I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

I am not a "tree hugger" or "turtle hugger" however indiscriminate killing/loss of important elements in gillnet fishing must stop. Natural selection is a hard enough pressure for flora and fauna to cope with. We cannot ethically apply non selective pressures to the ocean or land based species.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Pacific Fisheries Management Council

Dear Chair Lowman:
I am writing to ask your help. Please vote NO on any expansion of drift gill net fishing. Evidence has shown the unnecessary and wasteful killing of unintended by catch. Of particular concern to me are the sea turtles - especially Loggerheads which are needlessly drowned in these nets.
Thank you for considering my comments.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Martha McGinnis

Atlanta, GA 30360

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

Before the canned text, the issue for me is that we have to be wise stewards of the ocean and preserve its health in order to feed the billions who now and far into the future are depending on it as a food source. Drift gillnets are the antithesis of wise stewardship.

Take a stand! Take a step toward a world where gillnets are a historical footnote. And now the boilerplate:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dr. Steven J. Prince

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I couldn't say it any better. Give nature a chance, please.
I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to demand the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast.

In fact, I would like to see the Council support a complete BAN of drift gillnets, because they destroy as many non-fish species and marine mammals as the fish they catch!

In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Joe Stebbins

Seven Mile Beach, ky1-5645

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Naomi Dutch
Po

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote ‘No’ on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Thomas Taylor

Rossendale, ot OL13 8LP

Dorothy Lowman

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am thankful for the work the Council performs, especially its continued progressive action, which takes into account the interconnectedness of everything in the marine food web. As the chef at Alchemy Cultural Fare & Cocktails, a southern California restaurant based out of San Diego, it is my food philosophy to let the products speak for themselves. The diverse menu at Alchemy is a testament to my ideals, eclectic background, and commitment to sustainability. I am conscious of the effects a productive marine environment has on the food that I serve to my diners, which is why Alchemy has set out to educate the community on the importance of sustainable seafood, including fishing practices. We understand that maintaining a healthy, balanced, and productive Pacific Ocean is everyone's responsibility.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like

deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

Thank you for your conservation leadership on this pressing issue. We look forward to the Council taking positive action that gives us the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Respectfully yours,

Ricardo Heredia, Executive Chef/Partner
Alchemy Cultural Fare & Cocktails

Dear Chair Lowman, Administrator Stelle, and Director Bonham,
Pacific Fishery Management Council, NOAA Fisheries, and the California Department of Fish and Wildlife

I urge the Pacific Fishery Management Council, NOAA Fisheries, and the State of California to halt the current effort to expand the California-based drift gillnet fishery, and initiate a permanent prohibition on the use of drift gillnet gear throughout the U.S. West Coast Exclusive Economic Zone. This drift gillnet fishery targeting swordfish and thresher sharks entangles and kills over a hundred protected marine mammals per year, continues to take endangered sea turtles and sperm whales, and kills unacceptably high numbers of non-target species such as blue sharks, bigeye thresher sharks, striped marlin, ocean sunfish, and others. Despite the current regulations in place and over 30 years of efforts to address this waste, the continued bycatch from drift gillnets is unacceptable. The proposed expansion of the fishery will also encroach on recently designated critical habitat of endangered leatherback sea turtles, whose population continues to decline, as well as encroach on the ecologically important Davidson Seamount which is a major congregation area for marine mammals and fish.

As state and federal fishery managers, you have a crucial responsibility to California and U.S. citizens to protect endangered species and the health of our marine ecosystems to maximize the benefit to California and the Nation.

Continuing to authorize the drift gillnet fishery, much less considering expanding it, fundamentally contradicts this responsibility.

When these curtains of death are left to soak in ocean waters overnight they entangle some of the California Current's top ocean predators and migratory species. In order to maintain ocean health and biodiversity of the California Current marine ecosystem, drift gillnets should be eliminated and replaced with fishing methods that are proven to be clean. Ultimately, management resources should be focused on promoting and developing gear types that demonstrably minimize bycatch; and our fishery management agencies have an important responsibility to identify and promote such methods. They should not be expanding the use of drift gillnets, an inherently unselective fishing method which we know will kill high levels of non-target fish, marine mammals, and threatened and endangered species. Any efforts to maintain drift gillnets or bring back harmful gears such as longlines to the U.S. West Coast will run contrary to this responsibility and will only move us backwards.

Dear Chair Lowman:

I am a concerned citizen and as one that has worked in oil spill rehabilitation as well as rehabilitation within my own state of Maryland; I am taking the time to write to you as Chair of the Pacific Fisheries Management Council.

I am urging you as representative of the Pacific Fisheries Management Council to stop any additional action to expand the drift gillnet fishery for swordfish off the West Coast of the US. After working the BP Spill in the Gulf of Mexico, I learned a lot about sea turtles along with the threats outside of oil spills. Having spent time with a NOAA representative, I learned much about fishing problems. I strongly object to reducing or weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of the endangered leatherback sea turtles to two (2) over the past decade.

There has been a huge problem with gillnet fishing since there is usually high numbers of by-catch in this unsustainable swordfish fishery. Drift gillnets have been banned in the open ocean and along most of the US West Coast due to the high number of by-catches of all kinds of marine life including endangered whales, dolphins, sea turtles, shark, tuna along with other non-targeted fish.

As I remember, there were some recent emergency regulations put into place after

Two endangered sperm whales were entangled and killed in the California drift gillnet fishery. These gillnets are huge curtains of death which marine life has no

way to escape. Whales are slow to reproduce and as I stated, to begin with, endangered. I understand that the entire Pacific has fewer than 1,500 adult leatherbacks and they are being assaulted by plastic debris, climate warming, pollution and all kinds of fishing practices as well at overfishing for the Asian markets.

Dear PFMC:

I am horrified to read about the mass killing of sea animals in drift gillnets. This is just mass dessimation of fish and mammals, without regard for life at all.

There is no more to say, except that fishing industry has no right to hurt animals or our environment this way.

Please stop the use of these nets. Please stop the industrial killing and destruction of the oceans.

Sincerely,

Melissa Flower

Re: Drift Gillnets

Dear Chair Lowman, Administrator Stelle, and Director Bonham.

I am aware that the drift gillnet fishery, which targets swordfish and thresher sharks, entangles and kills over a hundred protected marine mammals per year. I am also aware that it entangles endangered sea turtles and sperm whales, and kills unacceptably high numbers of non-target species such as blue sharks, bigeye thresher sharks, striped marlin, and ocean sunfish.

Recently I learned that the Pacific Fisheries Management Council has planned a meeting to consider expansion of the drift gillnet fishery, and to discuss future use of drift gillnets off the West Coast. As you prepare for this meeting, I urge you to please halt the current effort to expand the California-based drift gillnet fishery, and please initiate a permanent prohibition on the use of drift gillnet gear throughout the U.S. West Coast Exclusive Economic Zone. Proposed expansion of the gill net fishery will encroach on recently-designated critical habitat of endangered leatherback sea turtles, the ecologically-important Davidson Seamount (a major congregation area for marine mammals and fish).

In order to maintain ocean health and biodiversity of the California Current marine ecosystem, drift gillnets must be eliminated and replaced with fishing methods that are proven to be clean. Ultimately, management resources must focus upon promoting and developing gear types that demonstrably minimize by-catch. It is your responsibility to identify and promote such methods. Please do not expand the drift gillnet fishery; rather, please prohibit drift gillnet gear altogether! Thank you.

With utmost conviction and sincerity,

Portland, OR 97220

RE: Agenda Item K.5 – Highly Migratory Species Management, CA Drift Gillnets

Dear Chair Lowman and Council Members,

Please accept these supplementary public comments from Turtle Island Restoration Network (TIRN) based on my attendance at both the Pacific Fishery Management Council Highly Migratory Species Management Team meeting held January 22 - 24 in La Jolla and the more recent National Marine Fisheries Service Pacific Offshore Cetacean Take Reduction Team meeting in Long Beach, Feb. 4 to 6. The purpose of these comments is to provide specific new information from these meetings for your consideration for decision making related to the California driftnet fishery targeting swordfish and thresher shark.

The science, bycatch data and discussions at the two driftnet fishery focused meetings reinforced the need to reduce (rather than increase) risk of interactions with endangered and protected sperm whales, leatherback sea turtles and other protected marine species in the California driftnet fishery.

Pacific Leatherback Conservation Area

Expanding the driftnet fishery into the Pacific Leatherback Conservation Area (PLCA) will increase risk of interactions with endangered sperm whales and critically endangered leatherback sea turtles.

A bycatch analysis prepared by NMFS science staff and presented at the HMS meeting found higher levels of historic observed takes of protected marine species by the driftnet fishery in the "triangle" area proposed for opening compared to within the PLCA and all fishing areas.

- Levels of endangered sperm whale bycatch per 100 driftnet sets was higher in the "triangle" compared to inside the PLCA and all areas.
- For all cetaceans, the bycatch per 100 sets was higher in the "triangle" than the PLCA and all areas.

— Leatherback bycatch per 100 driftnet sets in the "triangle" was slightly lower than in the PLCA but higher than all areas.

Clearly, allowing increased driftnet fishing in the proposed triangle area will increase risk of bycatch of sperm whales, cetaceans and leatherbacks compared to the status quo. Allowing increased take of endangered marine species would be irresponsible and possibly trigger another violation by the driftnet fishery of the Marine Mammal Protection Act and Endangered Species Act.

DRIFNET FISHERY BYCATCH COMPARISON TABLE PRESENTED BY NMFS AT HMS MEETING

ALL CETACEANS	**ALL AREAS**	**CURRENT CLOSURE (PLCA)**	**AREA CONSIDERED (Triangle)**
Observed Bycatch	656	170	46
Observed Sets	8365	2226	389
Bycatch per 100 sets	7.84	7.64	11.83
LEATHERBACKS	**ALL AREAS**	**CURRENT CLOSURE (PLCA)**	**AREA CONSIDERED (Triangle)**
Observed Bycatch	25	19	2
Observed Sets	8365	2226	389
Bycatch per 100 sets	.30	.85	.51
SPERM WHALES	**ALL AREAS**	**CURRENT CLOSURE (PLCA)**	**AREA CONSIDERED (Triangle)**
Observed Bycatch	10	6	3
Observed Sets	8365	2226	389
Bycatch per 100 sets	.12	.27	.77

Source: National Marine Fisheries Service, Highly Migratory Species Management Team Meeting, January 22 - 24, 2014, La Jolla, CA. Bycatch analysis for CA driftnet fishery, 1990 - 2012.

Emergency sperm whale regulations and 2014 fishing season

As the Council is aware, due to a violation of the MMPA because of the observed take of two sperm whales in 2010, emergency regulations were finally imposed on the CA driftnet fishery in 2013 that expired in January 2014. New regulations must be adopted before the fishery begins operating again in 2014. At this time, the TRT is finalizing its recommendations to NMFS, but as of now they are not publicly available.

The Council should be aware of the following issues related to pending regulations in the CA driftnet fishery:

1. The draft TRT recommendations as discussed during the public meeting allowed for increased sperm whale takes and fishing effort compared to the emergency regulations.
2. NMFS stated at the TRT meeting that the target date for adopting new regulations would be August 15, the date that the main fishery season begins.

2. The CA driftnet fishery is open from May 1 to August 14 for operation 75 miles offshore. It is unclear if or how the fishery will be allowed to legally operate during this period under the MMPA or ESA without regulations that address the excess sperm whale take. The Council should request that NMFS explain how this problem will be addressed.
3. The emergency regulations excluded waters seaward of the Santa Lucia escarpment and any undersea canyons and basins shoreward of the main north-south 2,012 meter depth contour to allow for more fishing effort despite the likely increased risk of endangered sperm whale entanglements.
4. The increased risk of sperm whale take in the Santa Lucia escarpment and offshore canyons under the emergency regulations was partially offset by the closure of Davidson Seamount and other canyons and basins contained within the Pacific Leatherback Conservation Area.
5. The Council should consider how allowing increased driftnet effort in the "triangle" would increase the cumulative risk of endangered sperm whale and endangered leatherback take in the fishery, and how that would impact the fishery's compliance with the MMPA and ESA.

Given the questions above, TIRN urges the Council to recommend to NMFS that the permanent driftnet fishery regulations must encompass and exceed the emergency regulation that expired Jan 31, 2014, which neither addressed areas at high risk of sperm whale bycatch nor long standing fishery management concerns like fleet-wide observer coverage.

Specifically, TIRN requests the following from NMFS and seeks Council support:

1. Prohibit the use of drift gillnet gear in the west coast swordfish/thresher shark fishery.
a. The fishery kills over 100 protected marine mammals per year (NMFS observer data, 2007-2012), more than have been documented from all other activities on the US West Coast and over half of which are cetaceans.
b. Measures to reduce marine mammal takes and monitor this fishery, like observer coverage, are costly and severely limited by available funds and vessel participation.
c. Swordfish drift gillnets are actively fished by a limited number of participants; the vast majority of permit-holders have chosen not to actively fish drift gillnets.
d. Strong precedent for banning swordfish driftnets includes the North Atlantic prohibition to "reduce bycatch of protected resources in a manner that maximizes the benefit to the Nation" (64 Fed. Reg. 4055, Jan. 27, 1999).
2. Until #1 is fully implemented, require 100 percent observer coverage, VMS on all vessels, and immediate closure of the CA driftnet fishery after serious injury or mortality of one CA/OR/WA sperm whale in any fishery.
a. Protections for sperm whales must encompass the full geographic area where sperm whales are known to be present because of the (i) unavoidable risks to sperm whales by the fishery (despite use of pingers, etc.), (ii) new information showing a declining sperm whale population*, and (iii) evidence that sperm whales regularly occupy ocean depths < 2000m.
b. Of the 10 observed takes of sperm whales in the DGN fishery since the 1990s, 2 of the takes occurred at depths < 2000m.
c. Sperm whale sightings are distributed fairly uniformly at the scales of the entire U.S. Exclusive Economic Zone off California (see Marine Mammal Commission letter to Craig Herberer of Nov. 5, 2013 ("MMC letter") citing Caretta 2013, Fig. 2).
d. Areas of concentrated fishing effort include two deep-water exceptions to the emergency rule's sperm whale zone, the Santa Clara Escarpment and the Southern California Bight canyons and basins.

These represent the most likely locations of fishery interactions with sperm whales and are unobserved under the emergency rule. (MMC letter citing Fig. 1, Caretta 2013).

3. Finally, NMFS should request information from its HMS MT and TRT on the extent to which sperm whales appear to use areas around Davidson Seamount because the Council is currently considering increasing fishing in a triangular area south of Pt. Sur between 12 and 100 miles from shore (see Decision Summary Document, Pacific Fishery Management Council, Mar. 7-11, 2013).

*At the HMS meeting, NMFS scientific staff presented draft sperm whale population data that indicated a declining trend. By the TRT meeting several weeks later, NMFS scientific staff revised its modeling and presented data that indicated an increasing trend. In any case the PBR and the status of the species will not change during the next two fishing seasons.

TIRN COMMENTS ON SCIENTIFIC PRESENTATIONS

TIRN would like to provide the Council with comments and a preview from our perspective on several of the scientific presentations given at the HMS and TRT meetings that are also likely to be shared at the Council meeting. They were mostly updates on research that was presented last year and continued into 2013.

Daytime Deep-Set Longline Experiment

The daytime deep-set pelagic longline research conducted by NMFS staff and longline fishers along the California coast and inside the Pacific Leatherback Conservation Area continued to produce high bycatch of non-target species compared to swordfish and thresher shark, the target species.

Over multiple cruises during 2011, 2012, and 2013, a total of 8 swordfish were caught. The bycatch included 328 blue shark along with 67 opah, 23 pomfret, 17 King of Salmon and several other species. ***The overall bycatch rate of target to non-target fish based on number of fish caught was approximately 98 percent.*** While no protected species were reported entangled during the research experiment, the project demonstrated the indiscriminate and high bycatch nature of longline gear.

Blue Shark Bycatch

The researchers leading the deep-set longline experiment downplayed the importance of blue shark bycatch based on estimates of post-hooking mortality of live discards. However, the long-term survival of blue sharks discarded after hooking is not known.

In fact, recent studies show that bycatch in commercial fisheries for swordfish and tuna in the Pacific is devastating blue shark populations by as much as 5 percent per year.[1] This represents a sharp decline for a shark known for its wide range, abundance and ability to reproduce more quickly than other slow-maturing shark species. A recent assessment of the blue shark population in the Pacific indicate that it is likely being overfished and overfishing is occurring in the North Pacific.[2] The International Union for the Conservation of Nature lists blue sharks on the Red List as "near threatened."[3]

In any case, NMFS defines bycatch as "discarded catch of any living marine resource plus retained incidental catch and unobserved mortality due to a direct encounter with fishing gear."[4] The definition does not distinguish between live or dead discards but all unwanted fish and marine life that is caught and thrown back to sea. So whether the blue shark was released alive or dead, it is classified as bycatch.

TIRN urges the Council to consider the high blue shark bycatch in the daytime deepset longline experiment as a serious conservation concern. Particularly if any proposal for Experimental Fishing Permits is put forth at the Council for further use of this gear in the U.S. West Coast EEZ, as was suggested by the lead researcher on the project at the HMS meeting.

TIRN urges the Council to reject any action on or consideration of EFP proposals for pelagic longlining of any kind along the U.S. West Coast.

Adaptive Fishery Management Modeling Research

The Council is likely to be presented with an overview of a fishery interactions modeling project being conducted by researchers funded by Stanford University's Center of Ocean Solutions and NASA. The adaptive fishery management project is designed to explore whether driftnet fishery bycatch and effort data can be correlated with satellite tracks showing sightings of leatherback, whales and other protected marine species along the U.S. West coast.

My understanding is that the goal of the project is to provide an "adaptive" fishery management tool that would theoretically allow more fishing effort while decreasing risks of interactions with protected species. The CA driftnet fishery is being used as a basis for the modeling project with the vision of developing software that would be used in other fisheries with similar levels of data to determine in real time where and when fishing can occur without endangering vulnerable marine life.

While TIRN supports and respects the long-term vision and objectives of the research, we are concerned that when the researchers present their project at policy meetings such as the HMS, TRT and the Council that they are giving policymakers and stakeholders the impression that implementation of the modeling tool in the driftnet fishery is imminent. In reality, the research is only just beginning and the modeling has not yet been tested to determine whether it is a valid approach.

The Council should be aware of the early state of the research when considering whether or when it can be applied to the driftnet fishery.

MERCURY IN SWORDFISH AND SHARK

When considering any expansion of the swordfish fishery, the Council should consider the fact that the U.S. Federal Food and Drug Administration (FDA) and Environmental Protection Agency (EPA) warns all women of child-bearing age not to eat swordfish or shark due to known high levels of mercury and the risk of damage to developing fetuses. This means that women 18 to 45, or roughly half of the population, should not ***ever*** eat swordfish or shark, mackerel and tilefish. That's because these fish species routinely exceed the FDA action level of 1 part per million methylmercury, a known neurotoxin.

Instead of working to expand a fishery that targets high-mercury fished caught with high-bycatch gears, TIRN urges the Council and NMFS to invest in enhancing sustainable low-mercury fisheries to supply the seafood that the entire population can enjoy without concern.

TIRN thanks the Council for considering our views in your decision making.

Sincerely yours,

Teri Shore

Ms. Dorothy M. Lowman
Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am thankful for the work the Council performs, especially its continued progressive actions, which take into account the interconnectedness of everything in the marine food web. As a marine life artist, I draw inspiration from a vibrant and healthy Pacific Ocean. I began changing the way people think about our environment when I first started painting life-size whales on the sides of buildings in the 1980s, and I continue striving to inspire our generation about the importance of marine life conservation. After 30+ years of involvement in ocean conservation, I am heartened to see decision makers here on the West Coast show the leadership necessary to move our fishery management system towards an ecosystem-based approach. By proactively protecting marine mammals and fish, we help to ensure the health of our marine ecosystem for the next generation of ocean enthusiasts, fishermen, seafood lovers and artists like myself.

In order to protect and enhance the ecosystem that I love and that drives my work, I write to encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you again for the opportunity to offer my thoughts on this matter and to participate in this public decision making process. I appreciate all that you do to maintain healthy oceans and sustainable fisheries.

Sincerely,

Wyland, President/CEO

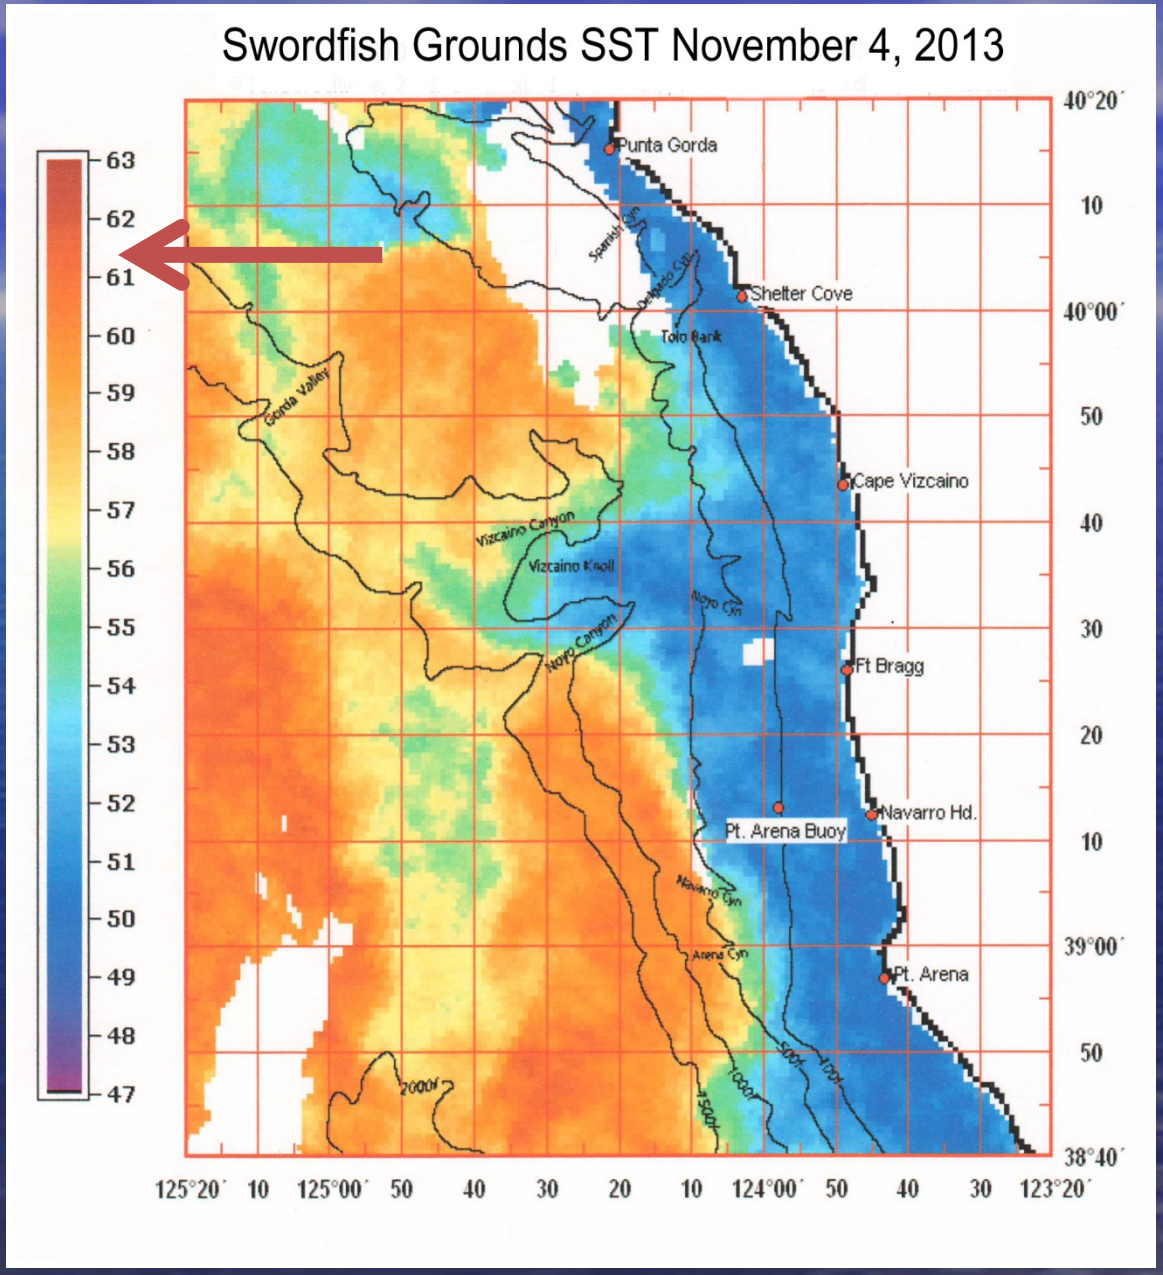
PLEASE

CALIFORNIA DRIFT GILL NET SWORDFISH FISHERY

One simple change could enhance fresh, local, sustainable landings by 25-30%

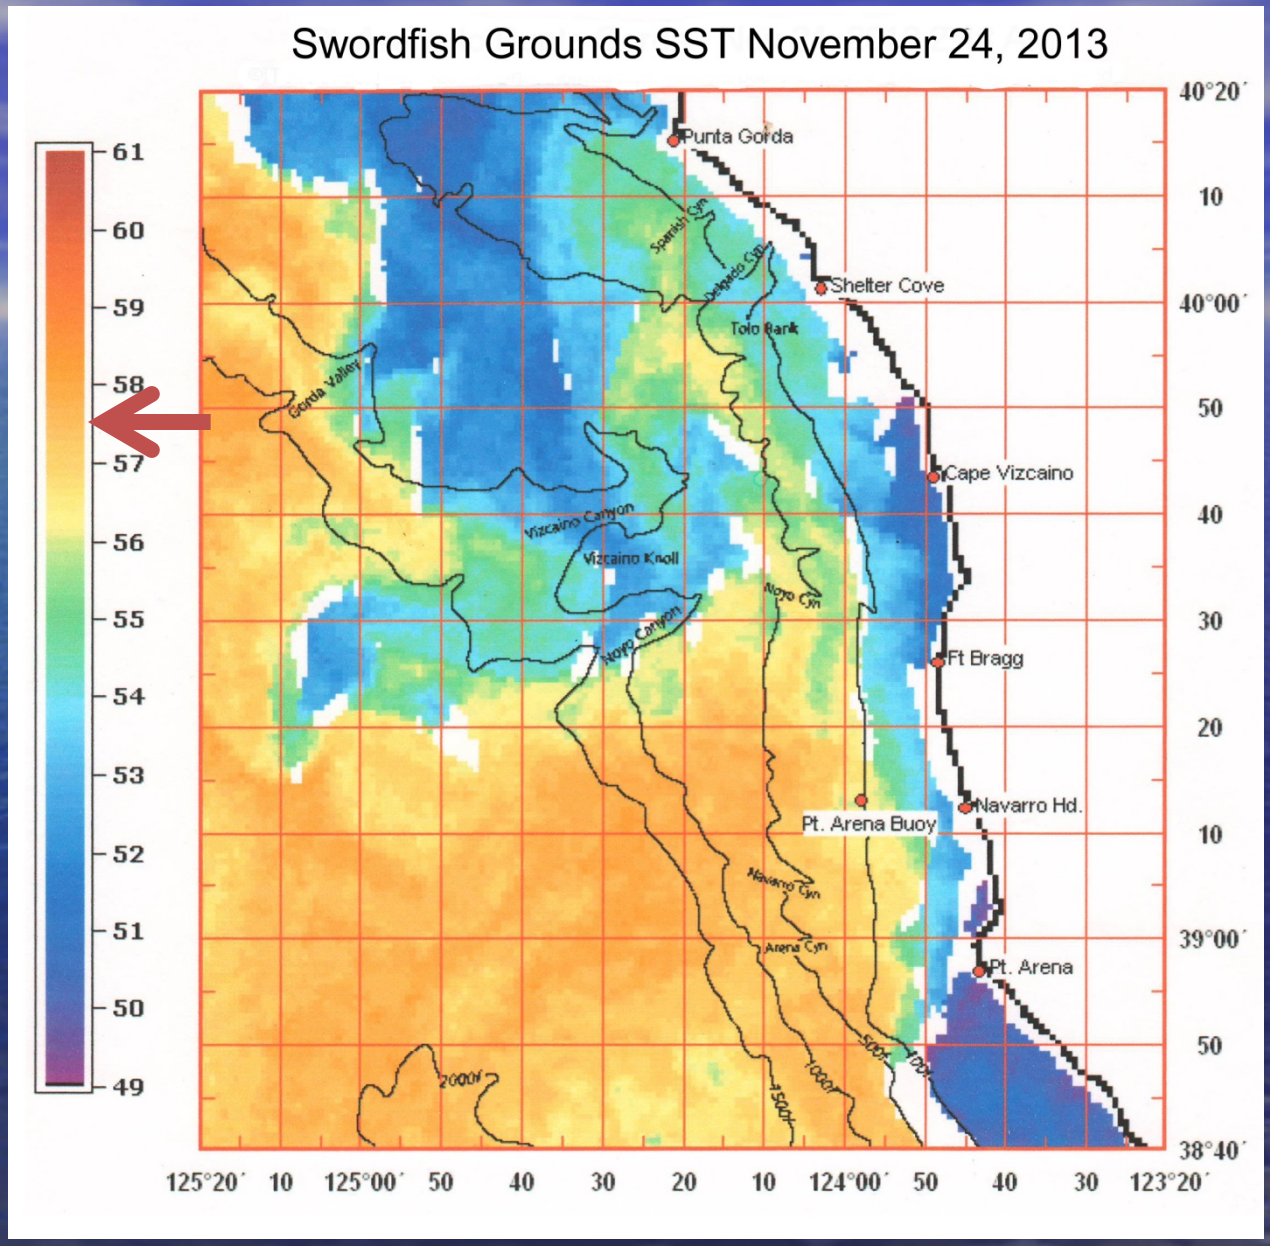


Sea Surface Temperature is Everything To Swordfish

Here's an area where swordfish were caught last year in November.

The 61-62° areas are good places to look for fish.

They are extensive in early November.



Here's the same area **three weeks later.**

Notice that SST has dropped from **61-62°** to **57-58°** in the area we fish.

The fish are long gone, with the warmer water.

This happens almost every year…

A SMALL CHANGE

If the start date for the swordfish DGN fishery In this area were simply moved from November 15 to November 1, it is highly likely that in most years fresh, local swordfish landings (now deemed **under-utilized** by NMFS) could be ***enhanced*** **by 25%-30%** due to the improved availability of the fish in early November.

TURTLES, YOU ASK?

In all the history of NMFS observers on drift gill net boats in this area since the inception of observers, there has been *only two leatherback turtles* caught in a net in the area we're talking about. **The turtles simply are not there during this time.** This has not impacted Leatherback turtle populations in the Pacific *at all* (especially compared to foreign fleets and beach egg collection in their nesting areas, well documented as the greatest impacts to Pacific Leatherbacks.)

Landings Enhancement Possible From This Change

- 20 years ago there were over 100 DGN vessels registered with DFW, and yet only one or two leatherback were taken in the PLCA incidental to this fishery during this time period

- Today there are only around 70 permits left, of which only about 20 actively fish.

- The U.S. imports about 90% of the fish consumed in the country. Last year imports increased over $1.1 Billion.

- One CA boat fished one trip here last fall and landed over 100 fish. If just a few more joined him earlier in November, *fresh, local* landings could be enhanced by as much as 60,000 lbs.

WHAT'S THE POINT?

Changing the start date of this fishery

- North of Monterey from
- November 15 to November 1

could enhance fresh, local landings of California swordfish (and local jobs) by as much as 25-30% ! (maybe more)

- NMFS has declared Pacific Swordfish stocks to be "healthy, abundant and harvested at sustainable levels."

QUESTIONS?

(and, thanks for listening.)

California's Drift Gillnet Swordfish Fishery

Sperm whale

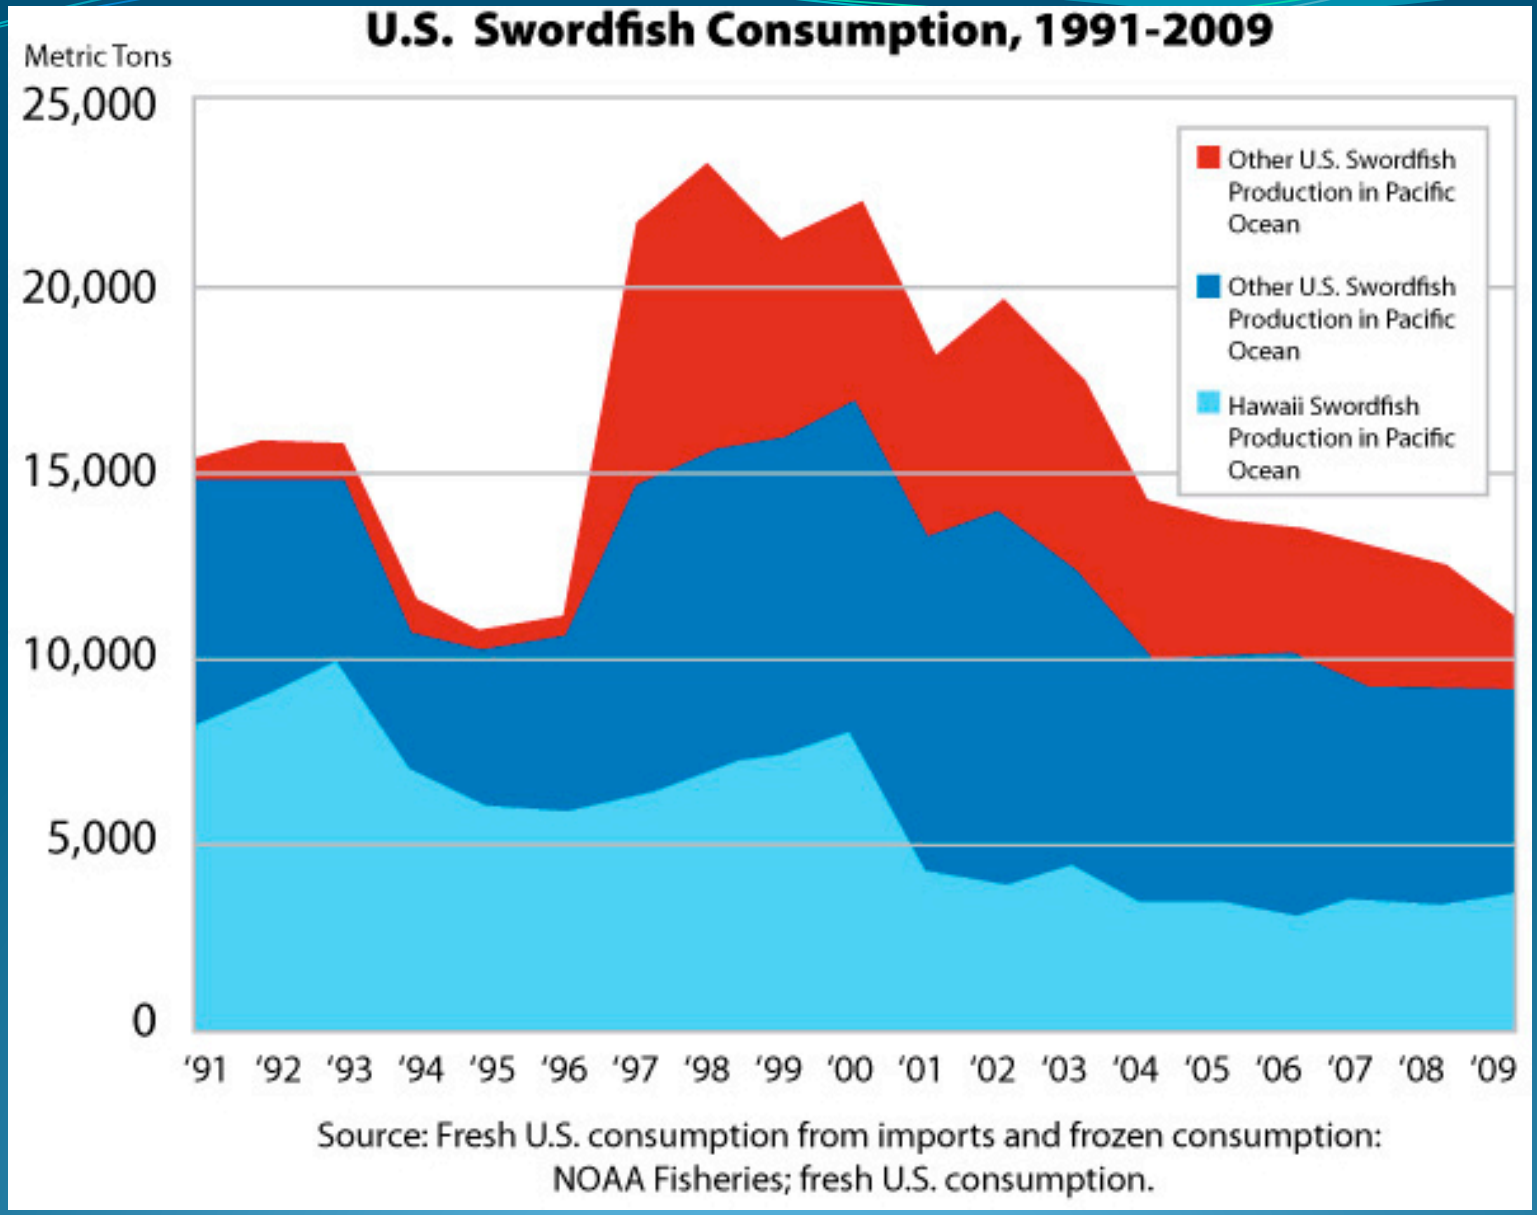
TRT Recommendations

- Weaker than emergency regulations
- Doesn't cover May 1 to Aug 15 season.
- May not meet ESA and MMPA

Emergency	TRT
100% observer cover in Zone	100% - 67% in Zone (to avoid PBR)
1 sperm whale mortality, fishery closes	1 sperm whale mortality in Zone, Zone Closes ONLY Effort Moves Inshore
	2nd sperm whale mortality, fishery closes
	NOTE: ZMG is legal threshold not PBR

No Federalization of Fishery

1. Conflicts with longstanding California fishery policy and management
2. Not in the interest of the state of California
3. Opens door to vacating decades of fishery reform
    1. Time and area closures
    2. Gear reform



4. State authority to issue permits is clear
5. Federal initiatives to expand driftnets and introduce longlining are in direct conflict with state statutes and policies
6. California Department of Fisher and Wildlife, California State Legislature, California Coastal Commission
7. People of California – the fishery is a public trust resource

Swordfish Market Transfer – Reality or Myth?

- No evidence – no science of market transfer effect
- 80 to 90 percent of U.S. Seafood is Imported
- Imports don't meet U.S. standards
- Solution – Enforce MSA and MMPA
- Dolphin-Safe Tuna
- Turtle-Safe Shrimp (TEDs)
- Instead NMFS Rulemaking 2010 abandoned
- CA AJR 8 – Call on NMFS to Act
- CA – require imports to meet U.S. standards?

Kill More Turtles and Marine Mammals Here to Save More There? Other nations will continue to sell their fish no matter what CA does.

WARNING!

Nearly all fish and shellfish contain some amount of mercury and related compounds, chemicals known to the State of California to cause cancer, and birth defects or other reproductive harm. Certain fish contain higher levels than others.

Pregnant and nursing women, women who may become pregnant, and young children should not eat the following fish:

SWORDFISH • SHARK • KING MACKEREL • TILEFISH

They should also limit their consumption of other fish, including tuna.

Fish and shellfish are an important part of a healthy diet and a source of essential nutrients. However, the federal Food and Drug Administration ("FDA") and U.S. Environmental Protection Agency ("EPA") advise pregnant and nursing women, women who may become pregnant, and children to limit their weekly consumption of fish and to eat fish that are lower in mercury.

The California Department of Health Services recommends that these individuals:

- Eat a variety of different types of fish;
- Eat smaller fish rather than older, larger fish;
- Begin following these guidelines one year before becoming pregnant.

According to the FDA and EPA, fish or shellfish that tend to be lower in mercury include pollock, shrimp, and scallops. Mercury levels in tuna vary. Tuna steaks and canned albacore tuna have higher levels of mercury than canned light tuna.

For more information about the risks of mercury in fish and about the levels in various types of fish consult the following websites:
U.S. Food and Drug Administration ("FDA") **www.cfsan.fda.gov**
U.S. Environmental Protection Agency **www.epa.gov/ost/fish**

or call the FDA toll-free at **1-888-SAFEFOOD (1-888-723-3366).**

Note: Northwest Albacore low in mercury.
Promote as alternative to swordfish.

Ms. Dorothy M. Lowman
Chair
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am writing to you as the co-owner and chef of the Border Grill restaurants. We are committed to sourcing and serving the freshest ingredients and are always conscious of where our food comes from. We serve only sustainable seafood in our restaurants, and strive to educate our customers through our distribution of sustainable seafood guides. We are continuously looking to step up our efforts with a host of environmentally-friendly policies. We know that a healthy Pacific Ocean means better food for our diners, and that maintaining a productive and balanced marine ecosystem is a responsibility that we must all share.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you for your consideration of my comments and for your continued work and commitment to ensuring a healthy and productive Pacific Ocean.

Respectfully yours,

Mary Sue Milliken, Co-Owner/Chef

RE: Swordfish and Thresher Shark Drift Gillnet Fishery Management

Dear Chair Lowman and Council Members,

On behalf of Defenders of Wildlife (Defenders), I write in regards to the management of the West Coast drift gillnet fishery for swordfish and thresher shark. We request that the Pacific Fishery Management Council (Council) take action to reduce harmful bycatch associated with this fishery. Specifically, we ask the Council to:

1. Maintain the current boundaries and closure period for the Pacific Leatherback Conservation Area (PLCA). We are greatly concerned about the potential for increased drift gillnet gear interactions with endangered leatherback turtles and other protected species inside the PLCA should any modification be implemented. The area currently under consideration overlaps with the Monterey Bay National Marine Sanctuary and contains recently designated critical habitat for leatherback turtles, which migrate across the Pacific Ocean to this area to forage. This area is also inhabited by a host of other protected species and marine wildlife, such as humpback whales and sperm whales, all of which have been killed or injured by drift gillnets within the proposed area during the last 20 years.

2. Request that the National Oceanic and Atmospheric Administration's Fisheries Service (NOAA Fisheries) make permanent the emergency measures implemented for the drift gillnet fishery during the 2013-2014 season. We strongly support these emergency measures, which are necessary for the drift gillnet fishery to maintain compliance with existing federal regulations under the Magnuson-Stevens Fishery Conservation and Management Act (MSA), the Endangered Species Act (ESA) and the Marine Mammal Protection Act (MMPA).

3. Establish enforceable caps on the killing of marine mammals and other protected species for the broader drift gillnet fishery. We strongly support the implementation of a system of enforceable caps for the drift gillnet fishery as long as it operates off the West Coast, modeled after the Hawaii shallow-set longline fishery in which enforceable caps are derived from the ESA- issued incidental take statements, and the fishery closes immediately for the remainder of the season if a cap is reached.

4. Support efforts to transition the drift gillnet fishery to a more sustainable gear type, such as buoy gear. To ensure the long-term

California Program Office

1303 J Street, Suite 270

Sacramento, CA 95814

Telephone 916-313-5800

sustainability and viability of the West Coast swordfish fishery, the Council, NOAA Fisheries, the swordfish industry and other stakeholders should invest in, research, and test alternative gear types that cause significantly less bycatch than drift gillnets. Deep-set buoy gear has been successfully deployed as a viable swordfish gear type in the North Atlantic Ocean. On the West Coast, projects are currently underway to test the viability of deep-set buoy gear types that show promise in terms of ability to catch swordfish, avoid bycatch and provide a fresh and sustainable seafood product.

Defenders believes that the current and potential threat of bycatch to marine species such as whales, sharks, and sea turtles caused by the West Coast drift gillnet fishery is unacceptable. The recommendations listed above will significantly reduce this threat as well as support the fishery's transition to a more sustainable gear type.

Thank you for your time and consideration. Please do not hesitate to contact me if you have any questions.

Sincerely,
Haley Stewart

Subject: Restore Protections for Sperm Whales -- Agenda Item K.5.b – Drift Gillnet Management

Dear Chair Lowman and council members,

As you look toward future regulations of the drift gill net fishery for off the west coast, I encourage you to make the 2013 NOAA Fisheries emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- 100% observer coverage on all drift gillnet fishing vessels from August 15 to January 31 in all areas deeper than the 1,100 fathom depth contour.
- Installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

“Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method.”
-- Theodore Roosevelt

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would alter the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

“Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish—indeed, all the living creatures of prairie and woodland and

seashore—from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."
-- Theodore Roosevelt

In addition to making these protections for sperm whales permanent, I ask that you continue developing comprehensive new measures to monitor and limit interactions with mammals, turtles, and other ocean life, and continue supporting research on new commercial fishing methods that will further minimize harm to the Pacific Ocean ecosystem by phasing out the use of all drift gillnets. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."
-- Aldo Leopold

Thank you for your conservation leadership on this pressing issue and for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Re: Agenda Item K.5: Drift Gillnet Monitoring, Management, & Alternative Gear Report

Dear Chair Lowman and council members:

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make permanent the 2013 NMFS emergency rule to protect sperm whales. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I, as a former commercial fisherman and current seafood marketer, ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales. I believe consumers will support these efforts if given the chance.

Thank you for your conservation leadership on this pressing issue.

Sincerely,

Kevin Scribner

RE: Swordfish and Thresher Shark Drift Gillnet Fishery Management

Dear Chair Lowman and Council Members,

We write in regards to the management of the West Coast drift gillnet fishery for swordfish and thresher shark (drift gillnet fishery). Starting with this meeting, and continuing on through the biennial management process, we request that the Pacific Fishery Management Council (Council) take action to reduce harmful bycatch associated with this fishery.

Specifically, we ask the Council to:

- Maintain the current boundaries and closure period for the Pacific Leatherback Conservation Area (PLCA).
- Request that the National Oceanic and Atmospheric Administration's Fisheries Service (NOAA Fisheries) make permanent the emergency measures implemented for the drift gillnet fishery during the 2013-2014 season.[1]
- Establish enforceable caps on the killing of sea turtles, marine mammals and other protected species for the broader drift gillnet fishery.
- Support efforts to transition the drift gillnet fishery to a more sustainable gear type, such as buoy gear.

By taking the actions above the Council can minimize and mitigate harmful impacts to marine wildlife from drift gillnets operating off the West Coast, while working to transition this fishery to a more sustainable gear type. The combination of these actions will help to develop a sustainable swordfish and thresher shark fishery while ensuring a healthy and balanced ocean ecosystem.

Maintain PLCA Boundaries and Closure Period

At the March 2013 Council meeting, the Highly Migratory Species Management Team (HMSMT) was tasked with evaluating potential modifications to the PLCA in order to expand drift gillnet opportunity. As part of this evaluation, the HMSMT was asked to analyze and report back on expected effort level, potential revenue increase, and the expected rate of turtle interactions for each modification alternative under consideration.[2]

[1] "Fisheries Off West Coast States; Highly Migratory Fisheries; California Drift Gillnet Fishery; Sperm Whale Interaction Restriction, Temporary Rule, Emergency Action." 78 *Federal Register* 171 (September 4, 2013) pp. 54548-54552
[2] PFMC. March 2013. Agenda Item I.2.d, Supplemental Motion in Writing.

We are greatly concerned about the potential for increased drift gillnet gear interactions with endangered leatherback turtles and other protected species inside the PLCA should any modification be implemented. The area currently under consideration overlaps with the Monterey Bay National Marine Sanctuary and contains recently designated critical habitat for leatherback turtles, which migrate across the Pacific Ocean to this area to forage. This area is also inhabited by a host of other protected species and marine wildlife, all of which have been killed or injured by drift gillnets within the proposed area during the last 20 years.[3]

It is clear that any reopening of the PLCA increases the potential for interactions not just with endangered sea turtles, but with other protected species. The March 2014 HMSMT report also highlights the increased rate of interaction for sea turtles and other marine life within the PLCA.[4] Large mesh drift gillnets are just too indiscriminate to be considered a sustainable gear type. They have been banned on the high seas[5] and in the Mediterranean.[6] Rather than focusing management attention on expanding opportunity for drift gillnets, the Council and NOAA Fisheries should focus efforts on developing an ecologically sustainable and economically viable domestic swordfish fishery.

Make Temporary Regulations Permanent

Through emergency action, NOAA Fisheries enacted the following regulations for the 2013-2014 drift gillnet season:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- 100 percent observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Installation and operation of a vessel monitoring system (VMS) on all drift gillnet vessels prior to embarking on a drift gillnet fishing trip.

This action was taken because an observer recorded two sperm whales caught in drift gillnet gear - one dead and one seriously injured - during the 2010-2011 fishing season. This incidental take was determined by NMFS to exceed the Potential Biological Removal[7] (PBR) for the California-Oregon-Washington stock of sperm whales as well as the incidental take statement (ITS) for the drift gillnet fishery.[8] In response, NOAA Fisheries promulgated these short-term measures to reduce drift gillnet interactions with sperm whales during the 2013-2014 fishing season to levels that do not exceed the PBR.

---

[3] This list includes endangered sperm whales, Dall's porpoise, short beaked common dolphin, northern right whale dolphin, northern elephant seal and California sea lion. Source: NOAA, West Coast Observer Program Data Summaries and Reports.
[4] PFMC. March 2014. Highly Migratory Species Management Team Report on Drift Gillnet Management. Agenda Item, K.5.b
[5] United Nations Resolution 46/215
[6] NMFS. 2012 Report to Congress. U.S. Actions Taken on Foreign Large-Seas High Seas Driftnet Fishing.
[7] "Fisheries Off West Coast States; Highly Migratory Fisheries; California Drift Gillnet Fishery; Sperm Whale Interaction Restriction, Temporary Rule, Emergency Action." 78 *Federal Register* 171 (September 4, 2013) p. 54548
[8] This incidental take statement was issued through the prior biological opinion conducted in 2004. A new incidental take statement was issued for the drift gillnet fishery in 2013 as a result of the sperm whale take during the 2010-2011 season.

We strongly support these emergency measures, which are necessary for the drift gillnet fishery to maintain compliance with existing federal regulations under the Magnuson-Stevens Fishery Conservation and Management Act (MSA), the Endangered Species Act (ESA) and the Marine Mammal Protection Act (MMPA).[9] In a fishery like this, with a demonstrated potential for episodic bycatch of protected species, 100 percent coverage is needed to ensure the highest degree of accountability under any system of enforceable caps, in particular for species – such as sperm whales - with a hard cap of 1.

Nothing has substantively changed regarding this fishery since these temporary regulations expired on January 31, 2014 that would render them unnecessary for the coming fishing season. As long as large-mesh drift gillnets operate off the West Coast, there will be a likelihood of interaction with sperm whales, as well as other marine mammals and fish. In order to minimize interactions with sperm whales, and to properly account for all incidental catch, we urge the Council to recommend that NOAA Fisheries make the temporary regulations permanent before the start of the 2014-2015 drift gillnet fishing season.

Establish Enforceable Caps for Protected Species

At the March 2013 meeting, the Council also called for continued analysis on the establishment of enforceable caps on incidental takes of sea turtles and other protected species, not just for a potential reopening of the PLCA, but for the broader fishery. We strongly support the implementation of a system of enforceable caps for the drift gillnet fishery as long as it operates off the West Coast, modeled after the Hawaii shallow-set longline fishery in which enforceable caps are derived from the ESA- issued incidental take statements, and the fishery closes immediately for the remainder of the season if a cap is reached.

As referenced above, any meaningful system of enforceable caps for rare or protected species would require 100 percent observer coverage to ensure all incidental catch is accounted for. To this end, the HMSMT report highlights the "low statistical power of significance testing obtained using small observer samples to estimate rare bycatch events. "[10] The report further notes that observed take would not be proportional to actual take (which is the operating assumption under the current Biological Opinion) if the fishery is subject to different levels of coverage in different areas. Therefore we do not support the use of probability-based methodology to support an enforceable cap system with less than 100 percent coverage. In order to respond in a timely and accurate manner to an enforceable cap being reached, there must be an observer on every set made. Additionally, NMFS and the Council must establish and adhere to science-based enforceable caps, and resist potential efforts to raise limits of allowable takes should they be reached. Enacting these requirements will help ensure that all bycatch is accounted for, and any negative impacts to protected species are minimized.

[9] These temporary regulations ensure that any injury or mortality to a sperm whale does not exceed the PBR and also to maintain existing incidental take compliance under the Endangered Species Act (ESA) and Marine Mammal Protection Act (MMPA) for the drift gillnet fishery. By requiring 100% observer coverage, NMFS ensures that there is full accounting of all bycatch rather than having to extrapolate from existing coverage levels, currently below the 20% target.

[10] PFMC. March 2014. Highly Migratory Species Management Team Report on Drift Gillnet Management. Agenda Item, K.5.b

We also understand that there is potential for cost-saving through the utilization of electronic monitoring to ensure full accountability. However, deployment of electronic monitoring equipment as a replacement for human observers should only be pursued if a scientific analysis proves it to be equally effective in identifying all incidental catch.

Support Efforts to Develop Viable Alternative Gear Types

To ensure the long-term sustainability and viability of the West Coast swordfish fishery, the Council, NOAA Fisheries, the swordfish industry and other stakeholders should invest in, research and test alternative gear types that cause significantly less bycatch than drift gillnets. As noted above, deep-set buoy gear has been successfully deployed as a viable swordfish gear type in the North Atlantic Ocean.[11] On the West Coast, projects are currently underway to test the viability of deep-set buoy gear types that show promise in terms of ability to catch swordfish, avoid bycatch and provide a fresh and sustainable seafood product.

NOAA Fisheries has in fact supported similar efforts in Turkey and Morocco, and has sponsored a project to transition Moroccan swordfish fishermen from drift gillnets to buoy gear. In an announcement made in November of 2012, NMFS states:

> "*A scientific experiment in Moroccan waters is planned to test the use of buoy gear – a gear type developed in a U.S. swordfish fishery that has demonstrated decreased bycatch rates while increasing target catch rates….. By sharing this technology (buoy gear), we can support Morocco's efforts to eradicate driftnets, an action that has many benefits for the marine environment."*[12]

Current West Coast experimental gear trials should be expanded in cooperation with the fleet, including Council and NMFS support for Exempted Fishing Permits (EFPs). We look forward to participating in this process and supporting efforts to transition this fishery to a gear type that is both ecologically sustainable and economically viable.

Conclusion

The drift gillnet fishery for swordfish and thresher shark has unacceptable levels of bycatch of a wide array of marine wildlife, including federally protected species. It cannot be viewed by any reasonable observer as a long-term sustainable fishery. At the same time, we understand the reasoning and justification for the need to maintain a sustainable domestic swordfish fishery within the West Coast exclusive economic zone. It is for these reasons that we offer the recommendations here that would allow for continued use of drift gillnets in the short term- under science-based regulations to minimize bycatch – while working to transition the fishery to a clean and sustainable gear type.

Re: Agenda Item K.5: Drift Gillnet Monitoring, Management, & Alternative Gear Report

Dear Chair Lowman and council members:

Flying Fish Oregon is a local, family run business and we are proud to sell all sustainable seafood. As a consumer, you have seafood choices. Not all fish and shellfish available in today's markets and restaurants are good choices from an environmental perspective. The California drift gillnet fishery has extreme amounts of bycatch and is causing serious harm in the ocean ecosystem.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.

- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

As a small business owner that believes in serving only the highest quality, sustainable seafood, I appreciate your efforts to maintain healthy and sustainable fisheries. Thank you for allowing me the opportunity to comment.

Sincerely,
Lyf Gildersleeve
Owner, Flying Fish

Re: Agenda Item K.5 *– Highly Migratory Species Management, Drift Nets*

Dear Chair Lowman and Council Members:

For more than forty years, *Wild Oceans* has worked on behalf of anglers dedicated to an ecosystems approach to conserving salt water fish. Our programs emphasize protecting the ocean's top predators – the billfish, tunas, swordfish, and sharks – while preserving healthy ocean food webs and critical habitats essential to the survival of all fish, marine mammals, sea turtles and seabirds. We have always worked for fishing and fishermen, but against indiscriminate and unsustainable types of fishing such as drift nets.

Last year, the Pacific Fishery Management Council debated whether it would be possible to allow the swordfish drift net fishery greater access to the Pacific Leatherback Conservation Area (PLCA) without increasing the risk of encounters between one of the ocean's deadliest gears and some of its most endangered animals. The council ultimately agreed that the risks were too high to make any changes. It's time to reaffirm that position, join the east coast councils, the U.S. government, the European Union and the United Nations in banning drift nets, and replace drift nets with alternative, "greener" methods of fishing.

Allowing drift nets contradicts the council's goal of minimizing bycatch

The evidence is overwhelming that drift nets are an extremely wasteful method of fishing, incapable of limiting what they catch to the targeted species. Such senseless squandering of precious resources is much too high a price to pay to permit their continued use. The council's decade long experiment with PLCA closures has

demonstrated that we *can* minimize the capture and killing of protected species by restricting drift nets, but also that curtailing the use of the nets is the *only* way to protect our ocean diversity from the indiscriminate entanglement and killing associated with this gear.

The use of indiscriminate drift nets is at odds with federal requirements to minimize bycatch.

- According to observer reports, from May 2001 to January 2013 more than 85 percent of the observed catch in the swordfish and thresher shark drift net fishery was bycatch. This bycatch include marlins, sharks, tunas and countless other fish.
- The fishery discarded more than 60 percent of the total catch. But this only includes the observed catch. It does not quantify the unobserved non-catch mortality that falls out of the net before the net is hauled in making the actual catch discarded higher than observed.
- It is estimated that more than 100 marine mammals and turtles as well as diving seabirds may die in swordfish drift nets every year. Some of these animals are endangered and are protected under national and international laws.

The focus of drift net bycatch discussions has been on avoiding turtle and sperm whale interactions, and noting the high risks and uncertainties involved, acceptable "takes" of these protected species. But in the end, even *if* the council could manage the fishery to avoid interaction with and mortality of marine mammals and sea turtles – a highly doubtful proposition - it would not decrease the bycatch of fish – thousands of non-target sharks, hundreds of billfish and many other species - which account for more than 85 percent of the entire catch in drift nets.

It's time to remove drift net gear from the California Current Ecosystem.

During the council's phase-out of the use of drift net gear in the west coast swordfish and thresher shark fishery, the Council should take the necessary steps to limit the catch of vulnerable species by:

- implementing hard caps on all vulnerable species including marine mammals, turtles, blue marlin and striped marlin, and vulnerable shark species and closing the fishery for the remainder of the season when any hard cap is met;
- requiring 100 percent observer coverage on all vessels employing drift net gear in order to enforce the hard caps; and
- requiring installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift net fishing trip.

There is a more economically and environmentally sustainable path

Opening a small area of the PLCA will do little to rescue the drift gillnet fishery economically, while continuing to take the council down the wrong path, expending valuable staff resources and funding on increased oversight and management of a way of fishing that is, inescapably, a regulatory dead-end.

Fortunately, there are viable alternatives. We have advocated and continue to advocate for assistance to fishers to make the transition to alternative sustainable fishing methods. This includes revitalizing the existing harpoon fishery while continuing researching into alternative gears.

Best fishing practices for bluewater fisheries (see attached briefing paper) can support small-scale, high-yield, locally supplied fisheries, commercial as well as recreational, using the latest technological developments in sustainable fishing. It is part of a progressive shift away from so-called modern, "efficient" methods of fishing that are wasteful and ultimately unmanageable.

For a number of years now, *Wild Oceans* has been promoting a transition away from drift nets and pelagic longlines – gears that fish passively and kill indiscriminately – to safer, more selective fishing methods for swordfish, tuna and other commercial species. One such emerging method is buoy-gear, used by swordfish fishermen in Florida for over a decade, supplying a high-value product with virtually no bycatch. It's been so popular with commercial fishermen that a pilot buoy-gear study is underway in the Gulf of Mexico, where longline bycatch of breeding bluefin is a threat to that severely overfished tuna's recovery.

As you know, in 2011, the Pflegler Institute of Environmental Research (PIER) began trials with swordfish buoy-gear off the California coast. In a presentation to the Highly Migratory Species Management Team in La Jolla in January 2014, a PIER researcher demonstrated that this gear can successfully target swordfish while reducing bycatch and allowing for high rates of survivability of the non-target fish that are hooked. It holds promise for providing an economically-attractive alternative to drift nets.

Existing gear, specifically harpoon, is also capable of catching as many swordfish as the drift net fishery, but without the bycatch or high regulatory costs. In 1978, prior to the authorization of drift gillnets off California, the harpoon fishery landed 1,171 metric tons of swordfish in a banner year. This is comparable to average swordfish catches by drift nets in the 1980s and far greater than any annual swordfish catches with drift nets in the past 18 years. The biggest disincentive to participating in the harpoon fishery after 1980 was the authorization of the more efficient, yet indiscriminate, drift gillnets.

Not all alternatives are created equal

In January, the Highly Migratory Species Management Team received an update on the daytime deep-set pelagic longline research conducted by NMFS staff and longline fishers along the California coast. This experimental fishery produced high bycatch compared to landings of swordfish and thresher shark. The experimental gear, deployed over the course of three seasons, caught eight swordfish. The bycatch included 328 blue shark along with 67 opah, 23 pomfret, 17 King of the Salmon (ribbonfish) and several other species. The project confirmed the indiscriminate and high bycatch nature of longline gear. Approximately 98 percent of the fish caught were non-target species.

Our position dating back to before the council banned longlines in 2004 has been to prohibit the gear within the west coast EEZ by indefinite moratorium, with the potential for re-evaluation only after completion of a *bona fide* bycatch reduction research program with pre-established protocols. We believe such an approach is necessary to maximize bycatch protection for numerous species of fish *and* protected species, since the ban on longlining could be lifted only if research demonstrates minimal impact on non-target, protected and vulnerable species.

Our position remains the same today. Unfortunately, neither the council nor NMFS has developed such a research protocol for its ongoing experiments with deep-set longlining. There must be clearly defined goals and objectives that can be used to evaluate the results; goals and objectives that would be developed through a transparent process involving stakeholders with interests in all affected species and fisheries. To debate the results of research without such criteria is unproductive.

The path forward

Drift nets are an anachronistic fishing gear that's on its way out everywhere. In fact, by allowing drift netting to continue off the west coast, the council is on the wrong side of history. The United Nations banned large-scale drift nets on the high seas twenty years ago. Since then, the U.S. has banned drift nets of any size in our east coast fisheries, including for swordfish, and we supported a ban at the International Commission for the Conservation of Atlantic Tunas. The European Union banned drift netting among its 27 member states in 2002.

The California Legislature has noticed, and is about to wrestle control of drift net management from the Council. Assembly member Paul Fong introduced legislation that would prohibit the use of drift gillnets to take shark and swordfish and would direct the Department of Fish and Wildlife to initiate and support an amendment to the Highly Migratory Species Fishery Management Plan to prohibit the use of drift gill nets to target shark and swordfish in the area subject to council oversight.

As we've mentioned before, the U.S. and Morocco signed a Memorandum of Understanding to end widespread drift netting for swordfish in the Mediterranean Sea in 2012. Under the MOU, we are helping that nation's fishermen move from drift nets to buoy-gear. According to the U.S. statement announcing the agreement: "If effective in Moroccan fisheries, this gear type potentially offers a small-scale, high-yield, locally supplied solution as an alternative to drift nets. By sharing this technology, we can support Morocco's efforts to eradicate drift nets, an action that has many benefits for the marine environment." That's our position, and we urge the Council to adopt this position as well.

Fishermen want to fish, consumers want local, fresh seafood caught in an environmentally-responsible way. Safe, sustainable fishing for big ocean fish is a win-win for everyone. Ending the use of drift nets in the swordfish and thresher shark fishery is a step towards this victory. Thank you for your time and attention to managing our Pacific fisheries for the future of fishing.

Sincerely,

Ken Hinman
President

Theresa Labriola
West Coast Fisheries Project Director

Best Fishing Practices

PACIFIC BLUEWATER SWORDFISH FISHERY

Fishing is a human right for the many, not for the few.
Danish fisherman Kurt Christensen

Introduction

"Best management practices" for fisheries are based on pre-determined goals, such as locally-supplied seafood, recreation and tourism, community-based employment and, in support of it all, maintaining abundant and sustainable fishery resources and a healthy environment. Although the primary goals may be social and economic, the long-term health of the resource is always the bottom line. And while each region's specific goals and needs may be unique, best fishing practices, such as low bycatch of non-target species, live release of incidentally-caught or undersize fish, and cost-effective monitoring and enforcement, are universal.

The billfishes, swordfish and tunas, along with dolphin-fish, wahoo and other pelagic species, support valuable recreational and commercial fisheries in many coastal regions. But studies suggest that populations of big ocean fish, including bluefin and bigeye tuna, swordfish, the marlins and many oceanic sharks, may have declined as much as 90 percent over the last 50 years. Efforts to restore them have been hindered in large part due to the continued use of non-selective fishing gears and methods used to target these fish commercially, including pelagic drift nets.

Some would contend that it is how many fish you catch, not how you catch them, that's important to sustaining fish populations. But this misconception ignores a half-century of evidence to the contrary. Our collective experience with non-selective fishing gears is this:

- Excessive bycatch and waste, resulting in one-quarter of the global catch being discarded as unwanted, prohibited or protected species;
- An inability to effectively control fishing mortality for any single species in a fishery that opportunistically targets and catches multiple species;
- Destructive impacts on marine life and the ability of fishermen and coastal fishing communities to survive, much less thrive; and,

- Disproportionate management and regulatory costs imposed on taxpayers and regional economies.

Best fishing practices for conserving and managing big ocean fish require transitioning fisheries away from the large-scale use of indiscriminate, ecologically-harmful fishing gears to more selective, sustainable fishing methods that provide an economically-feasible, low-bycatch alternative. Fortunately, those alternative methods exist.

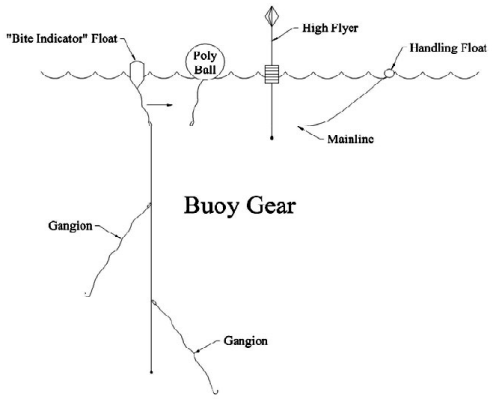
Untangling the Swordfish Drift Net Fishery

In the early 1980s, California's swordfish fishery transformed from primarily a harpoon fishery to a drift gillnet fishery. The drift net fishery sets invisible nets, fifty yards deep and up to a mile long that ensnare valuable swordfish, but also sea turtles and a whole lot more. The fishery targeted swordfish and thresher shark as far north as the Columbia River, and in 1985, the landings of swordfish soared to a historical high of 2,198 metric tons. In the past thirty years, the drift net fishery has been subject to a number of seasonal closures. It is revealing of the unmanageable nature of drift netting that the most effective regulations implemented are time-area closures; that is, taking the gear out of the water where and when it is doing the most harm.

In 2001, the National Marine Fisheries Service designated federal waters off Oregon and Northern California a Pacific Leatherback Conservation Area (PLCA), where drift netting is prohibited from late summer through the fall to protect critically endangered leatherback turtles that migrate to the coast seasonally to feed on jellyfish. Since then, Oregon and Washington have prohibited swordfish and thresher shark drift net fishing. While bycatch of some species has been substantially reduced, it has come at considerable cost (measured in time, money, and lost fishing opportunities) and a number of serious bycatch threats remain, most notably to marine mammals, sharks and tuna.

The seasonal closures, however, merely underscore the fact that there is no regulatory fix for drift net bycatch, aside from strictly limiting or prohibiting the gear. The PLCA restrictions effectively reduced the observed mortality of leatherback turtles from 112 in ten years to two in the past twelve seasons. But observer coverage remains low. Fewer than 20 percent of driftnet sets are observed, and the overall bycatch of non-target species and marine mammals remains significant. For example, according to observer reports for 2001 and 2013, for every swordfish or thresher shark landed, five other fish including sharks and tuna were caught. During the same time, driftnets snared one marine mammal or turtle for every 18 swordfish. Despite this, the Pacific Fishery Management Council is looking at proposals to expand the use of drift entanglement nets off the west coast. They propose to close the PLCA later in the year, open it sooner, shrink it in size or all-of-the-above.

Clearly, the major problem with drift nets is that they are mile-long curtains of death. Fishermen set them to "soak" overnight. The longer the nets stay in the water, the greater the bycatch and the higher the probability that bycatch will be hauled in dead. Shorter nets and set-times might diminish the lethal impact of drift nets, just as seasonal restrictions off of California reduced bycatch, but this also reduces fishing effort and moves us further away from ocean drift-netting, which is where we should be going. Alternatives to drift nets – namely, swordfish buoy-gear – developed, not surprisingly, by commercial fishermen in areas where drift nets and pelagic longlines have been prohibited, are economically viable and environmentally sustainable.



Safe, Sustainable Fishing for Large Ocean Fish

Take a picture of this...

A big striped marlin, feeding on the edge of the continental shelf, chases a bait ball of sardine. The frenzy blinds the marlin to the mile-long drift net, one of hundreds lying ahead. The net - set by a commercial drift net boat plying the blue waters of the Pacific Ocean – is meant for a swordfish or thresher shark. But the hungry marlin doesn't know that. Neither does the loggerhead turtle, dolphin and innumerable other ocean creatures, many prohibited or endangered species, that make up the unwanted "bycatch" of drift netting. The marlin chases the bait ball and gets entangled. She runs, she dives, but she's caught. And she won't be cut loose for hours, when the vessel's crew hauls back the drift net. By then it's too late, the fish is dead. Chalk it up as collateral damage, part of the cost of doing business with drift nets.

Now imagine…

The same commercial fishermen quit drift net fishing for a new way of catching swordfish. They set a very short mainline with one or two branch lines descending, attached to a buoy. There may be a dozen such "buoy-gears" set, with no more than 2 hooks per buoy. The fishermen actively tend the gear so they can retrieve it as soon as the buoy signals that the bait's been taken. Over 90% of what they catch is swordfish. If a juvenile sword or a non-target species is hooked, it can be released soon after, alive. But striped marlin, turtles, marine mammals, bluefin tuna and other vulnerable species are rarely if ever caught.

The gear is called **swordfish buoy-gear**, and it was developed by commercial fishermen on the east coast of Florida after longlines were banned there over a decade ago. It's now being tried all around the U.S. coast and overseas, where the U.S. government is promoting its use by developing countries.

The future belongs to safer, more selective, more sustainable fishing methods that are not only friendly to the environment, but friendlier to fishermen and fishing communities, too. Actively fished gears like buoy-gear provide fresher, higher quality swordfish, too. (Florida fishermen are working with retail chains, like Whole Foods, to get higher prices for their "sustainable" product.) Fishermen want efficiency? Catch rates with buoy-gear come in at 300+ swordfish per 1,000 hooks.

Summary

The use of pelagic drift nets should not be an option for sustainable commercial fisheries because of the irresolvable bycatch problems associated with this indiscriminate gear. The only ones who think drift nets can be sustainable are too narrowly focused on maximizing catches of swordfish and shark, without regard for the impact on other species.

Managing large-scale, indiscriminate gears like drift nets is extremely complicated and costly, from an economic as well as an environmental standpoint. Trying to conserve and protect swordfish, marlin, sharks, tunas, dolphin-fish, turtles, marine mammals and sea birds – targeting some, trying to avoid others; species in varying conditions from abundant to endangered and everything in between; with very different management goals and regulations for each – is the fisheries management equivalent of playing *Wack-a-Mole*.

Fortunately, there are economically-viable alternatives. Best fishing practices can support small-scale, high-yield, locally-supplied fisheries, commercial as well as recreational, using the latest technological developments in sustainable fishing. It is part of a progressive shift away from so-called modern, "efficient" methods of fishing that are wasteful and ultimately unmanageable.

Fishermen want to fish, consumers want local, fresh seafood caught in an environmentally-responsible way. Safe, sustainable fishing for big ocean fish is a win-win for everyone.

*This briefing paper was prepared by **Wild Oceans**, , an independent non-profit group of anglers dedicated to protecting the ocean's top predators – the billfish, tunas, swordfish, and sharks – while preserving healthy ocean food webs and critical habitats essential to the survival of all fish, marine mammals, sea turtles and seabirds.*

Swordfish & Common Thresher Fishery Drift Net Sets, 2001-2013

fishing years	*2001-2013*
observed sets	*2,371*
swordfish caught	*4,770*
common thresher shark caught	*2,340*
total non-target fish caught	*39,082*
striped marlin, blue marlin and other billfish caught	*120*
mola (sunfish) caught	*21,447*
shark caught (including longfin mako, shortfin mako, blue shark, basking shark)	*5,874*
marine mammals caught	*267*
percent of total sets observed	*19 percent*

National Oceanic Atmospheric Administration (NOAA), West Coast Observer Program data for 2001-2013.

In addition to the following letters that were received through the US Mail, over 140 copies of this same letter were received electronically through an email campaign. Those letters were received by the supplemental public comment deadline.

Re: Agenda Item K.5: Drift Gillnet Monitoring, Management, & Alternative Gear Report

Dear Chair Lowman and council members:

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

Thank you for your conservation leadership on this pressing issue.

Sincerely,

Roberta Maney

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

Thank you for your conservation leadership on this pressing issue.

Sincerely,

Caleb Hall

Re: Agenda Item K.5: Drift Gillnet Monitoring, Management, & Alternative Gear Report

Dear Chair Lowman and council members:

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

Thank you for your conservation leadership on this pressing issue.

Sincerely,

Gerald Eberhardt

Re: Agenda Item K.5: Drift Gillnet Monitoring, Management, & Alternative Gear Report

Dear Chair Lowman and council members:

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. Exposing California's Dirty Little Secret

The Truth about Drift Gillnets off our Coast

OCEANA

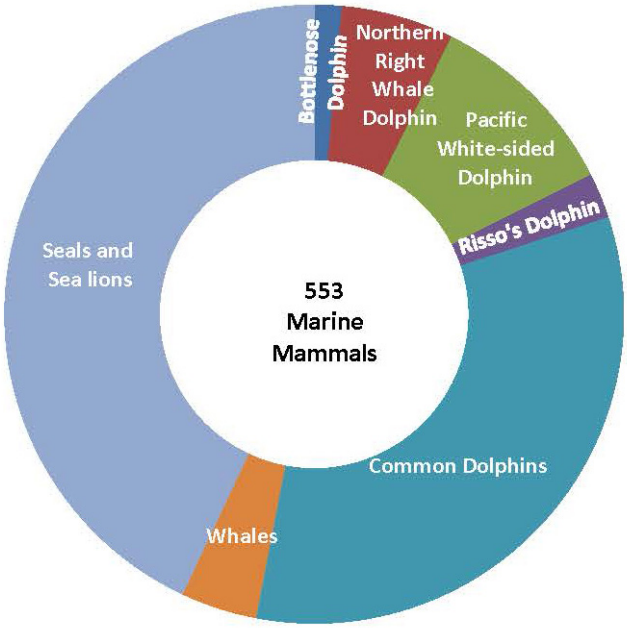
FEBRUARY 2014

IN BRIEF

Mile-long drift gillnets create a deadly trap for ocean wildlife. These nets, meant for swordfish and thresher sharks, form dangerous underwater walls that entangle iconic ocean marine life, preventing them from surfacing for air, so many eventually drown or become critically injured. After soaking in the ocean overnight, the nets are pulled from the water containing disturbing and unacceptably high numbers of dead and dying animals—including whales, dolphins, sea lions, sea turtles, numerous shark species and many other ecologically and economically important fish. With cleaner gear types available and historic lows in fishery participation, it is time to revitalize the swordfish fishery by eliminating drift gillnets and replacing them with cleaner gear.

THE ISSUE

Drift gillnets operating off California take protected marine species as bycatch in high numbers. Despite decreasing fishing effort and measures taken to reduce the capture of marine mammals, on average the fishery continues to kill over 100 dolphins, whales, seals, and sea lions per year (2002-2011). In addition, there are intermittent observed endangered leatherback and loggerhead sea turtle takes. Protected species incidentally injured and killed by this indiscriminate gear include the bottlenose dolphin, long-beaked common dolphin, short-beaked common dolphin, northern right whale dolphin, Pacific white-sided dolphin, California sea lion, Northern elephant seal, Risso's dolphin, short-finned pilot whale, gray whale, humpback whale, sperm whale, and minke whale.[1] Other major notable species taken as bycatch include the common mola (ocean sunfish), blue shark, Pacific bonito, skipjack tuna, common thresher shark, opah, striped marlin, albacore tuna, bluefin tuna, and salmon shark. In fact, 45% to 67% of the total catch (individuals, not weight) is discarded.[2] On average only 15.6% of the fishery is observed, a range of 12% to 19.5% (2007-2012)[3], levels insufficient to manage the fishery effectively, and insufficient for accurately accounting for the take of rare species. In August 2013, the drift gillnet fishery was changed to Category I status under the Marine Mammal Protection Act, a designation reserved for fisheries with frequent incidences of death and injury to marine mammals.



Due to concerns about bycatch, Washington State prohibits this fishing gear. In 2009, the Oregon Fish and Wildlife Commission rescinded all state drift gillnet permits, prohibiting Oregon fishermen from participating in the fishery.

A California sea lion drowned in a drift gillnet--along with a blue shark, visible in the background.
©Tom Campbell/Marine Photobank

BYCATCH PER SWORDFISH:

This fishery catches and throws back more marine life than it keeps. From 2007-2012, one marine mammal was caught for every 18 swordfish landed, four molas were caught for every swordfish, and two sharks were discarded for every three swordfish landed. In 2011 for every five swordfish landed one marine mammal was killed and six fish including sharks and tunas were tossed overboard, clearly dead or dying.[4]

Over five years (May 2007-January 2012) the fishery discarded:

- 63% of all animals caught, including more than 39,000 common molas (ocean sunfish) and hundreds of billfish
- More than 6,000 sharks, amounting to 45% of those caught
- 281 dolphins
- 238 seals and sea lions
- 22 whales
- 8 leatherback sea turtles

CONSERVATION MEASURES:

The Pacific Leatherback Conservation Area (PLCA) was designated in 2001 to protect leatherback sea turtles from drift gillnets by closing the area to this method of fishing annually from August 15 to November 15. The Pacific Loggerhead Conservation Area was established in 2001 to protect loggerhead sea turtles that migrate into waters south of Pt. Conception during forecasted El Niño events. The entire EEZ is closed to drift gillnets February 1 to April 30, and 75 miles off the California mainland is closed to gillnets from June 1 to August 14.[6] A depth restriction is also in place whereby the top of the nets must be set at a minimum of 36 feet below the surface and acoustic pingers must be affixed to the nets to reduce marine mammal takes.

INCIDENTAL TAKE STATEMENT FOR ENDANGERED SPECIES[7]:

The table below shows the incidental take statement limits for Endangered Species Act-listed species taken in the drift gillnet fishery. If these limits are reached over any 5-year period, NMFS is required to reinitiate formal consultation under the Endangered Species Act. As long as observed takes are under these limits, NMFS has determined the fishery is not likely to jeopardize these endangered species.

INCIDENTAL TAKE LIMITS

Species	Observed take during a 5-year period
Fin Whale	1
Humpback Whale	1
Sperm Whale	up to 2
Leatherback Turtle	up to 2
Loggerhead Turtle	up to 2
Olive Ridley Turtle	1
Green Turtle	1

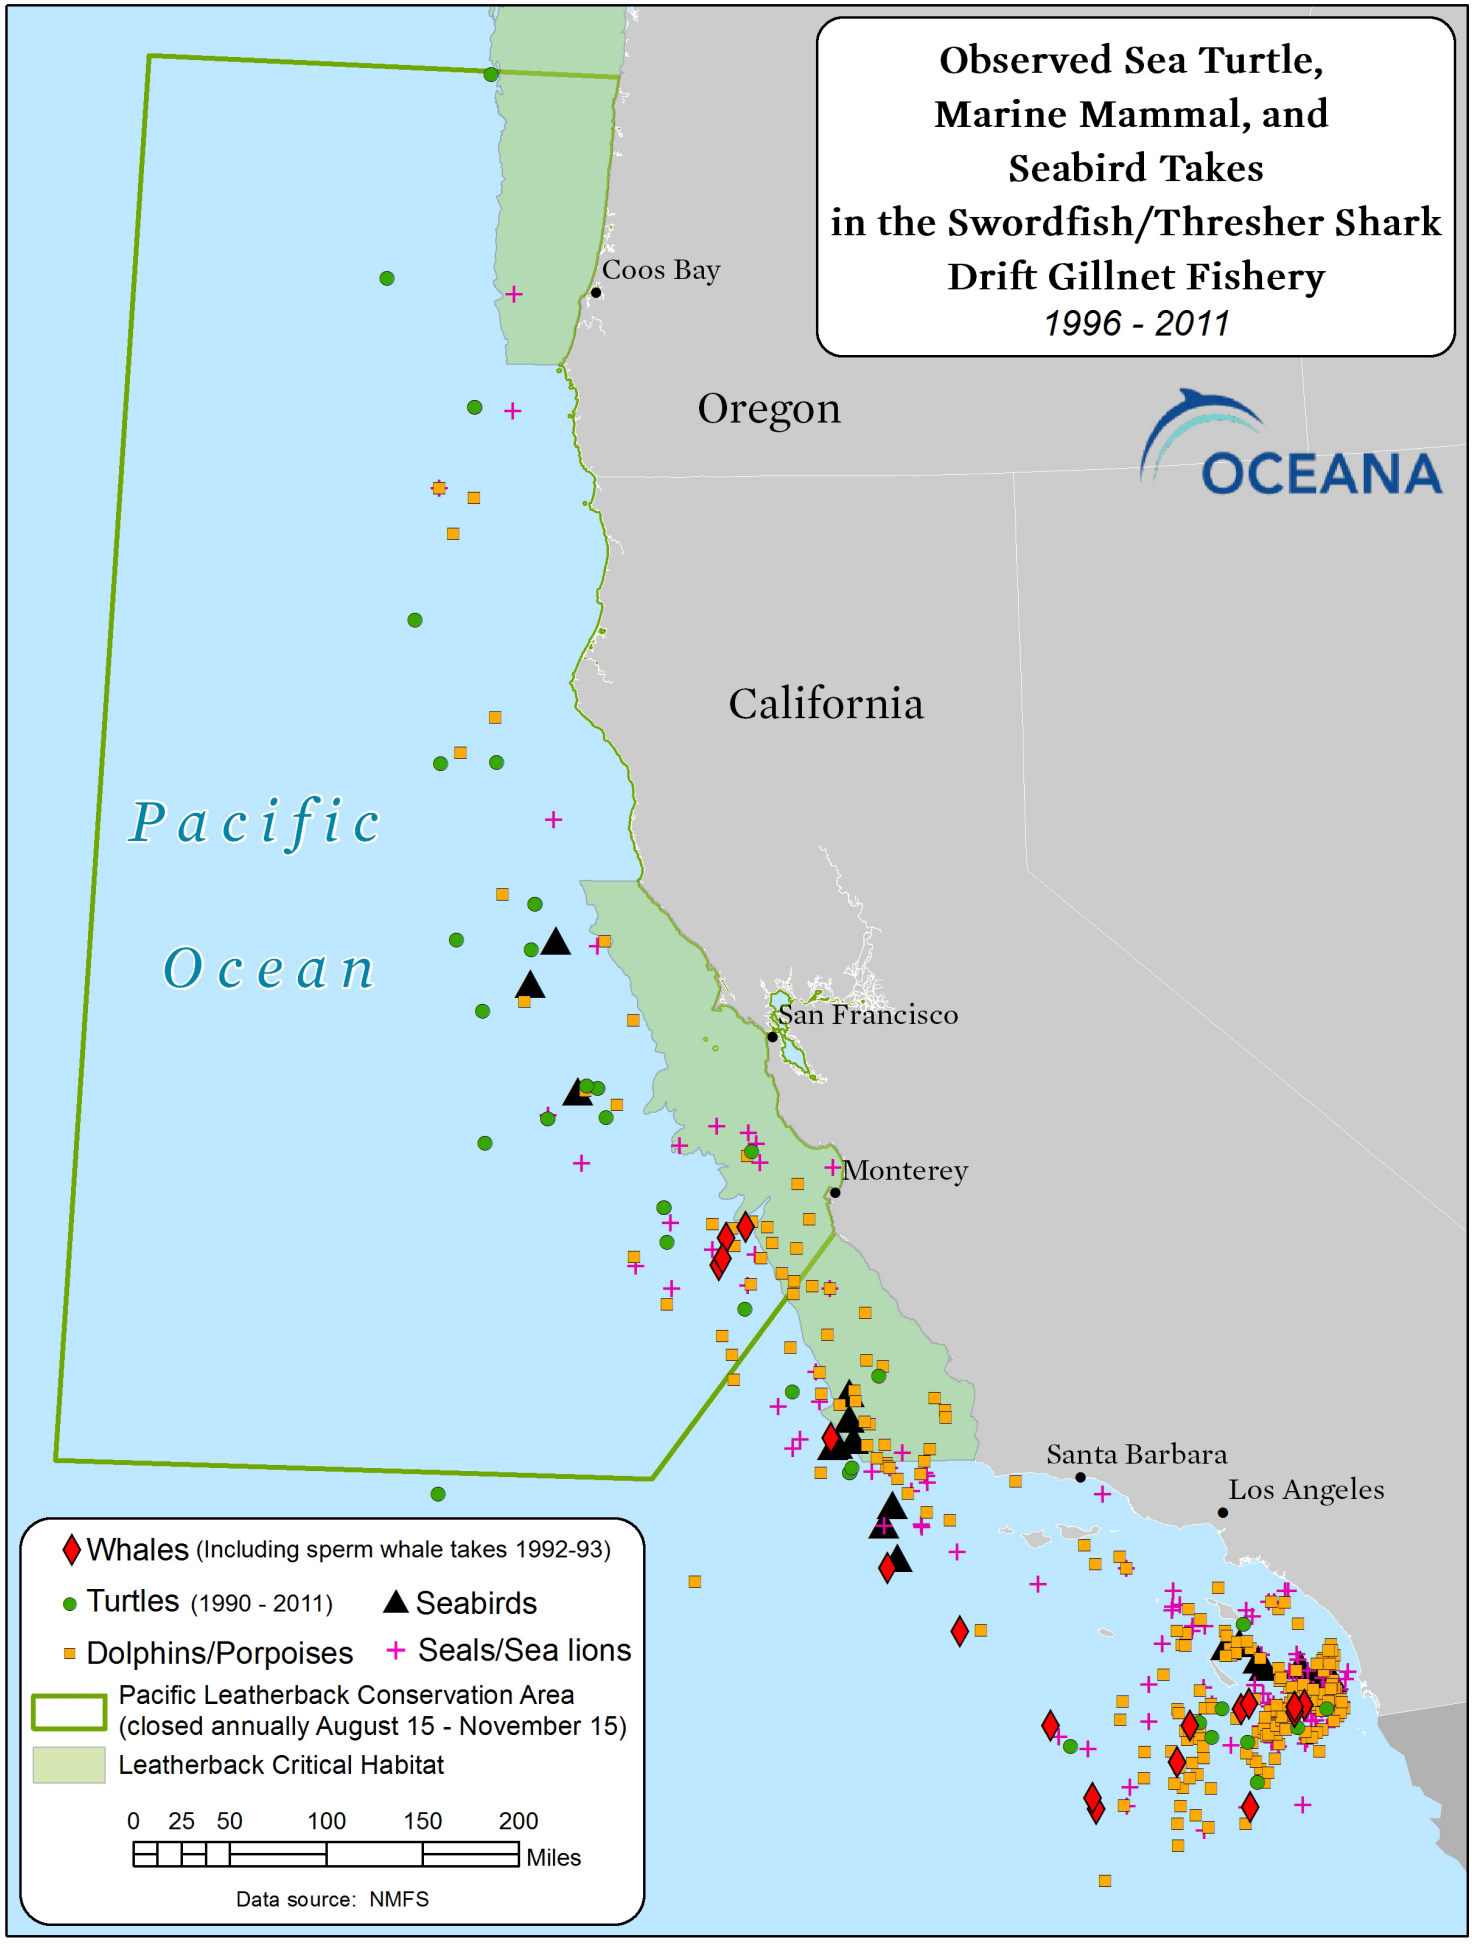
*Humpback whales and gray whales were also reported caught with drift gillnets, however, not by the observer program.
Source: NMFS Observer Program, 2007-2012. All estimates based on number observed divided by annual observer coverage.
All estimates rounded up to whole animals per NOAA Protected Resource Methodology.



In 2010 one endangered sperm whale was observed killed and another was observed seriously injured in a drift gillnet off southern California, resulting in NMFS estimating a total of 16 endangered sperm whale takes in the drift gillnet fishery in that year alone. Photo Credit: ©Peter Allinson/Marine Photobank

TAKES OF ENDANGERED WHALES:
In 2010 the drift gillnet fishery seriously injured and killed an estimated 16 endangered sperm whales. In response, in September 2013 the National Marine Fisheries Service (NMFS) implemented temporary emergency regulations prohibiting drift gillnet fishermen from fishing in waters deeper than 2,012 meters (6,601 feet) without 100% observer coverage and NMFS set a hard cap of one sperm whale take (serious injury or mortality) that would close the fishery in the event a sperm whale take is observed. These emergency measures also require a vessel monitoring system on all drift gillnet vessels.[5]

The temporary rule expired January 31, 2014 and NMFS did not renew the protection for these endangered whales.

ABOUT THE FISHERY

Large mesh drift gillnets are set at sunset and retrieved at dawn to target swordfish and common thresher sharks. These nets are greater than one mile in length with a mesh size of ≥ 14 inches and are set at a minimum of 36 feet below the ocean's surface (gear is typically 1,800 meters in length with a stretched mesh size ranging from 18 to 22 inches).[8] Fishermen also catch and sell other

fish species including albacore tuna, bluefin tuna, skipjack tuna, opah, shortfin mako shark, and louver. The swordfish drift gillnet fishery takes place in federal waters, primarily off southern California-but some effort occurs from Morro Bay to Monterey Bay and further north[9]- with main ports of operation in San Diego, Los Angeles area (e.g. San Pedro), Morro Bay, Santa Barbara, and Monterey.[10] The drift gillnet fishery operates from May 1 to January 31 with over 90% of the fishing effort occurring from August 15 through January 31.[11] The federal Pacific Fishery Management Council manages the fishery under the Highly Migratory Species Fishery Management Plan (federal HMS permits). The State of California has a limited entry permit system and various state implemented area closures.[12] In 2011 there were 76 permits but only 19 active vessels; in 2012 there were 16 active vessels.[13]

VALUE OF THE FISHERY

The annual ex-vessel value of the fishery (the amount of money that fishing vessels receive for unprocessed fish) ranged from an average of $512,000 to $1.27 million in recent years.

THE SOLUTION

Existing regulations are insufficient to address bycatch concerns and the drift gillnet fishery is ultimately a declining industry, already phased out in many other coastal states across the west and east coast as well as on the high seas and in the Mediterranean. It is time to remove the "Walls of Death" from our California shoreline and move to cleaner fishing gears. Harpoons are a proven gear type for catching swordfish without bycatch, which was the primary way swordfish were caught in California prior to the use of drift gillnets. The California Ocean Protection Council is also funding ongoing research with buoy gear off California, which has been used to reduce bycatch in the Atlantic swordfish fishery. While some may propose reopening pelagic longlining off the US west coast, this gear would also have unacceptably high bycatch, which is why California has banned it for over 30 years. The sooner the legislature acts, the stronger the incentives will be to innovate clean, sustainable fishing gear for swordfish. The California legislature has the authority to do this through legislation in order to ensure a vibrant, healthy, sustainable marine ecosystem and ocean-based economy into the future.

Year	# Vessels	Swordfish	Common Thresher Shark	Shortfin Mako Shark	Tunas	**Total**
2009	46	$1,142,000	$61,000	$44,000	$18,000	$1,265,000
2010	27	$416,000	$51,000	$28,000	$17,000	$512,000
2011	19	$787,000	$59,000	$28,000	$91,000	$965,000
2012	16	$769,000	$71,000	$29,000	$51,000	$920,000

ICONIC WHALES IN TROUBLE

Sperm whales are truly magnificent creatures, making some of the deepest dives of all whale species. Of the estimated 971 sperm whales in the Pacific West Coast stock, the National Marine Fisheries Service estimated that 16 whales were taken by the drift gillnet fishery in 2010 alone, far exceeding the allowable take of these endangered species under the federal Endangered Species and Marine Mammal Protection Acts.

ABOUT SPERM WHALES:

- Sperm whales can dive for a duration of over an hour and reach depths of over 3,280 feet.
- They are the largest of the toothed whales, with males weighing up to 45 tons and measuring 52 feet in length.
- Sperm whales have the largest brain of any animal, it can take up about 1/3 of the whale's total body length.
- Female sperm whales only produce a calf approximately once every five years.

Sperm whales diving in unison

Examples of bycatch documented from the drift gillnet fishery include:

fin whales
leatherback sea turtles
loggerhead sea turtles
Risso's dolphins
Dall's porpoises
Pacific white-sided dolphins
Northern right whale dolphins

Pacific electric rays
short-finned pilot whales
humpback whales
minke whales
sperm whales
California sea lions

Northern elephant seals
blue sharks
salmon sharks
bigeye thresher sharks
striped marlin
albacore tuna

mola molas
white sharks
basking sharks
megamouth sharks
short-and-long-beaked common dolphins

Oceana is the largest international advocacy group working solely to protect the world's oceans. Oceana wins policy victories for the oceans using science-based campaigns. Since 2001, we have protected over 1.2 million square miles of ocean and innumerable sea turtles, sharks, dolphins and other sea creatures. More than 550,000 supporters have already joined Oceana. Global in scope, Oceana has offices in North, South and Central America and Europe.

End the Walls of Death

Replace devastating drift gillnets off California with cleaner fishing gear

OCEANA | Protecting the World's Oceans

WALLS OF DEATH

In the Pacific Ocean off California, mile-long driftnets are used to capture swordfish and thresher sharks. But that's not all they catch. When the nets are deployed in the evenings to soak overnight to ensnare their targeted catch, they also entangle large open ocean travelers, including whales, dolphins, seals, sea turtles, numerous shark species and many other ecologically and economically important fish. The nets inflict such devastation to marine life that they earned the name "Walls of Death."

The drift gillnet fishery tosses 20–30% of its fish catch back into the ocean dead or damaged. In the 2010–2011 season, over 27 common molas, fondly called ocean sunfish, were discarded for every swordfish caught.

Common molas are bycatch in the drift gillnet fishery

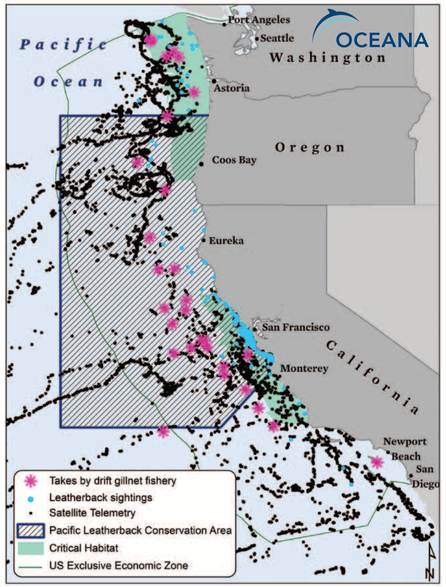
When a sea turtle, sea lion, or whale swims into the net, they become entangled in the mesh walls, leaving them incapacitated and unable to surface for air. When the nets are pulled from the water onto the fishing boats in the morning, they contain disturbing and unacceptably high numbers of dead and dying species of marine life. This fishery's high level of indiscriminate catch of non-targeted species results in the death of over a hundred marine mammals per year; also killed and injured are endangered Pacific leatherback and loggerhead sea turtles, striped marlin, albacore tuna, blue sharks, bigeye thresher sharks, and great white sharks.

Ensnared blue shark

Entangled pilot whale

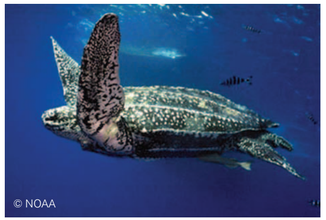
WHAT WE SHOULD DO NOW:

1. Phase out drift gillnets altogether.



2. Replace with cleaner gears such as harpoons which have zero bycatch and consider other cleaner alternatives.

3. Until drift gillnets are phased out, require 100% observer coverage to adequately monitor and account for all bycatch and discards.



4. Until drift gillnets are phased out, institute hard bycatch caps on all marine life taken.

DRIFT GILLNETS & SEA TURTLES

The ocean waters off the coasts of California, Oregon, and Washington are a primary destination for endangered Western Pacific leatherback sea turtles which make a 6,000 mile migration from nesting beaches in Indonesia to the U.S. West Coast specifically to feed on jellyfish. Sea turtles are navigation specialists but encounter many perils on their great migration including capture in drift gillnets at their feeding grounds. With a population decline of over 85% since the 1980s and continued 6% annual decline, they need protective measures to increase their chances of survival.

Data provided by NOAA Protected Resouces/NOAA SWFSC

In 2012, based on new scientific research and as a direct result of Oceana's petition to the federal government, the National Marine Fisheries Service (NMFS) designated 41,914 square miles of ocean waters off the shores of Washington, Oregon, and California as critical habitat for Pacific leatherback sea turtles under the Endangered Species Act. This adds additional habitat protections on top of the previously established Pacific Leatherback Conservation Area (PLCA), where drift gillnet fishing is prohibited annually from August 15 through November 15 to protect leatherback sea turtles that feed off the West Coast. The PLCA extends from shore to the high seas and from Point Sur, California to mid-Oregon.

FISHING INDUSTRY AT A CROSSROAD

Historically swordfish off California were skillfully caught with harpoons, allowing fishermen to catch swordfish one by one with virtually zero bycatch. The fishery transformed from the predominant harpoon fishery to primarily a drift gillnet fishery in the early 1980s when driftnets became legal to use and restrictions were placed on the harpoon fishery. Since then, the price of a pound of swordfish caught by harpoon has more than doubled relative to the price of gillnet caught swordfish. For example, in 2008, harpoon caught swordfish yielded $6.26 per pound compared to $2.80 per pound for drift gillnet caught swordfish.

With the introduction of drift gillnets, swordfish landings increased initially, but for a variety of reasons gillnet landings have waned in the last two decades. While California landings of swordfish from drift gillnets have hovered around 500 metric tons annually over the past decade, the harpoon fishery brought in over 1,600 metric tons at its peak in 1979. Furthermore, in 2009 due to concerns regarding high levels of bycatch, the Oregon Fish and Wildlife Commission banned the use of drift gillnets in Oregon state waters, making it illegal for Oregon-based fishermen to use drift gillnet gear off the state's coast. Washington also prohibits drift gillnet gear for swordfish, leaving California as the only West Coast state still allowing this destructive fishing gear that wreaks havoc on our ocean's diverse marine life.

A harpoon vessel catches a swordfish

NEXT STEPS:

The drift gillnet fishery is really a declining industry, already phased out in many other coastal states across the west and east coast. For years NMFS has been trying to expand the drift gillnet fishery and the agency is currently looking at how to revitalize California's swordfish fishery. Instead of looking to stimulate the fishery with this destructive gear, fishery managers should focus on revitalizing the harpoon fishery and exploring other clean ways to catch swordfish.

History has shown that catching swordfish with harpoons is feasible, has virtually no bycatch, and results in a higher price per pound for catch at the dock. It is time to remove the "Walls of Death" from our California shoreline and move to cleaner fishing gears to ensure a vibrant, healthy, sustainable marine ecosystem and ocean-based economy into the future.
