratification, high if model re-stratification.

B.2 Trip Limit--review commercially important, highly attained species and other requested species

Background: The GMT typically reviews the performance of commercially important trip limits relative to the sector allocations or harvest guidelines (e.g., sablefish). The goal this cycle is to take a closer look at trip limit performance to set the limits on January 1 with the aim of minimizing the necessary number of inseason adjustments (assuming trip limits were initially set “right”). This action should provide industry with some consistency while allowing harvest attainment closer to the harvest guidelines. The GMT reviewed inseason actions taken since 2007 for potential trip limits that may be considered candidates for review. The potential list of trip limits that may be reviewed includes:

1. Shortspine thornyhead south of 34° 27' N. latitude
2. Chilipepper, Minor Shelf, Shortbelly, Widow, and Bocaccio between 34° 27' and 40° 10' N. latitude

3. Black rockfish limits between 40° 10' N. latitude and 42° N. latitude
4. Shelf rockfish south of 34° 27' N. latitude
5. Bocaccio south of 34° 27' N. latitude
6. Shortspine thornyhead north of 34° 27' N. latitude
7. Lingcod north of 40° 10' N. latitude
8. Slope rockfish and darkblotched rockfish north of 40° 10' N. latitude

Relevant Factors for Analysis: This measure would require development of trip limit models (for most species) and estimates of impacts to overfished species for each species or complex identified. Overfished species impacts would be explored using WCGOP data products (nearshore/non-nearshore model or reports). Changes may not make a big difference to the fleet as a whole, but could be very important to certain individuals.

Workload: medium

B.3 Remove the periods 1, 2, and 6 closure for lingcod, could implement a daily or bi-monthly cumulative limit

Background: Lingcod retention is prohibited in Periods 1, 2, and 6 for both limited entry and open access fixed gears. The prohibition on retention has been in effect for these fisheries since the 1990s to improve the conservation of lingcod after being declared overfished. Note that Canada first declared a winter closure for lingcod in 1987 to protect spawning lingcod. Lingcod spawn beginning in the late fall in shallow waters. Although females do not spend much time in the spawning area, males are concentrated in these shallow waters guarding the eggs during winter and spring months. The closure for the fixed gear fishery was presumably designed to reduce catch of these males while concentrated during the nest-guarding season. The GMT points out that there is no lingcod closed season for individual fishing quota (IFQ fisheries; fixed gear and trawl) or Oregon recreational fisheries.

Public testimony was received from Mr. Jeff Miles at the September 2013 Council meeting requesting some level of retention during periods 1, 2, and 6. The request was made to land lingcod that are incidentally caught and discarded, with the suggestion that trip limits might be set low enough to prevent changes in fishermen behavior (i.e., prevent targeting).

Relevant Factors for Analysis: Since lingcod are harvested far below the ACL, the primary concern is increased interactions with overfished species. Trip-limit models may need to be developed to project catch of overfished species at various levels of retention during periods 1, 2, and 6. Overfished species impacts would likely be projected using WCGOP data products (e.g., nearshore and non-nearshore models) at the various levels of anticipated retention during the currently closed periods.

Effort = medium

B.4 Remove the Commercial Gear Restriction on Flatfish

Background: This measure was previously submitted for Council consideration but was never implemented. The following excerpt is from Agenda Item I.4.b, Supplemental GMT Report 2, April 2010.

Remove gear restriction for 'Other Flatfish' in the California commercial fishery

In 2003, the limited entry and open access fixed gear fisheries south of 40°10' N latitude were constrained by management measures to protect bocaccio. The current commercial gear restriction is “no more than 12 #2 hooks, up to 2-1lb weights, not subject to the RCA”. During the 2009-2010 management cycle, the recreational fishery removed their flatfish gear restriction because it was not effective in restricting the bycatch of overfished species. The commercial fishery is interested in pursuing a similar removal to have conforming regulations. CDFW does not anticipate that removing the gear restriction will increase impacts to overfished species because this fishery operates over sandy bottom habitats where overfished species are less likely to occur.

CDFW staff consulted Enforcement to determine there are no additional enforcement issues resulting from removal of this gear requirement. Staff will compare bycatch rates of rockfish in years with no gear restriction to years with a gear restriction to determine whether regulations have been effective in reducing take or interactions with overfished species. The GMT has concerns over the comparability of commercial fixed gear with recreational fisheries, where different suites of management measures are in place to control overall impacts as well as the potential to impact petrale sole (consider the non-trawl allocation).

Relevant Factors for Analysis: The GMT will need to explore overfished species impacts using WCGOP data products (nearshore/non-nearshore model or reports) and/or recreational data. Additionally, the GMT will review documents and meeting minutes to try to determine why this management measure was not implemented at that time. Information on the recreational fishery gear change that occurred in 2009-2010 may provide some data for this analysis, however there are concerns about the comparability of recreational and commercial data. This will need to be further explored.

Workload: medium

C. Trawl Sector (Shorebased IFQ, Catcher Processor, and Mothership)

C.1 Shorebased IFQ Trip limits

Relevant Factors for Analysis: Evaluate whether the current trip limits are expected to stay within the 2015-2016 harvest specifications utilizing 2011 and 2012 data. Species that will be of most interest for this analysis are the Other Fish complex and longnose skate. The Council may wish to identify additional species.

Workload: low

C.2 At-Sea Whiting Set-Asides

Relevant Factors for Analysis: Evaluate whether the current at-sea whiting set-asides (see regulations² Tables 1d and 2d) are expected to stay within the 2015-2016 specifications utilizing 2011 and 2012 data.

Workload: low

C.3 Rougheye Rockfish Excluder for Trawl Vessels Fishing Seaward of the RCA

Background: The Council tasked the GMT with evaluating the feasibility of using excluder devices to reduce the catch of rougheye rockfish in trawl fisheries (i.e., shorebased, catcher processor, and mothership trawl sectors). The recent rougheye rockfish stock assessment, along with recent catch reports from the WCGOP, was the underlying basis for this request to evaluate management measures that may be used to reduce or control fishing mortality of rougheye rockfish, if necessary. Even though rougheye rockfish are caught by both trawl and fixed gear, this management measure would only affect trawl fisheries.

Recent research is available that suggests excluder devices (i.e., grids or grates) may reduce the catch of rougheye rockfish relative to some of the other target species. This has been explored for pelagic trawls targeting Pacific whiting (Lomeli and Wakefield 2013³) and for bottom groundfish trawls seaward of the RCA (Wakefield and Lomeli 2013⁴). For pelagic trawls, the relative catch of many rockfish species (including rougheye) was reduced relative to whiting catch, especially at low to moderate whiting catch rates. This research showed that the current design may be less effective when whiting catch rates are high. The sample size was small for the bottom trawl research, and is therefore tentative until more research that is planned for 2014 can be accomplished. Nonetheless, the research with bottom trawls demonstrated that most of the larger rockfish species (including rougheye rockfish), along with roundfish (e.g., sablefish) and shortspine thornyhead catches may be reduced relative to catches of flatfish by using excluder devices. Hence, it is possible that excluder devices could be applied to this fishery to reduce the catch of slope rockfish and roundfish species while allowing access to flatfishes.

Relevant Factors for Analysis: This analysis would require exploring the feasibility of rockfish excluders to allow the escape of rockfish and other species of similar shape and behavior while allowing access to other slope targets (e.g., Dover sole, small thornyheads, and small sablefish for bottom trawl and Pacific whiting for pelagic trawl). A cost/benefit analysis may be difficult at this time. This research on the U.S. west coast is relatively new, and additional research is

²http://www.westcoast.fisheries.noaa.gov/publications/fishery_management/groundfish/2013_pink_pages_aug132013.pdf

³ Lomeli, M.J.M and W. W. Wakefield. 2013. A pilot study testing the efficacy of a flexible sorting grid rockfish excluder in the U.S. Pacific hake fishery: outcome of a collaborative workshop. January. Pacific States Marine Fisheries Commission and Fishery Resource Analysis and Monitoring Division, Northwest Fisheries Science Center.

⁴ Wakefield, W.W. and J.J.M Lomeli. 2013. Conservation engineering work in U.S. west coast groundfish fisheries. Poster Session. American Fisheries Society Annual Meeting, September 8-12, Little Rock, Arkansas.

planned which may help with predicted retention rates under various fishing conditions. The GMT noted that regulating gear modifications may be problematic because specific gear configurations may be required which might (a) restrict fishermen's ability to "tune" the gear to function properly and (b) be difficult to enforce. The Enforcement Committee (EC) would likely comment on various aspects of this management measure (e.g., enforceability, specific gear configuration, associated vessel monitoring system requirements, etc.). For example if such a gear requirement were in regulation, would fishermen be required to declare use of such gear prior to their trip, and not be allowed to carry any other trawl gear on board? The implementation phase of this management measure could therefore be complicated.

Although benefits may be shown (i.e., reduced catch of rougheye rockfish while allowing access to flatfishes), costs could also be high. For example, the expense of purchasing a new net with the excluder device is not inexpensive. The largest expense, however, may be the loss of numerous target species, such as sablefish and other rockfish species. Clogging rates (i.e., malfunctions) would also need to be considered in this analysis.

Effort = high

C.4 Shorebased IFQ - Initial Issuance

Background: In order to reduce the catch of some species, the issuance of IFQ may be required.

Relevant Factors for Analysis: For species where catch cannot be controlled or at least reasonably controlled using typical management measures (e.g., if reducing catch requires moving the seaward boundary of the RCA to 400 fathoms), IFQ may need to be issued. As an example, if the Council chooses to remove spiny dogfish from the Other Fish complex, issuance of IFQ may become necessary. The GMT may evaluate and highlight species for Council consideration, but has not had the opportunity to do so yet.

Workload: none for now, but could be medium/high

C.5 Shorebased IFQ Accumulation Limits

Background: The maximum number of quota shares (QS) and quota pounds (QP) an entity may control in the shorebased IFQ fishery is limited by accumulation limits (defined in regulation at 50 CFR 660.111). These limits vary according to the management unit for the stock or stock complex and are intended to restrict the consolidation of quota holdings by just a few entities. The QS limits restrict the amount an individual or entity may control through ownership or other means. The annual QP limits refer to the maximum amount that may be assigned to any one vessel during a given year to cover catch. The annual QP vessel limits are larger than control limits to allow several QS holders to work together on a single vessel. Additionally, there are daily vessel limits that regulate the unused QP in vessel accounts for Pacific halibut and overfished species.

Relevant Factors for Analysis: Initial performance of the accumulation limits was evaluated based on fishery performance in 2011 and 2012. The GMT anticipates needing outside expertise and experience, likely Jim Seger and Ed Waters, to assist with this analysis. If the Council

chooses to change the longspine thornyhead and shortspine thornyhead ACLs from north and south of 34° 27' N. latitude to coastwide, additional analysis will be required.

Workload: medium/high

Recreational

H. Washington, Oregon, and California

H.1 Canary Rockfish Bag Limit

Background: In order to minimize discards of canary rockfish, a sub-bag limit for canary rockfish has been contemplated but rejected in recent biennial cycles. State recreational fisheries managers are hearing more and more from the public that they “can’t get away from canary.” Additionally anglers are reporting encountering canary rockfish in shallow waters, where they used to be able to get away from them.

Relevant Factors for Analysis: This analysis will examine the impacts to canary rockfish by allowing retention of at least some amount of canary. This will turn some of the released alive and released dead canary rockfish into retained. The GMT will also need to determine the impacts to yelloweye rockfish, and possibly other species contained within the normal bag limit. As each state has different bag limits, season dates, and depth restrictions, this analysis will likely need to be done on a state-specific basis. There may be implications to the other nearshore species. The GMT anticipated examining recreational catch per unit effort data by depth and time to help inform this analysis. Additionally, possible changes in angler behavior will need to be considered.

Workload: medium/high

H.2. Bag Limits, Depth Restrictions, Season Dates, Time/Area Closures

Background: The examination of bag limits, depth restrictions, etc. to maximize non-overfished species while staying within overfished species HGs are regularly analyzed and included in the biennial environmental impact statements.

Relevant Factors for Analysis: This is part of the regular modeling done during each biennial cycle. Once the overfished and non-overfished ACLs, and associated HGs, are determined, the GMT can then model season structures, bag limits, depth restrictions, etc. The three states’ recreational projection models were reviewed by the SSC and have been updated to reflect those reviews.

Workload: high

D. Washington

D.1 Modify or eliminate boundaries for lingcod closures

Background: In 2012, deep-water lingcod closures were implemented in Washington to reduce encounters with yelloweye rockfish in the South Coast (Marine Catch Area 2) and Columbia River (Marine Catch Area 1) management areas. Washington Department of Fish and Wildlife (WDFW) will look at the boundary lines originally developed to determine if more discrete areas might more effectively reduce encounters with yelloweye and canary rockfish and streamline regulations making them easier for anglers to understand.

Relevant Factors for Analysis: The analysis will consider impacts to yelloweye and canary rockfish by modifying the boundaries of areas currently closed to lingcod retention. Changes could potentially open areas, allowing targeting of non-overfished rockfish and lingcod. Changes in angler behavior will be considered. Modifications could include establishing a fathom line or actual coordinates.

Workload: medium

D.2 New Yelloweye Rockfish Conservation Area

Background: Washington will explore new yelloweye rockfish conservation areas (YRCA) in an effort to reduce yelloweye rockfish mortality and stay within the Washington recreational HG for yelloweye rockfish.

Relevant Factors for Analysis: This analysis will help determine areas of high yelloweye rockfish interactions in the Washington recreational data. WDFW set line survey data in the north coast, and input from recreational anglers and the Charter industry may provide additional information on areas of high yelloweye concentrations. While YRCAs have been effective at reducing encounters with yelloweye rockfish it is difficult to quantify the savings from implementing YRCAs.

Workload: medium

D.3 Modify Depth Restriction

Background: Washington is exploring modifications to the season length for depth restrictions in the North Coast Management Area (Marine Areas 3 and 4) and South Coast Management Areas (Marine Area 2). This measure could be considered in conjunction with other management measures such as new YRCAs, to increase recreational fishing opportunity for health stocks like lingcod while continuing to minimize encounters with overfished species such as yelloweye rockfish.

Relevant Factors for Analysis: Recreational catch data from the Washington Ocean Sampling Program would be analyzed relative to impacts to canary and yelloweye rockfish. Reducing the length of time the depth restriction is in place could potentially direct fishing effort away from nearshore species. Analysis is based on recreational fishing data which captures depth and as a result impacts to overfished species are easier to quantify with based management measures.

Workload: medium

E. Washington and Oregon

E.1 Retain Groundfish, Lingcod only, or Flatfish only During the Pacific Halibut Fisheries

Background: Retention of any groundfish, lingcod only, or flatfish only during the Pacific halibut fishery is covered in both the halibut and groundfish regulations. In recent years, anglers have requested changes to individual areas to allow retention of lingcod, flatfish, or all groundfish, area by area (lingcod in the Columbia River Subarea for 2014). Each time one of these suggestions comes up through the Halibut Catch Sharing Plan (CSP) process, questions arise about whether or not it was analyzed in the biennial groundfish EIS, how it impacts overfished species, and whether or not it can be changed through the CSP process. The intent is that by analyzing a suite of groundfish retention options through the biennial process, it will streamline the halibut CSP process and eliminate some of the confusion about groundfish vs. halibut regulations and what can be done when.

Relevant Factors for Analysis: The GMT will evaluate the impacts of allowing retention of any or all groundfish, just lingcod, or just flatfish, which are anticipated to be primarily yelloweye rockfish and canary rockfish. Part of this analysis will be to attempt to estimate how many people might go from a truly bycatch fishery to targeting, and the impacts to yelloweye rockfish.

Workload: medium/high

F. Oregon

F. 1 Modify Depth Restriction

Background: Currently recreational fishing in Oregon is prohibited seaward of 40 fathoms from April 1 through September 30 in federal regulations. This analysis would change the depth restrictions from 40 fathoms to 50 fathoms.

Relevant Factors for Analysis: The Council is in the process of approving new mortality rates for when descending devices are used to release recreationally caught rockfish. The mortality rates, when descending devices are used, are the same from 30 to 50 fathoms. Therefore, Oregon would like to have that management line available. As part of this analysis, the GMT will need to compare impacts to canary and yelloweye rockfish, and other species in the marine bag. This will need to be done using the surface depth dependent mortality rates as well as the rates (when approved) for the use of descending devices. There has not been a summer fishery out to 50 fathoms in a long time, so it may be difficult to determine target species and bycatch species encounter rates.

Workload: medium/high

F.2 Area Closure

Background: The Stonewall Bank YRCA was implemented in 2004 to reduce and keep yelloweye rockfish mortality within the HG. The Oregon Department of Fish and Wildlife (ODFW) proposes examining possible changes to the Stonewall Bank YRCA coordinates to better isolate areas of yelloweye rockfish encounters.

Relevant Factors for Analysis: Since the Stonewall Bank YRCA was implemented; there has been a fair bit of tagging and movement research on yelloweye rockfish in the area. Additionally, the Oregon State University Goldfinger Lab has done much more detailed mapping of the area. Based on this new data, the analysis will attempt to determine if changes to the YRCA configuration may be appropriate. As with any YRCA analysis, quantifying “savings” will be difficult.

Workload: medium/high

G. California

G.1 Time/Area Closures, Bag limits, Depth Restrictions, and Season Closures

Background: The California Department of Fish and Wildlife (CDFW) is considering changes to recreational regulations to keep catches within allowable harvest limits (ACLs, HGs, etc.). The changes may include, but are not limited to, time/area management measures, bag limits, depth restrictions, and season structures. Such actions will be focused on maximizing fishing opportunity i.e. longer fishing seasons or access to deeper depths while keeping projected mortality below respective harvest limits for overfished species and target stocks.

Relevant Factors for Analysis: The RecFISH catch projection model will be used to project mortality resulting from season proposed season and depth restrictions to evaluate whether they will prevent harvest limits from being exceeded. Bag limit analyses can be conducted to evaluate the proportional increase or decrease in catch anticipated given the recent frequency of fish retained or discarded. The proportional increase or decrease from the bag limit would then be applied to the projected impacts with the proposed season and depth restrictions to project mortality.

Workload: medium

Range of Management Measures for California's 2015-2016 Commercial and Recreational Groundfish Fisheries

COMMERCIAL AND RECREATIONAL

The California Department of Fish and Wildlife (CDFW) is proposing changes to the 2015-2016 groundfish regulations with the intent of remaining within harvest limits, particularly for overfished species. Regulations not specifically referenced in this report are anticipated to remain status quo from 2013-2014.

Changes to Rockfish Conservation Area (RCA) lines

Proposals from Industry to modify RCA lines to more closely approximate depth contours are being reviewed by CDFW Biological and Enforcement staff.

COMMERCIAL

CDFW is proposing the following option for the 2015-2016 commercial groundfish management cycle:

Changes to the Flatfish Gear Restriction in the Non-Trawl RCA

- Status quo: The current commercial gear restriction for flatfish in the non-trawl RCA is *"no more than 12 #2 hooks, up to 2-11b weights, not subject to the RCA"*.
- Option: Remove gear restrictions for flatfish in the non-trawl RCAs.

Proposed changes to other federal commercial groundfish fisheries are included in the Groundfish Management Team Report on Management Measures for 2015-2016 Biennial Harvest Specifications (Agenda Item H.10.b, GMT Report).

RECREATIONAL

CDFW is proposing the following options for the 2015-2016 recreational groundfish management cycle:

Changes in Season Lengths and Depth Restrictions in Groundfish Management Areas

Season lengths and depth restrictions may be changed within each Management Area as needed to remain within the harvest guidelines, while providing as much fishing opportunity as possible.

Lingcod Bag Limit (statewide)

- Status quo: 2 fish
- Option: 3 fish

GROUND FISH ADVISORY SUBPANEL REPORT ON
BIENNIAL MANAGEMENT SPECIFICATIONS FOR 2015-16 GROUND FISH FISHERIES

The Groundfish Advisory Subpanel (GAP) met with the Groundfish Management Team (GMT) to go over management measures for 2015-16 and offers the following recommendations.

Remaining groundfish harvest specifications

The GAP has nothing to add regarding biennial specifications under this agenda item.

For the next items, we referred to [Agenda Item H.10.b, GMT Report](#). The GAP addressed each item in order and offers the following comments. In general, we agree with the GMT's inclusion of a range of analyses.

Set-aside deductions from the annual catch limits (ACLs) and trawl allocations

At the time this report was drafted, the GMT had not reported any new information to the GAP.

Preliminary two-year allocations

The GAP has no requests at this time.

Range of management measures for more detailed analysis

Referencing [Agenda Item H.10.b, GMT Report](#), the GAP considered the range of management measures proposed by the GMT. In general, we agree with the inclusion of most of the proposed analyses. We list below those items that have additional GAP comments, we list those below.

The GAP realizes that some of the analyses will depend on what action the Council takes on as a result of its action on stock complexes. All management measures related to the slope rockfish complex will be completed in the stock complex analysis as requested by the Council.

A.1 Rockfish Conservation Area (RCA) Coordinates – update RCA coordinates to better approximate depth

We understand the Council has changed its review of the management measures process and this is scheduled for review in June 2014. We plan to bring back a comprehensive proposal to modify trawl RCAs at that time.

A.3 Area closure – spiny dogfish Groundfish Conservation Area

The GAP understands the reason for the analysis, but spiny dogfish is a highly mobile species; there are no areas in which they reside for any period of time. It would be technically infeasible to include any closure areas for spiny dogfish. Furthermore, closure areas likely would have little effect.

C.3 Rougheye rockfish excluder for trawl vessels fishing seaward of the RCA

While the GAP recalls the Council requested inclusion of this analysis, the GAP neither supports including it in the analysis nor thinks regulations could be developed to implement the measure.

Research is under way to develop various excluder devices for groundfish trawl fisheries. However, this research is far from complete. Therefore, the GAP recommends against further analysis of this alternative because it is both legally and technically infeasible.

B.2 Trip limit – review commercially important, highly attained species and other requested species: Nos. 4 and 5; shelf rock and bocaccio south of 34° 27' N. latitude:

The limited entry and open access fixed-gear fleets request higher trip limits of bocaccio and shelf rockfish, since these fleets are nowhere near attaining their allocations. For example, a 1,000 lbs. bimonthly trip limit of bocaccio for limited entry and 400 lbs. bimonthly limit for open access may be a place to start. The GAP also suggests this be tied into the two-year allocation analysis.

G.1 (California) Time/area closures, bag limits, depth restrictions and season closures:

The GAP supports the request by the Southern California Charter Fleet to analyze a change in RCA lines to allow access to 50 fm to 60 fm depths for recreational anglers south of 34° 27' N latitude. We hope the Council considers increasing the bocaccio bag limit as incidental bycatch in this fishery as the stock rebounds. Considering a year-round fishery should also be analyzed as this species rebuilds.

H.1 (Washington, Oregon & California) Canary rockfish bag limit:

The GAP supports this analysis for retention of canary rockfish. There already is allowed retention of overfished species, i.e., bocaccio, and this retention could apply coastwide, for two states or for a single state.

We request the GMT analysis also include mortality rates based on the use of descending devices.

GROUNDFISH MANAGEMENT TEAM RECOMMENDATIONS FOR OFF-THE-TOP DEDUCTIONS (SET-ASIDES)

Deductions to the annual catch limits (ACL) or annual catch targets (ACT) are made to account for fishing-related mortality resulting from scientific research, non-groundfish fisheries (also called incidental open access fisheries), Pacific Coast treaty Indian tribal harvest, and, as necessary, exempted fishing permits (EFPs). These deductions are important accountability measures that increase the likelihood that catches will remain below ACLs or ACTs.

The Groundfish Management Team (GMT) discussed the available data and provides the following recommended updates to information contained in the 2013-2014 Environmental Impact Statement (EIS), [Appendix C](#) (Attachment 2). An explanation on how the set-aside recommendations were derived is provided below and final values provided in Appendix 1. These tables have been updated to reflect Council actions at this meeting, including changes to the Other Fish complex. The Council decision on the Other Fish complex establishes species-specific harvest specifications for spiny dogfish and potentially kelp greenling, Washington cabezon and Leopard shark and designates the remaining species as ecosystem components¹. For slope rockfish, the GMT only considers set-asides relative to the status quo complexes at this time. Set-asides for the various complex configurations will be evaluated over winter.

Additionally, set-asides taken from the trawl allocation are needed to accommodate bycatch in the at-sea whiting fishery. The GMT provides information on historical catch to inform the Council decision on set-asides for the at-sea whiting fishery for the 2015-2016 cycle below.

Lastly, a Pacific halibut set-aside is necessary to accommodate bycatch in the at-sea whiting fisheries and in the shorebased trawl sector south of 40°10 N. latitude. The 2014 Pacific halibut set-aside is 10 mt. At this time the GMT does not have any information to inform changes to this set-aside and as such recommends the 2014 value is used in the analysis.

Exempted Fishing Permits

The Council adopted preliminary EFPs for public review and their associated set-asides for both non-overfished and overfished species for 2015-2016 under Agenda Item H.2. The Council adopted the set-asides recommended by the GMT ([Agenda Item, H.2.b, Supplemental GMT Report, Table 1](#)) with modifications to increase the set aside for canary rockfish to 1.0 mt and yelloweye rockfish to 0.03 mt based on updated set aside requests from the applicants. These set-asides are summarized in Appendix 1.

Scientific Research

Research activities include the NMFS trawl survey, International Pacific Halibut Commission longline survey, and other Federal and state research. For the 2013-2014 cycle, the Council approach was to establish research set-asides equal to the maximum historical scientific research catch from 2005-2010, except for canary rockfish and yelloweye rockfish.

¹ Kelp greenling, Washington cabezon and Leopard shark would either be managed as individual species or as a complex.

The Council policy for canary and yelloweye rockfish was not based on the maximum historical value. The Council considered the high canary rockfish research catches of 7.2 mt in 2006 a rare event. The largest catches came from the NMFS trawl survey, and surveys in later years

encountered substantially less canary. The Council adopted a 4.5 mt canary rockfish set-aside, which is higher than the average research catch from 2005-2010. For yelloweye rockfish, the Council adopted a 3.3 mt research set-aside based on anticipated research needs of the International Pacific Halibut Commission (1.1 mt), Washington Department of Fish and Wildlife (1 mt), Oregon Department of Fish & Wildlife (1 mt), and other projects (0.2 mt).

For 2015-2016, research catch from the 2011 and 2012 West Coast Groundfish Observer Program (WCGOP) Groundfish Mortality Reports was summarized with previous year's estimates. The GMT followed the same approach recommended by the Council for the 2013-2014 process for recommending the research set-asides for 2015-2016 summarized in Appendix 1. As stated under [Agenda Item H.10. b, Supplemental GMT Report 3](#), for cowcod, the GMT requests the Council provide flexibility in the analysis to consider higher research values than the 0.2 mt in Attachment 1.

Non-Groundfish Fisheries (Incidental Open Access)

Following the same approach that was used for 2013-2014, estimates of impacts in the incidental open access fisheries were derived from the maximum values in the 2007-2012 WCGOP Groundfish Mortality Reports. The exception is that the recommended set-aside for longnose skate is based only on catch data from the 2009-2012 Groundfish Mortality Reports to reflect when catches of longnose skate were removed from the other skate category and reported individually.

The GMT recommends the Council adopt the 2015-2016 set-asides for the incidental open access fisheries, as displayed in Appendix 1.

Tribal

The Tribal fisheries consist of trawl (bottom, mid-water, and whiting), fixed gear, and treaty troll. As a placeholder for the coming biennium, the set asides for tribal fisheries should reflect the most recent estimates of bycatch across all fisheries reflected in the latest overfished species scorecard ([Agenda Item H.9.b, Supplemental GMT Report](#)) with some exceptions. In June of 2013, the projected impacts for overfished species in the scorecard were updated based on the final rule for the 2013 tribal allocation of whiting. Since that time, it has come to our attention that in the preliminary estimate of treaty fisheries management measures, the Quileute Tribe has indicated that they have not received requests from their fishermen to participate in the whiting fishery. The GMT uses a weighted average approach to estimate bycatch associated with the tribal whiting fishery each year. These latest bycatch estimates for the whiting fishery, as well as the preliminary proposed treaty tribal management measures are reflected in the set-asides listed in the table below. The GMT has read the letter submitted by the Makah Tribe ([Agenda H.10.b, Supplemental Tribal Report \(Makah\)](#)) and understands they may be requesting an increase to yellowtail, widow, and Pacific cod and will provide numbers by June 2014. Additional adjustments may be provided as the Tribes refine their fisheries proposals for 2015-2016 prior to June 2014 and are further likely to be changed based on final bycatch estimates from the 2013 whiting fishery.

The GMT recommends the Council adopt the tribal set-asides as displayed in Attachment 1.

At-Sea Whiting Set-asides

Unlike set-asides that are taken as off-the-top deductions after setting the ACL, set-asides for some overfished species (petrale and yelloweye) and non-overfished species are taken from the trawl allocation to accommodate bycatch in the at-sea whiting fishery. Like other set-asides, these impacts are not managed inseason, so the set-aside amounts need to be set high enough to accommodate anticipated catch.

The GMT reviewed the recent catch from 2011-2012 and recommends set-asides for the 2015-2016 cycle for all species, except spiny dogfish as displayed in Table 1.

Historical spiny dogfish catch for the at-sea whiting sector and the total estimated fishing mortality from the WCGOP Groundfish Mortality Reports for all sectors is summarized for 2009-2012 (Table 2). The GMT notes that catch in 2011 was significantly higher than all other years, therefore using an average that incorporates that year of high catch is likely precautionary compared to typical years. The Council should consider the historical mortality of spiny dogfish in the at-sea sectors when establishing a set-aside.

Table 1. Recommended set-asides from the trawl allocation to accommodate bycatch in the at-sea whiting fishery for 2015-2016. Bolded values represent changes from the 2013-2014 set-asides and overfished species are shown in all caps.

Species/Species Group	Value in 2014 Regulations (mt)	GMT Recommendations for 2015-2016 (mt)

Total estimated mortality all sectors (mt)							

GMT RECOMMENDATIONS

- 1. Adopt the EFP, research, incidental open access, tribal set-asides, and associated fishery harvest guidelines in Appendix 1 for preliminary analysis in the DEIS.**
- 2. Adopt the at-sea whiting trawl set-asides in Table 1, column labeled “GMT Recommendations for 2015-2016”, for preliminary analysis in the DEIS.**
- 3. Consider historical spiny dogfish mortality and establish an appropriate at-sea whiting set-aside for preliminary analysis in the DEIS.**
- 4. Adopt a 10 mt Pacific halibut set-aside, to accommodate bycatch in the at-sea Pacific whiting fisheries and in the shorebased trawl sector south of 40°10 N. lat. (estimated to 5 mt each), for preliminary analysis in the DEIS.**

Appendix 1. GMT proposed set-asides for overfished and non-overfished speices for 2015 (in mt).

GROUND FISH MANAGEMENT TEAM REPORT ON THE BIENNIAL HARVEST SPECIFICATIONS AND MANAGEMENT MEASURES PART II

Introduction

Based on the materials in the briefing book, the outcomes of Agenda Items H.4, H.5, and H.6 at this meeting, the Groundfish Management Team (GMT) had some additional discussions, and provide the following considerations. We anticipate working over the winter and having a January work session in order to expand on these items and help complete the draft environmental impact statement (EIS). We will provide additional thoughts for Council consideration at the March or April meetings, prior to the June final action.

Cowcod or Other Annual Catch Targets (ACT)

Groundfish mortality from Pacific Coast treaty Indian Tribes, projected research catch, non-groundfish fisheries (also termed incidental open access), and exempted fishing permits (EFPs) can be removed from either the annual catch limit (ACL) or annual catch target (ACT).¹ The resulting value is termed the fishery harvest guideline. It is our understanding, based on Council discussion under Agenda Item H.6, that the Council is interested in establishing a cowcod ACT, and that the research and other set-asides would come off the top of the cowcod ACL. That is, only Council-managed catch would accrue from the ACT. **The Council should confirm that set-asides should be removed from the cowcod ACL and not from the ACT, if established.**

Cowcod, Annual Catch Targets, and Rebuilding Generally

We discussed an intermediate ACL scenario for cowcod, and relatedly, the question of the potential research set-aside for the stock. In brief, we think some analysis is necessary before we can advise on either question. The research design and catch would depend on how much the fishery will take. Time is needed to explore how management measures and the fishery might change under higher cowcod ACLs. At some level of the cowcod ACL, the California recreational fishery becomes more constrained by bocaccio rockfish, and so any ACL higher would likely not be used. Additional modeling will inform an appropriate intermediate ACL value that would address the need for both research and the needs of fishing communities given constraints from other stocks, while applying the residual to faster rebuilding. We can explore these questions over winter. **The GMT recommends the Council provide the GMT flexibility in structuring the analysis to provide for a potential increase in cowcod research impacts.**

Of note, the topic of ACTs came up in the context of the cowcod research set-aside. The idea was that an ACT might be used to separate fishery catch from research catch. We have planned on more analysis of ACTs in general to give further attention to management uncertainty of catch and our catch projections. In short, we have noted in the past that the time to rebuild (T_{TARGET}) is calculated based on the ACL instead of the ACT. We questioned this practice because, if implemented, the ACT would be based on the best estimate of what catch would be. Rebuilding times based on the ACL are therefore potentially being calculated based on a less

¹ See General Definitions at 50 CFR 660.11

likely catch scenario and so biased. This is a matter that has been part of our rebuilding discussions with the Scientific and Statistical Committee (SSC) and we have a couple ways of exploring this issue. One is through rebuilding analysis scenarios and the other through the rebuilding management strategy evaluation (MSE). If possible with the new cowcod rebuilding analyses, we will explore scenarios for cowcod and do more general analysis in the Tier 1 environmental impact statement (EIS) or elsewhere.

Lastly, we have general plans to explore rebuilding related analyses within the Tier 1 EIS and elsewhere. However, cowcod is the only rebuilding analysis being updated this cycle. We do hope to conduct some analyses for other species to explore some of the questions we have raised over the past couple of cycles.

Sector-Specific Allocation Alternatives

The fishery harvest guideline is allocated between sectors with either formal allocations or two-year allocations.

The Council chose overfished species set-asides for EFPs earlier at this meeting. Those set-asides are combined with research, incidental open access fisheries, and tribal set-asides and are taken “off the top” of the Council’s preliminary preferred ACL, which the Council identified under Agenda Item H.6. The resulting value is the fishery harvest guideline.

There are four overfished species for which the Council determines two-year trawl and non-trawl allocations and within non-trawl sharing: cowcod, bocaccio, canary rockfish and yelloweye rockfish. The GMT has provided tables (Appendix 1) based on the preliminary preferred ACL and recent years sharing from the EISs and West Coast Groundfish Observer Program (WCGOP) groundfish mortality reports. **The Council should adopt preliminary two-year allocations for bocaccio, canary, cowcod, and yelloweye rockfish for analysis in the preliminary DEIS.**

Last cycle, the Council temporarily suspended the trawl and non-trawl Amendment 21 allocation for petrale sole, since the stock was declared overfished. In 2013-2014, the Council allocated 35 mt of petrale sole to the non-trawl sector and the remainder to the trawl sector. **The Council should adopt either a 2-year petrale sole allocation or revert back to the Amendment 21 allocation.**

Management Measures

Under Agenda Items H.4 and H.6, the Council chose to manage spiny dogfish with species-specific harvest specifications. The proposed ACLs are 1,912 mt for 2015 and 1,897 mt for 2016. This compares to the historical catch by sector presented in Table 1.

The available management measures for reducing spiny dogfish mortality include trawl and non-trawl rockfish conservation area (RCA) adjustments and trip limit adjustments. However, as demonstrated in the 2013-2014 harvest specifications and management measures EIS, these measures have limited efficacy.

In September, the Council expressed interest in exploring individual fishing quota (IFQ) for managing spiny dogfish in the shoreside IFQ fishery. **If the Council is interested in spiny dogfish IFQ for 2015-2016, a two-year trawl and non-trawl allocation may need to be**

consider the historical catches in Table 1. Further a methodology and process for establishing initial allocations would need to be derived.

Slope rockfish

The Council's recommendation to follow the NMFS proposal for the slope rockfish alters the analysis we described under [Agenda Item H.10.b, GMT Report](#) by adding individual management of certain stocks into the analysis of the flexible sorting grid and closed areas (Items A.2 and C.3). NMFS has expressed interest in leading the analysis, and so, we look for guidance on the team's role. Based on our experience with the issues over the past couple of cycles and the general outline of what would be involved with the analysis, the number of issues needing consideration increases with individual management in play. As the Council considered in September, much of the potential workload and Council time comes from the need to consider intersector and finer scale allocations. The general outline of potential management measures is well known (i.e., trip limits, closed areas, IFQ and co-op management, etc.). In addition, we have heard interest from the NMFS and industry in providing substantial time for industry input into management. Additional workshops or time at Council meetings might be needed. **The GMT recommends the Council provide guidance on the team's role in the slope rockfish analysis and on the extra process, if any, for engaging input from industry on developing management measures.**

Ecosystem Component (EC) Species Analysis

The Council chose to designate the following ecosystem component (EC) species within the groundfish fishery management plan (FMP) under Agenda Item H.4. Those species are: big skate, California skate, Aleutian skate, roughtail/black skate, Bering/sandpaper skate, all other skates, Pacific grenadier, giant grenadier, all other grenadiers, spotted ratfish, soupfin shark, and finescale codling. This raises specific questions that the GMT will analyze during this next year, because EC species have no associated overfishing levels (OFLs) or allowable biological catch (ABCs), and management measures are not applied to EC species. The GMT summarized the purpose of EC species designation under [Agenda Item H.4.b, GMT Report 2](#), where it was pointed out that one purpose was data collection to evaluate whether conditions have changed (e.g., increased targeting). The question is whether the GMT should explore ways to improve monitoring of these species. Monitoring catch trends can be accomplished a number of ways, including data from the observer program (at sea and at ports), and state port sampling programs. We also discussed whether it would be fruitful for WCGOP to include discard of EC species in their annual groundfish mortality reports. **We seek guidance from the Council to help develop our analysis regarding EC species, and ask if there is anything specific the Council may wish included in the analysis.** Our detailed analysis will be completed over the winter.

GMT Recommendations:

1. The Council should confirm that set-asides should be removed from the cowcod ACL and not from the ACT, if established.
2. Provide the GMT flexibility in structuring the analysis to provide for potential increased cowcod research impacts.
3. The Council should adopt preliminary two-year allocations for bocaccio, canary, cowcod, and yelloweye rockfish for analysis in the preliminary DEIS based on information in Appendix 1.
4. The Council should adopt either a 2-year petrale sole allocation or revert back to the Amendment 21 allocation.
5. If the Council is interested in spiny dogfish IFQ for 2015-2016, a two-year trawl and non-trawl allocation would need to be established and may be based on the historical catches in Table 1. Further a methodology and process for establishing initial allocations would need to be derived.
6. Provide guidance on the team's role in the slope rockfish analysis and on the extra process, if any, for engaging input from industry on developing management measures.
7. Provide guidance to help develop the team's analysis regarding EC species, and ask if there is anything specific the Council may wish included in the analysis.

Informational - Holdovers from Agenda Item H.6.

In our report under Agenda Item H.6 ([Agenda Item H.6.b, Supplemental GMT Report 2, November 2013](#)) we noted that we may have additional thoughts on the P^* white paper ([Agenda Item H.6.a, Supplemental Attachment 4, November 2013](#)). In response to a question from the Council, one of our representatives expressed the view that we believe more discussion is needed over the course of the upcoming cycles before the Council arrives at regular guidelines for using P^* . And that was the view we wished to elaborate on here.

The team has been highlighting the need for such discussion since the P^* -based control rule was adopted in Amendment 23. In brief, P^* is meant to reflect a risk decision. And in the classic definition, risk is the probability of an event times its consequence. Based on this model it would be fully reasonable for the Council to choose different P^* values for two stocks with equally uncertain stock assessments if the concern over the consequences of overfishing were different. Conversely, choosing the same P^* for the stocks implies the Council's view that the consequences are equal.

What we have highlighted in the past is that P^* is based on a very narrow, uncertain view of the consequences. Our hope is that the science might bring a more specific, longer-view focus to the consequences side of the equation by grounding the decision in specific outcomes for the stock (e.g., probability that the stock will be overfished over some time period). Stock assessments may be limited in their ability to do this. Yet decision tables used for setting harvest specifications for Pacific halibut and Pacific whiting in their international forums have been moving this direction. Again, our point is that a framework could be developed over time and that we expect the planned Tier 1 EIS analyses to help inform the effort. To be clear, we thought the Council's look to stock specific considerations in choosing P^* values under H.6 was the right approach to take for now.

In addition, we wished to further clarify our statement made about P^* and cartilaginous species under H.6 (Pp. 1-2, [Supplemental GMT Report](#)). In clarifying the statement to the Council, the GMT Chair did not wish to speak for the team about how we would have worded the sentence until he had opportunity to discuss it with the team. Having now had that discussion, the team consensus is that the sentence was erroneous and should have been struck from the report. The point that we had intended to make was that the Council had chosen a P^* of 0.3 for spiny dogfish last cycle because of the uncertainty in the F_{MSY} proxy. That rationale potentially changed when the Scientific and Statistical Committee (SSC) recommended the new proxy in September. Our statement was erroneous because the proxy would apply to all elasmobranchs. Furthermore, after the Council's action in H.4, the only elasmobranchs other than spiny dogfish requiring a P^* will be leopard Shark and longnose Skate.

On that note, the GMT discussed how the Council's rationale for the P^* recommendation of 0.35 for spiny dogfish could logically apply to longnose skate as well. However, we understand the Council did not apply the P^* of 0.3 to longnose skate in 2013-14 or recommend the same P^* as for spiny dogfish for 2015-16 because the stock's annual catch limit (ACL) is low enough that it subsumes what a P^* of 0.35 would produce in terms of an allowable biological catch (ABC). Like us, some may wonder and need to be reminded about the difference.

Table 1. West coast groundfish mortality estimates, by sector in metric tons, for dogfish shark from 2006-2012. Estimates assume 100% mortality for discarded dogfish shark for all gear types during 2006-2011. For 2012, 50% mortality was shown in Bellman et al. (2013) for discarded dogfish in the fixed gear fishery and 100% discard mortality in the trawl fishery. Data were acquired from Hastie and Bellman (2007), Bellman et al. (2008, 2009, 2010, 2011, 2012, and 2013).

GROUND FISH MANAGEMENT TEAM REPORT ON FISHERIES IN 2015-2016 AND BEYOND: MANAGEMENT MEASURES RANGE OF ALTERNATIVES

Introduction and Overarching Discussion

This report includes updated catch risk tables and includes the selected species scorecard for the current year, which we would have produced in the inseason statement had time allowed. First, we make some overarching comments and a recommendation.

As highlighted in our Agenda Item H.4 GMT reports, some fundamental questions have surfaced during discussions of “catch risk” and stock complexes. As noted there, we see the need for more clarity on certain aspects of the law and the science of overfishing, especially in the context of the stock complexes. This clarity would benefit both our analytical work and the policy deliberations at the Council. We therefore recommend that the issue be looked at over the remainder of this 2015-16 process, to the extent possible.

These fundamental issues underlie many of the topics we hear discussed by the Council and its advisors, including the use of harvest guidelines and questions on the appropriateness of directing management measures at stocks within complexes. Even with the selected species scorecard presented here, we have heard concerns that such efforts are leading us down the road of “individual management” for every stock. We have undertaken such assessments of catch risk for the very reason of helping to answer the question of which stocks need individual attention. Yet we do not think this question is easily answerable, until there is a more commonly held understanding of the proportionality between management response and overfishing risk. We cannot say we have a consensus view at the GMT or staff level.

To achieve better clarity, the desire to have flexibility in stock complex management and elsewhere needs to be connected to the Council’s primary responsibility under National Standard 1 of preventing overfishing. As one way of doing this, the team saw similarities in the flowchart that the Council considered for responding to status determination in the data moderate assessments (Agenda Item H.2.b, Supplemental NWFSC Powerpoint (Hastie), March 2013). Overfishing is another type of status determination that is made on catch compared to overfishing levels (OFLs) and allowable biological catches (ABCs). And in fact, some on the team had the impression that the flowchart already applied to this type of status determination. Others thought the flowchart and discussions around it were focused on the need for rebuilding data moderate stocks and that the overfishing aspect was not directly discussed. Either way, the team wishes to highlight the commonalities between the two and thinks it would be very helpful for such a “flowchart” to be produced and discussed relative to catch risk and overfishing. Such discussions could consider questions about the need to take management action in the following circumstances:

- 1) The primary range of the species is outside of the region managed under the West Coast Groundfish Fishery Management Plan (FMP).
- 2) Action is not necessary in a given management area within the FMP where the species is rare or does not occur.
- 3) Action has recently been taken to reduce mortality below the established ABC.

- 4) Additional data is available for a full assessment.
- 5) The species in question is a healthy stock subject to the mixed stock exception.

These circumstances are illustrative of what has popped up in GMT discussions yet we do not suggest this to be the exhaustive list or necessarily what a first cut effort would attempt to clarify.

Recommendation: Request that appropriate staff--NWFSC, SSC, Council staff, GMT--develop a flowchart for thinking about the overfishing risk and appropriate management response with data moderate and data poor stocks.

Considerations for Management of Stocks for which Mortality has Regularly Exceeded the ABC or OFL of a Component Stock of a Complex

The risk analysis conducted with regards to stock complexes at the September Council meeting ([Agenda Item G.8.b, Supplemental GMT Report 5, September 2013](#), Appendix B) was updated to reflect the 2015 OFLs and ABCs selected by the Council under H.6. The results are provided in Agenda Item H.6. The 2012 groundfish mortality estimates from the West Coast Groundfish Observer Program (WCGOP) were added to the analysis. In addition, fish identified as blackspotted rockfish were added to the estimates of rougheye rockfish to provide a direct comparison to the rougheye/blackspotted rockfish OFL. This OFL reflects categorization of the rougheye rockfish assessment as a category 2 stock assessment as recommended by the Scientific and Statistical Committee (SSC), due to the co-occurrence of the two species. Lastly, the proportion of rougheye/shortraker rockfish was calculated using the average proportion of the catch of each species from 2004-2012, then added to the estimates for each species. This was done to provide total estimates of mortality for comparison to respective ABCs and OFLs. A similar comparison was conducted for each complex component species and the results are provided in Tables 4 to 12.

The mortality estimates for overfished species and non-overfished species for 2011 and 2012, subject to individual management were also compared to their respective ABC and OFL, as well as ACL for overfished species, the results of which are provided in Table 13 and Table 14, respectively. The purpose of providing this information under this agenda item is to identify stocks for which management actions may be needed to address conservation concerns resulting from overages. As such, in tables where mortality from multiple timeframes are analyzed, particular attention should be paid to the comparisons of ABCs and OFLs to the average mortality in 2011 and 2012, which better reflects mortality under current management than longer time series that combine data from individual fishing quota (IFQ) and pre-IFQ periods. Annual groundfish mortality reports will be reviewed each year to monitor catch relative to the OFL and ABC values. Using this information, stocks can be prioritized for assessment to determine whether overharvest has continued or the status of the stock has been affected, respectively. The GMT will thoroughly analyze various management measures for selected species identified as at risk of overfishing. These analyses will evaluate various measures, some that may be applied to species that remain within a complex, and others that may require removing a species from the complex.

Selected Species Scorecard

At the June 2012 meeting, the Council requested the GMT provide landings information by

sector for aurora, rougheye, shorttraker, China, copper, and quillback rockfish under the inseason agenda item (see Council meeting minutes at <http://tinyurl.com/ldaoqo>). The purpose of presenting these data is to gain a better understanding of how catch accrues by sector throughout the year for these species. This information is not intended to inform inseason action. Per the Council request, the GMT prepared a landings report (Table 1, **Error! Reference source not found.**, and Table 3) of these selected species. The query date for these tables was October 27, 2013.

Originally, landings information was to be summarized from existing automated database reports. However, the GMT went a step further, and together with the Pacific States Marine Fisheries Commission (PSMFC), Pacific Fishery Management Council (PFMC) and National Marine Fisheries Service (NMFS) staff, developed a database reporting tool housed within PacFIN, which updates regularly to inform this data request. The current report includes landings estimates from the shoreside commercial fisheries (PacFIN VDRFD table), retained and discarded catch estimates as of the current query date, in the at-sea sectors (via the newly revised NORPAC 4900 Species Comp. Table in PacFIN), retained and dead discard estimates from recreational fisheries (via RecFIN).

Three tables are presented: Table 1 summarizes catch by species and management area, while **Error! Reference source not found.** summarizes catch by species and sector, only for the area north of 40°10' N. latitude, and **Error! Reference source not found.** does the same for the area south of 40°10' N. latitude. Footnotes in Table 1 include the anticipated 2015 component overfishing levels (OFLs) to inform how current catches relate to potential future harvest specifications (i.e., 2015). Landings data were better than 90 percent complete through August in Washington, September in Oregon, and July in California, at the time of this query (October 27, 2013). Component OFLs were taken from the 2013-14 Biennial Harvest Specifications Final Environmental Impact Statement. The estimates given here may not match exactly with every sector estimate obtained separately from independent databases, due to reporting lag and data capture date.

It is important to note that since OFLs are set for stock complexes, rather than for individual stocks within a complex, the Scientific and Statistical Committee recommends against using OFL contribution values to evaluate whether overfishing is occurring for component stocks (see <http://tinyurl.com/kz7p639>). In addition, the NMFS pointed out in Agenda Item H.4.b, Supplemental NMFS Report, November 2013, that although “the Minor Slope North and Minor Slope South complexes are divided at 40° 10’ N. latitude, combining northern and southern individual stock contributions to the OFL is more informative when determining management performance of these stocks coastwide (Agenda Item F.8.b, Supplemental SSC Report, June 2013)”.

Table 1. Catch estimates of selected species identified at the June 2012 PFMC meeting. Estimates include commercial landings for shoreside fisheries and total catch for at-sea sectors for 2013. This table also includes catches for the recreational sector (landed and discarded catch). This information is aggregated by species, complex and management area. For informational purposes; not intended for inseason Council action. Query date: October 27, 2013.

Species	Complex	Mgmt Area	2013 Sum of Catch	2013 Complex OFL (mt)	% of OFL Contribution	2011 WCGOP Annual Discard (mt) ^{a/}

a/ Shoreside discard from the 2011 WCGOP groundfish mortality report.

b/ Aurora rockfish projected 2015 OFLs (updated base on Agenda Item H.6.a Attachment 1, November 2013) are 17.4 mt north of 40° 10' and 74.3 mt south of 40° 10'; percentage of 2015 OFLs (updated base on Agenda Item H.6.a Attachment 1, November 2013) are 57 percent and 5 percent, respectively.

c/ Rougheye rockfish projected 2015 OFLs (updated base on Agenda Item H.6.a Attachment 1, November 2013) are 201.9 mt north of 40° 10' and 4.1 mt south of 40° 10'; percentage of 2015 OFLs (updated base on Agenda Item H.6.a Attachment 1, November 2013) are 35 percent and 2 percent respectively.

Table 2 Catch estimates of selected species, in the management area North of 40°10' N. latitude only, identified at the June 2012 PFMC meeting. Estimates include commercial landings for shoreside fisheries and total catch for at-sea sectors for 2013. This table also includes catches for the recreational sector (landed and discarded catch). This information is aggregated by species, and sector. For informational purposes; not intended for inseason Council action. Query date: October 27, 2013.

Re: Makah Treaty Groundfish Fisheries in 2015-2016

Dear Mr. Stelle:

We have been asked to write to you on behalf of the Makah Indian Tribe. Pursuant to 50 C.F.R. § 660.324(d), please be advised that the Tribe intends to continue all of its existing groundfish fisheries in 2015 and 2016, and requests that, except as noted below, all existing treaty groundfish regulations and allocations be continued.

The Tribe anticipates that it will continue to have five catcher boats participating in the Pacific whiting fishery in 2015 and 2016 and requests an allocation of 17.5 percent of the U.S. Total Allowable Catch for its fishery in each year.

The Tribe intends to request increases in the tribal set asides for yellowtail rockfish, widow rockfish and Pacific cod in 2015 and 2016. However, because of current market constraints, the Tribe has not yet determined the amount of the increases it will request. Tribal representatives will confer with your staff to determine that amount before the June 2014 Pacific Fishery Management Council meeting.

Makah representatives will be available to discuss any questions you or your staff may have regarding these matters at the upcoming Council meetings.

Sincerely,

ZIONTZ & CHESTNUT

Marc D. Slonim

Proposed 2015-2016 Tribal Management Measures

Black Rockfish - The 2015 and 2016 tribal harvest guidelines will be set at 30,000 pounds for the management area between the US/Canada border and Cape Alava, and 10,000 pounds for the management area located between Destruction Island and Leadbetter Point. No tribal harvest restrictions are proposed for the management area between Cape Alava and Destruction Island.

Sablefish - The 2015 and 2016 tribal set asides for sablefish will be set at 10 percent of the Monterey through Vancouver area ACL minus approximately 1.5 percent to account for estimated discard mortality. Allocations among tribes and among gear types, if any, will be determined by the tribes.

Pacific cod - The tribes will be subject to a 400 mt harvest guideline for 2015 and 2016.

For all other tribal groundfish fisheries the following trip limits will apply:

Thornyheads - Tribal fisheries will be restricted to 17,000 lbs/2 months for shortspine thornyheads and 22,000 lbs/2 months for longspine thornyheads. Those limits would be accumulated across vessels into a cumulative fleetwide harvest target for the year. The limits available to individual fishermen will then be adjusted inseason to stay within the overall harvest target as well as estimated impacts to overfished species

Canary Rockfish - Tribal fisheries will be restricted to a 300 pound per trip limit.

Other Minor Nearshore, Shelf and Slope Rockfish - Tribal fisheries will be restricted to a 300 pound per trip limit for each species group, or the Limited Entry trip limits if they are less restrictive than the 300 pound per trip limit.

Yelloweye Rockfish - The tribes will continue developing depth, area, and time restrictions in their directed Pacific halibut fishery to minimize impacts on yelloweye rockfish. Tribal fisheries will be restricted to 100 pounds per trip.

Lingcod - Tribal fisheries will be subject to a 250 mt harvest guideline for 2015 and 2016.

Spiny Dogfish – Tribal fisheries for dogfish in 2015 and 2016 would be restricted to 200,000 lbs/2 months. Targeting of dogfish by treaty fishermen in 2015 and 2016 would be conducted while staying within current estimates of impacts on overfished species.

Full Retention - The tribes will require full retention of all overfished rockfish species as well as all other marketable rockfishes during treaty fisheries.

Makah Trawl Fisheries for 2015 and 2016

Midwater Trawl Fishery - Treaty midwater trawl fishermen will be restricted to a cumulative limit of yellowtail rockfish, based on the number of vessels participating, not to exceed 250,000 lbs/2 month period for the entire fleet for a total catch of 677 mt. Their landings of widow rockfish must not exceed 10 percent of the cumulative poundage of yellowtail rockfish landed by a given vessel for the year. The tribe may adjust the cumulative limit for any two-month period to minimize the incidental catch of canary and widow rockfish, provided the average cumulative limit does not exceed 250,000 pounds for the fleet.

Bottom Trawl Fishery - Treaty fishermen using bottom trawl gear will be subject to trip limits similar to those applied in recent years for shortspine and longspine thornyhead, Dover sole, English sole, rex sole, arrowtooth flounder, and other flatfish. These are 110,000 lbs/2 months for Dover sole, English sole, and Other Flatfish; 150,000 lbs/2 months for arrowtooth flounder; 17,000 lbs/2 months for shortspine thornyhead; and 22,000 lbs/2 months for longspine thornyhead. For Dover sole, longspine thornyheads, and arrowtooth flounder, these bi-monthly limits in place at the beginning of the season will be combined across periods and the fleet to create a cumulative harvest target. The limits available to individual fishermen will then be adjusted inseason to stay within the overall harvest target as well as estimated impacts to overfished species. For petrale sole, fishermen would be restricted to 220 mt for the entire year. Because of the relatively modest expected harvest, all other trip limits for the tribal fishery will be those in place in recent years and will not be adjusted downward, nor will time restrictions or closures be imposed, unless in-season catch statistics demonstrate that the tribe has taken ½ of the harvest in the tribal area. Fishermen will be restricted to small footrope (≤ 8 inches) trawl gear. Exploration of the use of selective flatfish trawl gear may be conducted.

Observer Program - The Makah Tribe has an observer program in place to monitor and enforce the limits proposed above.

Agenda Item H.10.c
Public Comment
November 2013

7 October, 2013

Re Agenda Item H10: Requests for Groundfish regulation analysis

The Coastside Fishing Club is an all-volunteer California non-profit organization of 13,000 recreational fishermen dedicated to enhancing the recreational fishing experience for all Californians. We have been a strong proponent for incorporating the use of descending devices into the culture of the recreational groundfish fishery. And the first rule of this cultural change is to avoid the take of constraining species to begin with – consequently we are highly supportive of the adoption of the midwater gear proposal that derived from the Oregon EFP.

Through the use of these two techniques, the recreational impact on constraining species of rockfish should be reduced in future years, and thus open up the possibility of liberalizing the recreational groundfish regulations. As the Council considers its Tier 1 analysis for 2015 and beyond we request that the following conditions be included for California's recreational fishermen:

- Increased season lengths resulting from reduced take of constraining species resulting from use of descending devices
- Access to deeper waters resulting from reduced take of constraining species resulting from use of descending devices
- Increased season lengths resulting from reduced take of constraining species resulting from use of mid-water sport gear
- Access to deeper water resulting from reduced take of constraining species resulting from use of mid-water sport gear
- Combinations of the above

The Tier 1 analysis should be broad enough to cover the full range of potential regulatory options to include 12 month open seasons, and elimination of the recreational RCA depth restrictions.

Thanks

Richard Ross, President
Coastside Fishing Club

On Wed, Oct 9, 2013 at 10:00 AM, Andrew Guiliano <andygu@sbcglobal.net> wrote:

Mr Seger,

I received a request for public comment on West Coast Groundfish in the mail yesterday. I believe today is the last day to comment so I will be brief.

I currently fish a Limited Entry fixed gear permit from San Francisco. Other than Dungeness Crab, Groundfish represents the largest contribution of income to my family. Like many, We are a small boat operation providing fresh local seafood to the San Francisco restaurant community.

We have adapted reasonably well under the West Coast catch share program, but would like the council to consider two recommendations:

-Ability to anchor overnight in the RCA. California law allows commercial vessels access in the MLPA area's, which also fall under the RCA, for safe overnight anchoring. Given the large distances we often travel, and the fact that we have 100% VMS coverage, limited access into portions of the RCA would be beneficial for both safety and financial reasons. Specifically in our area in the anchorage at the Main Farallon Island. All other commercial fishing vessels have access to that anchorage other than those who participate in the West Coast Groundfish fishery.

-Access to a greater portion of the RCA. In 2012 only on 632lbs of Yellowtail Rockfish and 282lbs of Widow Rockfish was landed by the entire San Francisco commercial fleet. That's less than 1% of the allowable take under the Catch Share program. It's not that there is a shortage of either fish, the reason is simply that the RCA is too restrictive to allow **Commercial fishing** access into habitat conducive to Yellowtail, Widow and Chilipepper rockfish. At the Same time, CPFV that berth next me have access inside the RCA daily (state managed under actual depth restrictions, not waypoints as the RCA is determined by), and land thousands of pounds annually. We would like to see some allowance for midwater fishing for Yellowtail, Widow and Chilipepper rockfish by shrinking the RCA, which is currently 30-150 fathoms . Specifically access to 40 fathoms on the inside and 100 fathoms on the outside.

We understand the complications and challenges the council is faced with. We also understand the the complicated nature of crafting regulations for the entire West Coast and trying to strike a balance between fish and fisherman. Among the multitude of responsibilities I have is to provide a conduit of hands-on data from the water to the council. I thank you for the opportunity to do that.

Sincerely,

Andrew Guiliano
F/V Drake

Subject: Transporting Sablefish to Home Port

To: "pfmc.comments@noaa.gov" <pfmc.comments@noaa.gov>

To the PFMC,

Please include this in your program review:

Being able to transport Sablefish through an area closed to us for fishing in order to reach our home port to unload will make more sense economically, environmentally, and safety wise. Monitoring should not be an issue because we are already being monitored by VMS.

Here are some important points:

- The Limits are often restricted or lower above Lat36.
- The fishing grounds we use below lat36 are as close or closer to our home port by boat than to Morro Bay.
- At least 5 boats are unloading in Morro Bay instead of Moss Landing because of the regulations currently imposed. This causes a loss of jobs here and substantial added expense for the fishers.
- Fish unloaded in Morro Bay have to be transported by vehicle to Moss Landing. This is expensive, an unnecessary use of fuel, and turns what should be an 8-10 hour day into a 22 hour day.
- Boats are monitored by VMS so you can see where we are fishing and where we are traveling already.

We are asking you to allow us to fish below the Lat36 line and transport our catch to our home port in Moss Landing. This is a reasonable request that can be monitored by systems already in place. Please take this request into consideration at your program review. We understand that you take 2 years to make these decisions. Please understand that our community is negatively affected by these regulations right now. Thank you for your consideration.

Sincerely,
Julie Deyerle

From: Louie Zimm, Southern California Charter Representative on the Groundfish Advisory Subpanel

To: Pacific Fisheries Management Council

Re: H.6 2015-2016 Biennial Adjustments to the Recreational Groundfish Fishery South of 34° 27' N. Latitude

As I plan to inform the council regarding the difficult situation that confronts our Southern California fleet and ask for remedy for the 2014 season, I would also like to request the Council consider opening the recreational groundfish fishery south of 34° 27' N. Latitude for 2015 and 2016. My reasons for this are similar to the in-season request for 2014.

In March of this year (2013), the CDFW mandated size limit on Spotted Sand Bass, Barred Sand Bass and Calico Bass was increased from 12 inches to 14 inches. This regulatory change immediately forced the fleet to a 95% live discard situation that will continue as the biomass alters its size profile over the next few years. Thousands of bass were discarded with few retained by anglers.

Barred Sandbass and Calico Bass were the primary fall back target of recreational fishing boats during the January and February rockfish closure.

In this present situation, until the size distribution of the bass population alters, recreational anglers are left with very little opportunity during the January/February time frame.

Access to the rockfish resource is already severely restricted due to existing CCA and RCA area closures. We have also been hit with the movement (by in-season action) of the inshore RCA line from 60 to 50 fathoms.

In addition, the imposition of Marine Protected Areas in Southern California on the 1st of January 2012 further restricted our fleets access to rockfish habitat.

Fifteen new Marine Protected Areas are closed to bottomfishing along the mainland coast. Seven new closed areas at Catalina and San Nicholas Island are now closed to the recreational fleet. Furthermore, the north end of San Clemente Island is now a closed military area.

The commercial passenger vessel fleet has been hit especially hard by these combined access restrictions. In 2015 and 2016 the fleet will be facing further layoffs, if passengers have no reasonable opportunity to retain some catches. The CPFV fleet is very concerned about the looming loss of their licensed captains as these trained and highly skilled folks will seek other employment and not return to the fleet.

The primary reason for the Jan./Dec. closure is to restrict the catch of bocaccio. However, we now see that the population of bocaccio is rebounding significantly off Southern California. (See Information Agenda Item G.7.a, Supplemental Attachment 5 from September 2013 Briefing Book). This document shows a projected 2015 OFL of 1,444 tons south of 40 deg., 10 min. latitude with a range of alternative 2015 ABC's from 910 to 1380 tons. This contrasts with the previously proposed 2015 OFL of 881 tons. This substantial increase in recommended OFL is due to greatly increased recruitment.

The scorecard from F9b_SUP_GMT_JUN2013BB shows a projected impact of 125 tons by the California recreational fishery for 2013. This is 23.5% under the allowed attainment of the 163.5 metric ton allocation for this fishery. This ACL is based on a total harvest specification of only 320 tons for the entire bocaccio fishery.

We assert that the impact of a January/February opening of the recreational fishery for rockfish in the Southern California bight would not be sufficient to attain our present ACL and would have no chance of attaining future increased ACLs of this rapidly expanding population of bocaccio.

We also maintain that our present restriction to waters shallower than 50 fathoms greatly restricts our access to the majority of the bocaccio population. This, in conjunction with the bocaccio sub-limit of 3 fish will continue to restrict our impacts.

Please consider an adjustment to the 2015-16 specs to allow a recreational fishery for groundfish south of 34° 27' N. Latitude, during the months of January and February of 2015 and 2016. Also, please review the current policy of restricting recreational fishing to 50 fathoms in view of recent encouraging data regarding the cowcod population structure and our continuing use of recompression technology.

From: Louie Zimm, Southern California Charter Representative on the Groundfish Advisory Subpanel

To: Pacific Fisheries Management Council

Re: H.10 2015-2016 Biennial Management Specifications 2015-2016 Recreational Groundfish Fishery South of 34° 27' N. Latitude
Updated request

This past year the Southern California commercial passenger vessel fleet has been hit especially hard by access restrictions.

We respectfully request that the council make an adjustment for the 15-16 Specs cycle of RCA lines allowing access to 50-60 fathom bottom-fishing habitat for recreational anglers south of 34° 27' N. Latitude. We also hope the council considers in the future increasing the bag limit for bocaccio as an incidental by-catch in this multi-species fishery as the stock biomass increases.

When the science supports having a 12-month season, the industry would encourage consideration of a January/February open period.

This is the difficult situation that confronts members of our fleet from Dana Point, Oceanside, Mission Bay and San Diego Bay.

In March of this year (2013), the CDFW mandated size limit on spotted sand bass, barred sand bass and calico bass was increased from 12 inches to 14 inches. This regulatory change immediately forced the fleet to a 95% live discard situation that will continue as the biomass alters its size profile over the next few years. Thousands of bass were discarded live, with few retained by anglers.

Barred sandbass and calico bass were the primary fall back target of these southern recreational fishing boats during the January and February rockfish closure.

In this present situation, until the size distribution of the bass population alters, this part of the fleet are left with few opportunities beyond sand dabs and scorpionfish during the January/February time frame.

For all of our fleet, access to the rockfish resource is already severely restricted due to existing CCA and RCA area closures. We have also recently been constrained by the movement (by in-season action) of the inshore RCA line from 60 to 50 fathoms.

In addition, the imposition of Marine Protected Areas in Southern California on the 1st of January, 2012 further restricted our fleets' access to rockfish habitat.

Fifteen new Marine Protected Areas are closed to groundfishing along the mainland coast. Seven new closed areas at Catalina and San Nicholas Island are now closed to the recreational fleet. Furthermore, the north end of San Clemente Island is now a closed military area.

The commercial passenger vessel fleet has been hit especially hard by these combined access restrictions. The CPFV fleet is very concerned about the looming loss of their licensed captains as these trained and highly skilled folks may seek other employment and not return to the fleet.

We assert that the impact of moving the RCA line back to 60 fathoms for rockfish in the Southern California bight would not be sufficient to attain the 15/16 ACL and would have little chance of attaining future increased ACLs for this rapidly expanding population of bocaccio.

We maintain that our present restriction to waters shallower than 50 fathoms greatly restricts our access to the majority of the bocaccio population. Even liberalization of the restriction to 60 fathoms still restricts our access to much of the bocaccio biomass in this multi-species fishery.

We have demonstrated our proficiency at safely releasing cow cod in event of any encounters with this fish.

The latest Recfin data for cow cod in 2013 shows a by-catch of .85 metric tons, the majority of which our fleet releases to depth using recompression gear.

The 2012 data for the whole year shows a similar figure of .82 metric tons of cow cod by-catch.

In addition, the latest cow cod abundance indicators appear to be favorable, which would allow an increase in the ACL for this by-catch species. We are eagerly awaiting the results of the latest cow cod assessment to further inform this situation.

In summary, we respectfully request that the council make an adjustment of RCA lines allowing access to 50-60 fathom bottom-fishing habitat for recreational anglers south of 34° 27' N. Latitude, for the 15-16 Specs cycle. We also request the council consider increasing the bag limit for bocaccio as an incidental by-catch in this multi-species fishery as the stock biomass increases.

When the science supports having a 12-month season, the industry would encourage consideration of a January/February open period.

(Motion: Sones/Lincoln) Motion as amended carried unan.
Proposed 2015-2016 Tribal Management Measures

Black Rockfish - The 2015 and 2016 tribal harvest guidelines will be set at 30,000 pounds for the management area between the US/Canada border and Cape Alava, and 10,000 pounds for the management area located between Destruction Island and Leadbetter Point. No tribal harvest restrictions are proposed for the management area between Cape Alava and Destruction Island.

Sablefish - The 2015 and 2016 tribal set asides for sablefish will be set at 10 percent of the Monterey through Vancouver area ACL minus approximately 1.5 percent to account for estimated discard mortality. Allocations among tribes and among gear types, if any, will be determined by the tribes.

Pacific cod - The tribes will be subject to a 400 mt harvest guideline for 2015 and 2016.

For all other tribal groundfish fisheries the following trip limits will apply:

Thornyheads - Tribal fisheries will be restricted to 17,000 lbs/2 months for shortspine thornyheads and 22,000 lbs/2 months for longspine thornyheads. Those limits would be accumulated across vessels into a cumulative fleetwide harvest target for the year. The limits available to individual fishermen will then be adjusted inseason to stay within the overall harvest target as well as estimated impacts to overfished species.

Canary Rockfish - Tribal fisheries will be restricted to a 300 pound per trip limit.

Other Minor Nearshore, Shelf and Slope Rockfish - Tribal fisheries will be restricted to a 300 pound per trip limit for each species group, or the Limited Entry trip limits if they are less restrictive than the 300 pound per trip limit.

Yelloweye Rockfish - The tribes will continue developing depth, area, and time restrictions in their directed Pacific halibut fishery to minimize impacts on yelloweye rockfish. Tribal fisheries will be restricted to 100 pounds per trip.

Lingcod - Tribal fisheries will be subject to a 250 mt harvest guideline for 2015 and 2016.

Spiny Dogfish – Tribal fisheries for dogfish in 2015 and 2016 would be restricted to 200,000 lbs/2 months. Targeting of dogfish by treaty fishermen in 2015 and 2016 would be conducted while staying within current estimates of impacts on overfished species.

Full Retention - The tribes will require full retention of all overfished rockfish species as well as all other marketable rockfishes during treaty fisheries.

Makah Trawl Fisheries for 2015 and 2016

Midwater Trawl Fishery - Treaty midwater trawl fishermen will be restricted to a cumulative limit of yellowtail rockfish, based on the number of vessels participating, not to exceed 250,000 lbs/2 month period for the entire fleet for a total catch of 677 mt. Their landings of widow rockfish must not exceed 10 percent of the cumulative poundage of yellowtail rockfish landed by a given vessel for the year. The tribe may adjust the cumulative limit for any two-month period to minimize the incidental catch of canary and widow rockfish, provided the average cumulative limit does not exceed 250,000 pounds for the fleet.

Bottom Trawl Fishery - Treaty fishermen using bottom trawl gear will be subject to trip limits similar to those applied in recent years for shortspine and longspine thornyhead, Dover sole, English sole, rex sole, arrowtooth flounder, and other flatfish. These are 110,000 lbs/2 months for Dover sole, English sole, and Other Flatfish; 150,000 lbs/2 months for arrowtooth flounder; 17,000 lbs/2 months for shortspine thornyhead; and 22,000 lbs/2 months for longspine thornyhead. For Dover sole, longspine thornyheads, and arrowtooth flounder, these bi-monthly limits in place at the beginning of the season will be combined across periods and the fleet to create a cumulative harvest target. The limits available to individual fishermen will then be adjusted inseason to stay within the overall harvest target as well as estimated impacts to overfished species. For petrale sole, fishermen would be restricted to 220 mt for the entire year. Because of the relatively modest expected harvest, all other trip limits for the tribal fishery will be those in place in recent years and will not be adjusted downward, nor will time restrictions or closures be imposed, unless in-season catch statistics demonstrate that the tribe has taken $\frac{1}{2}$ of the harvest in the tribal area. Fishermen will be restricted to small footrope (≤ 8 inches) trawl gear. Exploration of the use of selective flatfish trawl gear may be conducted.

Amendment: (Lockhart/Sones)
Add Red Stripe 800 lbs per trip Amendment carried unan.

Observer Program - The Makah Tribe has an observer program in place to monitor and enforce the limits proposed above.
