## INTRODUCTION

The Salmon Technical Team (STT) and staff of the Pacific Fishery Management Council (Council) have prepared this stock assessment and fishery evaluation (SAFE) document as a postseason review of the 2013 ocean salmon fisheries off the coasts of Washington, Oregon, and California to help assess Council salmon fishery management performance, the status of Council area salmon stocks, and the socioeconomic impacts of salmon fisheries. This postseason report will also provide a detailed description of the salmon fishery portions of the affected environment to be incorporated by reference into an Environmental Assessment (EA) to comply with National Environmental Policy Act (NEPA) requirements for the 2014 ocean salmon management measures. The STT and Council staff will provide three additional reports prior to the beginning of the ocean salmon season to help guide the Council's selection of annual fishery management measures: Preseason Report I, Preseason Report II, and Preseason Report III. These reports will provide forecasts of stock abundance, determine annual catch limits, and will analyze the biological and economic impacts of the Council's proposed alternatives and adopted fishery management recommendations. Preseason Report I will also constitute the first part of the EA for 2014 ocean salmon fishery management measures, and include a statement of the purpose and need, a description of the affected environment, and a description and analysis of the status quo (no action) alternative. Preseason Report II will constitute the second and final part of the EA, and will include a description and analysis of the alternative management measures considered for 2014 ocean salmon fisheries. The alternatives analyzed in Preseason Report II will provide a reasonable range of environmental effects, which will bound those of the final fishery management measures included in Preseason Report III. Together, these two parts of the EA will provide the necessary components to determine if a finding of no significant impact (FONSI) is warranted.

West Coast fisheries in Council-managed waters (ocean fisheries between the U.S./Canada border and the U.S./Mexico border from 3 to 200 nautical miles offshore) are directed toward and harvest primarily Chinook or king salmon, Oncorhynchus tshawytscha, and coho or silver salmon, Oncorhynchus kisutch. Small numbers of pink salmon, Oncorhynchus gorbuscha, also are harvested, especially in odd numbered years. There are no directed fisheries for other Pacific salmon species, which are rarely caught in Council-managed fisheries.

The Council's annual review of ocean salmon fisheries provides a summary of important biological and socioeconomic data from which to assess the status of managed stocks, impacts of past management actions, to determine how well management objectives are being met, and to improve regulations for the future. The Council will formally review this SAFE document at its March meeting prior to the development of management alternatives for the approaching fishing season.

Chapter I summarizes ocean salmon fishery regulations and landings within the Council management area and management actions and landings under the jurisdiction of the Pacific Salmon Commission (PSC). Appendix A tables detail historical effort and harvest data by state and by management area. Appendix C summarizes historical ocean fishery regulations.

For Chinook and coho salmon, respectively, Chapters II and III assess, where possible, the achievement of pertinent management objectives by salmon stock (including those listed under the Endangered Species Act [ESA]), outline regulations used to achieve the objectives, and summarize inside fisheries catch and spawner escapement data. Appendix B tables detail historical spawning escapement and inside fisheries catch information. Detailed information for other salmon species is not included since Council fisheries have minor impacts on pink salmon escapements and no measurable impacts on sockeye or chum salmon or steelhead trout; however, catch and escapement data and objectives for Puget Sound pink salmon are summarized in Appendix B, Table B-43.

In 2011 the Council also adopted status determination criteria (SDC) for overfishing, approaching an overfished condition, overfished, not overfished/rebuilding, and rebuilt under Salmon Fishery Management Plan (FMP) Amendment 16. These criteria, approved and implemented in December 2011, were:

- Overfishing occurs when a single year exploitation rate exceeds the maximum fishing mortality threshold (MFMT), which is based on the maximum sustainable yield exploitation rate ( $\mathrm{F}_{\text {MSY }}$ );
- Approaching an overfished condition occurs when the geometric mean of the two most recent postseason estimates of spawning escapement, and the current preseason forecast of spawning escapement, is less than the minimum stock size threshold (MSST);
- Overfished status occurs when the most recent 3-year geometric mean spawning escapement is less than the MSST;
- Not overfished/rebuilding status occurs when a stock has been classified as overfished and has not yet been rebuilt, and the most recent 3 -year geometric mean spawning escapement is greater than the MSST but less than $\mathrm{S}_{\text {MSY }}$;
- A stock is rebuilt when the most recent 3-year geometric mean spawning escapement exceeds $\mathrm{S}_{\mathrm{MSY}}$.
All SDC rely on the most recent estimates available, which in some cases may be a year or more in the past because of incomplete broods or data availability. The above criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. Relevant stocks were evaluated relative to these new SDC as required by the FMP. In addition, new conservation objectives were adopted for some stocks based on revised estimates of $S_{\text {MSY }}$ and $\mathrm{F}_{\text {MSY }}$, which are the reference points used to establish stock-specific SDC. Stock specific reference points and recent year estimates for relevant stocks are presented in Tables II-6 and III-6.

Status determinations for overfishing, overfished, not overfished/rebuilding, and rebuilt are reported in this SAFE document; however, because approaching an overfished condition relies on a preseason forecast, that status determination is reported in Preseason Report I. In addition, some status determinations may be updated in Preseason Report I if more recent spawning escapement or exploitation rate estimates become available between the time this SAFE document and Preseason Report I are published.

Socioeconomic impacts of the fisheries are discussed in Chapter IV. Appendix D provides historical fishery-related socioeconomic data.

The annual review of ocean salmon fisheries is drafted as early as analyses of landings and escapement data are available. The most recent entries are noted as preliminary and later updated when the data become final. If updated information or error corrections that could substantially affect the development of management measures for the upcoming season are available, an errata sheet will be included as an appendix in one of the subsequent STT preseason planning documents.

## COMMON TABLE CONVENTIONS

All 2013 data provided in this report are preliminary. The following conventions apply to all tables in this report:

1. Due to rounding, the total values may not equal the sum of individual values.
2. A single dash indicates there are no data appropriate for a particular table cell, or in the case of fishing effort or landings, that the season was closed.
3. A double dash indicates no records are available, for example, a fishery may not have been sampled due to low and sporadic effort.
4. "NA" indicates data are not available at the time of publication, but are likely to be available at a future date.

Page Intentionally Left Blank

## CHAPTER I

## COASTWIDE OCEAN FISHING SUMMARY

Chapter I contains or references tables summarizing the current and historical ocean salmon fishing regulations and harvest data. In addition, this chapter provides a brief summary of the Council's regulatory objectives, by management area, for the most recent fishing year, reports on the results of the Council's selective fisheries for marked hatchery Chinook and coho, and bycatch mortality of Chinook and coho salmon. The final section in the chapter provides a brief summary of management information and harvests under the authority of the PSC.

## COUNCIL-AREA REGULATIONS AND LANDINGS

Summaries of the 2013 regulations for non-Indian commercial troll, treaty Indian commercial troll, and recreational ocean salmon fishing in both the exclusive economic zone (EEZ) (3 to 200 nautical miles from shore) and state territorial waters ( 0 to 3 nautical miles from shore) are provided in Tables I-1, I-2, and I-3, respectively. Historical summaries of regulations for each of the three West Coast states and for treaty Indian troll fisheries are provided in Appendix C, Tables C-1 through C-7. Table C-9 provides a summary of inseason regulatory actions and events during the 2013 season.

Catch, quota, and fishing effort statistics are presented in the following series of tables:
Table I-4: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by state of landing.

Table I-5: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by management area.

Table I-6: The 2013 coho and Chinook quotas for each fishery compared with actual harvests.
Appendix A, Tables A-1 through A-19: Historical monthly ocean salmon harvest data by state and port area.

Tables A-20 through A-28: Historical monthly ocean salmon harvest data by management area.
Appendix B, Tables B-1 through B-44: Historical inside harvest and escapement data.
Appendix C, Table C-8: Historical record of annual preseason catch quotas for the area north of Cape Falcon, as well as the stocks that were critical for ocean salmon management actions.

## REGULATORY OBJECTIVES BY MANAGEMENT AREA

The sections below provide a brief outline of the regulatory objectives that shaped the 2013 ocean salmon fisheries by management area and species. Further details of the conservation and allocation objectives by salmon stock and an assessment of performance are provided in Chapters II and III for Chinook and coho, respectively.

## Horse Mountain to U.S.IMexico Border

## Chinook Fisheries

Chinook fisheries management in this area is guided by FMP-defined control rules for Sacramento River fall Chinook (SRFC), Klamath River fall Chinook (KRFC), and by NMFS ESA consultation standards for

Sacramento River winter Chinook (SRWC), California Coastal Chinook, Oregon Coast Natural (OCN) coho, and Southern Oregon/Northern California Coast (SONCC) coho. The Council structured 2013 Chinook salmon fisheries south of Horse Mountain (near Shelter Cove, California) to meet the following objectives (in order of most to least constraining):

1. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
2. The SRWC ESA consultation standard requiring:
a. A 2013 maximum forecast age-3 impact rate for the area south of Point Arena of 12.9 percent.
b. Commercial seasons between Point Arena and the U.S./Mexico border shall open no earlier than May 1 and close no later than September 30, with the exception of a permissible October season conducted Monday through Friday between Point Reyes and Point San Pedro, which shall end no later than October 15; the minimum size limit shall be at least 26 inches total length.
c. The recreational season between Point Arena and Pigeon Point shall open no earlier than the first Saturday in April and close no later than the second Sunday in November; the recreational season between Pigeon Point and the U.S./Mexico Border shall open no earlier than the first Saturday in April and close no later than the first Sunday in October; the minimum size limit shall be at least 20 inches total length.
3. A 2013 Klamath basin natural area spawning escapement of no less than 73,800 fall Chinook adults which is produced, in expectation, by a spawner reduction rate of 68.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
4. A 2013 SRFC spawner escapement of no less than 250,300 hatchery and natural area adults, which is produced, in expectation, by a total exploitation rate of 70.0 percent.
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 30.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

Objectives 1 and 2 were the constraining factors for 2013 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a coastwide ocean fishery harvest rate of 16.0 percent on age-4 KRFC, a KRFC spawning escapement of 73,800 natural area adults, a SRWC age-3 impact rate of 12.9 percent for the area south of Point Arena, and a SRFC spawner escapement of 462,600 hatchery and natural area adults.

## Coho Fisheries

Coho fishery management for 2013 in this area was guided by the ESA consultation standard for Central California Coast (CCC) coho, which prohibits retention of coho in this area. No projection of nonretention fishery impacts on CCC coho was available; projected non-retention exploitation rates on Lower Columbia Natural (LCN), OCN and RK coho were 0.0, 1.6, and 3.4 percent, respectively, in this area. Retention of coho has been prohibited south of the Oregon/California border since 1996. Coho are
managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2013 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

## Humbug Mountain to Horse Mountain

## Chinook Fisheries

The area between Humbug Mountain (near Port Orford, Oregon) and Horse Mountain (near Shelter Cove, California) is referred to as the Klamath Management Zone (KMZ). Chinook fisheries management in this area is guided by FMP-defined control rules for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2013 Chinook salmon fisheries in the KMZ to meet the following objectives (in order of most to least constraining):

1. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
2. A 2013 Klamath basin natural area spawning escapement of no less than 73,800 fall Chinook adults, which is produced, in expectation, by a spawner reduction rate of 68.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
3. A 2013 SRFC spawner escapement of no less than 250,300 hatchery and natural area adults which is produced, in expectation, by a total exploitation rate of 70.0 percent.
4. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 30.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objective 1 was the constraining factor for 2013 Chinook fisheries management in the KMZ. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a coastwide ocean fishery harvest rate of 16.0 percent on age-4 KRFC, a KRFC spawning escapement of 73,800 natural area adults, and a SRFC spawner escapement of 462,600 hatchery and natural area adults.

## Coho Fisheries

Coho fisheries management in this area is guided by the ESA consultation standards for LCN, OCN, SONCC and CCC coho, which prohibits retention of coho south of the Oregon/California border. No projection of non-retention fishery impacts on CCC coho was available; projected exploitation rates on LCN, OCN and RK coho in this area were 0.1 percent, 0.7 percent and 3.3 percent, respectively. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2013 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

## Cape Falcon to Humbug Mountain

## Chinook Fisheries

Chinook fisheries management in this area is guided by conservation objectives for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, Lower Columbia River (LCR) natural tule Chinook, Snake River wild (SRW) Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2013 Chinook salmon fisheries in this area to meet the following objectives:

1. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
2. A 2013 Klamath basin natural area spawning escapement of no less than 73,800 fall Chinook adults, which is produced, in expectation, by a spawner reduction rate of 68.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
3. NMFS consultation standards and annual guidance for ESA-listed LCR natural tule Chinook, which required a total exploitation rate not to exceed 41.0 percent in marine and freshwater fisheries combined.
4. A 2013 SRFC spawner escapement of no less than 250,300 hatchery and natural area adults which is produced, in expectation, by a total exploitation rate of 70.0 percent.
5. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
6. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 30.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
7. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

Objectives 1 and 3 above were the constraining factors on 2013 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a coastwide ocean fishery harvest rate of 16.0 percent on age-4 KRFC, a KRFC spawning escapement of 73,800 natural area adults, a 41.0 percent total exploitation rate on LCR natural tules, and a SRFC spawner escapement of 462,600 hatchery and natural area adults.

## Coho Fisheries

Coho fisheries management in this area is guided by NMFS ESA consultation standards for LCN coho, OCN coho, and SONCC coho. The Council structured 2013 coho salmon fisheries in this area to meet the following objectives:

1. The LCN coho ESA consultation standard requirement of no greater than a 15.0 percent exploitation rate (marine and mainstem Columbia River combined).
2. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 30.0 percent as required by the exploitation rate matrix recommended by the OCN coho work group which was accepted by the Council as expert biological advice in November 2000.
3. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objective 1 above was the most constraining factor on 2013 coho fisheries management in this area. The Council adopted seasons in this area with projected impacts of 2.3 percent, 8.9 percent, and 0.3 percent on LCN natural coho, OCN coho, and RK coho, respectively. In all relevant fisheries, projected exploitation rates were 15.0 percent, 23.1 percent, and 7.3 percent, respectively.

## U.S./Canada Border to Cape Falcon

## Chinook Fisheries

Management objectives for Chinook fisheries in this area were to comply with NMFS ESA consultation standards for LCR natural tule, Lower Columbia River Wild (LRW), and Snake River Wild (SRW) fall Chinook; meet treaty Indian sharing obligations, the allocation provisions in the Salmon FMP, and provisions of the Pacific Salmon Treaty (PST); and to the extent possible, provide for viable ocean and inriver fisheries while meeting natural stock escapement objectives and hatchery fall Chinook brood stock needs. Columbia lower river hatchery (LRH) and Spring Creek Hatchery (SCH) fall Chinook have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon. The Council structured Chinook salmon fisheries between Cape Falcon, Oregon and the U.S./Canada Border to meet the following objectives:

1. The LCR natural tule Chinook ESA consultation standard requirement for a combined marine and freshwater exploitation rate of no greater than 41.0 percent.
2. The Snake River fall Chinook ESA consultation standard of at least a 30.0 percent reduction in the total ocean age-3 and age-4 age-equivalent (AEQ) exploitation rate from the 1988-1993 average.
3. For select Chinook stocks of concern to the PSC, keep the Individual Stock-Based Management (ISBM) index at or below 60.0 percent of the 1979-1982 base period average.

Objective 1 above was the primary constraint for 2013 ocean fisheries in this area. Under the adopted regulations (Tables I-1, I-2, and I-3), fisheries were projected to have a 41.0 percent total AEQ exploitation rate on LCR natural tules ( 19.8 percent in Council area fisheries), and a 51.9 percent reduction from the base period AEQ exploitation rate for SRW.

## Coho Fisheries

Management objectives for coho fisheries in this area were to comply with NMFS ESA consultation standards for LCN and OCN coho, meet treaty Indian sharing obligations and the allocation provisions in the Salmon FMP, provisions of the PST and, to the extent possible, provide for viable ocean and in-river fisheries while meeting natural stock escapement objectives and hatchery coho brood stock needs. Columbia River early and late hatchery coho have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon.

The Council structured coho salmon fisheries to meet the following objectives:

1. The LCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 15.0 percent.
2. An exploitation rate on Interior Fraser coho of no more than 10.0 percent in southern U.S. fisheries in accordance with the provisions of the southern coho management plan adopted by the PSC in February, 2002.
3. The OCN coho ESA consultation standard requirement for a combined marine and freshwater exploitation rate of no greater than 30.0 percent.
4. Meet inside/outside and treaty Indian/non-Indian allocation objectives.
5. Meet FMP objectives for allocation of impacts between commercial and recreational ocean fisheries, and among port areas for the recreational fishery.

Objectives 1 and 2 above were the primary constraints for 2013 ocean fisheries in this area. The adopted regulations (Tables I-1, I-2, and I-3) were projected to have a 15.0 percent total exploitation rate on LCN coho ( 11.0 percent in Council area fisheries), an exploitation rate in southern U.S. fisheries of 10.0 percent on Interior Fraser (Thompson River) coho ( 4.5 percent in Council area fisheries), and a total exploitation rate of 23.1 percent on OCN coho ( 10.6 percent in Council area fisheries).

## SELECTIVE FISHERIES AND SALMON BYCATCH

Estimated incidental Chinook and coho mortalities are reported in Tables I-7, I-8, and I-9. Unless otherwise noted, Chinook mortality estimates south of Humbug Mountain, Oregon were based on expansion of dockside sampling data. Under the Magnuson-Stevens Act, incidental mortality in commercial fisheries constitutes bycatch mortality, but incidental mortality resulting from the nonretention recreational fisheries does not.

The Council assumed a hook-and-release mortality rate of 26 percent in commercial troll fisheries coastwide and 14 percent in recreational fisheries north of Point Arena. In recreational fisheries south of Point Arena, the Council assumed 17 percent based on the proportion of fish caught using mooching versus trolling gear, and the estimated rates of 42.2 and 14 percent for these gear types, respectively. In addition, the Council assumes drop-off mortality for both Chinook and coho equal to 5 percent of total encounters.

## Selective Chinook Fisheries

Recreational fisheries selective for marked Chinook were planned for the four ocean subareas between Cape Falcon, Oregon, and the U.S.-Canada border. Areas 3 and 4 were open May 10 - 11, May 17 - 18, and June 22 through June 28, Area 2 was open June 8 through 22, and the Columbia River Area was open June 8 through 21. Preseason and postseason assessments of mark rates, catches, number of Chinook released, and incidental (bycatch) mortality for Council-area and some mixed-stock inside fisheries are summarized in Table I-8. Fisheries were sampled by a combination of on-water observers, voluntary trip reports, and dockside interviews. The observed mark rates were generally lower than predicted preseason with the exception of Area 2 where the mark rate was higher than expected. Observed non-retention mortality was less than expected but the quota was not reached.

In 2013, recreational fisheries in the Strait of Juan de Fuca operated under mark-selective retention restrictions for both Chinook and coho in Area 5 and the portion of Area 6 west of Port Angeles, from July 1 through August 15 (Figure I-1). As in 2012, the Areas 5 and 6 mark-selective fisheries were managed on a season rather than quota-based criteria. After August 15, the fisheries in Areas 5 and 6 remained open for marked coho only (no Chinook retention) through September 14; Area 5 operated under non-mark-selective fishing regulations for coho from September 15 through September 30 while Area 6 remained mark-selective for coho through September 30. Catch and release estimates, derived
from creel census programs conducted during the mark-selective fishery in Area 5 from July 1 through September 14 are presented in Table I-8. No inseason estimate was made for Area 6, which was open from July 1 through August 15 for mark-selective Chinook fishing. The observed mark rates were lower than predicted preseason. Observed non-retention mortality was greater than anticipated, and the expected catch was exceeded (Table I-8).

Mark-selective Chinook fisheries were also held in Puget Sound Area 9 from July 16 through August 04, in Area 10 from July 16 through August 18, in Area 11 June 1 through September 30, and in Area 13 May 1 through September 30 (Figure I-1). Winter mark-selective fisheries were held in Area 7 from December 1, 2012 through April 30, 2013. Winter mark-selective Chinook fisheries were held in Areas 8-1 and 8-2 November 1, 2012 through April 30, 2013. Area 9 had mark-selective Chinook opportunity November 1-30, 2012 and January 16 through April 15, 2013. Area 10 had mark-selective Chinook fisheries from October 1, 2012 through January 31, 2013. Areas 11 and 12 had mark-selective Chinook opportunity from February 1 through April 30, 2013.

## Selective Coho Fisheries

Recreational fisheries selective for marked coho were planned for the area between Cape Falcon and the OR/CA border, the four ocean subareas north of Cape Falcon, and the inside fisheries at Buoy 10 and in Areas 5 and 6 in the Strait of Juan de Fuca (Figure I-1). Numerous other Puget Sound, inside, and freshwater recreational fisheries in Washington and Oregon had mark-selective restrictions for coho. Non-Indian commercial mark-selective fisheries for coho were planned for the area between the U.S./Canada border and Cape Falcon. Preseason and postseason assessments of mark rates, catch, number of coho released, and incidental (bycatch) mortality for Council-area and some mixed stock inside fisheries are summarized in Table I-9. Fisheries were sampled by a combination of on-water observers, voluntary trip reports, and dockside interviews. The observed mark rates both north and south of Cape Falcon were lower than predicted preseason with the exception of the Columbia River Area which was slightly higher than predicted. Observed non-retention mortality was less than expected in all fisheries, although overall quotas were not reached in any of the fisheries.

## PACIFIC SALMON COMMISSION

The PSC was established to implement the 1985 Pacific Salmon Treaty (PST) between the U.S. and Canada. Because many of the stocks under the jurisdiction of the Council are significantly affected by management actions taken in Canadian and Alaskan waters, considerable interaction between the Council and the PSC occurs at both the policy and technical levels. Actual catches for PSC fisheries of the most relevance to the Council are summarized in Tables I-10 and I-11. Note that these catches result from inseason management of fisheries for compliance with aggregate abundance-based management (AABM; see below) under the PST. They do include incidental mortality associated with regulation of these fisheries, except as noted.

## Chinook Fisheries

Northern British Columbia (B.C.) and Southeast Alaska (SEAK) fisheries affect far-north migrating Chinook stocks from Washington, Oregon, and Idaho. These include Washington coastal stocks, Columbia and Snake River bright fall and summer stocks, and far-north migrating Oregon coastal Chinook stocks. The West Coast Vancouver Island (WCVI) troll and Georgia Strait troll and recreational fisheries affect far-north migrating stocks (including LRW) to a lesser degree, but have a major impact on more southerly distributed Columbia River tule and Puget Sound stocks.

In June 1999, the United States and Canada reached agreement on a framework for Chinook fishing regimes for 1999 through 2008. Under this agreement, SEAK (all gear), Northern B.C. (troll and recreational), and WCVI (troll and outside recreational) fisheries were regulated under aggregate AABM
regimes. These fishery regimes had catch ceilings derived from indices for total aggregate abundance of stocks contributing to specific components of the fisheries and target fishery harvest rates. For example, the allowable catch for WCVI troll and outside recreational fisheries were determined by the abundance index estimated for the WCVI troll fishery. The allowable catch for the WCVI AABM fisheries was designed to reduce harvest rates for the combined troll and outside recreational fisheries by approximately 35 percent from levels observed during 1985 through 1996. Provisions of a new ten-year agreement took effect January 1, 2009. The 2009 agreement reduced catch ceilings in SEAK and WCVI AABM fisheries by 15 percent and 30 percent respectively, from those in the 1999 agreement. The United States and Canada are developing management regimes for AABM fisheries based on total mortality rather than landed catch.

For fisheries not driven by AABM regimes, including Council area fisheries, the 1999 agreement established conservation obligations to reduce harvest rates on depressed Chinook stocks (those not meeting escapement goals) by 36.5 percent for Canadian fisheries and 40 percent for United States fisheries, relative to levels observed during 1979 through 1982. This individual stock-based management (ISBM) obligation was taken into account during Council and inside fisheries preseason management planning processes.

In 2013, AABM fisheries were conducted in accordance with the obligations set forth in the 2009 PST agreement. SEAK fisheries were constrained by an all-gear catch ceiling of 176,000 "treaty" Chinook in 2013, a 34.0 percent reduction from the ceiling of 266,800 in 2012, and 15 percent less than it would have been under the 1999 agreement. "Treaty" Chinook are those fish that are counted against the AABM catch ceiling; they represent total landed catch minus terminal exclusions (fish taken in terminal net fisheries where escapement goals are achieved) and hatchery add-ons (fish attributed to production from Alaskan hatchery facilities in excess of levels observed prior to the 1985 PST). The preliminary estimate of 2013 total catch of Chinook by SEAK fisheries was 246,700 while the catch of "treaty" Chinook was 183,900 (Table I-10). The catch ceiling for the Northern B.C. AABM fisheries (Northern B.C. troll plus Queen Charlotte Islands recreational) in 2013 was 143,400, compared to a ceiling in 2012 of 173,600 Chinook. The actual catch was estimated at 115,914 ( 69,264 troll plus 46,650 recreational). The Northern B.C. troll fishery in 2013 was conducted under a system started in 2010 of individual transferable quotas.

In addition to the overall catch ceiling determined by the PST, Canada's principal management objectives for the 2013 WCVI Chinook fisheries were to meet domestic allocation objectives as well as address concerns for Lower Strait of Georgia Chinook, WCVI Chinook stocks, spring run upper Fraser River Chinook, and Interior Fraser (Upper Fraser and Thompson) coho. The total allowable catch in 2013 by WCVI AABM fisheries under the 2009 PST Agreement was 115,300 Chinook compared to the allowable catch of 133,300 in 2012. The reported catch was 110,179 (35,393 troll, 13,074 First Nations, and 61,712 recreational; Table I-11).

Since 1999, the WCVI troll fishery has been managed to distribute the catch throughout the year with fisheries in the summer shaped to reduce impacts on coho and WCVI, Lower Strait of Georgia, and earlyrun Fraser River Chinook stocks. In accounting year 2013 (October 2012 through September 2013) troll fisheries were open for retention of Chinook in October through May and September (Table I-12). To protect Interior Fraser coho, coho retention was mark-selective and revival tanks were required for released coho.

The WCVI outside recreational fishery (the area where non-local stocks predominate) operated under a 45 cm (17.7 inches) total length minimum size limit, but with the additional restriction that Chinook over 77 cm (30.3 inches) could not be retained in the surf zone corridor (within 1 mile of shore) to protect localorigin stocks. The fishery harvested 61,700 fish, a decline of about seven percent from the 2012 catch.

Catch estimates for all Canadian ISBM fisheries in Northern B.C. were incomplete; the reported Chinook catch in 2013 was approximately 2,100 by commercial gillnets. Approximately 4,500 Chinook were caught by anglers from lodges in Rivers Inlet, Hakai Pass, and Bella Bella and Chinook by private anglers on the mainland coast. Tidal area recreational catch estimates near the mainland coast of Northern B.C. in 2013 were not available except for creel estimates for Area 3 and 4 where the catch was estimated to be about 10,300 Chinook. Catches by First Nations were approximately 8,500 Chinook for the North Coast, 1,800 for Haida Gwaii (Queen Charlotte Island) and 1,000 for the Central Coast.

Southern B.C. ISBM fisheries in 2013 harvested 170,300 Chinook (94,500 recreational, 66,800 First Nations, and 9,000 commercial).

No direct management measures for Chinook salmon within the Council management area were specified under the 2009 PST agreement, except for the ISBM commitment. The Council's ocean fisheries and inside fisheries conducted by the state and tribal managers were designed to minimize impacts on spawning escapements of depressed stocks, and preseason estimates of impacts were in compliance with terms of the PST agreement. Information necessary to evaluate the postseason impacts of Council area fisheries was not available.

## Coho Fisheries

In 2002 the PSC adopted a management plan for coho salmon originating in Washington and Southern B.C. river systems. The plan is directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the U.S. and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status (low, moderate, and abundant) and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan.

The forecast of 2013 abundance indicated that the status of interior Fraser River coho remained critically low. The lower Fraser, Georgia Basin, and the Johnstone Strait coho management units were all forecast to be at low or moderate status. The PSC coho status categories of low, moderate, and abundant are analogous to the FMP categories of critical, low, and normal.

In 2013, Canada's coho management objective was to constrain the exploitation rate by its fisheries on Thompson coho (a component of the Interior Fraser management unit) to a ceiling of 3 percent. Unmarked coho were released in many Southern B.C. commercial and recreational fisheries where Thompson coho were known to be prevalent. Estimated release mortality rates for legal-size coho by gear type were: seine 25 percent; northern gill net 70 percent; southern gill net 60 percent; troll 26 percent; and recreational 10 percent (Canadian Stock Assessment Secretariat, Research Document 99/128). Only terminal area fisheries along the WCVI and small portions of upper Johnstone Strait and the Queen Charlotte Islands were permitted for a short period to retain unmarked coho. Selective fishing techniques, such as barbless hooks for trollers, seine bunt restrictions, and use of revival tanks, were required. In 2013 a total of 444,837 coho were retained by commercial fisheries in Northern and Central B.C. and 9,415 coho in Southern B.C. fisheries. Coho kept and released by marine commercial fisheries are summarized in Table I-13.

For recreational fisheries, mark-selective coho retention was permitted in mixed stock areas, and barbless hooks were required. Mark-selective fisheries were implemented in most of Southern B.C. (Johnstone Strait, Strait of Georgia, Juan de Fuca Strait, and WCVI). The estimated total retained catch of coho in Southern B.C. marine recreational fisheries in 2013 was 122,470. Coho kept and released by marine recreational fisheries in Southern B.C. are summarized in Table I-14.

First Nations fisheries in Southern B.C. were estimated to have harvested 88,500 coho.

All salmon 21,300 , no c/d
except no chum more than retention north of 6,600 of Cape Alava, WA which may in August and be caught September. in the area between the U.S./ Canada border and the Queets

River.

Seven days per week. Chinook minimum size limit of 28 inches total length. 28 Chinook vessel limit May 24-28 in Areas 3 and 4. Vessels in possession of salmon may not cross the Queets River line without first notifying WDFW with area fished, total Chinook and halibut catch aboard, and destination. Cape Flattery, Mandatory Yelloweye Rockfish Conservation Area, and Columbia Control Zones closed. An inseason conference call will occur when it is projected that 21,975 Chinook have been landed overall, or 6,525 Chinook have been landed in the area between the U.S/Canada border and the Queets River, to ensure the guideline is not exceeded. Vessels must land and deliver their fish within 24 hours of any closure of this fishery. Vessels fishing or in possession of salmon while fishing north of Leadbetter Point must land and deliver their fish within the area and north of Leadbetter Point. Vessels fishing or in possession of salmon while fishing south of Leadbetter Point must land and deliver their fish within the area and south of Leadbetter Point, except that Oregon permitted vessels may also land their fish in Garibaldi, Oregon. Oregon State regulations require all fishers landing salmon into Oregon from any fishery between Leadbetter Point, Washington and Cape Falcon, Oregon must notify ODFW within one hour of delivery or prior to transport away from the port of landing $b$
10,220 d/ July 1-9 then Friday through Tuesday July 12-August 27 with a landing and possession limit of 50 Chinook and 40 coho per vessel per open period; Friday through Tuesday August 30-September 17 with a landing and possession limit of 20 Chinook and 50 coho per vessel per open period (Open period landing and posessions limits were adjusted throughout the season by inseason action, see Table C. 5 for details). Vessels in possession of salmon may not cross the Queets River line without first notifying WDFW with area fished, total Chinook and halibut catch aboard, and destination. No earlier than September 1, if at least 5,000 marked coho remain on the quota, inseason action may be considered to allow non-selective coho retention. Chinook minimum size limit of 28 inches total length. All coho must be marked except as noted above. Mandatory Yelloweye Rockfish Conservation Area, Cape Flattery and Columbia Control Zones, and beginning August 9, Grays Harbor Control Zone closed. Vessels must land and deliver their fish within 24 hours of any closure of this fishery. Vessels fishing or in possession of salmon while fishing north of Leadbetter Point must land and deliver their fish within the area and north of Leadbetter Point. Vessels fishing or in possession of salmon while fishing south of Leadbetter Point must land and deliver their fish within the area and south of Leadbetter Point, except that Oregon permitted vessels may also land their fish in Garibaldi, Oregon. Oregon State regulations require all fishers landing salmon into Oregon from any fishery between Leadbetter Point, Washington and Cape Falcon, Oregon must notify ODFW within one hour of delivery or prior to transport away from the port of landing. ${ }^{\text {b/ }}$

Chinook minimum size limit of 27 inches total length. Landing and possession limit of 20 Chinook per vessel per day. Any remaining portion of the May, June and/or July Chinook quotas may be transferred inseason on an impact neutral basis to the next open quota period. All fish caught in this area must be landed within the area and within 24 hours of any closure of the fishery and prior to fishing outside the area. See California State regulations for additional closures adjacent to the Smith and Klamath rivers. When the fishery is closed between the OR/CA border and Humbug Mountain and open to the south, vessels with fish on board caught in the open area off California may seek temporary mooring in Brookings, Oregon prior to landing in California only if such vessels first notify the Chetco River Coast Guard Station via VHF channel 22A between the hours of 0500 and 2200 and provide the vessel name, number of fish on board, and estimated time of arrival. Klamath Control Zone closed.

Chinook minimum size limit of 27 inches total length prior to September 1, 26 inches thereafter. All fish must be landed in California and offloaded within 24 hours of the August 29 closure. During September, all fish must be landed south of Point Arena.

Chinook minimum size limit 26 inches. All vessels fishing in this area must land and deliver all fish between Point Arena and Pigeon Point.

Single-point, single-shank barbless hooks required in all open areas coastwide. Unless otherwise noted, minimum size limits (total length): Chinook 28 inches, coho 16 inches. Pacific halibut retention allowed May 1, 2013 to April 30, 2014 during open salmon troll fisheries; min. size limit of 32 inches in total length (w/ head on). One Pacific halibut per each 3 Chinook, except one Pacific halibut may be landed without meeting the ratio requirement, and no more than 15 halibut may be landed per trip, unless modifed by inseason action (reduced to 5 halibut per trip Aug. 1 and closed to retention on Aug. 9 North of Cape Falcon and August 10th south).
b/ Phone or email notification shall include vessel name and number, number of salmon by species, port of landing and location of delivery, and estimated time of delivery. c/ Increased July 3 from 14,700 Chinook (no more than 6,100 may be caught north of the Queets R.) to 19,300 Chinook (no more than 6,600 may be caught north of the Queets R.) by an impact-neutral transfer of uncaught quota from the spring season of 4,600 Chinook (including 500 added to allowable catch for the area north of the Queets R.). Increased again Aug. 28 by 2,000 Chinook to 21,300 via an impact-neutral trade with the recreatonal fishery (see footnote $\mathrm{d} /$ ).
d/ Impact-neutral adjustments of commercial and recreational quotas north of Cape Falcon, accomplished through a quota trade between the fisheries. Net adjustment: Recreational fishery gave 3,200 Chinook and received 4,000 marked coho (coho distributed among the Subareas as follows: 1,000 to Columbia River; 1,480 to Westport; 1,100 to La Push; and 420 to Neah Bay). Commercial fishery gave 4,000 marked coho and received 2,000 Chinook (adjusted for impacts).
e/ Increased from 3,000 by an impact-neutral transfer of remaining June quota of 1,782 Chinook making the revised July quota 4,782 Chinook.
f/ Increased from 2,000 by an impact-neutral transfer of remaining July quota of 714 Chinook making the revised August quota 2,714 Chinook. g / Increased from 3,000 by an impact-neutral transfer of remaining May quota of 352 Chinook making the revised June quota 3,352 Chinook. $\mathrm{h} /$ Increased from 2,000 by an impact-neutral transfer of remaining June quota of 547 Chinook making the revised July quota 2,547 Chinook. i/ Increased from 1,500 by an impact-neutral transfer of remaining July quota of 192 Chinook making the revised August quota 1,692 Chinook.

a/ The overall quotas for these fisheries during the May 1-Sept. 15 ocean salmon management period were 52,500 Chinook and 47,500 coho. These quotas include troll catches by the S'Klallam and Makah tribes in Washington State Statistical Area 4B from May 1-Sept. 15. The overall Chinook quota was divided preseason to provide 26,250 Chinook for the May 1 June 30 Chinook-directed season and 26,250 Chinook for the July 1-Sept. 15 all-salmon season. Single point, single shank barbless hooks were required in all ocean fisheries.
b/ Minimum size limit 24 inches after May 1.
c/ Retention of steelhead prohibited; retention of chum prohibited prior to September 30.

| Pt. Arena to Pigeon Pt. |  |  |  |  |
| Apr. 6-Nov. 10 (207 days) | All except coho | None | - | Two salmon daily. Open five days per week (Wed.-Sun.) June 1- July 9. Minimum size limit of 24 inches total length through July 31; 20 inches thereafter. |
| Pigeon Pt. to U.S./Mexico Border |  |  |  |  |
| Apr. 6-Oct. 6 (172 days) | All except coho | None | - | Two salmon daily. Open five days per week (Wed.-Sun.) June 1- July 9. Minimum size limit of 24 inches total length. |

a/ All coho fisheries and quotas are mark-selective for fish with a healed adipose fin clip except the Sept. all-salmon Cape Falcon to Humbug Mt. non-mark-selective recreational coho fishery and as modified inseason to allow non-mark-selective coho retention beginning Sept. 6 from Queets R. to Leadbetter Pt. WA (Westport subarea) and beginning Sept. 1 from Leadbetter Pt. WA to Cape Falcon OR (Columbia River subarea).
b/ No more than one rod and single-point, single-shank barbless hooks required north of Pt. Conception, CA. No more than two single-point, single-shank barbless hooks when fishing for salmon or fishing from a boat with salmon on board between Pt. Conception and Cape Falcon, OR. If angling by any means other than trolling between Pt. Conception and Horse Mt., CA, no more than two single-point, single-shank, barbless circle hooks shall be used. The distance between the two hooks must not exceed 5 inches when measured from the top of the eye of the top hook to the inner base of the curve of the lower hook, and both hooks must be permanently tied in place (hard tied). Unless otherwise noted: minimum size limits are 24 inches for Chinook and 16 inches for coho.
c/ Impact-neutral adjustments of commercial and recreational quotas north of Cape Falcon, accomplished through a quota trade between the fisheries. Net adjustment: Recreational fishery gave 3,200 Chinook and received 4,000 marked coho (coho distributed among the Subareas as follows: Columbia River increased 1,000 from 37,380; Westport increased 1,480 from 27,660; La Push increase 1,100 from 1,890; and Neah Bay increase 420 from 7,780). Commercial fishery gave 4,000 marked coho and received 2,000 Chinook (adjusted for impacts).
d/ Remainder of the 29,140 unmarked coho quota converted to a non-selective equivalent $(6,350)$ on September 6 .
e/ Remainder of the 38,380 unmarked coho quota converted to a non-selective equivalent $(9,785)$ on September 1 .
f/ Unutilized coho quota from the July recreational mark-selective coho fishery from Cape Falcon to the Oregon/California border rolled into the September non-mark-selective recreational fishery from Cape Falcon to Humbug Mountain. Remaining July quota was 3,920 mark-selective coho. An impact-neutral transfer added 3,580 non-mark selective coho to the preseason quota of 16,000 .
g/ Marked coho catch included against the Cape Falcon to Humbug Mountain quota of 10,500
h/ The all-depth halibut season was open on May 9-11, 16-18, May 30-June 1, June 6-8, 20-22, and August 2-3.

a/ For Washington, commercial effort and landings include: (1) treaty Indian fisheries (ocean and Area 4B only from May 1-Sept. 30) beginning in 1972; (2) prior to 1978, catch off
British Columbia landed in Washington; (3) catch off Alaska landed in Washington; and (4) catch off Oregon and California beginning in 1976. Treaty Indian effort is in deliveries. Beginning in 1989, recreational angler trips and catch include state-managed, late-season Area 4B fishery when open (see Table IV-15).
b/ Recreational effort and catch includes Washington-based effort and catch from Oregon state waters (July 26-Aug. 1) and Strait of Juan de Fuca after WDFW and NMFS ocean closures in 1982.
c/ Preliminary.
d/ Oregon commercial troll landings include small numbers of salmon caught in Alaska (prior to 1990), Washington, and California. Oregon recreational effort data are total angler trips prior to 1979 and salmon trips beginning in 1979. Significantly reduced salmon per angler trip in 1994-1998 reflects regulations requiring nonretention of coho in the recreational fishery south of Cape Falcon.
e/ California commercial effort and landings include salmon caught off Oregon and landed in California prior to 2005, which were minor and except in 2004, when 227 days fished and 25,655 Chinook were included.

a/ Guidelines for Chinook fisheries are marked with an asterisk (*).
b/ Quotas do not match preseason quota/guidelines because inseason actions (i.e., trades and transferring quotas on an impact neutral basis) resulted in increases or decreases to the overall quota. See Tables I-I, I-2, I-3, or Appendix Table C-9 for specifics of inseason adjustments.
c/ Remainder on preseason quota of 29,140 marked coho was converted to non-selective equivalent beginning September 6. d/ Remainder on preseason quota of 38,380 marked coho was converted to non-selective equivalent beginning September 1.

TABLE I-7. Estimated incidental mortality of Chinook and coho in 2013 ocean salmon fisheries. Observed incidental mortality was calculated by scaling preseason projections of incidental mortality by the ratio of observed to projected catch.

a/ The bycatch mortality reported in this table consists of drop-off mortality (includes predation on hooked fish) plus hook-andrelease mortality of Chinook and coho salmon in Council-area fisheries. Drop-off mortality for both Chinook and coho is assumed to be equal to $5 \%$ of total encounters. The hook-and-release mortality (HRM) rates used for both Chinook and coho are:
Commercial: 26\%.
Recreational, north of Pt. Arena: 14\%.
Recreational, south of Pt. Arena: 17\% (based on the proportion of fish caught using mooching versus trolling gear, and the HRM rates of $42.2 \%$ and $14 \%$ for these gear types, respectively).
b/ Bycatch calculated as dropoff mortality plus fish released.
c/ Includes Oregon territorial water, late season Chinook fisheries.
d/ Based on reported released Chinook or coho.

## CHAPTER II

## CHINOOK SALMON MANAGEMENT

## CENTRAL VALLEY CHINOOK STOCKS

Central Valley Chinook stocks include fall, late-fall, winter, and spring stocks of the Sacramento and San Joaquin rivers and their tributaries. Two of these stocks are listed under the ESA: (1) Sacramento River winter Chinook, listed as endangered in January 1994; and (2) Central Valley spring Chinook, listed as threatened in September 1999.

## Management Objectives

The following objectives guided Council management of Central Valley Chinook salmon stocks in the 2013 fisheries: (1) for SRFC, an escapement of at least 250,300 hatchery and natural area adults; and (2) for SRWC, the ESA consultation standard specifying a maximum predicted age-3 impact rate of 12.9 percent and restrictions concerning the duration, timing, and minimum size limits for commercial and recreational ocean salmon fisheries south of Point Arena. Harvest impacts on Central Valley Chinook were a primary management concern in fisheries south of Point Arena.

## Regulations to Achieve Objectives

In 2013, fishing opportunity south of Cape Falcon was constrained by the California Coastal Chinook consultation standard that limited the KRFC age-4 ocean harvest rate to a maximum of 16 percent and the exploitation rate limit on ESA-listed tule Chinook. Fisheries south of Point Arena were also constrained by the SRWC consultation standard. Season and size limit details are presented in Tables I-1 and I-3.

## Commercial

Harvest impacts on SRWC were a primary management concern in fisheries south of Point Arena. To meet the terms of the California Coastal Chinook and SRWC ESA consultation standards, the commercial season south of Point Arena opened on May 1 and closed on September 30, with closures for portions of June and July. In addition, an October 1-15 fishery was open Monday through Friday between Point Reyes and Point San Pedro. Commercial fisheries south of Point Arena had a 27 -inch minimum size limit through August, reducing to 26 inches during September and October. No specific restrictions were required for ocean salmon fisheries to meet the escapement goal for SRFC. Under the 2013 regulations, the projected hatchery and natural area adult escapement of SRFC was 462,600 , which exceeded the minimum allowable escapement, defined by the control rule, of 250,300 hatchery and natural area adults.

## Recreational

Recreational seasons and size limits were structured to meet the SRWC ESA consultation standard. To meet the 2013 age-3 impact rate cap of 12.9 percent, fisheries south of Point Arena were limited to five days per week from June 1 through July 9. Additionally, the minimum size limit for recreational fisheries from Point Arena to Pigeon Point was 24 inches through July 31, and 20 inches thereafter. South of Pigeon Point the minimum size limit was 24 inches for the duration of the season. Recreational fisheries opened on March 15 between Cape Falcon and Humbug Mt., April 6 south of Horse Mountain, and May 1 in the KMZ. Recreational fisheries in the KMZ continued through September 8, while fisheries north and south of the KMZ extended later into the fall.

## Inside Harvest

Recreational angling for salmon in Central Valley rivers was expected to result in a catch of 75,300 adult SRFC. Harvest of SRFC in 2013 Central Valley river fisheries totaled 55,477 adults.

Since 1990, regulations have closed the mainstem Sacramento River to retention of salmon from January 15 to July 15, a period when winter Chinook adults are thought to be most abundant. Beginning in 2004, the retention closure was enacted earlier, on January 1 from the Carquinez Bridge to Red Bluff, in response to recovery of winter Chinook coded-wire-tags (CWTs) in the sport fishery. Owing to low Chinook escapement to the Stanislaus, Tuolumne, and Merced rivers during the last decade, the majority of the San Joaquin River has been closed to recreational salmon fishing. However, beginning in 2012, recreational angling opportunity was reintroduced on the Mokelumne River, the first such opportunity since 2007. Total harvest for the Mokelumne River in 2012 and 2013 was approximately 1,200 Chinook.

## Escapement and Management Performance

Total Chinook catch in commercial and recreational fisheries south of Cape Falcon was close to preseason expectations. Overall, commercial Chinook fisheries caught approximately 113 percent of preseason expectations and recreational Chinook fisheries caught approximately 105 percent of preseason expectations (Table I-7).

## Sacramento River Fall Chinook

Under the 2013 regulations, the projected spawning escapement in the Sacramento River Basin was 462,600 hatchery and natural area fall Chinook adults. A total of 404,666 hatchery and natural area adult spawners were estimated to have returned to the Sacramento River basin in 2013 (Table II-1, Figure II-1).

Fall Chinook returns to Sacramento River hatcheries in 2013 totaled 103,890 adults, and escapement to natural areas was 300,776 adults. Available data indicate hatchery-produced fish constitute a large portion of the Sacramento River naturally spawning fall Chinook population. Table II-1 and Figure II-1 display historical natural area and hatchery fall spawner escapement estimates. For a more detailed breakdown of the historical escapement see Appendix B, Tables B-1 and B-2.

Under the terms of Amendment 16 to the salmon FMP, SRFC are considered to be overfished when the 3year geometric mean spawning escapement falls below the minimum stock size threshold (MSST) of 91,500 hatchery and natural area adult spawners. The geometric mean of adult spawning escapement for years 2011-2013 is 239,771 and therefore SRFC are not overfished.

SRFC are considered to have been subject to overfishing if the estimated exploitation rate exceeds their maximum fishing mortality threshold (MFMT) of 0.78. An estimate of the 2013 SRFC exploitation rate is not yet available. However, fisheries in 2012 resulted in an exploitation rate of 0.54 , well below the MFMT. Therefore, overfishing did not occur in 2012 (Table II-6).

## Sacramento River Winter and Spring Chinook

Spawner escapement of endangered winter Chinook salmon in 2013 was estimated to be 5,653 adults and 469 jacks. This estimate was derived from a carcass survey conducted on the upper Sacramento River and includes winter Chinook captured in the Keswick trap, which provides brood stock to Livingston Stone National Fish Hatchery.

In 2013, it was noted that a number of Chinook salmon had strayed from the Sacramento River to irrigation diversions making up part of the Colusa Basin Drain. Many of these fish were winter Chinook (determined, in part, by the recovery of 11 winter run coded-wire tags from fish captured in the
diversions) and efforts to capture and relocate these fish to the Sacramento River were undertaken. Winter Chinook that were captured and released into the Sacramento River would be represented in the carcass survey spawner estimate. However, an additional 47 winter Chinook adults were captured in the Colusa Basin Drain and transferred to Livingston Stone National Fish Hatchery for spawning. These fish are included in the 2013 spawner escapement estimate reported above.

Winter Chinook spawner escapement estimates derived from Red Bluff Diversion Dam counts began in 1967, and from 1987 to 2008 the estimates were derived by expanding counts made during the period of dam operation (which overlaps with approximately 15 percent of the winter run migration period). Escapement estimates from the carcass survey are considered to better represent winter run spawner escapement owing to the small proportion of the winter run migration sampled during the Red Bluff Diversion Dam operation period. Red Bluff Diversion Dam gates were permanently removed in 2012, and escapement estimates based on dam passage will no longer be available.

Escapement of spring Chinook to the Sacramento River system in 2013 totaled 22,760 fish (jacks and adults), most of which (an estimated 18,507 fish) returned to upper Sacramento River tributaries; the remaining 4,253 fish returned to the Feather River Hatchery. No estimate of spring Chinook escapement to the upper mainstem Sacramento River could be made in 2013 due to changes in Red Bluff Diversion Dam operations; removal of the Red Bluff Diversion Dam gates in 2012 will prevent estimation of spring Chinook escapement to the upper mainstem Sacramento River in the future. The method used to estimate the spring Chinook return to the Feather River Hatchery was modified in 2005. In previous years, the estimate was equal to the number of Chinook that entered the hatchery during the early period of Chinook spawning. Since 2005, prior to the spring run spawning period, fish that entered the hatchery were tagged and returned to the river; the number of tagged fish that re-entered the hatchery during the spring run spawning period was used as the estimate of spring Chinook escapement in the Feather River. The fish that were tagged at the hatchery and returned to the river but did not re-enter the hatchery during the spawning period were counted in the natural fall run survey and reported as Feather River fall Chinook. The natural area spawner surveys in the Feather River are not currently capable of separating the spring and fall runs.

Historical spawner escapements for Sacramento River winter and spring Chinook salmon are presented in Appendix B, Table B-3.

## Sacramento River Late-Fall Chinook

Late-fall Chinook spawning escapement in 2013 was estimated to be 8,315 adults and 637 jacks. These Chinook returned primarily to the Coleman National Fish Hatchery and the upper Sacramento River. These numbers also include late-fall Chinook that returned to upper Sacramento River tributaries and those captured in the Keswick trap for use as broodstock at Coleman National Fish Hatchery (Appendix B, Tables B-3 provides historical spawner escapement).

## San Joaquin River Fall Chinook

San Joaquin River spawning areas are used primarily by fall Chinook. The estimated San Joaquin River fall Chinook spawning escapement in 2013 totaled 14,776 jacks and adults in natural areas and 6,268 jacks and adults to hatcheries (Appendix B, Tables B-1 and B-2 provide historical spawner escapements). Salmon production in the San Joaquin River is determined largely by spring outflows three years earlier. Since 1986, spawner returns to the San Joaquin River have constituted less than 10 percent of the total Central Valley escapement for fall run Chinook.

## NORTHERN CALIFORNIA COAST CHINOOK STOCKS

Northern California stocks include fall and spring stocks north of the entrance to San Francisco Bay. Primary river systems in this area are (from north to south) the Smith, Klamath, Mad, Eel, Mattole, and Russian rivers. Coastal Chinook stocks south of the Klamath River were listed as threatened under the ESA in September 1999.

## Management Objectives

The NMFS ESA consultation standard for California Coastal Chinook influenced management of 2013 Chinook fisheries south of Cape Falcon, Oregon. KRFC provided the basis for the NMFS ESA consultation standard for California Coastal Chinook, which limits the ocean harvest rate on age-4 KRFC to no more than 16.0 percent. KRFC were managed in accordance with their control rule specifying a maximum adult natural spawner reduction rate of 68 percent, resulting in an expected spawner escapement of 73,800 adults in natural areas. The available harvest of KRFC was shared equally between non-tribal and Klamath River tribal fisheries (tribes with federally-recognized fishing rights).

## Regulations to Achieve Objectives

To achieve the management objectives for California coastal Chinook and KRFC, the adopted regulations were designed to result in: (1) a Klamath River run of 272,400 fall Chinook adults, resulting in a spawner escapement of 73,800 adults to natural areas, taking into account projected river fishery impacts of 165,600 adults and returns to basin hatcheries; (2) 50 percent $(114,800)$ of the allowable adult harvest for tribal subsistence and commercial fisheries; (3) 34.8 percent $(40,000)$ of the non-tribal harvest to the Klamath River recreational fishery; and (4) 9.6 percent (approximately 7,200 fish) of the ocean harvest to the KMZ recreational fishery. The age-4 ocean harvest rate resulting from the above configuration was forecast to be 16.0 percent. Season and size limit details are presented in Tables I-1 and I-3.

## Commercial

Commercial fisheries south of Cape Falcon were constrained during the spring and summer months primarily to meet the California Coastal Chinook ESA consultation standard of a maximum KRFC age-4 ocean harvest rate of 16.0 percent. Several quota fisheries in the Oregon and California KMZ were open in 2013, and the Oregon KMZ was open without a quota for the months of April and May. Commercial fishing opportunity in areas north and south of the KMZ were generally more extensive relative to recent years (Table I-1).

## Recreational

Recreational fisheries were permitted in the KMZ from May 1 through September 8. Fisheries both north and south of the KMZ began earlier in the spring; March 15 for the area between Cape Falcon and Humbug Mountain and April 6 for the area south of Horse Mountain. These fisheries also extended later into the fall than recreational fisheries in the KMZ. (Table I-3).

## Inside Harvest

Yurok and Hoopa tribes shared a federally-reserved right of 50 percent $(114,800)$ of the available harvest surplus of adult Klamath fall Chinook. Tribal adult harvest was 62,774 , which was 55 percent of the quota (Appendix B, Tables B-4 and B-5). The State of California managed the river recreational fishery under a 40,000 adult fall Chinook quota. The estimated recreational fishery harvest was 19,728 adult fish, which was 49 percent of the quota (Table B-4). Harvest estimates for streams outside the Klamath River Basin were not available.

## Escapement and Management Performance

In the Oregon portion of the KMZ, commercial catches were largely below quota levels. Unused portions of the June and July quotas were transferred to the following month (July and August) on an impactneutral basis. The September Oregon KMZ commercial fishery caught only 14 percent of the quota. In the California portion of the KMZ, May, June, July, and August quotas were nearly attained. Unused portions of the May, June, and July quotas were transferred to the following month on an impact-neutral basis. The September California KMZ commercial fishery caught only three percent of the quota (Table I-6).

## Threatened California Coastal Chinook

Historical indices of spawner abundance, or actual spawning escapement estimates, for Chinook salmon in California coastal streams outside of the Klamath River Basin are limited. Cursory, nonsystematic surveys are conducted on one tributary of the Mad River and two tributaries of the Eel River. In 2013, extremely low flows resulted in fish passage barriers that severely limited access to these areas. Video counts of Chinook passage at Mirabel Dam on the Russian River have been conducted since 2000 (Appendix B, Table B-7).

The 2013 preseason forecast of the KRFC age-4 ocean harvest rate was 16.0 percent (the ESA consultation standard for California Coastal Chinook is no more than 16.0 percent). The postseason evaluation of the 2013 KRFC age-4 ocean harvest rate was not available.

## Klamath River Fall Chinook

The 2013 preliminary postseason river run size estimate for KRFC was 165,140 adults compared to the preseason-predicted ocean escapement (river run size) of 272,400 . The escapement to natural spawning areas was 59,627 adults, which was 81 percent of the 73,800 adult preseason prediction. The estimated hatchery return was 17,149 adults. Jack returns to the Klamath Basin totaled 14,398, including 10,358 that escaped to natural spawning areas. Table II-2, Figure II-2, and Appendix B, Table B-4 present historical harvest and escapement data for KRFC.

Spawning escapement to the upper Klamath River tributaries (Salmon, Scott, and Shasta Rivers), where spawning was only minimally affected by hatchery strays, totaled 13,202 adults. The Shasta River has historically been the most important Chinook salmon spawning stream in the upper Klamath River, supporting a spawning escapement of 27,600 adults as recently as 2012 and 63,700 in 1935. The escapement in 2013 to the Shasta River was 6,925 adults. Escapement to the Salmon and Scott Rivers was 2,240 and 4,037 adults, respectively (Appendix B, Table B-6).

Under the terms of Amendment 16 to the salmon FMP, KRFC are considered to be overfished when the 3 -year geometric mean spawning escapement falls below the minimum stock size threshold (MSST) of 30,525 natural area adult spawners. The geometric mean of adult spawning escapement in natural for years 2011-2013 is 69,045 and therefore KRFC are not overfished (Table II-6).

KRFC are considered to have been subject to overfishing if the estimated exploitation rate exceeds their maximum fishing mortality threshold (MFMT) of 0.71 . An estimate of the 2013 KRFC exploitation rate is not yet available. However, fisheries in 2012 resulted in an exploitation rate of 0.46 , well below the MFMT. Therefore, overfishing did not occur in 2012 (Table II-6).

## OREGON COAST CHINOOK STOCKS

Oregon Coast Chinook stocks include all fall and spring stocks from Oregon streams south of the Columbia River. These stocks are categorized into two major subgroups based on ocean migration patterns. Although ocean harvest distributions overlap somewhat, they are categorized as either north or
south/local migrating. North migrating Chinook stocks include stocks from the Elk River north, with the exception of Umpqua River spring Chinook. South/local migrating Chinook stocks include Rogue River spring and fall Chinook, Umpqua River spring Chinook, and fall Chinook from smaller rivers south of the Elk River.

Based on CWT analysis, the populations from 10 major north Oregon Coast (NOC) river systems from the Nehalem through the Siuslaw Rivers are harvested primarily in PSC ocean fisheries off B.C., SEAK and Oregon terminal area fisheries. NOC stocks are harvested to a much lesser degree in Council area fisheries off Washington and Oregon. Analysis of CWTs indicates the populations from five major midOregon Coast (MOC) systems between the Coos and the Elk rivers are harvested primarily in ocean fisheries off B.C., Washington, Oregon, and in terminal area fisheries. Minor catches occur in California fisheries and variable catches in SEAK troll fisheries. South/local stocks are important contributors to ocean fisheries off Oregon and northern California. Another central Oregon stock, Umpqua River spring Chinook, contributes primarily to ocean fisheries off Oregon and California, and to a lesser degree, off Washington, B.C., and SEAK.

## Management Objectives

The conservation objective for Oregon Coast Chinook was an aggregate of 150,000 to 200,000 natural adult spawners, as indicated by peak spawner counts of 60 to 90 fish per mile in standard index surveys. This stock has been an abundant stock historically; therefore, preseason abundance estimates were not developed for this stock, and it has not been of critical management concern. ESA consultation standards for OCN coho, LCN coho, and California Coastal Chinook, and KRFC management objectives generally result in reduced Council-area ocean fishery impacts on Oregon south/local migrating Chinook stocks. Council area Chinook fisheries have minor impacts on most of the stocks originating from the NOC and MOC, which have a northerly marine distribution pattern.

## Regulations to Achieve Objectives

The areas of primary management concern for ocean fisheries impacting Oregon Coast Chinook vary between the north and south/local migrating stocks, although there is some overlap. Preseason abundance estimates were not available for Oregon Coast Chinook; however, based on postseason abundance indicators, Council area fisheries impacts on these stocks have not significantly affected achievement of management objectives in recent years.

Oregon State waters terminal area fisheries in 2013 were adopted to provide additional harvest on robust hatchery or naturally produced fall Chinook. Special regulations for each of these seasons were implemented to maintain fishery impacts within conservation objectives. These regulations included season quotas, daily and weekly landing limits in commercial fisheries, and reduced daily and season bag limits and partial mark-selective restrictions in recreational fisheries. Season and size limit details are presented in Tables I-1 and I-3.

## Inside Harvest

Inside recreational harvest of fall and spring Chinook occurred in most Oregon coastal estuaries and rivers. For the 2013 fisheries, conservative regulations were adopted with the intention of reducing impacts on some of these stocks. Complete estimates of the 2013 recreational Chinook harvest in freshwater areas were not available. Historical estimates of the recreational harvest of fall and spring Chinook, derived from Oregon Department of Fish and Wildlife (ODFW) salmon and steelhead angler catch record cards, are reported in Table II-3.

## Escapement and Management Performance

The catch estimate for the two fall terminal area commercial fisheries was 1,137 Chinook.

Under the 2013 regulations, the STT expected the aggregate conservation objective for this stock would be met with the constraints required for California Coastal Chinook, KRFC, and LCN coho. Actual escapement was not estimated for the Oregon Coast Chinook stock aggregate; achievement of the aggregate 150,000 to 200,000 naturally spawning adults was assessed through peak spawner index counts of 60 to 90 adults per mile in nine index streams and included both spring and fall Chinook. Peak spawner index counts were based on traditional non-random surveys (e.g., stream surveys, dam counts, etc.). The aggregate Oregon coast goal of 150,000 to 200,000 naturally spawning Chinook adults was likely met in 2013. ODFW is developing alternate methodologies for establishing escapement goals for Oregon coastal Chinook stocks, including fall Chinook PSC indicator stocks. Upon completion of this process, the escapement goals and assessments for these stocks will likely change.

## North Migrating Chinook

Index counts of adult spawners (peak count per index mile) were conducted for eight of the nine standard streams and used to measure natural spawner escapement trends for north migrating fall Chinook in 2013. Data have been collected since about 1950 for most systems. Overall peak Chinook adult index spawner counts in 2013 were preliminarily estimated at 189 adults per mile, higher than the MSY spawner escapement level of 60 adults per mile.

The geometric mean of north migrating Oregon Coast Chinook adult escapement in 2011, 2012, and 2013 was 144 fish per mile, which exceeded both the MSST (30) and the MSY spawner escapement level. Estimates of exploitation rates were not available for 2012 or 2013, but earlier fisheries resulted in exploitation rates that were lower than the MFMT (0.78). Therefore, north migrating Oregon Coast Chinook should not be considered overfished or subject to overfishing (Table II-6).

## South/Local Migrating Chinook

Standard fall Chinook spawning index escapement data for the smaller southern Oregon coastal rivers (south of the Elk River) were available for the Winchuck, Chetco, and Pistol rivers (Appendix B, Table B-8). The estimated adults per mile in 2013 were preliminarily estimated at 32 adults per mile, lower than the MSY spawner escapement level of 60 adults per mile.

Rogue River carcass counts were used as an indicator of trends in escapement for naturally produced fall Chinook, but these surveys have not been conducted since 2004 (Table II-4). Two trend indicators of escapement for naturally produced spring Chinook were utilized: (1) Rogue River counts at Gold Ray Dam, and (2) Umpqua River counts at Winchester Dam (Table II-4). Gold Ray Dam was removed in October, 2010. For 2013 an estimate of natural spring Chinook escapement above the Gold Ray Dam site was made using the relationship of 2004-10 spawning ground surveys to the Gold Ray Dam passage. This estimate of 12,100 includes an unknown number jacks. Escapements based on these indicators continued an increasing trend in recent year's returns and the second highest since 2004 (Figures II-3 and II-4).

The geometric mean of south/local migrating Oregon Coast Chinook adult escapement in 2011, 2012, and 2013 was 32 fish per mile, which exceeded the MSST (30); therefore, south/local migrating Oregon Coast Chinook should not be considered overfished. Estimates of exploitation rates were not available so an assessment of overfishing status was not possible, but based on exploitation rates for KRFC, it is unlikely that south/local migrating Oregon coast Chinook were subject to overfishing (Table II-6).
Columbia River Basin Chinook salmon stocks include fall, summer, and spring stocks. NMFS has listed five Chinook ESUs within the Columbia Basin under the ESA, (1) SRW fall Chinook listed as threatened April 1992; (2) Snake River spring/summer listed as threatened April 1992; (3) upper Columbia River
spring listed as endangered March 1999; (4) LCR Chinook listed as threatened March 1999; and (5) upper Willamette River spring listed as threatened March 1999.

## COLUMBIA RIVER BASIN CHINOOK STOCKS

Columbia River Basin Chinook salmon stocks include fall, summer, and spring stocks. NMFS has listed five Chinook ESUs within the Columbia Basin under the ESA, (1) SRW fall Chinook listed as threatened April 1992; (2) Snake River spring/summer listed as threatened April 1992; (3) upper Columbia River spring listed as endangered March 1999; (4) LCR Chinook listed as threatened March 1999; and (5) upper Willamette River spring listed as threatened March 1999.

The assessment below focuses on the five major stock groups of Columbia Basin fall Chinook: lower river hatchery (LRH) tule stock and lower river wild (LRW) bright stock, both of which are part of the ESA-listed LCR Chinook ESU; Spring Creek Hatchery (SCH) tule stock; upriver bright (URB) stock, which includes the ESA-listed SRW Chinook ESU; and mid-Columbia bright (MCB) hatchery stock. A brief assessment of Columbia River upper river summer Chinook is also included. Management details for Columbia River spring Chinook stocks are not discussed. Council-managed ocean salmon fisheries have very limited impacts on these stocks (less than a 2 percent exploitation rate in base-period fisheries); as a result, mid-Columbia spring stocks were removed from the FMP under Amendment 16 in December 2011. Appendix B, Tables B-12 through B-19, contain historical harvest and escapement data for fall, summer, and spring stocks. Appendix B, Table B-20 summarizes catch information for all three Chinook runs in the Columbia Basin. Additional information on these stocks and inriver fisheries can be found in the Joint Staff Report: stock status and fisheries for spring Chinook, summer Chinook, sockeye, steelhead, and other species and miscellaneous regulations and the Joint Staff Report concerning the fall in-river commercial harvest of Columbia River fall Chinook, summer steelhead, coho salmon, chum salmon, and sturgeon published annually by the joint staffs of ODFW and WDFW.

## Management Objectives

Council-area fisheries north of Cape Falcon in 2013 were managed to access SCH and LRH stocks while meeting the NMFS ESA consultation standards for the ESA-listed LCR Chinook ESU (both LCR natural tules and LRW) and SRW fall Chinook ESU. The standard for ESA-listed LCR natural tules was a total (ocean plus inriver) AEQ exploitation rate of no more than 41.0 percent, an increase from the ceiling rate of 37.0 percent in 2011. For preseason modeling, the estimated total exploitation rate on a composite of Washougal, Kalama, Cowlitz, and Big Creek hatchery tules was used as a surrogate for LCR natural tules. The NMFS ESA consultation standard for LRW was a North Lewis River fall Chinook spawning escapement of 5,700 ; the preseason forecast was for an escapement of 14,200 . The standard for the SRW ESU was no less than a 30.0 percent reduction in the Snake River Fall Index (SRFI) from the 1988 through 1993 base period AEQ exploitation rate for all ocean fisheries combined.

No specific escapement goal was established for the ESA-threatened Snake River wild fall Chinook stock. However, in the Proposed Recovery Plan for Snake River Salmon, NMFS proposed a delisting goal for Snake River fall Chinook of an eight-year (approximately two generation) geometric mean of at least 2,500 natural origin spawners in the mainstem Snake River annually.

The NMFS ESA consultation standard for the threatened LCR natural tule Chinook was the primary constraint on Council-area Chinook fisheries north of Cape Falcon, and to a lesser extent, south of Cape Falcon.

## Regulations to Achieve Objective

Fisheries north of Cape Falcon are managed with quotas to help ensure impacts to stocks do not exceed allowable limits and to ensure allocation objectives are met. The 2013 combined abundance of URB,

Fraser River origin, and other stocks contributing to the southeast Alaska and British Columbia AABM fisheries and the corresponding allowable catch were lower thanthan in 2012. The 2013 preseason forecast of Columbia River stocks per se were greater than that in 2011. Nevertheless, the 2012 total allowable catch (TAC) in fisheries north of Cape Falcon was lower than in 2012.

The 2013 overall non-Indian Chinook total allowable catch (TAC) for North of Cape Falcon was 92,000 including an 8,000 coastwide mark-selective Chinook quota for a portion of the recreational fishery (non-mark-selective equivalent of 88,000 ). These compare to a 2012 non-Indian TAC of 99,000 , including a 8,000 coastwide mark selective Chinook quota for a portion of the recreational fishery; the equivalent non-mark-selective TAC was 95,000 . The 2013 overall TAC was divided into 44,000 commercial and 48,000 recreational (non-mark-selective equivalent of 44,000 ). The treaty Indian ocean troll TAC was 52,500 Chinook, and is applicable to the May-September period. This compares to a 2011 treaty Indian TAC of 55,000. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Commercial

Non-Indian commercial fisheries north of Cape Falcon included a Chinook-directed fishery in May and June initially open seven days per week with no landing limit. Two-thirds of the overall non-Indian commercial Chinook quota north of Cape Falcon was allotted to the May-June time period to increase opportunity when Chinook were more available to the fishery. Inseason action was taken to limit the days per week and institute landing and possession limits and later close the area north of the Queets River toward the end of the season to ensure the quota of 29,300 Chinook was not exceeded and to limit impacts on Puget Sound Chinook.

The non-Indian commercial all-salmon fishery was scheduled for July 1 through September 17 with preseason quotas of 14,700 Chinook and 14,220 marked coho. The fishery was open Friday through Tuesday most weeks with various landing and possession limits for each open period. The fishery also had a cap on how much of the catch could come from above the Queets river to limit impacts on Puget Sound Chinook. In addition, vessels were restricted to fishing and landing catch either north or south of Leadbetter Point during any one open period.

## Recreational

The recreational fisheries north of Cape Falcon included a June mark-selective Chinook fishery and an all-salmon fishery (mark-selective for coho except in September in the areas south of the Queets River) during the late June-September time period.

The June mark-selective Chinook fishery was open in Areas 3 and 4 May 10 - 11, May 17 18, and June 22 through June 28, Area 2 was open June 8 through 22, and the Columbia River Area was open June 8 through 21.. The fishery operated as scheduled with a total catch of 2,798 marked Chinook. The summer all-salmon fisheries north of Cape Falcon opened June 29 in Areas 3 and 4, June 23 in Area 2, and June 22 in the Columbia River area through the earlier of the coastwide quotas of 40,000 Chinook or 74,760 mark-selective coho or the automatic closure date of September 22 north of Leadbetter point and September 30 south of Leadbetter Point. The coho mark-selective restriction was lifted in the area between the Queets River and Leadbetter Point on September 6, and in the Columbia River area on September 1. The fishery closed as scheduled on the automatic closure dates with total catches of 30,843 Chinook and 50,159 marked and unmarked coho.

## Treaty Indian

Treaty Indian ocean fisheries were similar in structure to recent years, with a May-June Chinook-directed fishery and a July to mid-September all-salmon fishery. Chinook quotas were 26,250 for the May-June fishery, 26,250 for the July-September fishery, and the coho quota in the all-salmon fishery was 47,500.

The Chinook directed fishery ran through all of May and closed on June 17 due to obtainment of the Chinook sub-quota. An overage of 4,654 Chinook was subtracted from the July-September all species fishery. An additional adjustment of 1,103 Chinook was subtracted to keep the treaty troll fishery impact neutral on the stocks of concern. This decreased the sub-quota to 20,493 Chinook. The all species fishery opened on July 1 and closed on September 4, taking 94\% of the Chinook quota and 100\% of the coho quota.

## Inside Harvest

Since the Columbia River Fishery Management Plan expired on December 31, 1998, fall Chinook in Columbia River fisheries were managed through 2007 under the guidance of annual management agreements among the U.S. v. Oregon parties. In 2008, a new 10 -year management agreement was negotiated through the U.S. v. Oregon process, which included revisions to some inriver objectives. In particular, the "2008-2017 U.S. v Oregon Management Agreement" (2008-2017 MA) specified that with run sizes of at least 200,000 URB, including at least 8,000 SRW fall Chinook, the allowable URB impact rate would be 45.0 percent. NMFS used the URB impact rate as a proxy in the SRW consultation standard.

In 2013, the fall fisheries were managed to achieve the NMFS ESA consultation standards for threatened LCR natural tule and SRW Chinook, and the 2013 URB and SRW preseason forecast run sizes were both large enough to allow a 45.0 percent harvest rate in inriver fisheries per the 2008-2017 MA.

Within the ESA limitations there were harvestable numbers of salmon available for all major stocks in 2013. The postseason fall Chinook run reconstruction, however, was not completed in time for this report. The preliminary catch estimates (adults) for the non-Indian commercial gillnet fisheries were 11,361 spring, 1,954 summer, and 117,740 fall Chinook, which included 8,064 spring, 0 summer, and 22,010 fall Chinook in Select Area (terminal) fisheries. The preliminary catch estimates (adults) for the treaty Indian fisheries were 9,282 spring, 13,397 summer, and 234,351 fall Chinook. The preliminary catch estimate (adults) for the recreational fisheries included 23,080 fall Chinook in the Buoy 10 fishery, and 7,140 spring, 2,058 summer, and 32,710 fall Chinook in mainstem fisheries below Bonneville Dam, 886 spring Chinook in mainstem fisheries above Bonneville Dam, and 13,890 fall Chinook in the Hanford Reach fishery above McNary Dam (Appendix B, Table B-20).

## Escapement and Management Performance

All Columbia River summer and fall stocks met their escapement objectives (Table II-5). Preliminary estimates of river mouth returns based on inseason run updates were: 67,570 summer, 90,690 LRH; 14,502 LRW; 69,000 SCH; 832,500 URB; and 163,600 MCB. Estimates for SRW were unavailable. The total ocean escapement of the five fall stocks was $1,182,292$ fall Chinook (Figure II-5). The estimated escapement for summer Chinook in 2013 was 68,380, exceeding the MSY spawner escapement objective of 12,143 adults established under FMP Amendment 16. The preliminary estimated natural area escapement (Hanford Reach, Yakima River, and above Priest Rapids Dam) for URB Chinook in 2013 was 293,000 exceeding the MSY spawner escapement level of 39,625 adults established under FMP Amendment 16.

The preliminary 2013 URB inriver harvest rate estimate was 42.2 percent. The total adult SRW, hatchery, and supplementation fall Chinook count at Lower Granite Dam in 2013 was 56,565 , up from 34,688 in 2012. Estimates of SRW and supplementation fall Chinook spawning escapement in 2013 were not available. The eight-year mean of SRW natural origin spawners through 2011 was 3,125 fish.

Postseason estimates of exploitation rate on LCR natural tule or SRW for ocean fisheries were unavailable.

The overall ocean TACs for treaty Indian and non-Indian Chinook fisheries were not exceeded. All Council area fisheries north of Cape Falcon were closed before exceeding their final quotas.

The geometric mean of Columbia upper river summer Chinook adult escapement in 2011, 2012 and 2013 was 54,123, which exceeded the MSST threshold (6,072); therefore, Columbia upper river summer Chinook should not be considered overfished (Table II-6). Estimates of combined ocean and inriver exploitation rates were not available for 2012 and 2013, but the previous three years’ exploitation rates were less than the MFMT (0.75); therefore, Columbia upper river summer Chinook should not be considered subject to overfishing (Table II-6).

The geometric mean of Columbia URB fall Chinook adult escapement in 2011, 2012, and 2013 was 233,448 , which exceeded the MSST threshold $(19,182)$; therefore, Columbia URB fall Chinook should not be considered overfished (Table II-6). Estimates of combined ocean and inriver exploitation rates were not available for 2012 and 2013, but the previous three years' exploitation rates were less than the MFMT (0.86); therefore, Columbia URB fall Chinook should not be considered subject to overfishing (Table II-6).

## WASHINGTON COASTAL CHINOOK STOCKS

Washington coastal Chinook stocks include all fall, summer, and spring stocks from coastal streams north of the Columbia River through the western Strait of Juan de Fuca (west of the Elwha River, inclusive). This complex consists of several natural stocks, generally of small to medium-sized populations, and some hatchery production (primarily Willapa Bay and Quinault River). Coastal stocks are not impacted significantly by Council-area ocean fisheries.

## Management Objectives

Willapa Bay natural fall Chinook did not have a defined conservation objective in the Salmon FMP during the preseason process, although WDFW has a spawning escapement objective of 4,350 natural Chinook, which is based on peak density estimates and watershed area. Amendment 16 to the Salmon FMP, adopted in December 2011, included an MSY spawning escapement objective of 3,393, which was based on the WDFW objective.

Spawning escapement goals for natural stocks managed within this complex north of Willapa Bay, established in U.S. District Court by WDFW and the treaty Indian tribes, were recognized in the Council's FMP conservation objectives. Objectives for Grays Harbor and the North Coast river systems were established pursuant to the U.S. District Court order in Hoh v. Baldrige. However, annual natural spawning escapement targets may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of Hoh v. Baldrige and subsequent U.S. District Court orders. After agreement is reached on the annual targets, ocean fishery escapement objectives are established for each river, or region of origin, which include provisions for treaty Indian allocation and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal Chinook other than those in the FMP were made in 2013.

## Regulations to Achieve Objectives

Preseason abundance forecasts for some Washington coastal Chinook stocks were available for the first time in 2008 for the Council preseason management process. Because Council area fishery impacts to Washington coastal Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Willapa Bay Chinook

## Inside Harvest

Run size, harvest, and escapement data for Willapa Bay fall Chinook are presented in Appendix B, Table B-23.

No Chinook-directed non-Indian gillnet fishery was conducted during July 2013 but there was an 84-hour marked Chinook-directed fishery in early August 2013. These fisheries, prior to August 16, are commonly referred to as the "summer dip-in" fishery; they occur irregularly because historically they were dependent on Columbia River tule abundance, which now includes the ESA-listed LCR natural tule stock. This fishery was generally assumed to harvest Columbia River tule stocks in a mix similar to adjacent ocean area catches; however, in light of recent catch composition information ( $>70$ percent local Willapa Bay and Grays Harbor origin stock) this assumption has been questioned.

The 2013 pre-season forecast of Chinook returning to Willapa Bay was 28,354 fish (4,917 natural and 23,437 hatchery). There were four 12 -hour and four 24 -hour marked Chinook-directed non-Indian gillnet fisheries beginning August 19 through September 12. Retention of unmarked Chinook was prohibited. Total Chinook harvest in the non-Indian gillnet fisheries during 2013was 14,004 fish, based on preliminary data.
Recreational fisheries in the marine waters of Willapa Bay were open from June 8 through July 31, 2013, concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1, 2013 through January 31, 2014, Willapa Bay was open to recreational fishing with no more than three adults allowed to be harvested daily. Barbless hooks were required when fishing for salmon. Retention of chum and unmarked Chinook was prohibited. Anglers were allowed to fish with two poles if they had a Two-Pole Endorsement.

Recreational salmon fisheries in tributaries to Willapa Bay varied in duration but were generally open August 1 through January 31, 2014. Retention of unmarked Chinook was prohibited. Single-point, barbless hooks were required in all areas. Recreational harvest estimates for 2013 were not available.

## Escapement and Management Performance

During 2012, Chinook returning to hatcheries in the Willapa Bay watershed totaled 22,457 fish. Based on current hatchery production, this return was sufficient to achieve the goal of 9,800 total Chinook escapement to Willapa Bay hatchery facilities. An escapement estimate was unavailable for 2013.

An estimate of the 2013 natural spawning escapement was not available; the 2012 natural escapement was 2,158 Chinook, below the FMP objective of 3,393 . An estimated 2,184 natural Chinook were harvested in commercial and recreational fisheries in 2011, above the preseason expectation of 1,487 .

The geometric mean of Willapa fall Chinook adult escapement in 2010, 2011, and 2012 was 2,838, which exceeded the MSST $(1,696)$; therefore, Willapa Bay fall Chinook should not be considered overfished (Table II-6). Exploitation rate estimates were not available for 2012 and 2013. Estimates of exploitation rates for all Washington Coast fall Chinook are based on Queets River fall Chinook CWT analyses, and while ocean impacts for these fall stocks may be assumed to be similar, inside impacts may vary substantially. The MFMT for Willapa Bay fall Chinook is 0.78.In 2009, 2010 and 2011, the Willapa Bay fall Chinook exploitation rates, using Queets stock as a surrogate, were $0.60,0.61$ and 0.64 respectively,; therefore, Willapa Bay fall Chinook should not be considered subject to overfishing (Table II-6). The MFMT for Willapa Bay fall Chinook is also based on a proxy derived from an average value of other Chinook stocks; therefore, overfishing status based on total exploitation rates for Willapa Bay fall Chinook are less certain than for some other Washington Coast Chinook stocks.

## Grays Harbor Chinook

## Inside Harvest

Run size, harvest, and escapement data for Grays Harbor Chinook are presented in Appendix B, Table B25.

The Quinault Indian Nation conducted a spring/summer commercial gillnet fishery on the Chehalis River and in Gray Harbor commercial fishing Areas 2A, 2A-1, C, and D in 2013. Mesh restrictions were imposed to allow targeting of spring/summer Chinook and white sturgeon. Thirty-one spring Chinook were reported in the harvest during these fisheries.

The non-Indian recreational season allowed a modified spring Chinook fishery in the Chehalis River during the spring Chinook management period. The non-Indian recreational season was open for the retention of one Chinook per day from May 1 through June 30 in the mainstem Chehalis River. Preliminary catch data are not available for the 2013 fishery, however, preliminary data indicate that 59 Chinook were harvested during this fishery scheduled in 2012. The report on harvest of spring Chinook by the Chehalis Tribe fishery is not available at this time. No summer non-Indian gillnet fishery directed at non-local Chinook stocks occurred in 2013.

The Quinault Indian Nation conducted a fall gillnet fishery harvesting a total of 2,875 fall Chinook in two separately scheduled areas: the first in the lower Humptulips River and adjacent Area 2C of Grays Harbor and the second in the lower Chehalis River and adjacent areas of Grays Harbor, Areas 2D, 2A, and 2A-1. Fishing was restricted to east of Stearns Bluff in the Chehalis River, and Areas 2D, 2A, and 2A-1 to limit catch of Chinook, which tend to concentrate in deep areas off the mouths of the Johns and Elk rivers. The Chehalis area treaty Indian fishery caught 2,427 Chinook, which was about 67 percent of what was expected. The Humptulips area treaty Indian fishery reported harvest was only about 24 percent of what was expected. A total of 448 Chinook were caught. The combined Grays Harbor treaty Indian Chinook catch was 52 percent of what was expected.

The non-Indian gillnet fishery in Humptulips commercial Area 2-C was open for four days in late October and November. Retention of all fall Chinook, coho, and chum was allowed. The Chinook harvest totaled 26, which was 19 percent of the expected harvest. The non-Indian gillnet fishery in the Chehalis River commercial Areas 2A and 2D was open for four 12-hour periods in October. Area 2D was truncated to those areas lying easterly of a north-south line from the confluence of the Hoquiam and Chehalis rivers to Renney Island then easterly to "Range Marker G" located on the south shore of Grays Harbor. Then the boundary extended east to the eastern boundary of Area 2D at the Highway 101 Bridge. The 12-hour fishery on October 10, 2013 required the use of tangle net gear only. There were four 24 -hour periods in late October and November. During these fisheries, all areas of 2D were open. During all fisheries live boxes were required, and wild Chinook could not be retained. A total of 13 hatchery-origin Chinook were harvested during this fishery, 27 percent less than expected. The use of live boxes was required.

The recreational fishery in Marine Area 2-2 was open from September 16 through November 30. From September 16 to September 22, up to 3 adult salmon could be retained per day, of which one could be a Chinook, From September 23 to September 28, all recreational salmon fisheries in Marine Area 2-2 were closed to protect Chinook. From September 29 to the end of the season, only coho and chum retention was allowed.

The fall recreational fishery in the Chehalis River was open to the retention of one Chinook per day from May 1 to the end of June and again from October 1 to the end of November. The May and June Chinook fishery was allowed only in the mainstem Chehalis River from the mouth up to the confluence with the

Skookumchuck River. The October and November Chinook fishery was allowed only in the mainstem Chehalis River from the mouth upstream to the Porter Bridge. A recreational mark-selective Chinook fishery was open on the Satsop River from September 16 through the end of November. This fishery was limited to the Satsop mainstem from the mouth upstream of the bridge at Schafer Park. In the fall recreational Humptulips River fishery from the mouth to confluence of the East and West forks, a daily limit of 3 adults, of which only one could be a Chinook, was allowed from September 16 through November 30. From December 1 through January 31, the daily limit was 2 adults, of which only one Chinook could be retained. Recreational harvest estimates were not available at this time.

## Escapement and Management Performance

Chehalis River spring Chinook are of natural origin and managed for an escapement goal of 1,400 adults. The 2013 terminal run forecast for spring Chinook was 2,247 adult fish. The preliminary escapement estimate for 2013 spring Chinook is not available at this time.

Grays Harbor fall Chinook were managed for a natural spawning escapement goal of 14,600 adults. The 2013 Grays Harbor fall Chinook forecast was 20,636 natural and 3,626 hatchery adults. The return of hatchery-origin fall Chinook to Grays Harbor hatchery programs were sufficient to provide for 2014 fall Chinook production goals. The natural spawning escapement estimates for 2013 are not available at this time. The initial 2012 spawning ground escapement estimate for the Grays Harbor was 11,969 naturalorigin fish and 827 hatchery-origin fish. The initial natural escapement to the Chehalis River was 8,170 and to the Humptulips River it was 3,799 .

## Quinault River Chinook

## Inside Harvest

Historical terminal gillnet harvest data for Quinault River Chinook stocks are presented in Appendix B, Table B-27.

A run of natural spawning spring/summer Chinook enters the river from April through July. The spring/summer Chinook run is typically small and any harvest is taken incidentally during fisheries directed at sockeye and steelhead. The tribal fishery harvested 20 spring/summer Chinook in 2013 primarily during its sockeye directed fishery.

The 2013 harvest of Quinault River fall Chinook was mostly hatchery-origin fish taken in September and October. The treaty Indian net catch totaled 7,148 fall Chinook.

## Escapement and Management Performance

Quinault fall Chinook were managed for hatchery production. The 2013 fall Chinook spawning escapement estimate was not available. Hatchery fall Chinook egg-take goals for the Quinault River were attained at the Lake Quinault tribal hatchery.

## Queets River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Queets River spring/summer and fall Chinook are presented in Appendix B, Tables B-29 and B-30, respectively.

The 2013 treaty Indian gillnet harvest of spring/summer Chinook remained closed during the spring/summer period through the last week of August. The non-Indian inriver recreational fishery was closed to retention of Chinook.

Fall Chinook were harvested from September 1 through October 16 with a small number added during a later week from November 17 through the 23rd by the treaty Indian fall gillnet fishery. The treaty Indian fishery was structured to target hatchery and natural coho while also harvesting Chinook at a total tribal plus non-tribal harvest rate of 40 percent. The treaty Indian gillnet fishery harvested 1,945 fall Chinook in the commercial fishery compared to a preseason expected catch of 1,487 . Recreational fisheries targeted coho and Chinook during standard September 1 through November 30 schedules in the Queets and Clearwater Rivers. The on-reservation Salmon River recreational harvest was limited to retention of coho. Only mark-selective Chinook retention was allowed for recreational fisheries within Olympic National Park waters (Queets mainstem upstream of the Quinault Indian Reservation, and lower section of the Salmon River). Catch estimates for 2013 recreational salmon fisheries were not available.

## Escapement and Management Performance

The 2013 spawning escapement estimate for Queets River spring/summer Chinook was 518 adults, about $26 \%$ percent below the MSY spawner escapement goal of 700 .

The geometric mean of Queets River spring/summer Chinook adult spawning escapement in 2011, 2012, and 2013 was 528, which is above the MSST (350); therefore, Queets River fall Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates for 2012 were not available for Washington coastal spring/summer Chinook stocks, but based on the limited inriver harvest rate and ocean harvest rates of Queets fall Chinook, it is unlikely that Queets River spring/summer Chinook were subject to overfishing in recent years (Table II-6).

The 2013, Queets River fall Chinook spawner survey estimate was 4,080 . The indicator Chinook originate from wild brood stock taken each year in the river. The spawning escapement estimate for Queets River fall Chinook was 3,706.

The geometric mean of Queets River fall Chinook adult spawning escapement in 2011, 2012, and 2013 was 3,756 , which exceeded the MSST $(1,250)$; therefore, Queets River fall Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for 2012, but estimates from 2009, 2010, and 2011 were below the MFMT ( 0.87 ); therefore, Queets River fall Chinook should not be considered subject to overfishing (Table II-6).

## Hoh River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River spring/summer and fall Chinook are presented in Appendix B, Tables B-32 and B-33, respectively.

The 2013 Hoh River spring/summer Chinook terminal abundance forecast was 851 fish, 49 fish below the escapement goal floor of 900 . The treaty Indian gillnet fishery occurred between the weeks of April 29 and August 12, and was scheduled for one day per week in Stat. Weeks 18-20, two days per week in Weeks 21 and 22 and back to one day per week in Weeks 23-27 and 33. Fishing was closed in weeks 2832 and $34 \& 35$. Preseason targeted harvest rate (including ceremonial and subsistence catch), was 5.8 percent of the forecasted run. Tribal regulation in 2013 required a minimum of an 8 -inch stretch mesh during the first four weeks in order to minimize incidental take of steelhead kelts. The treaty Indian commercial gillnet fishery harvested 532 Spring Chinook. Results of mark sampling and scales indicated that 415 of these were of hatchery origin and 117 of natural origin. An additional 17 hatchery and 6 native wild Chinook were harvested by the Hoh Tribe for Ceremonial and Subsistence purposes.

The non-Indian recreational fishery operated from May 16 through August 31, Wednesdays through Sundays, with a bag limit of one marked adult per day from the mouth to Willoughby Creek. A preliminary estimate of Chinook taken in the sport fishery was not available. Retention of unmarked fish was not allowed this year.

Hoh River fisheries for fall Chinook were based on an expected terminal run size of 3,095 adults, allowing for a terminal harvest rate of 36.8 percent. The spawning escapement was expected to be 1,955 adults.

The treaty Indian fishery targeted 25.5 percent of the terminal run. The treaty Indian gillnet fishery was scheduled for three days per week during weeks 36 through 45, and two days per week in weeks 46 through 48. The Hoh treaty commercial fishery caught approximately 1,531 wild Chinook, with a preseason expected catch of 789, an estimated 10 Chinook were harvested for Ceremonial and Subsistence purposes. Results of mark sampling indicated that 142 hatchery Chinook were also harvested by the Hoh treaty commercial fishery.

The non-Indian recreational fishery extended from September 1 through November 30, with the river below Willoughby Creek open and a daily-bag-limit of six salmon, two of which could be adults. The portion of the river between Willoughby Creek and Morgan's Crossing was open October 16 through November 30. The delayed opening was to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan's Crossing was closed to recreational salmon fishing. The sport fishery harvest of wild Chinook was not available.

## Escapement and Management Performance

The 2013 preliminary spawning escapement for Hoh River spring/summer Chinook is 1,070 . The geometric mean of Hoh River spring/summer Chinook spawner escapement in 2011, 2012, and 2013 was 932, which exceeded the MSST (450); by those metrics, Hoh River summer Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Washington coastal spring/summer Chinook stocks, but based on the limited inriver harvest rate and lack of Ocean harvest data, it is difficult to assess the extent to which Hoh River spring/summer Chinook were subject to overfishing in SUS fisheries in recent years (Table II-6). The population remains in decline with spawning escapement at or below the floor seven of the past eight years. The declining abundance is constraining to the Hoh Tribal Treaty In-River Fishery.

The preliminary 2013 spawning escapement estimate for Hoh River fall Chinook is 750. The geometric mean of Hoh River fall Chinook adult spawning escapement in 2011, 2012, and 2013 was 828, which exceeded the MSST (600); therefore, Hoh River fall Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Hoh River fall Chinook, but Queets River Fall Chinook were used as a proxy. Exploitation rate estimates were not available for 2012 but earlier estimates were below the MFMT (0.90); given these assumptions, Hoh River fall Chinook should not be considered subject to overfishing (Table II-6).

## Quillayute River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River spring, summer, and fall Chinook are presented in Appendix B, Tables B-35 and B-36 respectively. Spring and summer Chinook are currently managed separately, but data for both are combined in Table B-35. All hatchery-origin fish are considered to be spring Chinook, and all natural spawners and tribal brood stock collections are
considered to be summer Chinook. The management of these stocks is currently under review by the WDFW and Quileute Tribal co-managers.

The recreational and tribal fisheries for spring and summer Chinook were established by a preseason management agreement between WDFW and the Quileute Tribe. The total tribal catch for 2013 was 1,049 spring and 156 summer Chinook. Catch for ceremonial and subsistence use is included in the IGN harvest numbers. Estimates of 2013 recreational spring and summer Chinook harvest were unavailable.

The total 2013 Quileute Tribal harvest of fall natural Chinook was 1,952. Fall hatchery Chinook catch was 49. Catch for ceremonial and subsistence use is included in the IGN harvest numbers. An estimate of the 2013 recreational catch was unavailable.

As in past years, WDFW required release of unmarked Chinook during July and August to reduce impacts of the recreational fishery on the natural summer Chinook stock. The fall recreational fishery from September through November proceeded with normal bag limits and schedule. The Quileute Tribe did not have a closure in their fishery this year, but as in past years, reduced their fishery to 29 hours per week during July and August to reduce impacts to summer Chinook.

## Escapement and Management Performance

The 2013 management agreement called for an escapement goal of 200 hatchery spring Chinook. The actual rack return was 528 , which exceeded hatchery requirements.

The summer Chinook run was managed to achieve an MSY spawner escapement of 1,200 adults, jacks, and brood stock collection combined. The preliminary estimated natural spawning summer Chinook escapement of 948 was under the escapement goal.

The geometric mean of Quillayute River summer Chinook spawner escapement in 2011, 2012, and 2013 was 733, which exceeded the MSST threshold (600); therefore, Quillayute River summer Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Washington coastal spring/summer Chinook stocks, but based on the limited inriver harvest rate and ocean harvest rates of Queets fall Chinook, it is unlikely that Quillayute River summer Chinook were subject to overfishing in recent years (Table II-6).

Terminal area fisheries on fall Chinook were managed for a target 40 percent harvest rate, and an MSY spawner escapement goal of 3,000 adults. The preliminary escapement estimate of 4,017 fall Chinook was above the escapement goal.

The geometric mean of Quillayute River fall Chinook adult spawning escapement in 20011, 2012, and 2013 was 3,826 , which exceeded the MSST threshold $(1,500)$; therefore, Quillayute River fall Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Quillayute fall Chinook, but Queets River fall Chinook was used as a proxy. Exploitation rate estimates were not available for 2012, but earlier estimates were below the MFMT ( 0.87 ); therefore, Quillayute River fall Chinook should not be considered subject to overfishing (Table II-6).

## Hoko River Chinook

## Inside Harvest

Hoko River Chinook are primarily harvested in fisheries in southeast Alaska and northern British Columbia with minimal harvest in Council area and inside waters. Tribal and recreational fisheries in the

Hoko River for Chinook salmon have not occurred since the early 1980's, although some catch is occasionally reported by anglers on WDFW Catch Record Cards.

## Escapement and Management Performance

The preliminary escapement estimate of 656 Chinook was below the MSY spawner escapement goal of 850 and included 435 from the supplementation program (Appendix B, Table B-38).

The geometric mean of Hoko River summer/fall Chinook spawner escapement in 2011, 2012, and 2013 was 778, which exceeded the MSST threshold (425); therefore, Hoko River summer/fall Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for 2013 but estimates from 2010, 2011, and 2012 were well below the MFMT ( 0.78 ); therefore, Hoko River summer/fall Chinook should not be considered subject to overfishing (Table II-6).

## PUGET SOUND CHINOOK STOCKS

Puget Sound Chinook stocks include all fall, summer, and spring stocks originating from U.S. tributaries in Puget Sound and the eastern Strait of Juan de Fuca (east of Salt Creek, inclusive). This stock complex consists of numerous natural Chinook stocks of small to medium-sized populations and significant hatchery production. The Puget Sound ESU was listed under the ESA as threatened in March 1999.

## Management Objectives

Puget Sound Chinook stocks are listed under the ESA and were managed pursuant to the provisions of a WDFW/Tribal management plan approved under an ESA Section 4(d) rule promulgated by NMFS. This plan contains exploitation rate ceilings for ESA-listed Puget Sound stocks expressed in terms of constraints on total fishery rebuilding exploitation rates (RER) or of exploitation rates on fisheries south of the Canadian border for those stocks without RERs. The Council's annual management objectives for ESA-listed stocks are to meet the ESA consultation standards set forth by NMFS.

## Regulations to Achieve Objectives

Puget Sound stocks contribute to fisheries off B.C., are present to a lesser degree off SEAK, and are impacted to a minor degree by Council-area ocean fisheries. Because Council-area fishery impacts to Puget Sound Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. The only Council-area regulations affecting any of these stocks was closing the Cape Flattery Control Zone for the non-Indian commercial troll fishery and holding the non-Indian commercial troll fishery to impacts in Area 3 and Area 4 not to exceed those modeled preseason. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Inside Harvest

Commercial inside fishery harvest of Puget Sound Chinook was managed on the basis of six regional stock management units or, in some cases, component stocks within management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest was regulated according to the natural spawning escapement goal or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) is presented in Appendix B, Table B-39. These catches included some fish of non-Puget Sound origin. The total commercial harvest in Puget Sound in 2013 was 109,968 Chinook, compared to 120,117 Chinook caught in 2012. The 2013 non-Indian net catch was 9,330 Chinook, compared to 9,053 Chinook caught in 2012. The 2013 treaty Indian net and troll harvest was 100,638 Chinook, compared to 111,064 Chinook caught in 2012.

Chinook catches in the Puget Sound recreational fishery for years beginning in 1971 are presented in Appendix B, Table B-40. Catch estimates for the 2013 Puget Sound recreational fishery were unavailable.

## Escapement and Management Performance

Puget Sound Chinook management goals for fishery planning processes in 2013 were compared to predicted exploitation rates to assess compliance with ESA consultation standards (Table II-5). Information to evaluate performance against these constraints was unavailable.

Historical hatchery and natural run component escapements and net catches for summer/fall Chinook for each Puget Sound region of origin are presented in Appendix B, Table B-40. Historical spring Chinook escapement data are presented in Appendix B, Table B-43.

Preliminary data suggest most Puget Sound hatcheries met their summer/fall Chinook goals.
Naturally spawning Puget Sound spring and summer/fall Chinook remained depressed in 2013. Preliminary data suggest no Puget Sound spring Chinook natural stocks met their escapement goals. Preliminary information on 2013 natural spawning escapements for summer/fall Chinook stocks indicate escapement goals were met in some areas, but not in many others. Escapement estimates for 2013 were not available for most runs. In many natural spawning areas, hatchery-origin Chinook comprise a large component of the natural spawning population.

## COASTWIDE GOAL ASSESSMENT SUMMARY

FMP Conservation objectives for Council managed Chinook stocks in effect during the preseason planning process of 2013 were met for stocks with available estimates. (Table II-5). Information to assess compliance with FMP conservation objectives and ESA consultation standards in 2013 was unavailable for LCR natural tule Chinook, SRW fall Chinook, several Washington coast Chinook stocks, and all Puget Sound natural Chinook stocks.

SRFC and KRFC are managed to meet or exceed annual catch limit spawner abundance ( $\mathrm{S}_{\mathrm{ACL}}$ ) levels. In 2013, escapement goals for these stocks were equal to the preseason $\mathrm{S}_{\mathrm{ACL}}$ as a result of large abundance forecasts. It is not yet possible to evaluate spawner escapement estimates for SRFC and KRFC against postseason $\mathrm{S}_{\mathrm{ACL}}$ values; this evaluation will be made in the Preseason I report.

## Stock Status Determinations

In 2011 the Council adopted SDC for overfishing, overfished, not overfished/rebuilding, and rebuilt under FMP Amendment 16. These criteria, approved and implemented in December 2011, were:

- Overfishing occurs when a single year exploitation rate exceeds the MFMT ( $\mathrm{F}_{\mathrm{MSY}}$ );
- Overfished status occurs when a 3-year geometric mean spawning escapement is less than the MSST;
- Not overfished/rebuilding status occurs when the most recent a 3-year geometric mean spawning escapement is greater than the MSST but less than $\mathrm{S}_{\text {MSY }}$;
- A stock is rebuilt when the most recent a 3-year geometric mean spawning escapement exceeds $\mathrm{S}_{\mathrm{MSY}}$.

All criteria rely on the most recent estimates available, which in some cases may be a year or more in the past because of incomplete broods or data availability. The above criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. Stock specific reference points and recent year estimates for relevant stocks are presented in Table II-6.

Based on the most recent available data on exploitation rates and spawning escapements, none of the relevant Chinook stocks were overfished and no stocks were subject to overfishing.

TABLE II-1. Sacramento River natural and hatchery adult fall Chinook escapement in numbers of fish.

|  | Upper River ${ }^{\text {a }}$ |  |  | Lower River |  |  | Total |  | Grand Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

a/ Above the Feather River; 1971-1985 estimates include Tehama-Colusa Spawning Channel.
b/ Fish spawning in natural areas are the result of hatchery and natural production; estimates generally based on carcass surveys.
c/ Estimation methodology was changed due to an extremely high Battle Creek escapement in 2002.
d/ Preliminary.

a/ Inriver run size includes a USFWS estimate of 30,550 fish (19\% of the run) that died prior to spawning in September 2002.
b/ Preliminary.
c/ In December 2011, Amendment 16 to the Salmon Fishery Management Plan was approved, which replaced the 35,000 spawning escapement floor with an $\mathrm{S}_{\text {MSY }}$ management objective of 40,700 natural area adult spawners. The 35,000 spawner floor was in effect from 1989-2007 and in 2011. In 2008-2010, fisheries were managed for a natural area spawning escapement of 40,700 adults under requirements of a rebuilding plan.
d/ Annual escapement goals may be more or less than $S_{M S Y}$ in some years due to meeting $S_{A C L}$ requirements and de minimis fishing provisions.

a/ North migrating peak counts are taken on nine miles of standard index surveys over nine river systems (see Appendix B, Table B-11 for individual system counts). Complete carcass counts are listed in Appendix B, Table B-10. Complete counts for Gold Ray and Winchester dams are listed in Appendix B, Table B-9.
b/ In 2004 one of the standard survey sections was not sampled. In the previous two years this section accounted for $33 \%$ of the total adult carcass counts.
c/ Preliminary.
d/ Surveys were not conducted.
e/ Gold Ray Dam removed October, 2010. Natural estimate derived using relationship of 2004-2010 spawning ground surveys to Gold Ray Dam passage. Estimate includes an unknown number of jacks.

TABLE II-5. Performance of Chinook salmon stocks in relation to 2013 preseason conservation objectives (preliminary data).

| System and Stock | 2013 Conservation Objective(s) | Achievement |
| :---: | :---: | :---: |
| Sacramento River Chinook |  |  |
| Fall | 122,000-180,000 natural and hatchery adults. | Preliminary estimate of 404,666 natural and hatchery adult fall Chinook, well above the upper end of the escapement goal range. |
| Winter (Endangered) | Age-3 impact rate for the area south of Point Arena, CA no greater than 12.9\% (NMFS ESA consultation standard). | Preseason projection of $12.9 \%$; no postseason estimate was available at time of printing. |
| Spring (Threatened) | Same objective as for winter Chinook. | See Winter Chinook achievement. |
| California North Coast Chinook |  |  |
| Klamath River Fall | Minimum escapement of 40,700 natural area adult spawners. | Preliminary estimate of 59,627 is $147 \%$ of the conservation objective. |
| California Coastal (Threatened) | No greater than $16.0 \%$ ocean harvest rate on age-4 Klamath River fall Chinook. | Preseason projection of $16.0 \%$; no postseason estimate was available at time of printing. |
| Oregon Coast Chinook |  |  |
| North Migrating Stocks South/Local Migrating Stocks | 150,000-200,000 natural adult spawners (equivalent to peak spawner index counts of $60-90$ adults per mile). | 144 natural adult spawners per mile, above the upper bound of the aggregate stock index range. |
| Columbia River Basin Fall Chinook |  |  |
| LRW (Component of threatened lower Columbia River Chinook ESU) | MSY objective of 5,700 natural North Lewis River adult spawners. | Preliminary estimate of 11,172 is $196 \%$ of the conservation objective. |
| LCR natural tules (Component of threatened lower Columbia River Chinook ESU) | Total (ocean plus inriver) AEQ exploitation rate on ESA-listed natural tules of no more than $41.0 \%$. | Preseason projection of $36.02 \%$. No postseason estimate was available. |
| LRH | 12,600 adult hatchery spawners. | Preliminary projection of 37,350 adult hatchery spawners, $296 \%$ of goal. |
| SCH | 7,000 adult hatchery spawners. | 21,590 adult hatchery spawners, $308 \%$ of goal. |
| MCB | No FMP objective; target of 7,750 hatchery adults. | 43,946 adult hatchery spawners, $567 \%$ of goal. |
| URB | 40-45,000 natural and hatchery adults above McNary Dam, plus meet treaty Indian obligations. U.S. v. Oregon parties agreed to 60,000 in 2011. | 454,991 natural and hatchery adults over McNary Dam, 1,071\% of MSY target in FMP. |

TABLE II-5. Performance of Chinook salmon stocks in relation to 2013 preseason conservation objectives (preliminary data). (Page 2 of 2)

| System and Stock | 2013 Conservation Objective(s) |  |  | Achievement |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Columbia River Basin Fall Chinook (continued) |  |  |  |  |  |  |
| Snake River Fall Chinook (Threatened; component of URB) | SRFI $\leq 0.700$ for all ocean fisheries combined (i.e., no less than a 30.0\% reduction from the 1988-1993 base period exploitation rate). |  |  | Preseason SRFI projection of 0.519. Postseason estimate was not available. |  |  |
| Washington Coastal Chinook |  |  |  |  |  |  |
| Fall | Natural spawner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations. |  |  | Based on preliminary estimates, objectives were met. Willapa Bay and Garys Harbor fall estimates were not available. |  |  |
| Spring/Summer | Natural spawner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations. |  |  | Based on preliminary estimates, objectives were met. Grays Harbor spring estimates were not available. |  |  |
| Puget Sound Chinook |  |  |  |  |  |  |
| (Threatened) | Minor part of Washington ocean harvest; Council ocean management not directed at these stocks. Adult equivalent exploitation rate standard developed for some stocks: |  |  | Postseason estimates were not available. Preseason predictions of adult equivalent exploitation rates and spawner objectives were: |  |  |

## CHAPTER III

## COHO SALMON MANAGEMENT

## OREGON PRODUCTION INDEX AREA COHO STOCKS

Oregon Production Index (OPI) area coho stocks include all Washington, Oregon, and California natural and hatchery stocks from streams south of Leadbetter Point, Washington, although stocks produced north of Leadbetter Point are also intercepted in the OPI area. The largest naturally produced coho stock is OCN coho, which includes coho produced from Oregon river and lake systems south of the Columbia River. OCN coho are managed as a stock aggregate with four identified components. Prior to 2000, NMFS listed three coho ESUs within the OPI area as threatened: CCC coho listed October 1996, SONCC coho listed May 1997, and OCN coho listed August 1998. In 2002, NMFS began an update of all its listing determinations and in January of 2006 concluded that the OCN ESU did not warrant listing under the ESA. That determination was overruled by a U.S. Court decision in 2007, and subsequently relisted by NMFS as threatened in February 2008. Columbia River natural coho were listed as endangered under the Oregon State ESA in 2002, and as threatened under the Federal ESA on June 28, 2005. The primary OPI hatchery stocks include a south migrating Columbia River (early) stock, a north migrating Columbia River (late) stock, public hatchery coho from the Oregon and northern California Coast, and formerly a small cooperative program along the southern Oregon Coast known as the Salmon Trout Enhancement Program (STEP), which was discontinued after the 2004 brood releases.

## Management Objectives

In establishing ocean salmon fisheries that impact OPI area coho stocks, the Council was guided by the reasonable and prudent alternatives of NMFS 1999 Supplemental Biological Opinion and Incidental Take Statement for CCC and SONCC coho and the March 2013 NMFS ESA guidance letter for LCN natural and OCN coho, which required:

1. No directed coho fisheries or retention of coho in all commercial and recreational fisheries off California to protect endangered CCC coho.
2. Marine fishery impacts on endangered CCC and threatened SONCC coho must be no more than 13.0 percent as indicated by projected impacts on RK hatchery coho.
3. Fishery impacts on threatened LCN coho must not exceed a coastwide marine and mainstem Columbia River exploitation rate of 15.0 percent.
4. Fishery impacts on threatened OCN coho must not exceed a coastwide marine and freshwater exploitation rate of 30.0 percent.

Based on parent escapement levels and observed OPI smolt-to-jack survival for 2010 brood OPI smolts, the total allowable OCN coho exploitation rate for 2013 fisheries was no greater than 20.0 percent under the Salmon FMP (Amendment 13) and no greater than 30.0 percent under the matrix developed by the OCN Coho Work Group during their review of Amendment 13. The work group recommendation was accepted by the Council as expert biological advice in November 2000.

The Council was also guided by a treaty Indian/non-Indian sharing agreement for Columbia upriver coho stocks, which required passage of 50 percent of the run destined for areas above Bonneville Dam.

## Regulations to Achieve Objectives

Historically, OPI area coho stocks contributed primarily to ocean fisheries off Oregon and northern California and, to a lesser degree, Washington and B.C. The Council has prohibited retention of coho in all fisheries south of the Oregon/California border since 1996. For the adopted seasons the STT projected exploitation rates of 7.3 percent for RK coho in marine fisheries, 23.1 percent for OCN coho in marine and freshwater fisheries combined, and 11.0 percent for LCN coho in marine fisheries.

Total allowable harvest set preseason for the non-Indian commercial and recreational fisheries for coho in 2013 was 89,000 , a slight increase from the 83,000 quota in 2012. For the treaty Indian fishery, the overall quota of 47,500 coho was a decrease from the 55,000 coho quota in 2012. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Commercial Troll

Commercial troll fisheries have been closed to coho retention south of Cape Falcon since 1993 with the exception of limited fisheries in 2007 and 2009.

Non-Indian commercial troll fisheries from Cape Falcon to the U.S./Canada border in 2013 had an overall quota of 14,220 coho (Table I-1). The fisheries were restricted to mark-selective coho retention.

All species treaty Indian fisheries north of Cape Falcon were not restricted to mark-selective retention of coho, and operated on an overall quota of 47,500 coho (Table I-2).

## Recreational

From 1994 through 1998 coho retention was prohibited in Oregon recreational fisheries south of Cape Falcon. Retention of coho has been prohibited off California since 1996 to protect ESA-listed CCC coho. Mark-selective coho directed ocean recreational fisheries have been implemented in the OPI area since 1998. Limited non-mark-selective recreational ocean coho fisheries have occurred in recent years; 2004 between Leadbetter Point and the Queets River and 2011 between Cape Falcon and Humbug Mountain. In 2012 and 2013, non-mark-selective fisheries occurred between the Queets River and Cape Falcon, and between Cape Falcon and Humbug Mountain. Adequate abundance of marked coho in the OPI area has resulted in allowable harvests of marked coho in Oregon and Washington within constraints for OCN and LCN coho.

In 2013, after inseason adjustments, the recreational coho fisheries north of Cape Falcon operated with quotas of 8,200 in the Neah Bay subarea, 3,040 in the La Push subarea, 29,140 in the Westport subarea (with the remainder on September 6 converted to a non-mark-selective quota of 6,350 ), and 38,380 in the Columbia River subarea (with the remainder on September 1 converted to a non-mark-selective quota of 9,785) (Table I-3). The recreational fishery between Cape Falcon and the Oregon/California border operated with a mark-selective quota of 10,500 in July. After inseason adjustments, a non-mark-selective fishery with a quota of 19,580 occurred in September between Cape Falcon and Humbug Mountain (Table I-3).

## Inside Harvest

Coho retention in all California fisheries was prohibited.
The 2013 inside recreational harvest of coho in Oregon coastal streams, as in recent years, was very restricted and generally limited to areas where surplus hatchery coho returns were expected. Estimates of the 2013 inriver recreational coho harvest for most areas were not available. Historical estimates of the recreational harvest of adult coho in Oregon coastal estuaries and rivers, derived from ODFW salmon and steelhead angler catch record cards, are reported in Table III-1.

Limited recreational fisheries for naturally-produced coho (non-mark-selective) were approved in twelve estuaries and three lake systems in 2013. The total catch estimate for these fisheries was 5,591in the estuaries, 300 in Siltcoos, 82 in Tahkenitch, and 21 in Tenmile lakes.

The 2013 Columbia River non-Indian commercial gillnet fishery harvested 48,400 adult coho, compared to 17,100 coho in 2012. Select Area fisheries in both Oregon and Washington accounted for 38,600 of the total 2013 Columbia River commercial coho catch. The Columbia River treaty Indian mainstem commercial gillnet coho catch was approximately 4,600 fish, compared to the 2012 catch of 6,400 coho. Columbia River commercial coho fisheries were primarily non-mark-selective. Coho harvest information for Columbia River commercial and recreational fisheries are presented in Appendix B, Table B-21.

The Buoy 10 and mainstem recreational fisheries below Bonneville Dam harvested 7,600 adult coho compared to 7,400 adult coho in 2012. All Columbia River recreational fisheries in 2013 were markselective for coho. In 2013 Columbia River managers opened the Buoy 10 fishery August 1 for marked Chinook (or left ventral clipped) and marked coho, with a daily bag limit of two adult salmon only one of which may be a Chinook. From September 2-12 Chinook retention was not allowed. From September 13-25 the fishery was open for marked Chinook and marked coho, with the daily bag limit of two adult salmon. From September 26 through December 31 the fishery was open for Chinook and marked coho, with a daily bag limit of two adult salmon. Barbless hooks were required in these fisheries. The upriver boundary for the fishery was at the Tongue Point, Oregon to Rocky Point, Washington line. The 2013 Buoy 10 effort totaled 65,800 angler trips (Table III-2). Historical Buoy 10 catch and effort data are provided in Appendix B, Table B-22. Recreational coho harvest estimates for Columbia River tributaries were not available.

## Escapement and Management Performance

The overall abundance estimate for OPI area stocks in 2013 was 452,100 compared to 311,300 in 2012 and to the recent ten-year average of 821,400 (Table III-3; Figure III-1). All Council area coho fisheries complied with quota limits. (Table I-6).

## Central California Coast and Northern California Coho

For CCC coho, redd counts have been made for the Lagunitas Creek basin since 1995 and are reported in Table B-7. As of February 11, 2014, 161 redds were counted. However, the spawning season for this watershed may not be complete and the final redd count may change. Estimates were available for escapement to Klamath River Basin hatcheries, but not for coho spawning in natural areas. In 2013, a total of 6,206 adult coho returned to Trinity River Hatchery and 1,186 adult coho returned to Iron Gate Hatchery. These values compare to a combined goal of 2,000 adults.

## Oregon Coast Natural Coho

The preliminary estimate of natural spawner escapement in 2013 to Oregon coastal river and lake systems from the Sixes River north (Oregon coast ESU) was 109,400 adult coho. This compares to 99,100 adults in 2012. Historical spawner escapement estimates of naturally produced coho are reported in Table III-1.

Preliminary information indicates the second lowest total natural spawning population on the Oregon coast since 2007 when the current random sampling protocol went into effect. The total estimate of the natural spawning population in 2013 was 120,600, including estimates from the Rogue River, which is part of the SONCC ESU (Table III-4, Figure III-2).

Preliminary postseason estimates of combined marine and freshwater exploitation on OCN coho was 15.8 percent, less than the preseason projection of 23.1 percent, and below the 30.0 percent maximum allowed
under the FMP and the OCN work group matrix. Preliminary postseason estimates of marine exploitation on RK coho was 11.3 percent, over the preseason projection of 7.3 percent, and below the 13.0 percent maximum ESA consultation standard.

## Oregon Coastal Hatchery Coho

The preliminary estimate of total coho returns to Oregon coastal public hatcheries was 6,200 adults (Table III-1). Hatchery egg-take goals were expected to be met at all public hatchery stations.

## Columbia River Coho

The 2013 ocean escapement of adult early and late Columbia River coho stocks was 243,000 fish, compared to 143,900 adults in 2012 (Appendix B, Table B-21). The 2013 Columbia River coho abundance was sufficient to meet all hatchery brood stock escapement needs.

Preliminary postseason estimates of marine exploitation on LCN coho was 9.8 percent, less than the preseason projected 11.0 percent.

## WASHINGTON COASTAL COHO STOCKS

Washington coastal coho stocks include all natural and hatchery stocks originating in Washington coastal streams north of the Columbia River to the western Strait of Juan de Fuca (west of the Sekiu River). The stocks in this group most pertinent to ocean salmon fishery management were Willapa Bay (hatchery), Grays Harbor, Quinault (hatchery), Queets, Hoh, and Quillayute coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

## Management Objectives

Preseason Management goals in 2013 for Grays Harbor and Olympic Peninsula coho stocks included achieving natural spawning escapement objectives and treaty Indian allocation requirements. The Council's preseason conservation objectives for stocks managed for natural production were based on maximum sustainable yield (MSY) spawner escapements established pursuant to the U.S. District Court order in Hoh v. Baldrige. The conservation objectives for the Queets, Hoh, and Quillayute rivers were developed as ranges intended to bracket estimates of MSY escapement. The range reflected the inherent uncertainty by using the high estimate of recruits-per-spawner and the low estimate of carrying capacity for the lower bound, and the low estimate of recruits-per-spawner and the high estimate of smolt carrying capacity for the upper end of the range. The ranges were further adjusted upward by 26 to 184 percent for risk aversion and habitat considerations. Annual targets for natural spawning escapement and total escapement were established by WDFW and treaty Indian tribes under the provisions of U.S. v. Washington and subsequent U.S. District Court orders. After an annual agreement was reached, ocean fishery escapement objectives were established for each river, or region of origin. Agreements included provisions for treaty Indian allocation requirements and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal coho other than those in the FMP in place during the preseason process were made in 2013.

In December 2011, Amendment 16 to the FMP was approved, which established new conservation objectives and SDC for Washington coastal coho based on either $S_{\text {MSY }}$ estimates derived from FRAM run reconstruction programs or existing conservation objectives.

## Regulations to Achieve Objectives

Washington coastal coho stocks did not play a primary role in 2013 Council area ocean fishery management because of greater constraints on Interior Fraser (Thompson River, B.C.) and LCN coho
stocks. Overall harvest quotas were limited to levels well below those of the late 1980s and early 1990s. All non-Indian ocean coho fisheries were mark-selective except for a September recreational coho fishery south of Cape Falcon and the September recreational coho fishery in the Columbia River and the Westport areas. The nontreaty troll fishery was selective all season. Treaty Indian fisheries were not mark-selective. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Willapa Bay Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement data for Willapa Bay coho are presented in Appendix B, Table B-24. The 2013 gillnet coho harvest in Willapa Bay totaled 11,545 fish. Based on the preseason forecast for a terminal run of 95,700 fish, the scheduled commercial fisheries were expected to harvest approximately 20,115 total coho.

From June 8, 2013 through July 31, 2013, Willapa Bay (Marine Area 2-1) was open for recreational fishing concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1, 2013 through January 31, 2014, Willapa Bay was open to recreational fishing with a daily-bag-limit of six salmon, no more than three adults. Chum and unmarked Chinook retention was prohibited. Barbed hooks were prohibited when fishing for salmon. Anglers were allowed to fish with two poles if they had a Two-Pole Endorsement. Expected harvest in recreational fisheries based on preseason forecast abundance was 3,415 hatchery and wild coho. Marine and freshwater recreational harvest estimates were unavailable for 2013, but for 2012, Marine Area 2-1 and freshwater recreational harvest estimates totaled 5,030 fish.

Freshwater recreational fisheries in the Willapa Bay watersheds varied in duration but were generally open for salmon fishing from August 1, 2013 through January 31, 2014 with a daily-bag-limit of six salmon, and no more than two or three adults. Chum and unmarked Chinook retention was prohibited. Single-point barbless hooks were required in all areas.

## Escapement and Management Performance

Willapa Bay coho were managed primarily for natural production. Estimates of natural spawning escapement for 2013 were unavailable. The most recent but still preliminary natural escapement estimate available was 20,024 in 2012, which met the WDFW escapement objective of 13,090 natural spawners. Escapement to Willapa Bay hatcheries in 2012 was estimated at 15,513 coho, which met the WDFW escapement objective of 6,100 spawners. FMP conservation objectives remain undefined for Willapa Bay coho.

The FMP conservation objective for Willapa Bay natural coho is undefined, so a determination of overfished status could not be made. Estimates of exploitation rates were not available, so an assessment of overfishing status was not possible, but based on exploitation rates for other Washington coastal coho stocks, it is unlikely that Willapa Bay coho were subject to overfishing (Table III-6).

## Grays Harbor Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement data for Grays Harbor coho are presented in Appendix B, Table B-26. The 2012 run size forecast for Grays Harbor coho, after accounting for ocean fishery impacts, was 198,012 fish ( 150,208 natural and 47,804 hatchery). Treaty Indian and non-Indian gillnet fisheries harvested 42,621 coho (natural, hatchery, and net-pen origin) in 2012. Recreational harvest estimates for 2013 are not available at this time.

The Quinault Indian Nation operated two separately scheduled gillnet fisheries for Chinook, coho, and chum in the area of the Lower Humptulips and in the area of the Lower Chehalis, as described in Chapter II under the section labeled Grays Harbor Chinook. The expected coho fishery impacts were limited by the expected abundance and harvest of Chinook in the Lower Chehalis side of the fishery. The Chehalis area Treaty fishery caught 18,687 coho, while the Humptulips area Treaty fishery catch was 3,270 coho. The combined Grays Harbor Treaty coho catch of 21,957 was 37 percent of expected harvest.

The non-Indian gillnet fishery in Humptulips commercial Area 2-C was open for four days late-October through mid-November. Retention of fall Chinook, coho, and chum were allowed. Live boxes were not required. Catches totaled 26 Chinook and 149 coho. The non-Indian gillnet fishery in the Chehalis River commercial Areas 2A and 2D was open for four 12-hour periods in October. Area 2D was truncated to those areas lying easterly of a north-south line from the confluence of the Hoquiam and Chehalis rivers to Renney Island then easterly to "Range Marker G" located on the south shore of Grays Harbor. Then the boundary expended east to the eastern boundary of Area 2D at the Highway 101 Bridge. The 12-hour fishery on October 10, 2013 required the use of tangle net gear only. There were four 24-hour periods in late October and November. During these fisheries, all areas of 2D were open. During all fisheries live boxes were required, and wild Chinook could not be retained. Total catch for areas 2A and 2D is 5,792. The total coho harvest during non-Indian gillnet fisheries in Grays Harbor was 5,941 fish, 71.2 percent less than the forecasted harvest estimate.

Chehalis Tribe Chehalis River mainstem fisheries occurred in the fall of 2013. The total harvest in 2013 is not available at this time as fisheries targeting coho are still on-going. The most recent five-year average (2008 to 2012) of reported coho harvest during Chehalis Tribe fisheries has been about 1,455 fish.

Estimates of catch in recreational fisheries for 2013 were unavailable; however, fisheries were conducted in three general areas: Marine Area 2.2, the Chehalis River and its tributaries, and the Humptulips River.

The recreational fishery in Marine Area 2.2 was open from September 16 through November 30. From September 16 to September 22, the retention of up to three adult salmon per day was allowed; of which one may be a Chinook. From September 23 to September 28 all recreational fisheries for salmon was closed to protect Chinook. From September 29 to the end of the season, only coho and chum retention was allowed.

The Chehalis River and its tributaries were open for coho fishing on the following dates and areas:

- Downstream of the high bridge on Weyerhaeuser 1000 line approximately 400 yards downstream from Roger Creek: September 16 through November 30, 2013 with a daily limit of 6 salmon, up to 3 adults may be retained, of which 2 may be wild coho. December 1, 2013 through January 31, 2014 with a daily limit of 6 salmon, up to 2 adults, with no Chinook, chum, or unmarked coho retention.

The Humptulips River recreational fishery was open for coho fishing on the following dates and areas, with a bag limit of two adult salmon daily.

- From the mouth to Ocean Beach Road from October 1 through November 30, 2013: a daily limit of 6 salmon, up to 3 adults may be retained, of which 1 may be a wild coho. From December 1, 2013 through January 31, 2014: a daily limit of 6 salmon, up to 2 adults may be retained, release wild coho.
- From the Ocean Beach Road to the confluence of the East and West forks: September 16 through November 30, 2013: a daily limit of 6 salmon, up to 3 adults may be retained; of which 1 may be a wild coho. From December 1, 2013 through January 31, 2014: a daily limit of 6 salmon, up to 2 adults may be retained, release wild coho.

## Escapement and Management Performance

Grays Harbor coho are managed for natural production with a spawning escapement goal of 35,400 . The 2013 terminal run forecast for natural spawning coho was 179,960 adult fish and 68,200 hatchery-origin coho. A preliminary escapement estimate for 2012 is 66,836 natural spawning coho. An estimate for 2013 Grays Harbor coho was not available. The returns of hatchery-origin coho to Grays Harbor hatchery programs were sufficient to provide for 2014 coho production goals. For the last three returns, natural origin escapement was estimated in 2009 at 64,994 , from which 892 were taken for hatchery brood stock; 86,876 in 2010, from which 755 were taken for hatchery brood stock; and 59,432 in 2011, from which 363 were taken for hatchery brood stock.

The geometric mean of Grays Harbor coho escapement in 2010, 2011, and 2012 was 77,825 , which was above the MSST of 18,320 ; therefore, Grays Harbor coho should not be considered overfished. Estimates of Grays Harbor coho exploitation rates were not available for 2012; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Grays Harbor coho should not be considered subject to overfishing (Table III-6).

## Quinault River Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement for Quinault River coho are presented in Appendix B, Table B-28. The treaty Indian gillnet fishery targeted hatchery Chinook and coho from early September through mid-November. A total of 20,477 coho were harvested by the gillnet fishery during the 2013 season.

## Escapement and Management Performance

Quinault River coho were managed for hatchery production. Escapement estimates for Quinault River coho in 2013 were unavailable. The Quinault National Fish Hatchery egg take objectives for 2013 were achieved.

## Queets River Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement for Queets River coho are presented in Appendix B, Table B-31. Queets River fisheries were managed according to preseason abundance estimates and planned Council ocean fisheries. The fishery was structured to target returning hatchery and natural coho while limiting total freshwater Chinook harvest to a maximum rate of 40 percent. The total harvest of coho in the Treaty Indian gillnet fishery was 4,515 commercially-landed fish, which was less than the preseason modeled catch of 12,883 . The gillnet harvest was comprised of a mix of early-timed hatchery fish and normal/late-timed natural fish and the harvest of both was substantially less than anticipated. A final estimate of the hatchery/natural mix in the catch is currently unavailable. Coho catch estimates in the treaty Ceremonial and Subsistence fishery are not yet available. Recreational fisheries operated with standard September 1 through November 30 schedules in the Queets, Clearwater, and Salmon Rivers, and a standard bag limit in the Clearwater and Queets. A third adult coho was allowed in the Salmon River in Park and State waters. Recreational fisheries for coho were non retention within Olympic National Park waters. Estimates of the non-Indian and treaty Indian recreational catches were not available.

## Escapement and Management Performance

The 2013 natural escapement estimate is unavailable. The expected natural coho escapement for 2013 based on preseason modeling was 10,587 , with a preseason escapement objective range of 5,800 to 14,500 natural coho. Actual escapement is anticipated to be below the preseason expectation because
actual catches were well below the preseason modeled catches. The 2012 post-season natural coho escapement estimate was 4,285.

The geometric mean of Queets River coho escapement in 2010, 2011, and 2012 was 7,455, which was above the MSST of 4,350; therefore, Queets River coho should not be considered overfished. Estimates of Queets River coho exploitation rates were not available for 2012; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Queets River coho should not be considered subject to overfishing (Table III-6).

## Hoh River Coho

## Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River coho are presented in Appendix B, Table B-34. The 2013 terminal run size of Hoh River natural coho was projected to be 7,340 . The tribal fishery targeted 30 percent of the terminal run. The treaty Indian gillnet fishery occurred from the week of September 1 to the week of December 31 (which included Stat Weeks 49-52 of steelhead management), as described in Chapter II under the section labeled Hoh River Chinook. The tribal commercial fishery harvested approximately 4,597 wild coho, and 233 hatchery-origin coho, with 20 coho retained for ceremonial and subsistence purposes. The non-Indian recreational fishery extended from September 1 through November 30, with the area below Willoughby Creek open and a daily-baglimit of six salmon, two of which could be adults and no mark-selective coho restriction. The portion of the river between Willoughby Creek and Morgan's Crossing opened October 16 to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan's Crossing did not open for recreational salmon fishing. A catch estimate for the 2013 recreational fishery of wild coho was not available.

## Escapement and Management Performance

The preliminary 2013 spawning escapement estimate for coho in the Hoh River is 2,573 . The escapement goal range established for this stock is 2,000 to 5,000 . The geometric mean of Hoh River coho escapement in 2011, 2012, and 2013 was 6,933; therefore, Hoh River coho should not be considered overfished. Estimates of Hoh River coho exploitation rates were not available for 2012; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Hoh River coho should not be considered subject to overfishing (Table III-6).

## Quillayute River Coho

## Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River summer and fall coho are presented in Appendix B, Table B-37. The recreational and tribal fisheries for coho were established by preseason agreement between WDFW and the Quileute Tribe. A total of 1,028 (412 natural) summer coho were harvested in the Quileute Tribe's commercial, ceremonial, and subsistence fisheries. An estimate of the 2013 recreational catch was unavailable.

Tribal harvest of fall coho in 2013 was 12,611. The Quileute Tribal net fishery harvested 8,027 natural fall coho and 4,584 hatchery fall coho. No fall coho were taken in the ceremonial and subsistence fishery. An estimate of the 2013 recreational catch was unavailable.

WDFW reduced the impacts of the recreational fishery on natural summer and fall coho by requiring mark-selective fisheries for coho through September. The Quileute Tribe did not have a closure in their fishery this year, but, as in past years, limited their fishery to 29 hours per week during July and August.

## Escapement and Management Performance

The summer coho run in the Quillayute is managed primarily for its hatchery component, which returns in August and September. The summer coho hatchery rack return was 2,504 , well above the goal of 300 . Natural summer brood stock was not collected for the Sol Duc hatchery. The preliminary estimate for 2013 natural summer coho escapement was 451.

The preliminary 2013 escapement estimate for natural fall coho was 7,063 . This was above the MSY spawner escapement objective of 6,300 for this stock. Sol Duc Hatchery collected 9 natural fall coho for integration in their fall coho program.

## PUGET SOUND COHO STOCKS

Puget Sound coho salmon stocks include natural and hatchery stocks originating from U.S. tributaries in Puget Sound and the Strait of Juan de Fuca. The primary stocks in this group that are most pertinent to ocean salmon fishery management were Strait of Juan de Fuca, Hood Canal, Skagit, Stillaguamish, Snohomish, and South Puget Sound (hatchery) coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

## Management Objectives

The Council's previous conservation objectives were based on the Puget Sound Salmon Management Plan, which defined management objectives and long-term goals for these stocks as developed by representatives from Federal, state, and tribal agencies. Conservation objectives for specific stocks were based on either maximum sustainable production for stocks managed primarily for natural production or on hatchery escapement needs for stocks managed for artificial production. The original conservation objectives were developed by a State/Tribal Management Plan Development Team following the Boldt Decision with the goal for natural spawning stocks defined as "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The methodology used to develop the objectives was based on assessment of the quantity and quality of rearing habitat and the number of adult spawners required to fully seed the habitat. Some objectives were subsequently modified by the U.S. District Court Fisheries Advisory Board and later determinations of the WDFW/Tribal Technical Committee. However, annual natural management objectives may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of U.S. versus Washington and subsequent U.S. District Court orders. (see "Memorandum Adopting Salmon Management Plan"; U.S. versus Washington, 626 F. Supp. 1405 [1985]).

The PSC adopted a management plan for coho salmon originating in Washington and southern B.C. river systems in 2002. The plan was directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the U.S. and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan. Categorical status was employed by the PST under the 2002 Coho Agreement to indicate general ranges of allowable total exploitation rates for U.S. and Canadian coho management units in 2013. Three categories were employed: low (total exploitation rate $<20$ percent), moderate (total exploitation rate 2040 percent), and abundant (total exploitation rate $>40$ percent).

In 2013, the Council adopted management objectives for Puget Sound coho as recommended by WDFW and tribal co-managers under provisions of U.S. v. Washington. The annual objectives were based on the

Comprehensive Coho Agreement categorical status and associated maximum exploitation rate limits. The Council formally adopted exploitation rate management objectives for Puget Sound coho in November 2009, which were generally consistent with PSC objectives, and replaced the longstanding FMP spawning escapement objectives in 2010. For 2013, the objectives were as follows:

- Strait of Juan de Fuca (East and West): Moderate status 40 percent maximum exploitation rate
- Hood Canal: Moderate status
- Skagit: Abundant status
- Stillaguamish:
- Snohomish:

Abundant status
Abundant status

45 percent maximum exploitation rate
60 percent maximum exploitation rate
50 percent maximum exploitation rate
60 percent maximum exploitation rate

## Regulations to Achieve Objectives

Puget Sound coho stocks did not play a primary role in 2013 ocean fishery management considerations, since management of impacts to Interior Fraser (Thompson River, B.C. Canada) and LCN coho were more constraining. Inside fisheries, primarily in Puget Sound, were constrained to meet PSC objectives for Interior Fraser coho. The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Puget Sound coho, LCN coho, OCN coho, and Interior Fraser coho. Season and size limit details are presented in Tables I-1, I-2, and I-3.

## Inside Harvest

Inside harvest of Puget Sound coho was managed on the basis of the six regional management units. Harvest of coho for each management unit is regulated according to the natural spawning escapement or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and nonIndian) for all coho stocks combined is presented in Appendix B, Table B-39. The 2013 total Puget Sound commercial catch of coho was 318,936 fish, compared to a catch of 383810 coho in 2012. NonIndian harvest was 29,446 coho, compared to 35,628 coho in 2012. Treaty Indian net and troll fisheries harvested 289,490 coho, compared to 347,182 coho in 2012.

Historical coho catches in the Puget Sound recreational fishery beginning in 1971 are listed in Appendix B, Table B-40. Catch estimates for the 2013 Puget Sound recreational fishery were unavailable.

## Escapement and Management Performance

Puget Sound FMP conservation objectives were updated to reflect exploitation rate management objectives adopted by the Council in 2009. No 2013 postseason estimates were available for southern U.S. (SUS) harvest impacts on Puget Sound coho stocks; therefore, the 2013 preseason exploitation rate objectives could not be evaluated, although none of the Puget Sound coho management units have exceeded their annual exploitation rate limits in recent years. Preliminary 2013 escapement information indicates natural Puget Sound coho escapements were generally average, but actual escapement numbers were unavailable.

Adult spawning escapements for Western Strait of Juan de Fuca coho in 2005, 2006, 2007, and 2008 were lower than the FMP conservation objective in place at the time, and therefore an Overfishing Concern was triggered, which resulted in a NMFS determination that the stock was overfished. The geometric mean of Strait of Juan de Fuca coho escapement (combined Western and Eastern; the current stock designation) in 2010, 2011, and 2012 was 17,877, which was above the MSST of 7,000 identified in FMP Amendment 16 and above the $S_{\text {MSY }}$ estimate of 11,000 ; therefore, Strait of Juan de Fuca coho should be considered rebuilt. Estimates of Strait of Juan de Fuca coho exploitation rates were not available for 2012 or 2013; however, fisheries in earlier years resulted in an exploitation rates well below the MFMT (0.60); therefore, Strait of Juan de Fuca coho should not be considered subject to overfishing (Table III-6).

The geometric mean of Hood Canal coho escapement in 2010, 2011, and 2012 was 14,313, which was above the MSST of 10,750; therefore, Hood Canal coho should not be considered overfished. Estimates of Hood Canal coho exploitation rates were not available for 2012 or 2013; however, fisheries in earlier years resulted in exploitation rates below the MFMT (0.65); therefore, Hood Canal coho should not be considered subject to overfishing (Table III-7).

The geometric mean of Skagit coho escapement in 2010, 2011, and 2011 was 50,659 , which was above the MSST of 14,875; therefore, Skagit coho should not be considered overfished. Estimates of Skagit coho exploitation rates were not available for 2012 or 2013; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.60); therefore, Skagit coho should not be considered subject to overfishing (Table III-7).

The geometric mean of Stillaguamish coho escapement in 2010, 2011, and 2012 was 32,475 , which was above the MSST of 6,100; therefore, Stillaguamish coho should not be considered overfished. Estimates of Stillaguamish coho exploitation rates were not available for 2012 or 2013; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.50); therefore, Stillaguamish coho should not be considered subject to overfishing (Table III-7).

The geometric mean of Snohomish coho escapement in 2010, 2011, and 2012 was 89,394 , which was above the MSST of 31,000; therefore, Snohomish coho should not be considered overfished. Estimates of Snohomish coho exploitation rates were not available for 2012 or 2013; however, fisheries in earlier years resulted in exploitation rates well below the MFMT ( 0.60 ); therefore, Snohomish coho should not be considered subject to overfishing (Table III-7).

## BRITISH COLUMBIA COHO STOCKS

## Management Objectives

B.C. coho stocks were managed under the PSC management plan as described in the previous section on Puget Sound coho.

## Regulations to Achieve Objectives

In 2013, Interior Fraser coho were in the "low" status category, which required the total exploitation rate in SUS fisheries not to exceed 10.0 percent. This requirement constrained both Council area and inside fisheries. The preseason expectation was that the total SUS fishery exploitation rate on Interior Fraser coho would be 10.0 percent ( 4.5 percent in Council area fisheries). The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Interior Fraser coho.

## Inside Harvest

Harvest of coho in inside waters affecting B.C. coho stocks occurred in Puget Sound fisheries, which were described in the previous section of this chapter.

## Escapement and Management Performance

Postseason estimates of SUS inside harvest impacts on coho stocks subject to the PSC coho management plan were unavailable. Preseason expectations were for an exploitation rate of 5.5 percent for inside fisheries on Interior Fraser coho.

## COASTWIDE GOAL ASSESSMENT SUMMARY

Preliminary assessment indicates that ESA consultation standards and FMP Conservation objectives for Council managed coho stocks in effect during the preseason planning process of 2013 were met for all other stocks with available estimates (Table III-6). Information to assess compliance with FMP conservation objectives and ESA consultation standards in 2013 was unavailable for Grays Harbor, and Queets River, and Puget Sound coho stocks.

## Stock Status Determinations

In 2011 the Council adopted SDC for overfishing, overfished, not overfished/rebuilding, and rebuilt under FMP Amendment 16. These criteria, approved and implemented in December 2011, were:

- Overfishing occurs when a single year exploitation rate exceeds the MFMT ( $\mathrm{F}_{\text {MSY }}$ );
- Overfished status occurs when a 3-year geometric mean spawning escapement is less than the MSST;
- Not overfished/rebuilding status occurs when the most recent a 3-year geometric mean spawning escapement is greater than the MSST but less than $\mathrm{S}_{\text {MSY }}$;
- A stock is rebuilt when the most recent a 3-year geometric mean spawning escapement exceeds $\mathrm{S}_{\mathrm{MSY}}$.
All criteria rely on the most recent estimates available, which in some cases may be a year or more in the past because of incomplete broods or data availability. The above criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. All relevant stocks were evaluated relative to these new SDC as required by the FMP. Stock specific reference points and recent year estimates for relevant stocks are presented in Table III-6. All relevant coho stocks were not overfished. Exploitation rate estimates were not available for coho stocks in 2012. Preliminary estimates suggest that Hood Canal coho were subject to overfishing in 2010.

a/ Does not include estimates for the southern OCN component (Rogue River). Spawner escapements to rivers prior to 1990 were estimated by a nonrandom standard index of streams north of the Rogue River. A total coastwide spawner escapement methodology based on stratified random sampling (SRS) was initiated in 1990 and used through 1997 and was implemented concurrently with the standard index methodology. The SRS methodology indicated that actual escapements were less than estimated by the standard rivers index. The spawner index data for years prior to 1990 have been recalibrated in this table to be comparable with the SRS estimates. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used.
b/ Oregon coastal Salmon Trout Enhancement Program (STEP) production from hatchery smolt rearing sites only.
c/ Natural and hatchery fish prior to 1990, marked fish only thereafter.
d/ Freshwater sport catch from ODFW salmon/steelhead angler catch record card information and represents only those coho greater than 24 inches total length through 1993, and those coho with a total length greater than 20 inches from 1994 on. Includes estimated mortality from hook-and-release..
e/ Preliminary.

TABLE III-2. Estimated weekly effort (in angler trips) and catches of Chinook and coho in the 2013 Buoy 10 recreational fisheries (all data are preliminary).

a/ Includes boat-based and shore-based fisheries from the upstream boundary at Tongue Point/Rocky Point line (2000), downstream to Buoy 10 line including Clatsop Spit, South Jetty of the Columbia R., and North Jetty of the Columbia R. after the ocean closed. Fishery opened Aug. 1 for marked Chinook and marked coho, with daily-bag-limit of two adult salmon, only one of which may be a Chinook. Sept. 2-12, Chinook retention not allowed. From Sept. 13-25 fishery open for marked Chinook and marked coho, with a daily-bag-limit of two adult salmon. Sept. 26-Dec. 31 the fishery open for Chinook and marked coho, with a daily-bag-limit of two adult salmon. Barbless hooks required in these fisheries.
b/ Includes adults and jacks as determined by CWT analysis.

a/ The OPI area includes ocean and inside harvest impacts and escapement to streams and lakes south of Leadbetter Pt., Washington.
b/ Incl. est. nonretention mort.: troll: release mort.(1982-present) and drop-off mort.(all yrs.); sport --release mort.(1994-present) and drop-off mort.(all yrs.)
c/ Includes STEP smolt releases through the 2007 return year, after which the program was terminated.
d/ Includes Rogue River.
e/ FRAM post season runs used after 1985 and includes OPI origin stock catches in all fisheries
$\mathrm{f} /$ Private hatchery stocks are excluded in calculating the OPI area stock aggregate ocean exploitation rate index.
g/ Preliminary.

a/ A spawner escapement methodology study based on SRS had been in effect from 1990 to 1997 in which coho salmon population estimates have been made for Oregon coastal river systems from the Sixes River and north. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used. Spawner population estimates include an adjustment for observation error.
b/ Estimate based on 899 miles of spawner habitat within Nehalem, Tillamook, and Nestucca Rivers and other direct ocean tributaries from Necanicum River through Neskowin Creek.
c/ Estimate based on 1,163 miles of spawner habitat within Siletz, Yaquina, Alsea, and Siuslaw Rivers and other direct ocean tributaries from the
d/ Estimate based on 1,622 miles of spawner habitat within Umpqua, Coos, and Coquille Rivers. Also includes spawners using tributaries to
e/ Estimate based on a mark-recapture methodology and 410 miles of spawner habitat within the Rogue River.
f/ Unreliable estimate.
g/ Preliminary.

a/ Prior to 1994, the conservation objective was expressed in terms of the total escapement of OCN spawners in index numbers rather than as an exploitation rate. The index escapement objectives from 1981 through 1993 are provided in Table III-2 of the Review of 1998 Ocean Salmon Fisheries and Table 1 of Amendment 11. From 1994 through 1997, Amendment 11 specified that at low stock sizes, only incidental harvest of OCN coho could occur and that impacts could not exceed $20 \%$. Beginning in 1998, the OCN conservation objective has been as specified in Amendment 13 which is also the basis for the NMFS jeopardy standards under the Endangered Species Act listing.
b/ From the coho FRAM.
c/ In 2005, the NMFS conservation objective and was in terms of marine area fisheries. In 2006, the NMFS conservation objective was in terms of Council area and mainstem Columbia River fisheries; thereafter in terms of all marine area and mainstem Columbia.
d/ The preseason projection was in terms of a marine exploitation rate.
e/ Preliminary.

TABLE III-6. Performance of coho salmon stocks in relation to 2013 preseason conservation objectives (preliminary data).

| System and Stock | 2013 FMP Conservation Objective | Achievement |
| :---: | :---: | :---: |
| OPI Area Coho (Columbia River and coastal stocks south of Leadbetter Point) | Natural spawner escapement objectives as provided below; meet hatchery egg-take goals; meet treaty Indian obligations. | Hatchery egg-take goals achieved. No information available on catch allocation. |
| Northern California (Threatened) and CCC (Endangered) | No directed coho fisheries or retention of coho south of the OR/CA border. Marine exploitation rate $\leq 13.0 \%$ as indicated by $R / K$ hatchery stocks. | No coho retention south of the California/Oregon border. Preliminary postseason estimate of $11.3 \%$. |
| OCN | Combined marine and freshwater exploitation rate $\leq 30.0 \%$. | Preliminary postseason estimate of $14.3 \%$. |
| Columbia River Natural (Threatened) | Combined marine and mainstem Columbia River exploitation rate $\leq 15.0 \%$. | Preliminary postseason estimate of $13.7 \%$ exploitation rate in marine and mainstem Columbia River fisheries. |
| Washington Coast Coho | Natural spawner escapement objectives as provided below and in state/tribal agreements; meet hatchery egg-take goals; meet treaty Indian obligations. | Hatchery egg-take goals achieved. No information available on catch allocation. |
| Grays Harbor | 35,400 natural adult spawners. | Escapement estimate was unavailable; preseason projection was 180,900 ocean escapement. |
| Queets | 5,800 to 14,500 natural adult spawners. | Escapement estimate was unavailable; preseason projection was 19,300 ocean escapement. |
| Hoh | 2,000 to 5,000 natural adult spawners. | Preliminary postseason escapement estimates was 2,573 . |
| Quillayute Fall | 6,300 to 15,800 natural adult spawners. | Preliminary postseason escapement estimates was 7,063 . |

TABLE III-6. Performance of coho salmon stocks in relation to 2013 preseason conservation objectives (preliminary data).

| Page (2 of 2) |  |  |
| :---: | :---: | :---: |
| System and Stock | 2013 FMP Conservation Objective | Achievement |
| Puget Sound Coho | Stepped exploitation rate objectives; meet hatchery egg-take goals; meet treaty Indian obligations and inside non-Indian fishery needs for six management units. | Data not available for 2012 natural spawner escapements. Hatchery egg-take goals will be met. |
| Strait of Juan de Fuca | $\leq 40 \%$ total exploitation rate. | Preseason expectation of an 12.9\% total exploitation rate; postseason estimate unavailable. |
| Hood Canal | $\leq 45 \%$ total exploitation rate. | Preseason expectation of a 45.0\% total exploitation rate; postseason estimate unavailable. |
| Skagit | $\leq 60 \%$ total exploitation rate. | Preseason expectation of a 36.2\% total exploitation rate; postseason estimate unavailable. |
| Stillaguamish | s50\% total exploitation rate. | Preseason expectation of a $27.8 \%$ total exploitation rate; postseason estimate unavailable. |
| Snohomish | $\leq 60 \%$ total exploitation rate. | Preseason expectation of a $25.1 \%$ total exploitation rate; postseason estimate unavailable. |

TABLE III-7. Coho stock status relative to overfished and overfishing criteria. A stock is overfished if the 3-year geometric mean spawning escapement is less than the minimum stock size threshold (MSST); a stock experiences overfishing if the total annual exploitation rate exceeds the maximum fishing mortality threshold (MFMT).
Table III-7. Coho stock status relative to overfished and overfishing criteria. A stock is overfished if the 3-year geometric mean spawning escapement is less than the minimum stock size threshold (MSST); a stock experiences overfishing if the total annual exploitation rate exceeds the maximum fishing mortality threshold (MFMT).

## CHAPTER IV

## SOCIOECONOMIC ASSESSMENT OF THE 2013 OCEAN SALMON FISHERIES

SUMMARY: Total 2013 exvessel value of the Council-managed non-Indian troll commercial salmon fishery was $\$ 34.1$ million, the highest total since an inflation-adjusted $\$ 34.7$ million in 2004, largely thanks to California's highest value commercial salmon fishery since 1988. The exvessel value of the coastwide commercial fishery in 2013 was more than triple the 2008-2012 inflation-adjusted average of $\$ 8.1$ million (which includes two zero years for California, 2008 and 2009), but still 40 percent below the 1979 through 1990 inflation-adjusted average of $\$ 56.8$ million. The coastwide average exvessel price for Chinook in 2013 was $\$ 6.14$ per pound, 12 percent above last year's inflation-adjusted average. At $\$ 2.18$ per pound, average 2013 West Coast coho prices were six percent higher than last year's inflationadjusted average. The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2013 was 307,100, an increase of 6 percent from last year, but 49 percent below the 1979 through 1990 average. Total West Coast income impacts associated with recreational and commercial ocean salmon fisheries for all three states combined in 2013 were estimated at $\$ 79.3$ million, the highest level since an inflation-adjusted $\$ 101.1$ million in 2004. While total income impacts in 2013 were 40 percent above the prior year's inflation-adjusted level, they were still 56 percent below the 19791990 inflation-adjusted average. The four lowest total income impacts (adjusted for inflation) were recorded during 2008-2011.

## ALLOCATION OF THE SALMON RESOURCE

Salmon management by the Council involves numerous allocation issues including:

- Determining the amount of salmon available for ocean harvest after considering expected abundances, harvests by inside fisheries, and spawning escapement goals.
- Allocating harvest among broad management areas and among port areas within the management areas.
- Allocating harvest between Indian and non-Indian harvesters.
- Allocating the non-Indian portion between commercial and recreational harvesters.

The amount of salmon available for harvest in Council management areas depends, in part, on harvest in Canada and Alaska. Allocation of harvest between the West Coast, Canada, and Alaska is determined within the constraints of the PST.

In general, the recreational fishery has tended to have a more stable harvest level than the commercial fishery (in both absolute and relative terms) (Figures IV-1 and IV-2). The majority of the annual variation in available ocean harvest is usually taken up in the commercial fishery. However, both commercial and recreational fisheries have suffered substantial declines relative to harvest levels of the 1980s, the effects of which are amplified within specific geographic areas.

Decisions on allowable harvests for a particular stock often have implicit allocation effects on the geographic distribution of salmon harvest. Seasons may be more restrictive along a particular area of the coast to protect a depressed stock that is encountered at a higher rate there than in other areas. The geographic distribution of harvest opportunity along the coast involves balancing the often conflicting objectives of maximizing ocean harvest and distributing the responsibility for resource conservation. A brief outline of the regulatory objectives which shaped the 2013 season is provided in Chapter I; and an assessment of success in meeting the objectives is provided in Chapters II and III.

## COMMERCIAL SALMON FISHERIES

## West Coast Non-Indian Commercial Ocean Fishery

## In-season Price Trends

Coastwide average exvessel prices for troll caught Chinook and coho in 2013 were $\$ 6.14$ and $\$ 2.18$ per pound, respectively. Monthly average exvessel price data provide information on price trends over the season (Table IV-1). California Chinook prices were at their highest in May and October, averaging $\$ 7.89$ and $\$ 7.21$ per pound, respectively. Oregon Chinook prices were highest in April and May, averaging $\$ 8.07$ and $\$ 7.89$ per pound, respectively. In Washington, average Chinook prices were highest in May at $\$ 7.65$ per pound (There were no Washington landings in April). California and Washington average Chinook exvessel prices were at their lowest in July, while Oregon average Chinook prices were lowest in September, slightly lower than in July. For the season, exvessel Chinook prices in Washington, Oregon and California averaged $\$ 6.16, \$ 5.88$ and $\$ 6.23$ per pound, respectively. Coho prices in Washington and Oregon averaged $\$ 2.17$ and $\$ 2.56$ per pound, respectively.

## Annual Trends (Seasons, Value, Prices, and Pounds)

Average Chinook and coho troll exvessel price and value by state and species, compiled from fish receiving tickets and expressed both in nominal terms and inflation-adjusted 2013 dollars, are presented in Tables IV-2, IV-3, and IV-4. Data on pink salmon are shown in Table IV-5. The gross domestic product implicit price deflator, developed by the Bureau of Economic Analysis, was used to adjust nominal dollar values for inflation (Appendix D, Table D-22). Landings weights by state and port for Chinook and coho are presented in Tables IV-6, IV-7 and IV-8. These tables and the following discussion describe the non-Indian commercial fishery in Council management areas and associated state territorial ocean area waters.

Total 2013 coastwide exvessel value of the Council-managed non-Indian commercial troll salmon fishery was $\$ 34.1$ million, 67 percent higher than the prior year ( $\$ 20.4$ million), and more than three-and-a-half times the 2011 level of $\$ 9.5$ million (adjusted for inflation). Coastwide exvessel value was more than 26 times its all-time low level of $\$ 1.3$ million recorded in 2008 (including pinks, adjusted for inflation).

In 2013 California achieved $\$ 23.6$ million in commercial troll exvessel landings value of Chinook, 72 percent above the prior year's level ( $\$ 13.7$ million), and nearly four-and-a-half times the 2011 California commercial ocean salmon harvest value of $\$ 5.3$ million (adjusted for inflation). 2013 saw California's highest inflation-adjusted landings value since 1988 ( $\$ 66.7$ million), although landings revenues in 2013 were still 21 percent below the 1979-1990 inflation-adjusted average of $\$ 29.9$ million.

The 2013 exvessel value of the Oregon commercial troll Chinook and coho harvest of $\$ 7.6$ million was the highest level since 2005 ( $\$ 9.8$ million), 75 percent higher than in 2012 ( $\$ 4.3$ million), and three-and-ahalf times the 2008-2012 average of $\$ 2.1$ million (inflation-adjusted). Still Oregon’s 2013 commercial troll harvest value was 58 percent below the 1979-1990 average of $\$ 18$ million, and 16 percent below the 1979-2012 average of $\$ 9$ million (inflation-adjusted).

The 2013 exvessel value of Washington's non-Indian troll Chinook and coho harvest of $\$ 2.8$ million was 19 percent above last year's inflation-adjusted value of $\$ 2.4$ million. Average exvessel value of Washington's commercial landings over the past four years (2010-2013) of $\$ 2.6$ million is higher in inflation-adjusted terms than any single year's total since 1988 ( $\$ 3.7$ million). However the 2010-2013 average value is still 68 percent below the 1979-1990 inflation-adjusted average of $\$ 8.1$ million.

The 2013 average West Coast ocean harvest Chinook price of $\$ 6.14$ per pound is the third highest in inflation-adjusted terms since 1979, and reverses a mostly downward trend over the prior four years. Adjusted for inflation, the average Chinook price over the last eight years (2006-2013) was $\$ 6.01$ per pound (which includes the highest recorded inflation-adjusted average price of $\$ 7.47$ in 2008). The average Chinook price over those years is higher in inflation-adjusted terms than any single year except 1979 and 2008, when the average inflation-adjusted prices were $\$ 6.44$ and $\$ 7.47$ per pound, respectively. Part of the reason exvessel prices may have been high in recent years may be due to the relatively restricted fishing opportunities (see Chapter I and Appendix C for details). The 2013 coastwide average Chinook price was 12 percent above last year's value ( $\$ 5.50$ ), one percent above the previous five-year (2008-2012) average of $\$ 6.08$ per pound, and 54 percent above the 1979-2012 average of $\$ 3.99$ per pound (inflation-adjusted). At $\$ 2.18$ per pound, 2013 average West Coast coho prices were six percent higher than last year and one percent higher than two years ago, but four percent below the previous five year average (2008-2012) of $\$ 2.28$, and 25 percent below the 1979-1990 average of $\$ 2.91$ (inflation-adjusted).

In terms of numbers of fish, the 2013 coastwide, non-Indian commercial troll Chinook harvest of 450,100 fish was 38 percent above last year and nearly three-and-a-half times 2011 (Figure IV-1). The number of Chinook harvested commercially in 2013 was the highest level since 2005, but still 28 percent below that number (627,200), and 31 percent below the 1976-2012 long-term average of 649,400 fish. The 2013 coastwide average weight per Chinook (12.3 pounds) was eight percent above last year's average (11.4 pounds), eight percent below the 2011 average weight, and approximately equal to the previous five year (2008-2012) average (Appendix D Tables D-1, D-2, and D-3).

The non-Indian commercial fishery caught 6,500 coho coastwide in 2013, an increase of 66 percent over the prior year $(3,900)$, and 84 percent above the 2011 catch $(3,500)$, but 85 percent below the 2009 recent year peak coho harvest level of 42,000 fish. The coastwide average weight per coho ( 5.2 pounds), although only six percent and seven percent below the prior two years' average weights, respectively, was the lowest average weight recorded in a coho harvest year since the mid 1990s. The 2013 average weight was about 38 percent below the highest average coho weights recorded since 1980, i.e., 8.5 pounds in 2006 and 8.4 pounds in 2008. Coastwide coho exvessel value was $\$ 73,700$ in 2013, 67 percent above the inflation-adjusted value for the prior year ( $\$ 44,200$ ), but 87 percent below the inflation-adjusted $\$ 578,300$ recorded in 2009 (Figure IV-4).

West Coast port areas with the highest commercial Chinook landings (by weight) in 2013 were San Francisco ( 32 percent), Fort Bragg ( 26 percent), Coos Bay ( 14 percent) and Monterey ( 7 percent). In 2012 the leading ports were San Francisco (32 percent), Monterey (18 percent), Fort Bragg (17 percent), Newport ( 7 percent) and Coos Bay ( 6 percent). In 2013, the ports north of Cape Falcon accounted for only about 9 percent of coastwide Chinook harvest by weight, their lowest share since 2005 ( 8 percent). In comparison, ports north of Cape Falcon accounted for 14 percent of landings in 2012, 21 percent in 2011, 51 percent in 2010, 95 percent in 2009 and 84 percent in 2008. Between 2000 and 2007, ports north of Cape Falcon accounted for an average of about nine percent of coastwide Chinook landings by weight.

Compared with last year, commercial Chinook harvest by weight in 2013 was up 50 percent in California, 74 percent in Oregon, and less than four percent in Washington. Compared with last year, the 2013 commercial Coho harvest by weight was down 47 percent in Oregon but up 77 percent in Washington. Commercial harvest of coho in California has been prohibited since 1992.

## Ocean Commercial Salmon Harvesters

Based on Pacific Coast Fisheries Information Network (PacFIN) data, a total of 1,099 vessels participated in the West Coast commercial salmon fishery in 2013. This is eight percent more than participated in

2012 (1,021), 31 percent greater than the number participating in 2011 (842), and 66 percent greater than the number that participated in 2010 (664). The number of vessels making landings in 2013 was the highest vessel participation total since 1,222 vessels participated in 2005. Note that these coastwide vessel counts are less than totals derived by summing values in the state-level tables (Tables D-4, D-5, and D-6) because a given vessel may be counted in more than one state and also due to variation in the degree of completeness at the time data were extracted for this report.

In 2013, 670 commercial vessels made salmon landings in California compared with 616 vessels in 2012, 464 vessels in 2011, and 215 vessels in 2010. Zero vessels landed salmon in California in 2008 and 2009. In 2007, there were 601 vessels active in California (Table D-4). In Oregon, the active fleet increased by 30 vessels in 2013, to 399 vessels compared to 369 vessels the prior year (Table D-5). The number of active vessels in Washington increased by three from 105 vessels last year to 108 vessels in 2013 (Table D-6). Coastwide, the number of limited entry salmon permits issued in 2013 decreased by 49 from the previous year to 2,270 . Landings were made on 52 percent of all permits in 2013, up from 47 percent in 2012, 37 percent in 2011 and 29 percent in 2010. Note: Years 2008 and 2009 are the two lowest vessel participation years on record (1982-2013). From 1982 to 1993 an average of 5,193 of 7,942 total permits ( 65 percent) harvested on an annual basis. Harvest opportunity began declining substantially after that time, and some permits were subsequently purchased in a buyback program.

In 2013, coastwide average inflation-adjusted exvessel value of salmon landings per vessel increased 54 percent compared to 2012 , to $\$ 29,000$ per vessel. Compared to last year, average exvessel revenue per vessel in 2013 was up 58 percent in California, 62 percent in Oregon, and 15 percent in Washington. Note that some caution needs to be exercised in interpreting average per vessel exvessel revenue. For example, the averages may be influenced as much by a disproportionate change in the number of small or large harvesters from one year to the next as by a change in the average revenues of those vessels remaining in the fishery.

Additional historical information on landings by vessel size, percentages of the fleet responsible for the majority of harvest, and harvest by residence of participants in each state's fisheries is included in Appendix D.

## West Coast Treaty Indian Commercial Ocean Fishery

Treaty Indian commercial fisheries off Washington operate under regulations established by the Council. While some of the treaty Indian harvest is for ceremonial and subsistence purposes, the vast majority of the catch is sold commercially. Commercial treaty Indian fisheries provide food to consumers and generate income in local and state economies through expenditures related to harvesting, processing, and marketing of the catch. In 2013 the treaty Indian ocean troll fishery harvested 52,500 Chinook (497,900 pounds) and 47,700 coho ( 241,000 pounds), compared with 56,400 Chinook ( 529,700 pounds) and 37,500 coho ( 198,600 pounds) in 2012, 34,700 Chinook ( 382,200 pounds) and 13,600 coho ( 77,600 pounds) in 2011, and 34,300 Chinook (298,800 pounds) and 11,500 coho (80,300 pounds) in 2010 (Tables A-15 and D-3). The preliminary exvessel value of Chinook and coho landed in the treaty Indian ocean troll fishery was $\$ 6.4$ million in 2013 compared with inflation-adjusted values of $\$ 2.4$ million in 2012, $\$ 1.8$ million in 2011, $\$ 1.4$ million in 2010, and $\$ 1.1$ million in 2009 (revenue values based on January 27, 2014 PacFIN data).

## Columbia River Commercial Fishery

Harvest in the ocean salmon fisheries impacts the inriver fisheries by affecting the number of fish available for harvest in inside treaty Indian and non-Indian fisheries. Table IV-9 shows the exvessel value of treaty Indian and non-Indian commercial harvest of Chinook, coho and chum salmon in the Columbia River. All prices and values in the table and the following discussion are reported in inflation-
adjusted dollars. Exvessel prices for inriver commercial salmon catch varies considerably with species (Chinook, coho or chum), race (e.g., spring versus fall Chinook), and stock (e.g., tules versus brights). Spring Chinook generally bring the highest prices, and tule fall Chinook and chum the lowest prices.

Total exvessel value of combined treaty Indian and non-Indian commercial salmon harvested in the Columbia River in 2013 was $\$ 11.8$ million. This was 80 percent above the 2012 level of $\$ 6.5$ million, and nine percent above the inflation-adjusted 2011 level of $\$ 10.8$ million. Of these amounts, the total inflation-adjusted exvessel value of non-Indian commercial salmon harvested in the Columbia River was $\$ 5.4$ million in 2013, $\$ 3.4$ million in 2012, $\$ 5$ million in 2011, and $\$ 5.4$ million recorded in 2010 (Table IV-9).

Total 2013 exvessel value of treaty Indian salmon harvested in the Columbia River and sold on fish tickets was $\$ 6.4$ million. This is more than double the inflation-adjusted level of $\$ 3.1$ million in 2012, nine percent above the $\$ 5.8$ million landed in 2011, and 24 percent above the inflation-adjusted 2010 value of $\$ 5.2$ million. Note that these values include only sales made to licensed fish buyers. Treaty Indian fisher direct sales to the public are accounted for in harvest monitoring reports (Table B-20), but estimates of the pounds and value of such sales are not included in Table IV-9.

## Puget Sound and Washington Coastal Inside Fisheries

Information on 2013 Puget Sound and Washington coastal inside fisheries is preliminary. Based on PacFIN data (as of January 27, 2014), the exvessel value of all salmon species taken in the commercial non-Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) in 2013 was $\$ 34.0$ million. This was the highest value in inflation-adjusted terms since $\$ 35$ million in 1989. Of the total landings in 2013, $\$ 4.2$ million were Chinook and coho (compared with $\$ 6.3$ million in 1989). By way of comparison, in 2012 the total inflation-adjusted exvessel value of the commercial non-Indian salmon fisheries in these areas was $\$ 6.1$ million, of which $\$ 1.6$ million were Chinook and coho. In 2011 the total inflation-adjusted exvessel value in these areas was $\$ 12.6$ million, of which $\$ 2.1$ million were Chinook and coho. In 2010 the total was $\$ 11.4$ million for all salmon species, of which $\$ 1.2$ million were Chinook and coho. The 1981 through 2012 inflation-adjusted average annual exvessel value from these fisheries was $\$ 16.1$ million, of which on average approximately $\$ 4.0$ million were Chinook and coho.

The preliminary 2013 exvessel value reported to PacFIN (as of January 27, 2014) for all salmon species taken in the commercial treaty Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) was $\$ 22.0$ million, of which $\$ 11.4$ million were Chinook and coho. In previous years, substantial additional landing reports have come in after publication of this review. The updated value for 2012 commercial treaty Indian harvest in Puget Sound and Washington coastal inside fisheries is $\$ 13.3$ million for all salmon species, of which $\$ 8.3$ million were Chinook and coho (inflationadjusted). The exvessel value of the 2011 commercial treaty Indian harvest in Puget Sound and Washington coastal inside fisheries was $\$ 20.8$ million for all salmon species, of which $\$ 7.8$ million were Chinook and coho (inflation-adjusted). From 1981 through 2012 the inflation-adjusted average annual exvessel value of commercial treaty Indian fisheries in Puget Sound and Washington coastal inside areas is $\$ 20.8$ million, of which on average $\$ 7.9$ million were Chinook and coho.

## Klamath River Fisheries

Commercial sales in the Yurok and Hoopa Valley Reservation Indian fall gillnet fisheries in the Klamath River occurred in 1987-1989, 1996, 1999-2004, and 2007-2013. Average commercial catch of fall Chinook was about 22,900 fish over those years, most of which were taken in the estuary. Commercial sales also occurred in spring Chinook gillnet fisheries in 1989, 1996, 2000-2004, and 2007-2013, with an annual average of about 1,100 fish sold. The 1989 total harvest of 27,700 fall Chinook reportedly had an
average weight of 15.4 pounds per fish and sold for $\$ 852,000$ ( $\$ 1.3$ million adjusted to 2013 dollars). In 1996, 3,129 spring Chinook and 40,147 fall Chinook were harvested, with an average weight per fish landed of 13.5 pounds and value at first sale of an estimated $\$ 525,000$ ( $\$ 673,000$ adjusted to 2013 dollars). Records are not available for the weight and value of harvests for years after 1996 as each Indian fisher now markets their fish independently. The fishery has occurred in most recent years with the exception of 2005 and 2006. In 2013 approximately 51,400 commercial fall Chinook were harvested, which although the second highest total since 1987, was 36 percent below the 2012 harvest of 80,900 fish. The 2012 fall Chinook harvest was more than double the previously highest total of 40,147 taken in 1996. By comparison, only 15,600 fall Chinook were harvested in 2011, and 15,300 were harvested in 2010. The spring Chinook commercial harvest in 2013 was 971 fish, 13 percent higher than last year and the highest total since 2,300 were harvested in 2007. By comparison, only 33 spring Chinook were taken in 2011, and 259 were harvested in 2010 (Appendix B, Table B-5).

## CEREMONIAL AND SUBSISTENCE SALMON FISHERIES

In addition to the commercial Indian fisheries discussed above, fish are taken in Indian fisheries each year for ceremonial and subsistence purposes. Estimates of the amount of salmon used for ceremonial and subsistence purposes are documented in Appendix B. Discussion of the importance of ceremonial and subsistence fish to Indian communities is presented in Appendix B to Amendment 14 of the salmon FMP.

## RECREATIONAL SALMON FISHERIES

## Ocean

The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2013 was 307,100 , an increase of six percent over 2012, and 45 percent above the 2011 level, but 49 percent below the 1979-1990 annual average of 599,700. Compared with 2012, preliminary estimates of the number of trips taken in 2013 decreased by three percent in California, but increased by 28 percent in Oregon and by three percent in Washington. (Note that Washington effort estimates shown in Tables IV10 and IV-13 may differ from those in Tables I-4 and (Appendix A) Table A-17 because the former exclude bank fishers on the Columbia River north jetty.)

Recreational ocean area salmon fishing takes place primarily in two modes: (1) anglers fishing from privately owned pleasure craft, and (2) anglers employing the services of charter vessels. In general, success rates on charter vessels tend to be higher than success rates on private vessels. Small amounts of shore-based effort directed toward ocean area salmon also occur from jetties and piers. The coastwide proportion of angler trips taken on charter vessels in 2013 ( 27 percent) fell six percent from 29 percent of trips in 2012, but was virtually the same proportion as in 2011. Underlying this coastwide trend were a slight increase over last year in the proportion of charter trips in California, a decrease of 12 percent in Oregon, and decrease of two percent in Washington. Figure IV-5 and Tables IV-10, IV-11, IV-12, and IV-13 display details of recreational effort and catch by port area and mode for each state.

## California

The number of ocean recreational salmon trips in California in $2013(143,800)$ reversed an upward trend that had continued since 2008. The 2013 total was three percent below $2012(148,000)$, but still higher than in any other year since $2005(172,100)$. The number of salmon trips in 2013 was 16 percent higher than in the prior year in Fort Bragg and 15 percent higher in San Francisco, but lower than last year's total in Crescent City ( -10 percent), Eureka ( -3 percent), and Monterey ( -31 percent). A total of 113,300 Chinook were caught in California on a total of 143,800 trips, for an average success rate of 0.79 fish per trip. The charter industry's share of California recreational salmon trips in 2013 was about 36 percent, which was slightly above last year's share, and the highest proportion since 2005 (Table IV-10, Table IV11 and Figure IV-5).

## Oregon

Ocean recreational salmon trips in Oregon in 2013 were up 28 percent to 86,300 trips compared with an estimated 67,300 angler trips in 2012 (Tables IV-10 and IV-12). Total trips in 2013 were also 77 percent higher than 2011, and 52 percent above the most recent five year average (2008-2012). Compared with last year, effort was higher in ports both north and south of Cape Falcon: up 27 percent in Astoria, 20 percent in Tillamook, four percent in Newport, 81 percent in Coos Bay, and seven percent in Brookings. The charter industry's share of Oregon recreational salmon trips in 2013 was about nine percent, which is 12 percent lower than last year, and about 18 percent below the recent five year (2008-2012) average share (Table IV-10, Table IV-12 and Figure IV-5).

From 1984 to 1993, on average coho accounted for 87 percent of the annual Oregon recreational ocean salmon catch. From 1994 through 1998 the lack of opportunity to retain coho south of Cape Falcon generally resulted in much lower angler success rates. With the opportunity to retain coho in markselective fisheries south of Cape Falcon beginning in 1999, salmon retention rates increased. From 2002 through 2011, retention rates ranged between 0.44 and 1.08 salmon per angler-day. The 2013 Oregon salmon retention rate of 0.52 was toward the lower end of this range and virtually the same as last year's value. The 2013 value was also the highest since a retention rate of 1.08 was recorded in 2009, and it continues a rising trend exhibited since a recent low of 0.44 in 2010. In 2013, coho's contribution to the total Oregon recreational ocean salmon catch was only 32 percent, the second lowest share recorded since at least 1979, and the lowest since 1994.

## Washington

In 2013, 77,000 ocean angler trips were taken on vessels on the Washington coast, an increase of three percent from the 75,000 trips taken in 2012, and six percent above the recent five year (2008-2012) average of 72,500 . About 32 percent of Washington angler trips were taken on charter vessels in 2013, down two percent from 2012, and three percent below the recent five year average share of 33 percent (Table IV-10, Table IV-13 and Figure IV-5).

The angler success rate in Washington (in terms of retained fish per angler-trip) was 0.97 in 2013, up 12 percent from 0.86 in 2012, but six percent below the recent five year (2008-2012) average success rate of 1.03. Note that these figures do not include angler effort that occurs from the ocean side of the Columbia River jetty, or in the state managed Area 4B add-on fishery (if open).

In order to increase angler participation in non-salmon recreational fishing (e.g., bottomfish) and to extend the length of the salmon season, partial-week closures were instituted in the recreational fishery north of Cape Falcon beginning in 1985. Sunday through Thursday salmon openings were used beginning in 1996 in the Westport and Columbia River port areas. Until relatively recently, the Neah Bay and La Push areas were generally open seven days per week. In 2013 the main-season recreational salmon fishery in the Columbia River area (south of Leadbetter Point and north of Cape Falcon) was open seven days per week. Most open areas north of Leadbetter Point were also open seven days per week throughout the season, with the exception of Queets River to Leadbetter Point, which was open Sunday through Thursday during June 23-July 18 but seven days per week thereafter. In 2013 there were 45,500 bottomfish trips north of Cape Falcon, a two percent increase from 44,500 trips in 2012 and continuing an upward trend exhibited since the 2009 low point of 37.2 (Table IV-14). Compared with 2012, the Columbia River and Neah Bay areas both showed increases in total bottomfish effort, while Westport and La Push were both slightly lower.

## Buoy 10 and Area 4B Add-On Fisheries

In 2013 salmon anglers fishing from private and charter boats from Oregon and Washington made a total of 64,000 trips in the Buoy 10 fishery. This effort level is slightly above the 63,700 trips in 2012 and 34
percent above the 47,700 trips in 2011. Angler success/retention rates in the Buoy 10 fishery increased to 0.47 salmon per day in 2013 from 0.41 in 2012, 0.38 in 2011 and 0.29 in 2010 (Table IV-15).

In 2000, about 3,400 trips were made in the late-season Area 4B add-on fishery. Since that time there have been no late season Area 4B add-on fisheries (Table IV-15), with the exception of 2008, when there were an estimated 782 private trips and no charter trips. There was no Area 4B add-on fishery in 2013.

There were numerous other inside recreational salmon fishing opportunities in Puget Sound and coastal streams and estuaries that are not discussed in this chapter of the Review. See Appendix B for estimates of harvest in some of those other fisheries.

## SALMON FISHERY INCOME IMPACTS AND COMMUNITY DEPENDENCE

Coastal community income impacts provide information on the effects of fluctuations in salmon harvest on local economies and small businesses. Income impacts are based on commercial landings and recreational fishing days (angler-trip), and were estimated using the Fishery Economic Assessment Model (FEAM). The income impact estimation process is discussed and results presented below. More detailed information on these procedures is available from the Council on request.

Estimated state and local community income impacts of commercial and recreational ocean salmon fisheries and selected state-managed fisheries are shown in Tables IV-16 through IV-20. These impacts represent estimates of total personal income associated with harvesting, processing and first level distribution activities in the commercial salmon fisheries along with trip-related expenditures made by recreational salmon anglers, expressed at the local community (county) and state levels. Income impacts are estimated based on several components: reported commercial landings and exvessel prices by port or area, an inventory of local harvesters and processors, estimates of harvester and processor expenditures, surveys of the expenditure patterns of recreational anglers, and local and state-level total income impact coefficients generated by IMPLAN ${ }^{\circledR}$ models constructed for each port or area. Under this modeling framework, most of the benefit of higher than average commercial fishery exvessel prices is assumed to go to the harvesters. Commercial ocean harvests that are landed outside of coastal areas (e.g., landings of troll caught salmon in Puget Sound ports) are not included in these estimates of coastal community impacts, but are included in the overall state-level impacts.

The income impacts presented below are estimates of annual trends and are intended to indicate the possible redirection of economic activity between nonfishing and fishing-dependent sectors. As such they represent likely upper bounds on the local community and state income impacts generated by West Coast salmon fisheries. All income impact estimates reported in this review are in terms of inflation-adjusted 2013 dollars.

## West Coast Ocean Fishery Commercial and Recreational Income Impacts

Total state level income impacts associated with recreational and commercial ocean salmon fisheries for all three states combined in 2013 were $\$ 79.3$ million, the highest level since $\$ 101.1$ million in 2004 (in inflation-adjusted terms). The 2013 total was 40 percent above the inflation-adjusted 2012 level of \$56.6 million, but still less than half ( 44 percent) of the inflation-adjusted average for 1979-1990 of \$179.7 million (Note: The 1979-1990 period includes the ten largest values in the data series). (Tables IV-16, IV17 and IV-18). West Coast income impacts associated with the 2013 non-Indian commercial ocean fishery were $\$ 54.5$ million, 68 percent higher than the estimate for 2012 ( $\$ 32.5$ million), and more than
quadruple the recent five year (2008-2012) average of $\$ 12.8$ million in inflation-adjusted terms ${ }^{1 /}$. Income impacts generated by the three states’ 2013 ocean recreational fisheries were estimated at $\$ 24.9$ million, three percent above last year's level of $\$ 24.1$ million, and 59 percent above the 2008-2012 inflationadjusted average of $\$ 15.6$ million. Note that these coastwide values may mask effects in individual communities. Tables IV-16, IV-17 and IV-18 provide greater detail on the estimated impacts in individual port areas in the three West Coast states.

## Selected Inside Fisheries

## Columbia River Commercial Fisheries

Historically the non-Indian and treaty Indian Columbia River commercial fisheries have generated a substantial amount of income for the Oregon and Washington communities on the Columbia River. An inflation-adjusted average of $\$ 32.0$ million was generated annually from these fisheries during 19861990. In 2013, income impacts associated with the Columbia River commercial catch (combined nonIndian and treaty Indian) were estimated at $\$ 22.7$ million. This value is 82 percent above last year's level of $\$ 12.5$ million, and also 37 percent above the 2008-2012 inflation-adjusted average of $\$ 16.6$ million, over which time total inflation-adjusted income impacts of these fisheries ranged from a low of $\$ 12.5$ million in 2012 to a high of $\$ 20.8$ million in 2011 (Table IV-19).

## Buoy 10 and Area 4B Add-On

Estimated local community income impacts associated with the 2013 Buoy 10 recreational salmon fishery were $\$ 2.6$ million, slightly below the estimate for last year's fishery, and 32 percent higher than the estimated value of $\$ 2$ million for 2011. The estimate for 2013 was also 20 percent higher than the inflation-adjusted average of $\$ 2.2$ million during 2008-2012 (Table IV-20). There was no late-season Area 4B add-on fishery in 2013. The most recent Area 4B add-on fishery occurred in 2008, the first since 2000. Inflation-adjusted local community income impacts associated with the 2008 area 4B add-on fishery were an estimated $\$ 31,700$. In the five out of six years between 1995 and 2000 when the Area 4B add-on fishery occurred, an annual average 3,500 angler trips generated estimated (inflation-adjusted) annual state-level income impacts averaging $\$ 171,600$ in years the fishery occurred (Table IV-20).

a/ These exvessel values do not include the postseason settlement payments some fishers may have received from buyers, and therefore may underestimate the true payments received by fishers for their landings. Beginning circa 1999, these postseason settlements are believed to have grown for the California fishery. For 2002, the exvessel value reported here is believed to be under-reported by roughly 5 percent to 10 percent.
b/ Does not include pink salmon landings, if any.
c/ Preliminary.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.
b/ Does not include pink salmon landings.
c/ There was no legal coho fishery in 1988. The value used in this average for 1988 is for landings of fish caught south of Cape Falcon and seizures of illegal fish.
d/ In 1994-1996 Chinook were caught off Oregon and landed in Washington. Value information was not provided to preserve confidentiality.

TABLE IV-5. Non-Indian troll pink salmon landed in Oregon and Washington, estimates of exvessel value, and average price (dollars per dressed pound) in nominal and real (inflation adjusted, 2013) dollars.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.
b/ The major port areas listed may include smaller ports as follows: Neah Bay includes only Neah Bay; La Push also includes Kalaloch; Westport also includes Aberdeen, Bay City, Copalis Beach, Hoquiam, Moclips, Taholah, Bay Center, Grayland Beach, Raymond, South Bend, and Tokeland; llwaco also includes Long Beach, Nahcotta, Naselle, and all Columbia River Ports; Puget Sound includes all Puget Sound ports east of Neah Bay.
c/ State total includes landings where port of landing is not specified.
d/ There was no ocean commercial fishery for Chinook north of Cape Falcon in 1994-1996; however, Chinook were caught off Oregon and landed in Washington.
e/ Less than 500 pounds.

TABLE IV-9. Landings, exvessel values and average prices (inflation adjusted, 2013 dollars) of inriver commercial harvest of Columbia River salmon. ${ }^{\text {al }}$ (Page 1 of 2)

TABLE IV-9. Landings, exvessel values and average prices (inflation adjusted, 2013 dollars) of inriver commercial harvest of Columbia River salmon. ${ }^{\text {a/ }}$ (Page 2 of 2 )

a/ Excluding pink, sockeye, and steelhead.
b/ Mainstem below Bonneville and select areas (Youngs Bay, Tongue Point, Blind Slough, and Deep River).
c/ Treaty Indian landings and values do not include direct sales to consumers.
d/ For Washington, this column includes fall brights, tules, and jacks. Price changes may reflect a change in the mix of brights, tules, and jacks rather than annual price changes.
e/ Gillnet exvessel salmon prices are recorded in round weight and therefore are not strictly comparable to exvessel troll prices.
$\mathrm{f} /$ Less than $\$ 500$ or 500 pounds.
g/ Preliminary. (All Washington values in this table are based on preliminary information available when each year's Salmon Review is drafted.)
h/ Washington prices for years prior to 2000 are based on a combination of Washington and Oregon value information.
i/ Treaty Indian values are primarily mainstem Columbia set gillnet but also include Klickitat dipnet, Drano Lake (Little White Salmon River mouth), and Priest Rapids Pool fisheries.

a/ Catch numbers may include some illegal harvest.
b/ Fewer than 50 fish.
c/ Preliminary.
d/ Salmon data from surveyed ports only. These generally include Astoria, Garibaldi, Depoe Bay, Newport, Winchester Bay, Coos Bay, and Brookings. Since 1981, Pacific City and Florence have also been included. Gold Beach data are included from 1981-1987. Astoria was not included in 1994.
e/ Numbers do not include angling from the Columbia River jetty.
$\mathrm{f} /$ Numbers do not include angling from the Columbia River jetty or from the late-season state waters Area 4B fishery. g/ Values for 1982-1985 include some inriver Columbia River fishing after closure of the ocean fishery.

a/ Fewer than 50 angler trips.
b/ Preliminary.
c/ Columbia River north jetty was not sampled in 2005 and 2007 due to construction limiting access
$\mathrm{d} /$ Oregon data is a minimum estimate, as the jetty is not sampled, and bottomfish sampling of vessels only occurs when the ocean is open for salmon
e/ No Oregon bottomfish trips are included.
$\mathrm{f} /$ Includes tuna trips: Ilwaco - 9 charter, 14 private; Westport - 784 charter, 0 private.
g/ Annual sturgeon angler trips for the lower Columbia River from the western tip of Puget Island to mouth.

a/ From 2000, catch downstream of boundary line from Tongue Pt., OR to Rocky Pt., WA. Prior to 2000 only catch downstream of Astoria-Megler Br.
b/ Prior to 1987, data on charter and private anglers were combined. Total Buoy 10 catch and effort data prior to 1987 are provided in Table B-21.
c/ Preliminary.
d/ There was no Area 4B add-on fishery prior to 1989.
e/ There was no Area 4B add-on fishery opening because the Area 4 ocean quota was not attained.
$\mathrm{f} /$ There has been no Area 4B add-on fishery in these years or planned after 2009.

a/ Per pound and per day estimates of income impacts are provided from output of the Fishery Economic Assessment Model (FEAM). These are the income impacts associated with expenditures in the troll and/or recreational sectors. There is no differentiation between money that may be new to the area versus money that may otherwise have been expended in other sectors. It is assumed that all fish landed at a port are processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 IMPLAN data. Beginning in 2001, values are from a FEAM run based on 2000 PacFIN landings and 1998 IMPLAN data. b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.
c/ Excluding pink salmon.
d/ Preliminary.
e/ Eureka impacts are from fish caught in the Fort Bragg area fishery and landed in Eureka.

a/ Per pound and per day estimates of income impacts are provided from output of the Fishery Economic Assessment Model (FEAM). These are the income impacts associated with expenditures in the troll and/or recreational sectors. There is no differentiation between money that may be new to the area versus money that may otherwise have been expended in other sectors. It is assumed that all fish landed at a port are processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 IMPLAN data. Beginning in 2001, values are from a FEAM run based on 2000 PacFIN landings and 1998 IMPLAN data. b/ Recreational values exclude recreational shorebased effort from the Columbia River north jetty.
c/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.
d/ Through 1993, commercial values include a very small amount of fish landed in Washington coastal areas not included in the major port groups.
e/ Excluding pink salmon.
$\mathrm{f} /$ All commercial values in this table are based on preliminary information available at the start of each year's Salmon Review. g/ The non-Indian commercial and recreational fisheries were closed north of Cape Falcon in 1994. Some commercial catch taken south of Cape Falcon was landed in the Puget Sound area.

a/ Beginning in 1979, monthly totals are the sum of statistical weeks with closest fit to the calendar month. Excludes harvests off Alaska, Washington (north of Leadbetter Point), and California that were landed in Oregon. Landings are reported by port of landing through 1978 and by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1988 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1988 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.
b/ Preliminary.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month. The average 1976-1980 effort is from combined salmon/steelhead punch card and sampled port data. Since 1981, data from sampled ports only. Effort since 1979 consists of salmon angler trips only. Data prior to 1979 include combined bottomfish and salmon trips. Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; Newport area includes Depoe Bay and Newport; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only terminal area fisheries.
b/ Preliminary.

Neah Bay and La Push statistics do not include estimates of 707 Chinook killed during Chinook nonretention fishery (July 19-August 20, 1987).
b/ Includes catch from the Washington State waters Area 4B fishery in 1991, 1992, 1993, 1996, 1997, 1998, 2000, and 2008.
c/ Preliminary.
d/ Includes catch from the North Jetty when the ocean fishery was open; does not include catch reported as occurring inside the Columbia River mouth (North Jetty catch when the ocean fishery was closed, and Buoy 10 was open).

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.
b/ Preliminary.
c/ Treaty troll effort in number of landings, which closely approximates days fished because treaty Indian fishers do not usually make multi-day trips. Season totals do not include January-April, October, or November-December treaty troll effort.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.
b/ Includes catch from the Washington State waters Area 4B fishery in 1991, 1992, 1993, 1996, 1997, 1998, 2000, and 2008.
c/ Preliminary.

## APPENDIX B <br> HISTORICAL RECORD OF ESCAPEMENTS TO INLAND FISHERIES AND SPAWNING AREAS

## LIST OF TABLES

Page
TABLE B-1. California Central Valley natural area fall Chinook salmon spawning escapement in numbers of fish ..... 205
TABLE B-2. California Central Valley hatchery fall Chinook salmon escapement in numbers of fish ..... 206
TABLE B-3. Sacramento River late-fall, winter, and spring Chinook salmon spawning escapement in numbers of fish ..... 207
TABLE B-4. Summary of Klamath River fall Chinook salmon estimates in numbers of adults and jacks ..... 208
TABLE B-5. Estimates of Yurok and Hoopa Valley reservation Indian gillnet Chinook harvest in numbers of fish ..... 209
TABLE B-6. Shasta, Scott, and Salmon rivers fall Chinook salmon spawning escapement estimates in numbers of fish ..... 210
TABLE B-7. Summary of California North Coast salmon spawning stock surveys in numbers of fish or redd counts ..... 211
TABLE B-8. Peak spawning counts in index areas for selected south/local migrating Oregon coastal fall Chinook stocks ..... 212
TABLE B-9. Counts of natural and hatchery spring Chinook salmon at Gold Ray Dam on the Rogue River and at Winchester Dam on the North Umpqua River in thousands of fish ..... 213
TABLE B-10. Rogue River fall Chinook carcass counts in numbers of fish ..... 214
TABLE B-11. Peak counts for north migrating Oregon coastal Chinook stocks on selected fall Chinook spawning index stream surveys ..... 215
TABLE B-12. Estimates of minimum inriver run size, catch, and escapement in numbers of Columbia River adult spring Chinook destined for areas below Bonneville Dam ..... 216
TABLE B-13. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult spring Chinook destined for areas above Bonneville Dam ..... 217
TABLE B-14. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult summer Chinook destined for areas above Bonneville Dam ..... 218
TABLE B-15. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult Spring Creek Hatchery (SCH) stock fall Chinook ..... 219
TABLE B-16. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult lower river hatchery (LRH) stock fall Chinook ..... 220
TABLE B-17. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult lower river wild (LRW) stock fall Chinook ..... 221
TABLE B-18. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult upriver bright (URB) stock fall Chinook destined for areas above McNary Dam and the Deschutes River ..... 222
TABLE B-19. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult mid-Columbia bright (MCB) stock fall Chinook destined for areas below McNary Dam, not including the Deschutes River ..... 223
TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River ..... 224
TABLE B-21. Estimates of minimum inriver run size, catch, and escapement in thousands of adult coho entering the Columbia River ..... 227
TABLE B-22. Estimated catch and effort in the Buoy 10 fishery ..... 228
TABLE B-23. Willapa Bay fall Chinook terminal run size, catch, and spawning escapement in numbers of fish ..... 229
TABLE B-24. Willapa Bay coho terminal run size, catch, and spawning escapement in numbers of fish ..... 230
TABLE B-25. Grays Harbor Chinook terminal catch, spawning escapement, and run size in numbers of fish ..... 231
TABLE B-26. Grays Harbor coho terminal catch, spawning escapement, and run size estimates in numbers of fish ..... 233
TABLE B-27. Treaty Indian gillnet catch of Chinook, chum, and sockeye salmon in the Quinault River in numbers of fish ..... 234
TABLE B-28. Estimated inriver run size, catch and escapement for Quinault River coho in numbers of fish ..... 235
TABLE B-29. Estimated inriver run size, catch, and escapement of Queets River spring/summer Chinook in numbers of fish. ..... 236
TABLE B-30. Estimated inriver run size, catch, and escapement of Queets River fall Chinook in numbers of fish ..... 237
TABLE B-31. Estimated terminal run size, catch, and escapement for Queets River coho in numbers of fish ..... 238
TABLE B-32. Estimated inriver run size, catch, and escapement for Hoh River spring/summer Chinook in numbers of fish. ..... 239
TABLE B-33. Estimated inriver run size, catch, and escapement for Hoh River fall Chinook in numbers of fish ..... 240
TABLE B-34. Estimated inriver run size, catch, and escapement for Hoh River coho in numbers of fish ..... 241
TABLE B-35. Estimated inriver run size, catch, and escapement for Quillayute River spring/summer Chinook in numbers of fish. ..... 242
TABLE B-36. Estimated inriver run size, catch, and escapement for Quillayute River fall Chinook in numbers of fish ..... 243
TABLE B-37. Estimated inriver run size, catch, and escapement for Quillayute River coho stocks in numbers of fish ..... 244
TABLE B-38. Estimated inriver run size, catch, and escapement for Hoko River summer/fall Chinook in numbers of fish. ..... 246
TABLE B-39. Puget Sound commercial net and troll fishery salmon catches in numbers of fish. ..... 247
TABLE B-40. Summary of Puget Sound marine recreational salmon catch estimates in numbers of fish from catch record cards ..... 249
TABLE B-41. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound Chinook stocks. ..... 250
TABLE B-42. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound coho stocks ..... 253
TABLE B-43. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks. ${ }^{\text {a/ }}$ (Page 1 of 4) ..... 257
TABLE B-44. Puget Sound spring Chinook spawning escapement estimates in numbers of adult fish. ..... 261

a/ Most estimates based on carcass surveys with a jack length cut-off. In 2004, CDFW reviewed and updated 1971-2003 escapement estimates to reflect final project reports.
b/ Upper Sacramento mainstem estimates generally based on carcass surveys with a jack length cut-off, however, jack estimates from Red Bluff Diversion Dam (RBDD) reports have occasionally been used. Early (pre-2001) mainstem Sacramento River adult and jack estimates based on RBDD passage.
c/ Upper Sacramento River escapement includes Sacramento River mainstem; Battle, Clear, Mill, Deer, Butte, Cottonwood, and Cow creeks; and other small tributaries when surveys were conducted. Specific escapement estimates by tributary can be found at www.calfish.org.
d/ Survey methodology was variable; may not be comparable to other surveys.
e/ Change in estimation methodology due to extremely high Battle Creek escapement.
$f /$ Preliminary.

a/ In 2004, CDFW reviewed and updated 1971-2003 adult and jack spawner escapements based on final project reports.
b/ Chinook spawning during the fall; may include spring run fish.
c/ Nimbus Hatchery adult and jack counts include fish taken at Nimbus Weir, 1979-current.
d/ Total adults in Sacramento Hatcheries include Tehama-Colusa Fish Facility escapements, 1971-1985.
e/ Preliminary.
f/ Current hatchery-specific goals, not PFMC goals.

a/ Jacks and adults based on sampling at Red Bluff Diversion Dam (RBDD) from unpublished CDFW data. Beginning in 1987 for late-fall and winter run, estimates based on historical run patterns and partial counts at RBDD due to raising of dam gates during the last part of the late-fall run and first part of the winter run.
b/ Since 1998, late-fall adult and jack estimates are based on carcass counts of natural spawners plus fish spawned at Coleman Hatchery.
c/ Estimates of late-fall and winter run includes Chinook trapped at Keswick Dam for use as broodstock at Coleman or Livingston Stone Hatcheries.
d/ RBDD and carcass survey estimates represent alternative methods for determining winter run Chinook escapement.
e/ Natural spawning spring run which are isolated from fall run; primarily Mill Creek, Deer Creek, and Butte Creek escapement.
f/ Sacramento River spring run estimates are the total RBDD counts minus the spring run numbers in the upper Sacramento tributaries. If this number is less than or equal to zero, the upper Sacramento River spring run estimates are zero.
$\mathrm{g} /$ Feather River spring run estimates are primarily fish returning to Feather River Hatchery. Spring run are not distinguished from fall run in the natural spawning surveys and are reported in the fall run natural escapement numbers
$\mathrm{h} /$ Jack proportion could not be determined.
i/ Primarily number of spawners at Coleman Hatchery 1991-97. No data available for natural spawners, RBDD gates were raised during time coinciding with the late-fall run.
j/ Methodology change from using snorkel survey to carcass survey for Butte Creek spring run estimates.
k/ Methodology change for distinguishing spring run Chinook at Feather River Hatchery implemented in 2005. Fish arriving prior to the spring Chinook spawning period were tagged and returned to the river. The spring Chinook escapement estimate is the number of these tagged fish that subsequently returned during the spring Chinook spawning
// RBDD did not go into operation until June 15, a month later than normal; thus RBDD winter and spring run estimates are unavailable.
$\mathrm{m} /$ RBDD gates were permanently removed on September 1, 2012; thus RBDD winter and spring run estimates are no longer available.
$\mathrm{n} /$ Preliminary.
o/ Includes 47 adults that were transferred from the Colusa Basin Drain to Livingston Stone Hatchery for use as broodstock.

TABLE B-4. Summary of Klamath River fall Chinook salmon estimates in numbers of adults and jacks.

a/ Total inriver run includes an estimated 30,550 fish that died prior to spawning in September 2002.
b/ Preliminary.
c/ In December 2011, Amendment 16 to the Salmon Fishery Management Plan was approved, which replaced the 35,000 spawning escapement floor with an $\mathrm{S}_{\text {MSY }}$ management objective of 40,700 natural area adult spawners. The 35,000 spawner floor was in effect from 1989-2007 and in 2011. In 2008-2010, fisheries were managed for a natural area spawning escapement of 40,700 adults under requirements of a rebuilding plan.

| $2013^{\text {h/ }}$ | 6,925 | 1,096 | 4,037 | 587 | 2,240 | 240 |

a/ From 1930-1937, 1957-1987 and 1991-1995, Shasta counts were made near the river mouth. From 1938-1955, they were made 6.5 miles upstream from the mouth; considerable spawning occurred downstream from the racks in these years. From 1988-1990, escapements were estimated from mark-recapture data (spawning surveys). 1991- present estimates were generated from weir counts.
b/ In 1991, estimates were generated from weir counts. In 1992-2007, estimates were generated from carcass surveys. In 2008-2011, estimates were generated from a combination of video weir counts and carcass surveys.
c/ In 2005 and 2007, redd counts were used in lieu of carcass surveys.
d/ Commercial fishing in lower Klamath River closed by the state after the 1933 season.
e/ Gillnetting resumed in lower 20 miles of Klamath River by Hoopa Valley Indian Reservation fishers in 1976.
f/ Shasta adults include 276 females taken to Iron Gate Hatchery in 1981.
g/ Low water conditions appeared to hinder entry into the Shasta River in 1988.
h/ Preliminary.

a/ Survey frequency variable from year to year (between 1 and 10 surveys annually).
b/ Numbers reflect maximum annual counts of live fish and carcasses with adults and jacks combined. Counts are not shown in
years where visibility is too poor to conduct surveys.
c/ Survey area was from mouth to falls (2 miles).
d/ Survey area was the mainstem and West Fork ( 4.5 miles).
e/ Total run size estimate including jacks and adults. Survey methodology changed in 2000-2001 to using index sites, and subsequent estimates are not comparable to previous estimates.
$\mathrm{f} /$ Video counts of combined adults and jacks made at Mirabel Dam. Image quality may be affected by turbidity.
g/ Numbers reported are redd counts. Olema Creek is excluded.
h/ Low flows appeared to increase mainstem spawning and decrease tributary spawning for Cañon, Sprowl, and Tomki creeks.
i/ Cañon and Sprowl creek totals exclude fish unidentifiable to species due to poor visibility or advanced decomposition.
j/ Preliminary data.
k/ Extremely low flows created passage barriers that precluded or severely limited salmon access to surveyed tributaries.
l/ Redd counts as of February 11, 2014.

TABLE B-8. Peak spawning counts in index areas for selected south/local migrating Oregon coastal fall Chinook stocks.

a/ Pistol River was subject to several "slope failures" in 1986 resulting in severe short-term alterations in gravel bars and spawning index areas. Considerable debris and siltation severely limited Chinook surveys resulting in "0" counts in Deep Creek index areas through December.
b/ Preliminary.

a/ Jacks included in natural, hatchery, and total counts.
b/ Gold Ray Dam removed October, 2010. Natural estimate derived using relationship of 2004-2010 spawning ground surveys to Gold Ray Dam passage. Estimate includes an unknown number of jacks.
c/ Jacks include all Chinook less than 20 inches prior to 1978 and all Chinook less than 24 inches beginning in 1978.
d/ Preliminary.

a/ Includes some upriver origin spring Chinook through 1980. Beginning in 1981, the lower river catch of lower river spring Chinook is based on mark recoveries rather than the
timing of the catch, as in previous years. Since 1986, GSI and VSI techniques have been used for stock composition analysis. Commercial catch includes Select Area fisheries.
Sport catch is mainstem Columbia River, does not include tributaries. Catch may include small numbers of jacks. Sport fishery closed in 1995 to 1997.
b/ Prior to 1988, the escapement goal at Willamette Falls was 30,000 to 35,000 . Beginning in 1988, the goal was dependent on run size under the Willamette Basin Fish
Management Plan. Since 2001, hatchery escapement targets are set in the Fisheries Management and Evaluation Plan developed by ODFW. Lower Willamette sport catch may
include small numbers of jacks.
c/ Includes hatchery escapement, tributary recreational catch, and natural spawning escapement for 1975 to present. The years 1971-1973 are based on using the 1975-1976
Cowlitz River recreational fishery adult harvest rates.
d/ Includes hatcheries operated by all agencies. Values are included in the totals for the tributary runs.
e/ Preliminary.

a/ Spring Chinook accounting ends on June 15. Chinook formerly managed separately as Snake River summer Chinook are now grouped with all upriver spring Chinook because of overlap in run timing. Snake River summer Chinook have been moved from Table B-14 to this table.
b/ Includes some lower river origin spring Chinook through 1980. Beginning in 1981, the lower river catch of upriver spring Chinook is based on mark recoveries rather than timing of the catch as in previous years. Since 1986, GSI techniques have been used for stock composition analysis. Commercial catch includes estimated miscellaneous fishery-related impacts from test fisheries, commercial shad fisheries, and Select Area commercial gillnet fisheries beginning in 1979 and catch and release mortalities from selective fisheries beginning in 2001 . Sport catch includes mainstem fisheries between Buoy 10 and Bonneville Dam.
c/ Spring season fishery closed in 1975, 1976, and from 1978 to 2000. Spring Chinook landed during those years were from the winter season fishery.
d/ Includes below Bonneville Dam C\&S starting in 2008.
e/ Snake River escapement at Lower Granite relative to escapement goals. Wild escapement goal includes Snake Basin harvest below Lower Granite Dam, Lower Granite count of wild escapement, and Tucannon wild return. Hatchery escapement goal includes Lower Granite count of hatchery escapement only.
f/ Hatchery rack and trap returns above Lower Granite Dam plus Tucannon and hatchery returns above Priest Rapids Dam (Wenatchee, Entiat, and Methow) plus Ringold. Does not include Leavenworth or East Bank.
g/ Preliminary.
h/ U.S. v. Oregon goal; not an FMP goal: wild escapement goal includes Snake Basin harvest below Lower Granite Dam, Lower Granite count of wild escapement, and Tucannon wild return. Hatchery escapement goal includes Lower Granite count of hatchery escapement only.

a/ Summer Chinook accounting begins on June 16. Chinook managed as Snake River summer Chinook prior to 2004 are now grouped with all upriver spring Chinook because of overlap in run timing. As of 2004, they have been moved from this table to Table B-13.
b/ Includes estimated miscellaneous fishery-related impacts from mainstem recreational fisheries, test fisheries, commercial shad fisheries, and terminal area commercial gillnet fisheries beginning in 1979. Includes catch and release mortality in selective fisheries beginning in 2002.
c/ No directed commercial summer Chinook fishery from 1964 to 2003. Landings during those years are bycatch from commercial shad and sockeye fisheries.
d/ No directed commercial summer Chinook fishery from 1965 to 2003. Landings during those years are bycatch from commercial sockeye fishery.
e/ No ceremonial and subsistence permits issued, sales of platform and hook-and-line subsistence catch allowed and included in commercial catch.
f/ Preliminary.
g/ Comanager goal established in 2004 associated with regrouping Snake River summer Chinook with Snake River spring Chinook.
h/ MSY spawning escapement objective adopted in 2011 under Amendment 16 based on Chinook Technical Committee Report 99-3.

a/ Based on Columbia River fall Chinook database, WDFW, unpublished.
b/ Includes tributary catches.
c/ Preliminary estimates based on inseason run updates.
d/ Escapement objective is for North Lewis River, but escapement numbers include other fish. The escapement objective for the North Lewis River was met for all years except 1998, 1999, 2007, 2008, and 2009

a/ Based on Columbia River fall Chinook database, WDFW, unpublished. Does not include hatchery URB Chinook reared and released below McNary Dam.
b/ Includes tributary and mainstem catches between Bonneville and Priest Rapids dams.
c/ Includes Deschutes, Yakima, Upper Columbia, and Snake River escapements.
d/ Upper Columbia escapement only: Yakima River, Hanford Reach, and Priest Rapids Dam count.
e/ Deschutes esc. time series revised in 2010 to match Deschutes R. Chinook Spawner Esc. Goal using U.S. v. OR Tech. Advisory Comm. Data (Sharma et al. 2009).
f/ Snake River wild; adjusted for stray hatchery fish. Includes wild fish hauled to Lyons Ferry Hatchery.
g/ Preliminary based on inseason run update.
h/ MSY spawning escapement objective adoped in FMP Amendment 16 in 2011.
i/ The U.S. v. Oregon parties managed for a McNary Dam esc. of 60,000 beginning in 2008. Starting in 1994, inriver fisheries were managed for ESA consultation standards

## TABLE B-20. Estimate of minimum inriver run size and catch in numbers of adult spring summer and fall Chinook from the Columbia River. (Page 3 of 3 )

a/ For spring Chinook: includes lower and upper Willamette, Clackamas, Cowlitz, Kalama, Lewis, and Sandy Rivers. Sandy River harvest not available before 1990. Catch estimates may include small numbers of Jacks. Does not include SAFE sport. For summer Chinook: all tributaries are closed. For fall Chinook: all tributaries downstream from Bonneville Dam.
b/ Includes Select Area catch.
c/ Youngs Bay Select Area began in 1992. Tongue Point and Blind Slough began in 1998. Select Area test fisheries began in 1991. Other Select Areas include Knappa in Oregon and Deep River in Washington.
$\mathrm{d} /$ Includes tributaries between Bonneville and McNary Dams, the Snake and Yakima rivers, Icicle and Ringold creeks. For Spring Chinook, this is Ringold creeks and tributaries above Lower Granite Dam. For summer Chinook, this is Wanapum and Hanford Reach
e/ Primarily mainstem fisheries between Bonneville and McNary dams, but also includes fish caught in miscellaneous commercial Indian fisheries such as Klickitat dip net and mainstem fisheries upstream from McNary Dam. Spring season fishery closed in 1975, 1976, and from 1978 to 2000 . Spring Chinook landed during those years were from the winter season fishery. Summer season fishery closed from 1974 to 1982,1989 to 2000. Summer Chinook landed during those years are bycatch from shad and sockeye fishery
f/ Primarily mainstem fisheries between Bonneville and McNary dams. Significant subsistence fisheries also occur in tributaries throughout the Columbia and Snake River basin, especially for spring Chinook, which are no included in these estimates.
g/ Upriver spring Chinook accounting ends on June 15 and summer Chinook accounting begins on June 16.
$\mathrm{h} /$ Spring Chinook Buoy 10 area catch is included in mainstem sport.
i/ Preliminary. Fall Chinook estimates are from inseason run updates.
j/ Summer Chinook retention was prohibited for all mainstem non-Indian and treaty Indian fisheries until 2003. Small non-Indian incidental mortalities prior to 2003 are associated with recreational Steelhead fisheries and commercial shad and Sockeye fisheries. A few stray summer Chinook are caught in Select Area (terminal) fisheries that are open for late returning spring Chinook and early returning fall Chinook. Prior to 2003, Treaty Indians could retain summer Chinook for subsistence purposes
k/ No ceremonial and subsistence permits issued, sales of platform and hook-and-line subsistence catch allowed and included in commercial catch or non-ticked public sales
// Fall Chinook minimum run size includes LRH, LRW, SCH, URB, MCB, and SAB

| GOAL |  | Hatchery Production |  |  |  |  |  |  | Hatchery Production |  |

a/ These numbers match OPI databases. Adjustments were made to the escapement figures and catches.
b/ Mainstem recreational catches listed in this table include tributary catches and catches in the Chinook/Hammond area of 3,195 in 1989, 28 in 1990, and 1,151 in 1991.
c/ Includes hatcheries operated by all agencies.
d/ Willamette Falls, Clackamas River (North Fork Dam) and Sandy River (Marmot Dam).
e/ Includes additional small adults counted as jacks for 1983-1984 and 1986-1989.
f/ Bonneville Dam count minus Zone 6 mainstem commercial treaty Indian harvest.
g/ Preliminary

a/ Prior to 1982, Buoy 10 area catches were not estimated separately and are included in the Columbia River marine area (Cape Falcon to Leadbetter Pt.) recreational catches. Estimates include bank anglers fishing from Clatsop Spit in Oregon and from the North Jetty in Washington. Effort and catch for the North Jetty fishery applied to the ocean quota for the Columbia River area until the ocean fishery closed. Beginning in 2000, includes catch and effort from the Astoria-Megler Bridge upstream to the new boundary from Tongue Point, Oregon to Rocky Point, Washington.
b/ Includes adults and jacks as determined by CWT analysis.
c/ 1989 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 32 and 33 . A total of 7,922 angler trips produced catches of 492 Chinook, 3,195 coho, and a catch rate of 0.47 fish per trip. Catches in this fishery were counted against the Buoy 10 quota.
d/ 1990 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32 . A total of 3,225 angler trips produced catches of 54 Chinook, 28 coho, and a catch rate of 0.03 fish per trip.
e/ 1991 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32 . A total of 2,759 angler trips produced catches of 39 Chinook, 1,151 coho, and a catch rate of 0.43 fish per trip.
$\mathrm{f} /$ Preliminary.

a/ Non-local gillnet is catch in Area 2G prior to Aug. 16.
b/ Adults. Sport catch since 1991 includes marine areas within Willapa Bay (e.g., Washaway Beach).
c/ Escapement estimates after 1984 are based on revised spawning habitat estimates. Natural = adult returns assumed to be from natural origin parents
d/ Does not include catch of non-local stocks
e/ Preliminary.
$\mathrm{f} / \mathrm{MSY}$ spawning escapement objective established in FMP Amendment 16; WDFW goal is 4,350.
g/ WDFW goal; not an FMP goal.

a/ Age-3 and older.
b/ Age-3 and older, including hatchery fish spawning naturally.
c/ Includes fish taken from the spawning grounds for broodstock.
d/ Minimum estimate due to incomplete estimates of river recreational catch. Does not include non-local catch.
e/ Fewer than 50 fish.
f/ WDFW is not able to differentiate spawning time and believes this includes fall Chinook.
$\mathrm{g} /$ Preliminary.
$\mathrm{h} / \mathrm{MSY}$ spawning escapement objective adopted under Amendment 16. Previous objectives of 1,400 (spring) and 14,600 (fall) were used for preseason planning in 2011.
i/ Rec. catch estimates by WDFW reflect a catch record card bias correction factor of 0.833 . Quinault Indian Nation does not believe this factor is appropriate. Unadjusted catch estimates are 1,000 for 1987; 2,400 for 1988; 2,500 for 1989; 2,400 for 1990; 4,500 for 1991; 2,600 for 1992; 4,200 for 1993; 4,300 for 1994; 6,500 for 1995; 6,800 for 1996; 3,400 for 1997; 3,500 for 1998; and 100 for 1999; terminal run sizes would be adjusted accordingly.

a/ Beginning in 1987, estimates provided by WDFW for recreational catch reflect punch card bias correction factor.
b/ "Natural" includes hatchery fish spawning in wild. "Hatchery" includes wild fish taken for brood stock.
c/ Terminal run size numbers from 1981 to present are under co-manager review.
d/ The combined natural and hatchery run size total may not add to the sum of the catch and escapements due to hatchery total run size including on-station and off-station escapements.
e/ Preliminary.
f/ The MSH Escapement objective of 35,400 was used for preseason planning through the 2013 season.

| GOAL |  |  |  | 2,500 ${ }^{\text {f/ }}$ |  |  |  |

a/River sport catch of age-3 and older fish. The 2000 sport fishery was closed to retention of unmarked Chinook. The 2002 sport fishery was closed to Chinook retention on October 18 due to unusually low water conditions. The 2008 sport fishery was closed to the retention of Chinook. The 2009 sport fishery was closed to retention of unmarked Chinook in Queets and Salmon Rivers within Olympic National Park.
b/ Includes Indicator Stock. Estimates for years prior to 2001 assume a broodstock take of 150 as a placeholder until individual run reconstructions are complete.
c/ Includes from 100 to 200 wild Chinook captured each season near spawning grounds to be used as Indicator broodstock.
d/ This is an integrated wild/hatchery program. Brood stock are unmarked wild fish collected from river.
e/ Preliminary.
$\mathrm{f} / \mathrm{Minimum}$. Terminal run managed at 40 percent exploitation rate of terminal run size.

a/ Includes dip-in fish from other river systems
b/ Recreational catch of adults (coho over 20 inches).
c/ Natural escapement and run size estimates include fish taken for hatchery brood stock.
d/ Queets stock only; does not include non-local, dip-in fish.
e/ 1991 and 1997 supplemental was included in natural escapement and run size.
f/ Escapement estimates are from non-standard methods due to poor survey conditions during the coho spawning season.
g/Preliminary. Escapement estimates for 2009 and 2010 were under review; data for the 2011 run were being processed.

a/ Beginning in 1981, catch breakouts recalculated to account for Solduc hatchery yearling release dip-in fish.
b/ Recreational catch of adults (at least 24 inches total length); beginning in 2008, all Chinook must be marked with a healed adipose fin clip.
c/ Sport fishery closed until July 14.
d/ Sport fishery closed to retention of wild adult spring/summer Chinook through August 31
e/ Sport fishery open May 16 through August 31 from mouth to Willoughby Creek.
f/ Preliminary
$\mathrm{g} /$ Minimum. Terminal run managed at 31 percent harvest rate of inriver run size.

| GOAL | 2,000 to 5,000 |  |  |  |  |  |  |  |

a/ Includes dip-in fish from other river systems.
b/ Recreational catch of adults (coho over 20 inches).
c/ Natural escapement and run sizes estimates include fish taken for hatchery brood stock.
d/ Recreational fishermen were limited to Chinook only. Release of adult coho required. Tribal net fishery used large mesh to minimize coho impacts.
e/ Sport and tribal gillnet seasons reduced inseason in response to delayed upriver movement of coho caused by extreme low water conditions in October and early November. Closures were for two weeks
f/ Preliminary.

| GOAL |  |  |  | 1,200 ${ }^{\text {g }}$ |  |  |  |  |

a/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch. Catch during designated ceremonial and subsistence fisheries is listed sepatately.
b/ Recreational catch of adults; mark selective for adipose fin clipped coho beginning in 2003.
c/ Natural escapement includes hatchery strays and broodstock fish.
d/ Hatchery escapement and terminal run size exclude hatchery strays.
e/ Preliminary.
f/ Terminal run size estimates incomplete because inriver sport catch estimates were unavailable.
g/ FMP goal is adults; WDFW goal of 1,200 includes age-3 males (jacks).

| GOAL |  |  |  | 6,300-15,8 |  |  |  |  |

a/ Includes dip-in fish from other systems.
b/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch. Catch during designated ceremonial and subsistence fisheries is listed separately.
c/ Recreational catch of adults (coho over 20 inches).
d/ Natural escapement and run size estimates include fish taken for hatchery brood stock
e/ Hatchery escapement and terminal run size exclude hatchery strays.
$f /$ Preliminary.
g/ Terminal run size estimates incomplete since inriver sport catch estimates were unavailable.
$\mathrm{h} /$ Regulations required nonretention of coho.

a/ River recreational catch of age-3 and older fish.
b/ Includes fish taken for hatchery brood stock and hatchery strays.
c/ Preliminary.
d/ Terminal run size estimates incomplete since inriver sport catch estimates are unavailable.
d/ Goal in terms of naturally spawning fish and includes supplementation production
e/ Not an FMP goal.

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
b/ Includes estimated off-station returns.
c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by troll and recreational fisheries inside Puget Sound.
d/ Preliminary.
e/ Since 1999, numbers include Tulalip hatchery returns, which are not added into escapement since no broodstock is taken at the hatchery.

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
b/ Includes estimated off-station returns.
c/ Terminal run size is defined as the run to terminal marine areas; spawning escapement plus sport and commercial net catch (inriver and terminal fishery catch). Prior to 1996, estimates are Puget Sound run size, which is defined as the run available to Puget Sound net fisheries; spawning escapement plus commercial net catch (inriver, terminal, and preterminal Puget Sound net fishery catch), but not including fish caught in Puget Sound troll and recreational fisheries.
d/ Preliminary.

TABLE B-43. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks. ${ }^{\text {a/ }}$ (Page 4 of 4)
$\sum \quad \mathrm{a} /$ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
N b/ Includes estimated off-station returns.
c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by troll and recreational fisheries inside Puget Sound
d/ Preliminary.
e/ State-Tribal comanager goal; the only Council goal is for a total Puget Sound pink salmon spawning escapement of 900,000 natural spawners.
f/ Nisqually escapement estimate incomplete
g/Large runs of pinks have returned to Green River in 2001, 2003, 2005, 2007, 2009, and 2011; however, no formal escapement methodology exists, and Green River pinks are not included in the run reconstruction model. When the model is revised, pre-terminal catch estimates for all stocks will be affected

TABLE B-44. Puget Sound spring Chinook spawning escapement estimates in numbers of adult fish.

a/ Hatchery escapement estimates include all rack returns (retained and released).
b/ Natural escapement estimates based on carcass counts expanded by a 3.48 multiplier developed from 5 years of redd count-based estimates. Most natural spawners are hatchery fish spawning in the wild.
c/ This estimate includes adult Chinook returns to Hupp Springs, White River Hatchery, and the Buckley Trap.
d/ Program has been discontinued.
e/ Preliminary.

| 2013 | Columbia River hatchery tules | 52.5 | 44.0 | 48.0 | Lower Columbia River and Interior Fraser Natural | 47.5 | 14.2 | 74.8 |

a/ Although the Skagit River escapement goal would not be achieved, management was based on meeting WDFW's escapement goal for Hoh River coho and allocation based on aggregation to Washington coastal tribes.
b/ The Council management regime was not expected to meet equitable adjustment requirements for Skagit River coho.
c/ Plus 7,430 hooking mortality for pink fishery.
d/ Plus 3,250 hooking mortality for pink fishery.
e/ Hooking mortality of 2,800 coho for June 1-15 fishery not included.
$\mathrm{f} /$ Plus 1,200 hook-and-release mortality for the Neah Bay all-salmon-except-coho fishery.
g/ Marked hatchery coho only (healed adipose fin clip). Except 2004 non-Indian troll Sept. 1-5 between Queets River and Cape Falcon, and sport Aug. 29-Sept. 6 between Queets River and Leadbetter Point.
h/ Sharing of impacts on ESA listed Puget Sound Chinook also affected the shaping of ocean and inside fisheries
i/ For 2002, the Council elected to constrain fishing so that the OCN exploitation rate would not exceed 12.5 percent per ODFW's recommendation to provide additional protection for lower Columbia River natural coho, which are listed as endangered under the Oregon State-ESA. The FMP objective for OCN coho was 15 percent.
j/ Includes mark-selective fishery quotas of: 12,000 (equivalent to 5,000 non-mark selective quota) in 2010, and 4,800 (equivalent to 2,000 non-mark selective quota) in 2011 .

## GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES

Feb. 28 National Marine Fisheries Service (NMFS) provides the Council with a letter outlining the 2013 management guidance for stocks listed under the Endangered Species Act (ESA) and stocks of concern.

Mar. 9 Based on Council recommendations, NMFS takes inseason action to delay the scheduled opening for the commercial salmon fishery from Cape Falcon, Oregon to the Oregon/California border, from March 15, 2013, to April 1, 2013.

Mar. 9 Based on Council recommendations, NMFS takes inseason action to cancel the opening scheduled in the commercial fishery from Horse Mountain, California to Point Arena, California (Fort Bragg subarea), originally scheduled for April 16, 2013.

Mar. 11 Council adopts three commercial, tribal, and recreational ocean salmon fishery management alternatives for public review.

Mar. 15 North of Cape Falcon Salmon Forum meets in Olympia, Washington to initiate consideration of recommendations for treaty Indian and non-Indian salmon management alternatives.

Mar. 25-26 Council holds public hearings on proposed 2013 management alternatives in Westport, Washington; Coos Bay, Oregon; and Eureka, California.

Mar. 27 North of Cape Falcon Salmon Forum meets in Lynnwood, Washington to further consider recommendations for treaty Indian and non-Indian salmon management alternatives.

Apr. 10 Council adopts final ocean salmon fishery management recommendations for approval and implementation by the U.S. Secretary of Commerce. The proposed measures comply with the salmon fishery management plan (FMP) and the current biological opinions for listed species.

May 3 Ocean salmon seasons implemented as recommended by the Council and published in the Federal Register on May 3 (78 FR 25865), with an effective date of May 1, 2013.

May 9 NMFS inseason conference number one results in closing the OR/CA Border to Humboldt South Jetty commercial troll fishery effective at noon on May 10 due to projected attainment of quota.

May 20 NMFS inseason conference number two results in closing the U.S./Canada border to Queets River commercial troll fishery effective May 20 due to projected attainment of quota.

May 23 NMFS inseason conference number three results in reopening the U.S./Canada border to Queets River commercial troll fishery effective May 24 through May 28 with a landing and possession limit of 28 Chinook.

June 4 NMFS inseason conference number four results in a quota adjustment for the June OR/CA Border to Humboldt South Jetty commercial salmon fishery to roll-over remaining May quota. Remaining May quota was 300 Chinook; an impact-neutral transfer added 352 Chinook making the revised June quota 3,352 Chinook.

June 7 NMFS inseason conference number five results in closing the June OR/CA Border to Humboldt South Jetty commercial salmon fishery effective June 9 to prevent exceeding the adjusted June quota of 3,352 Chinook.

June 10 NMFS inseason conference number six results in reopening the June OR/CA Border to Humboldt South Jetty commercial salmon fishery for 24 hours on June 11 to utilize remaining quota.

## GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES (continued)

July $3 \quad$ NMFS inseason conference number seven results in three quota adjustments:

1) A roll-over of remaining June quota to the July OR/CA Border to Humboldt South Jetty commercial salmon fishery. Remaining June quota was 387 Chinook; an impact-neutral transfer added 547 Chinook making the revised July quota 2,547 Chinook.
2) A roll-over of remaining June quota to the July Humbug Mt. to OR/CA Border commercial salmon fishery. Remaining June quota was 2,475 Chinook; an impact-neutral transfer added 1,782 Chinook making the revised July quota 4,782 Chinook.
3) A roll-over of remaining May-June quota to the July-September non-Indian commercial salmon fishery north of Cape Falcon. Remaining May-June quota was 5,263 Chinook (of which, 533 were north of the Queets River); an impact-neutral transfer added 4,600 Chinook (of which, 500 were added north of the Queets River) making the revised JulySeptember quota 19,300, of which no more than 6,600 Chinook could be landed north of the Queets River.

July 11 NMFS inseason conference number eight results in changing the open period landing and possession limit from 50 to 100 Chinook per vessel for the Queets River to Cape Falcon, nonIndian commercial all-salmon fishery effective July 12.

July 15 NMFS inseason conference number nine results in opening the recreational fishery from Queets River, Washington to Leadbetter Point, Washington (Westport Subarea) seven days a week (previously Sun. through Thurs.) effective July 19.

NMFS inseason conference number ten results in closing the July OR/CA Border to Humboldt South Jetty commercial salmon fishery effective July 21 to prevent exceeding the adjusted July quota of 2,547 Chinook.

July $25 \quad$ NMFS inseason conference number 11 results in:

1) Reducing the open period landing and possession limit from 50 to 40 Chinook per vessel for the U.S/Canada Border to the Queets River non-Indian commercial all-salmon fishery effective July 26,and
2) Reducing coast-wide trip limits for halibut retained incidental to the commercial salmon fishery from 15 halibut per trip to 5 halibut per trip effective August 1 to avoid exceeding quota.

July 26 NMFS inseason conference number 12 results in a quota adjustment for the August OR/CA Border to Humboldt South Jetty commercial salmon fishery to roll-over remaining July quota. Remaining July quota was 245 Chinook; an impact-neutral transfer added 192 Chinook making the revised August quota 1,692 Chinook.

August 1 NMFS inseason conference number 13 results in changing the daily bag limit in the recreational fishery in the Westport Subarea from two fish per day, no more than one of which can be a Chinook to two fish per day, both of which can be Chinook effective August 4.

August 2 NMFS inseason conference number 14 results in:

1) Closing the August OR/CA Border to Humboldt South Jetty commercial salmon fishery effective August 3 to prevent exceeding the adjusted August quota of 1,692 Chinook, and
2) A roll-over of remaining July quota to the August Humbug Mt. to OR/CA Border commercial salmon fishery. Remaining July quota was 798 Chinook; an impact-neutral transfer added 714 Chinook making the revised August quota 2,714 Chinook.

## GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES (continued)

August $8 \quad$ NMFS inseason conference number 15 results in:

1) Changing the open period landing and possession limit from 100 to 150 Chinook per vessel for the Queets River to Cape Falcon, non-Indian commercial all-salmon fishery effective August 9 ,
2) Changing the open period landing and possession limit from 40 to 80 marked coho per vessel for the non-Indian commercial all-salmon fishery north of Cape Falcon effective August 9,
3) Closing the retention of incidental halibut in the commercial salmon fishery effective August 9 north of Cape Falcon and effective August 10 (with all incidental halibut landed by August 11) south of Cape Falcon,
4) Changing the daily bag limit in the recreational fishery in the Neah Bay and La Push Subareas from two fish per day to two fish per day, no more than one of which can be a Chinook effective August 10, and
5) Transferring unutilized coho quota from the July recreational mark-selective coho fishery from Cape Falcon to the Oregon/California border to the September non-mark-selective recreational fishery from Cape Falcon to Humbug Mountain. Remaining July quota was 3,920 mark-selective coho. An impact-neutral transfer added 3,580 non-mark selective coho to the September quota making the adjusted quota 19,580 non-mark-selective coho salmon.

August 15 NMFS inseason conference number 16 results in closing of the non-Indian commercial salmon fishery north of the Queets River effective August 15 due to quota attainment.

NMFS inseason conference number 17 results in:

1) Closing of the non-Indian commercial salmon fishery north of Cape Falcon immediately until further notice, and
2) Changing the daily bag limit in the recreational fishery in the Columbia River, La Push, and Neah Bay Subareas from two fish per day, no more than one of which can be a Chinook to two fish per day, both of which can be Chinook effective August 23.

NMFS inseason conference number 18 results in:

1) Impact-neutral adjustments of commercial and recreational quotas north of Cape Falcon, accomplished through a quota trade between the fisheries. Net adjustment: Recreational fishery gave 3,200 Chinook and received 4,000 marked coho (coho distributed among the Subareas as follows: 1,000 to Columbia River; 1,480 to Westport; 1,100 to La Push; and 420 to Neah Bay). Commercial fishery gave 4,000 marked coho and received 2,000 Chinook (adjusted for impacts),
2) Reopening the non-Indian commercial salmon fishery between Cape Falcon and the Queets River Friday through Tuesday effective August 30 with a landing limit of 35 Chinook and 40 marked coho per vessel per open period, and
3) Allowing retention of unmarked coho in the recreational fisheries in the Columbia River Subarea effective September_1 and in the Westport Subarea effective September 6.

September $5 \quad$ NMFS inseason conference number 19 results in changing the open period landing and possession limit in the non-Indian commercial salmon fishery between Cape Falcon and the Queets River from 35 Chinook and 40 marked coho to 75 Chinook and 50 marked coho per vessel effective September 6.

September 11 NMFS inseason conference number 20 results in changing the daily bag limit in the recreational salmon fishery from Cape Falcon to Humbug Mountain to all salmon, two fish per day, seven days per week effective September 12.

## NON-INDIAN COMMERCIAL TROLL SEASONS

April 1 Cape Falcon to Humbug Mt. non-Indian commercial all-salmon-except-coho fishery open seven days per week.

April 1 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery open.
May 1 U.S./Canada border to Cape Falcon; non-Indian commercial all-salmon-except-coho fishery open May 1 through the earlier of June 30 or attainment of 29,300 Chinook quota (no more than 8,700 may be landed north of the Queets River). Areas north of the Queets River modified inseason to a 25 day season (May 1-20 and 24-28) due to quota attainment.

May 1 OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery opens through the earlier of May 31 or a 3,000 Chinook quota.

May 1 Pt. Arena to U.S./Mexico border non-Indian commercial all-salmon-except-coho fishery opens a 125 day season through Sept. 30 (for specific days open see Table I-1).

May 10

May 22 Horse Mt. to Pt. Arena non-Indian commercial all-salmon-except-coho fishery opens a 104 day season through Sept. 30 (for specific days open see Table I-1).

June 1 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of June 30 or a 4,000 Chinook quota.

OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery opens through the earlier of June 30 or attainment of 3,000 Chinook quota (modified on an impactneutral basis to 3,352 Chinook in response to landings in the May quota fisheries in this area).

OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery closes to evaluate landings; fishery reopens for 24 hours on June 11 to utilize remaining quota.

Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.
U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery opens through the earlier of September 17 or attainment of 14,700 preseason Chinook guideline, of which no more than 6,100 may be caught north of the Queets River. Chinook quota was modified by inseason action on July 3 to roll-over uncaught quota from the May-June fishery though an impact-neutral transfer of 4,600 Chinook ${ }_{1}$ of which; 500 were added north of the Queets River making the revised July-September quota 19,300, of which no more than 6,600 Chinook could be landed north of the Queets River or a 14,220 marked coho quota (reduced to 10,220 through inseason transfer of 4,000 coho to recreational fisheries). Chinook quota increased again inseason to 21,300 through an inseason transfer of 2,000 Chinook from recreational fisheries. For specific season dates and regulations see Table I-1 and Table C-5.

Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of July 31 or attainment of 3,000 Chinook quota (modified on an impact-neutral basis to 4,782 Chinook in response to landings in the June quota fisheries in this area, later adjusted to 4,760).

OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery opens through the earlier of July 31 or attainment of 2,000 Chinook quota (modified on an impactneutral basis to 2,547 Chinook in response to landings in the June quota fisheries in this area).

OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery closes due to quota attainment.

## NON-INDIAN COMMERCIAL TROLL SEASONS (continued)

July 31 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.

Aug. 1 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of August 29 or attainment of 2,000 Chinook quota (modified inseason on an impact-neutral basis to 2,714 Chinook in response to landings in the June and July quota fisheries in this area).

Aug. 1 OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery opens through the earlier of August 29 or attainment of 1,500 Chinook quota (modified on an impact-neutral basis to 1,692 Chinook in response to landings in the July quota fisheries in this area).

Aug. 3 OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery closes due to quota attainment.

Aug. 13 U.S./Canada border to Queets River, non-Indian commercial all-salmon fishery closes as Chinook quota is reached.

Aug. 29 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.

Sept. 4-Oct 31 Cape Falcon to Humbug Mt. non-Indian commercial all-salmon-except-coho fishery opens seven days per week with a landing and possession limit of 100 Chinook per vessel per landing week (Wed.-Tues.).

Sept. 16 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery opens through the earlier of Sept. 30 or attainment of 1,000 Chinook quota.

Sept. 16 OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery opens through the earlier of Sept. 27 or attainment of 6,000 Chinook quota.

Sept. 17 Queets River to Cape Falcon, non-Indian commercial all-salmon fishery closes as scheduled.
Sept. 27 Humbug Mt. to OR/CA border non-Indian commercial all-salmon-except-coho fishery closes as scheduled.

Sept. 30 OR/CA border to Humboldt South Jetty non-Indian commercial all-salmon-except-coho fishery closes as scheduled.

Oct. $1 \quad$ Pt. Reyes to Pt. San Pedro non-Indian commercial all-salmon-except-coho fishery opens an 11 day Monday through Friday season (for specific dates see Table I-1).

## TREATY INDIAN COMMERCIAL TROLL SEASONS

May 1 All-salmon-except-coho fisheries open through the earlier of June 30 or attainment of 26,250 Chinook quota.

June 18 All-salmon-except-coho fisheries closes due to quota attainment.
July 1 All-salmon fisheries open through the earlier of September 15, attainment of 26,250 Chinook quota (modified inseason to 20,493 to adjust for overage in May-June), or a 47,500 non-mark-selective coho quota.

Sept. $4 \quad$ All-salmon fisheries close due to coho quota attainent.

## RECREATIONAL SEASONS

Mar. 15-June 30 Cape Falcon to Humbug Mt. all-salmon-except-coho fishery open seven days per week with a 24inch minimum size limit for Chinook.

Apr. 6-Nov. 10 Horse Mt. to Pt. Arena all-salmon-except-coho fishery open seven days per week with a 20 -inch minimum size limit for Chinook.

Apr. 6-July $9 \quad$ Pt. Arena to U.S./Mexico border all-salmon-except-coho fishery open seven days per week, except June 1 through July 9 when closed on Monday and Tuesday, with a 24 -inch minimum size limit for Chinook.

May 1-June 30 Humbug Mt. to OR/CA border all-salmon-except-coho fishery open seven days per week with a 24inch minimum size limit for Chinook.

May 1-Sept. 8 OR/CA border to Horse Mt. all-salmon-except-coho fishery open seven days per week with a 20inch minimum size limit for Chinook.

May $10 \quad$ U.S./Canada border to Queets R. WA (Neah Bay and La Push subareas) all-salmon-except-coho mark-selective Chinook fishery opens May 10-11, May 17-18, and June 22-28 or attainment of the U.S./Canada border to Cape Falcon quota of 8,000 marked Chinook. Fishery is open seven days per week with a 24 -inch minimum size limit for Chinook.

June 8 Queets R. to Leadbetter Pt. (Westport subarea) all-salmon-except-coho mark-selective Chinook fishery opens through the earlier of June 22 or attainment of the U.S./Canada border to Cape Falcon quota of 8,000 marked Chinook. Fishery is open seven days per week with a 24 -inch minimum size limit for Chinook.

Leadbetter Pt. to Cape Falcon (Columbia River subarea) all-salmon-except-coho mark-selective Chinook fishery opens through the earlier of June 21 or attainment of the U.S./Canada border to Cape Falcon quota of 8,000 marked Chinook. Fishery is open seven days per week with a 24 -inch minimum size limit for Chinook.

June 21 Leadbetter Pt. to Cape Falcon (Columbia River subarea) all-salmon-except-coho mark-selective Chinook fishery closes as scheduled.

June 22 Queets R. to Leadbetter Pt. (Westport subarea) all-salmon-except-coho mark-selective Chinook fishery closes as scheduled.

June 28 U.S./Canada border to Queets R. WA (Neah Bay and La Push subareas) all-salmon-except-coho mark-selective Chinook fishery closes as scheduled.

June 22 Leadbetter Pt. to Cape Falcon, all-salmon mark-selective coho fishery opens though the earlier of September 30 or attainment of a 37,380 marked coho quota (increased by 1,000 to 38,380 through an inseason transfer from the commercial fisheries), with an 9,900 Chinook guideline seven days per week. Bag limit is two fish per day; no more than one Chinook per day prior to August 22, no more than two Chinook per day August 23-Sept.30, Beginning Sept. 1, modified inseason to a non-mark-selective coho fishery with remaining quota converted to an impact neutral quota of 9,785.

June 23 Queets River to Leadbetter Pt., all-salmon mark-selective coho fishery opens though the earlier of September 23 or attainment of a 27,660 marked coho quota (increased by 1,480 to 29,140 through an inseason transfer from the commercial fisheries), with a 23,500 Chinook guideline (decreased by 3,200 to 20,300 through an inseason transfer to the commercial fisheries). Sun.-Thurs prior to July 18, seven days per week thereafter. Bag-limit of two fish per day; no more than one Chinook per day prior to August 3, no more than two salmon August 4-31 and September 1-30. Beginning Sept. 6, modified inseason to a non-mark-selective coho fishery with remaining quota converted to an impact-neutral quota of 6,350 . Grays Harbor Control Zone closed beginning August 11.

## RECREATIONAL SEASONS, (continued)

June 29 U.S./Canada border to Cape Alava, all-salmon mark-selective coho fishery opens through the earlier of September 22 or attainment of a 8,200 marked coho quota ( 7,780 preseason quota plus transfers of 420 coho from the commercial fishery), with a 4,900 Chinook guideline, seven days per week. Bag-limit is two fish per day plus two additional pinks; no more than one Chinook per day August 10-22.

Cape Alava to Queets River, all-salmon mark-selective coho fishery opens through the earlier of September 22 or attainment of a 2,990 (1,890 preseason quota plus transfers of 1,100 coho from the commercial fishery) marked coho quota, with a 1,650 Chinook guideline, seven days per week. Bag-limit is two fish per day, plus two additional pinks; no more than one Chinook per day August 10-22.

July 1 Cape Falcon to OR/CA border all-salmon mark-selective-coho fishery opens through the earlier of July 31 or attainment of a 10,500 marked coho quota. Fishery is open seven days per week with a 24 -inch minimum size limit for Chinook.

July 10-Nov. 10 Pt. Arena to Pigeon Pt. all-salmon-except-coho fishery open seven days per week with a 24 -inch minimum size limit through July 31 for Chinook; 20-inch minimum size limit thereafter.

July 10-Oct. 6 Pigeon Pt. to U.S./Mexico border all-salmon-except-coho fishery open seven days per week with a 24-inch minimum size limit for Chinook.

July 31 Cape Falcon to OR/CA border all-salmon mark-selective-coho fishery closes as scheduled.
Aug. 1-31 Cape Falcon to Humbug Mt. all-salmon-except-coho fishery open seven days per week with a 24inch minimum size limit for Chinook.

Aug. 1-Sept. 8 Humbug Mt. to OR/CA border all-salmon-except-coho fishery open seven days per week with a 24inch minimum size limit for Chinook.

Sept. $1 \quad$ Cape Falcon to Humbug Mt. non-mark-selective coho fishery opens Sept. 1-2 then Thursday through Saturday through Sept. 7. Open seven days per week beginning Sept. 12 through Sept. 30 or attainment of a 19,580 coho quota ( 16,000 preseason plus an impact-neutral roll-over of 3,580 from the July mark-selective fishery).

Sept. 3 Cape Falcon to Humbug Mt., all-salmon-except-coho fishery opens Sept. 3-4 then Sept. 8 through 11, Sunday through Wednesday.

Sept. $8 \quad$ Humbug Mt. to OR/CA border all-salmon-except-coho fishery closes as scheduled.
Sept. 28 La Push area ( $48000^{\prime \prime}$ N. Lat. to $4750^{\prime} 000^{\prime \prime}$ N. Lat.), all-salmon mark-selective coho fishery opens through the earlier of Oct. 13 or attainment of 50 Chinook quota or a 50 coho quota.

Sept. 22 U.S./Canada border to Queets River recreational fishery closes as scheduled.
Sept $30 \quad$ Queets River to Cape Falcon, recreational fishery closes as scheduled.
Sept. 30 Cape Falcon to Humbug Mt. recreational non-mark-selective coho fishery closes as scheduled.
Oct. 1-31 Cape Falcon to Humbug Mt. all-salmon-except-coho fishery open seven days per week with a 24inch minimum size limit for Chinook.

Oct. 13 La Push area (4800'00" N. Lat. to 4750 '00" N. Lat.), all-salmon mark-selective coho fishery closes as scheduled.
a/ Unless stated otherwise, season openings or modifications of restrictions are effective at 00:01 hours of the listed date. Closures are effective at 23:59 hours of the listed date.

a/ All values in this table are based on preliminary information available at the start of each year's review. Treaty Indian statistics include landings from Puget Sound.
b/ Season totals include additional winter treaty Indian troll.
c/ In 1994-1996 the non-Indian fishery for Chinook was closed north of Cape Falcon; however, Chinook were caught off Oregon and landed in Washington

a/ Derived from vessel registrations and fish landing tickets.
b/ In 1980, the establishment of a restricted vessel permit system drew a number of historically active vessels back into the fishery.
c/ In 1984, vessels were not required to land at least one salmon to be eligible for a permit in 1985. The Oregon Fish and Wildlife Commission waived this requirement because of the elimination of the coho fishery south of Cape Falcon.
d/ In 1985, vessels traditionally landing salmon south of Cape Blanco and north of Cape Falcon were not required to land at least one salmon to be eligible for a permit in 1986. The Oregon Fish and Wildlife Commission waived this requirement because of the complete closure of the coho season south of Cape Blanco and a limited one-day coho season between the Columbia River and Cape Falcon.
e/ During the 1991 session of the Oregon Legislature, legislation passed waiving the requirement that troll permit holders must buy a 1991 permit to be able to renew for 1992. This was a one-time exemption for 1991 only.
$\mathrm{f} /$ Permits were reissued in a lottery, because the total number of permits had fallen below 1,200.
g/ Preliminary.

a/ Derived from vessel registrations and fish landing tickets.
b/ Number of boats includes only those recording pounds greater than 0.
c/ Excludes pink salmon landings.
d/ Preliminary.
e/ Fewer than three vessels. Values combined with nearest category to preserve confidentiality.

a/ All values in this table are based on preliminary information available at the start of each year's review.
b/ Excludes pink salmon landings.
c/ Number of boats includes only those recording pounds greater than 0.
d/ The fishery was closed north of Cape Falcon, however, Chinook were caught off Oregon and landed in Puget Sound.
e/ Fewer than three vessels. Values combined with nearest category to preserve confidentiality.

a/ Preliminary.
b/ Total pounds and exvessel values reported in this table may be less than are reported in other tables of the Review. The differences are generally one percent or less and likely related to vessel information missing for certain landings.
c/ Fewer than three vessels. Values combined with next category to preserve confidentiality.
d/ Landed on the coast and transported to Puget Sound for processing.

a/ "Home state" refers to the declared state of residence of vessel skipper, who, in most cases, is also the vessel owner.
b/ Includes vessels with home states other than California, Oregon, and Washington.
c/ Includes vessels of unknown lengths.
d/ Length category for 1982 is $>36$.
e/ Preliminary.

a/ Legislation that created the license requirement expired in 1987. Annual license fees were between $\$ 25$ and $\$ 100$ from 19801987. The license requirement was reinstituted by rule in 1988 and 1989 with a $\$ 10$ fee.
b/ Beginning in 1990, responsibility for licensing of charter vessels was transferred to the Marine Board, and fees for Oregon residents were increased from $\$ 10$ to between $\$ 50$ and $\$ 100$.

Marine Fisheries Management Zones

[^0]:    1/ Income impact estimates for the commercial fishery do not include postseason settlement payments fishers may have received from buyers. These postseason settlements may be particularly significant for the California fishery.

[^1]:    a/ Includes catch from the Washington State waters Area 4B fishery.

[^2]:    a/ For earlier years see Review of 2004 Ocean Salmon Fisheries, Appendix C, Table C-5.
    b/ Mark selective coho fishery; all retained coho must be marked with a healed adipose fin clip.
    c/ For detailed regulations, including quotas and inseason adjustments, see TABLE I-1.
