Agenda Item K.1
Situation Summary
March 2014

NATIONAL MARINE FISHERIES SERVICE REPORT

The National Marine Fisheries Service (NMFS) Southwest Region will provide a briefing on recent regulatory and international activities related to the Fishery Management Plan (FMP) for West Coast Fisheries for Highly Migratory Species (HMS) (see Agenda Item K.1.b, NMFS Report).

The NMFS Southwest Fisheries Science Center (SWFSC) will provide an update on research of interest to the Council, as described in Agenda Item K.1.c, NMFS SWFSC Report.

Council Action:

None.

Reference Materials:

1. Agenda Item K.1.b, NMFS Report: NMFS Highly Migratory Species Regulatory Report.
2. Agenda Item K.1.c, NMFS SWFSC Report: Research Activities.

NMFS HIGHLY MIGRATORY SPECIES REGULATORY REPORT

Emergency Rule to Minimize Take of Sperm Whales in DGN Fishery

On September 4, 2013, NMFS issued temporary regulations (78 FR 54548) under the authority of Section 305(c) of the Magnuson-Stevens Fishery Conservation and Management Act (MSA) to reduce the risk of entanglement of sperm whales in the California thresher shark/swordfish large-mesh drift gillnet (DGN) fishery. The need for this emergency action stemmed from the observed take of two sperm whales in the DGN fishery during the 2010 through 2011 fishing season and the subsequent need to reduce the risk of future sperm whale takes so as to legally comply with both the Endangered Species Act and the Marine Mammal Protection Act. This emergency action was time sensitive as NMFS otherwise could not have legally authorized the DGN fishery to operate for the 2013 applicable federal statutes. The regulations implemented an immediate closure of the DGN fishery if one sperm whale was observed killed or seriously injured during the season and required all DGN fishing vessels to carry a NMFS-trained observer from August 15, 2013 to January 31, 2014 in a 100 percent observer coverage area (Zone). The Zone covered nearly all areas in the U.S. exclusive economic zone deeper than the 1,100 fathoms (2,012 meters) depth contour. Owners/operators of vessels who fished with DGN gear were also required to install and operate a vessel monitoring system (VMS).

The temporary regulations expired with the end of the DGN fishing season on January 31, 2014. There were no observed interactions with sperm whales during the season and all 19 vessels that participated in the fishery had operational VMS units. The Pacific Offshore Cetacean Take Reduction Team met from February 4 through 6, 2014, at the NMFS office in Long Beach to review available information, including performance of the temporary regulations, and made recommendations to NMFS on modifications to the Take Reduction Plan for permanent regulations to minimize take risk for sperm whales and other species included in the Plan.

Proposed Rule to Implement IATTC Resolution C-13-02 for the Conservation and Management of Bluefin Tuna in the Eastern Pacific Ocean

Publication Date: January 10, 2014 (79 FR 1810)
Public comment deadline: February 10, 2014
Public hearing: 1-4pm PST, February 10, 2014, NMFS office in Long Beach, CA

This action if adopted would implement under the Tuna Conventions Act IATTC Resolution C-13-02 that would place a limit on commercial harvests of Pacific bluefin tuna in the Convention Area for 2014. The proposed rule specifies a Commission-wide catch limit of 5,000 metric tons for commercial fleets in the Eastern Pacific Ocean and allows a minimum of 500 metric tons for the United States. The rule is expected to have a beneficial impact on Pacific bluefin tuna and other living marine resources since it would extend catch limits that expired December 31, 2013. The economic impacts of this rule will likely be negligible since the U.S. fleets that catch Pacific bluefin tuna have not caught more than 500 metric tons of bluefin in more than a decade. For more information please see: http://www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2013-0119.

Proposed Rule to Implement IATTC Resolution C-13-01 for the Conservation of Tropical Tunas in the Eastern Pacific Ocean

Publication Date: February 5, 2014 (79 FR 6876)
Public comment deadline: February 25, 2014
Public hearing: 1-4pm PST, February 12, 2014

This action proposes to implement under the Tuna Conventions Act Resolution C-13-01 adopted by the Inter-American Tropical Tuna Commission in June 2013. NMFS is proposing to: (1) extend the effective period of the current tuna conservation regulations by continuing a 500 metric ton bigeye tuna catch limit to longline vessels greater than 24 meters in overall length and a 62-day closure period to purse seine vessels of class size 4 to 6 (greater than 182 metric tons) to 2014 through 2016; and (2) include an exemption to the purse seine closures due to force majeure. There are only slight adjustments being made to the existing tuna conservation measures, which were implemented (76 FR 68332, November 4, 2011) as a result of the adoption of IATTC Resolution C-11-01 in 2011 and expired at the end of 2013. For more information please see http://www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2014-0014.

Proposed Rule to Implement IATTC Resolution C-04-06 on the Establishment of a Vessel Monitoring System

The following proposed rule is the subject matter of Agenda Item K.2.

Publication Date: February 6, 2014 (79 FR 7152)
Public comment deadline: March 10, 2014
Public hearing: 1-4pm PST, February 28, 2014 at the NMFS office in Long Beach, CA

This action proposes to implement under the Tuna Conventions Act IATTC Resolution C-04-06 adopted by the IATTC in June 2004. This rule proposes to require owners and operators of tuna-fishing vessels in the eastern Pacific Ocean to have installed, activate, carry and operate vessel monitoring system (VMS) units (also known as "mobile transmitting units"). The VMS units would have to be type-approved and authorize NMFS to receive and relay transmissions (also called "position reports") from the VMS unit to the IATTC and to NMFS. For more information please see http://www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2013-0117.

Proposed Rule to Implement Part of IATTC Resolution C-13-04 on the Conservation of Whale Sharks

This rule would implement under the Tuna Conventions Act IATTC Resolution C-13-04 intended to conserve whale sharks and collect information on fish aggregating devices. This proposed rule is in development and it is anticipated that they will publish early spring 2014.

This action requires that by July 1, 2014, owners and operators of purse seine vessels in the eastern Pacific Ocean would be prohibited from setting a purse seine on a school of tuna associated with a live whale shark, if the shark is sighted prior to the beginning of the set. If a whale shark is encircled in the purse seine net the master of the vessel would be required to ensure that all reasonable steps are taken to ensure its safe release and report the details of the incident to the Inter-American Tropical Tuna Commission and NMFS.

Proposed Rule to Implement IATTC Resolution C-12-07 for the Establishment of a Program to Monitor Transshipments

This proposed rule is in development and it is anticipated that they will publish early spring 2014.

This rule implements under the Tuna Conventions Act IATTC Resolution C-12-07 that if adopted will establish a program to monitor transshipments by large-scale tuna fishing vessels. This rule would govern transshipments by U.S. large-scale tuna fishing vessels and carrier, or receiving, vessels. The rule would establish: (1) criteria for transshipping in port; (2) criteria for transshipping at sea by longline vessels, only to an authorized carrier vessel with an IATTC observer onboard and an operational vessel monitoring system; (3) the Pacific Transshipment Declaration Form, which must be used to report transshipments in the IATTC Convention Area. The rule is neither applicable to troll or pole-and-line vessels, nor to vessels that transship fresh fish at sea.

SOUTHWEST FISHERIES SCIENCE CENTER REPORT ON RECENT RESEARCH RELEVANT TO THE U.S. WEST COAST HIGHLY MIGRATORY SPECIES FISHERIES

Researchers at the NOAA Southwest Fisheries Science Center (SWFSC) are conducting a number of studies on highly migratory species and their fisheries of relevance to the Council.

Predicting occurrence of leatherback turtles in the California Current ecosystem – Further progress has been made on characterizing the habitat use patterns and behavior of leatherback sea turtles along the U.S. West Coast based on electronic tagging data. Satellite telemetry data collected from leatherback turtles tagged at nesting beaches in the western Pacific and along the central coast of CA between 2003 and 2011 were used to predict the foraging habitat in the California Current ecosystem. Environmental data (sea surface temperature, upwelling indices, chlorophyll concentration, etc.) were associated with each location. All observed locations in the Pacific Leatherback Conservation Area (PLCA) were assumed to be associated with foraging. A predictive model was developed to infer foraging by leatherbacks at areas and times lacking turtle telemetry data. A high probability of foraging behavior occurred within the PLCA during Aug-Nov but varied among years according to the annual variability in the environmental conditions. This telemetry research has helped understand leatherback turtle critical habitat and important behavioral patterns along the U.S. West Coast.

Estimating limit reference points for western Pacific leatherback turtles off the U.S. West Coast –

SWFSC scientists are developing limit reference points for potential use in managing leatherback bycatch in Pacific swordfish fisheries. These reference points are closely analogous to Potential Biological Removal (PBR) used for marine mammals under the Marine Mammal Protection Act. The primary difference is that the limit reference points under development for leatherback sea turtle bycatch account for age differences in relative reproductive value. The new estimator, termed Relative Value Loss Limit (RVLL), was evaluated under management strategy-like simulations and found that it could be useful for defining reference points for marine turtles. Though it has yet to be tested on real data, funding was recently awarded to work with partners (fisheries and data managers) on estimating turtle reference points for the California drift gillnet fishery, as part of a broader funding initiative to develop an analysis "toolbox" for aiding protected species management. A suite of information needs were outlined, including leatherback life history, demographic data on interactions in California fishery, satellite telemetry data, nesting data, etc. Guidelines for development of reference points consistent with IUCN Red List criteria were also mentioned.

Abundance and trend estimation for sperm whales in the CA current, 1981-2008 –

Efforts are underway by SWFSC scientists to develop a Markov chain Monte Carlo methodology to estimate a hierarchical Bayesian (HB) model of sperm whale abundance and trend. Recent examples of HB trend models for abundance estimation of protected species (whales) based on visual survey data collected off of the US west coast were provided, along with preliminary results of abundance and trend estimates for sperm whales. Reasons for using HB trend models include the need to describe population trends in stock assessments, ability to efficiently make use of all available data, improved parameter estimation and ability to project abundance into the future under given conditions. Data are collected using visual line-transect (distance sampling) methods between 1991 - 2008. Sightings obtained from within 5.5km (maximum perpendicular detection distance) of the survey vessel are used to estimate the probability of visual detection as a function of covariates such as group size and sea state. For sperm whales, group sizes of ≤ 2 have a lower probability of being detected than those > 2, and Beaufort Sea State also significantly affects detection probability. Some evidence for a declining trend in estimated

sperm whale abundance from 1991 – 2008 was detected, along with a trend in observing more solitary animals (and fewer larger groups) in more recent survey years, but causes of the potential trend could not be inferred. In particular, it is unknown to what extent the trend might reflect true population declines vs. decreasing use of the study area by the stock.

The effects of time and area closures on the catch and catch rates of HMS shark and swordfish in the California drift gillnet fishery –

This project involves collaboration between researchers at the SWFSC and UC Santa Barbara. Trends in catch, effort and catch rates (catch per unit effort or CPUE) in the California drift gillnet fishery are evaluated to determine how they were affected by time and area closure measures that went into effect in the 1980s to conserve thresher shark and in 2001 to mitigate endangered leatherback sea turtle bycatch. A bootstrap methodology is used to estimate the effects of time and area closures and other regulatory measures on the catch rates of swordfish, common thresher shark, shortfin mako shark and blue shark and to quantify uncertainty in the estimates. Preliminary results support that the thresher shark conservation closure in the late-1980s had negative CPUE effects on common thresher and shortfin mako sharks and a positive effect on swordfish CPUE, while the 2001 PLCA closure had significant negative CPUE effects on thresher shark and blue shark and small positive CPUE effects on shortfin mako shark and swordfish. An apparent consequence of the time and area closures is the concentration of present day fishing effort to almost exclusively within the Southern California Bight. Further results of this project are expected to provide insight to the socio-economic impacts of time and area closures on the operation of the fishery and information on the usefulness of the fishery- and management-dependent drift gillnet catch per unit effort data for stock assessment.

Dynamic ocean management: current applications and potential for implementation on the U.S. West Coast – This collaborative project conducted among partners from the SWFSC, Stanford University, San Diego State University, and the Center for Ocean Solutions (Monterey Bay Aquarium) aims to utilize spatio-temporal data generated by real-time monitoring technology to create tools for fishery managers and stakeholders to make timely, informed decisions. Near real-time ocean sensing data including fishing vessel-borne data, animal telemetry, and remote sensing products are being combined with socio-economic, biological and other data as inputs into models designed to help balance the dual objectives of minimizing interactions with protected species (marine mammals and turtles) while maximizing opportunities to target marketable species (swordfish, tuna, etc.). Partnerships with stakeholders and managers are envisioned to obtain information on fishing practices and desirable management objectives, will strengthen ties between science, management, and end-users of these products. Several examples of dynamic ocean management have been examined and serve as models for work now beginning on U.S. west coast swordfish fisheries. One example is achieving yellowtail flounder avoidance in the New England scallop fishery where fishers provide daily effort and bycatch data which are then compiled by scientists at the University of Massachusetts into a report of areas to avoid on the next fishing day. Another example is use of thermal habitat data to predict southern bluefin tuna habitat which subsequently goes into creating dynamic management zones designed to minimize catch of this quota-limited species. A third example, of potential relevance to the future of the west coast swordfish fisheries, is the Hawai'i TurtleWatch program, designed to help shallow-set longline vessels avoid endangered loggerhead sea turtles while targeting swordfish by alerting fishermen to temperature zones where loggerhead encounter rates are likely to be high. The idea behind these examples and the project in progress is to help managers optimize fishing effort and fishing revenues, by allowing larger fishing areas to remain open for longer periods with reduced bycatch rates.

Agenda Item K.1.c
Southwest Fisheries Science Center, HMS Research Report, March 2014

Dr. Russ Vetter, Director, Fisheries Resources Division
NMFS Southwest Fisheries Science Center

K.1.c.1. Recent and Upcoming ISC Activities

- Shark WG
  - January in La Jolla, CA: Finalized data for blue shark re-assessment
    Held second Shark Age and Growth Workshop
  - June in Keelung, Taiwan: Complete blue shark re-assessment
- Billfish WG
  - February in Honolulu, HI: Full stock assessment of North Pacific swordfish
- Bluefin WG
  - February in La Jolla, CA: Updated 2013 bluefin assessment
- Emergency Interim Plenary-
  - March by teleconference: Develop conservation information for bluefin tuna
- Albacore WG
  - April in La Jolla, CA: Complete full assessment of N. Pacific albacore
- Plenary
  - July 16-21 in Taiwan: Review and adopt assessments since 2013 Plenary

Swordfish

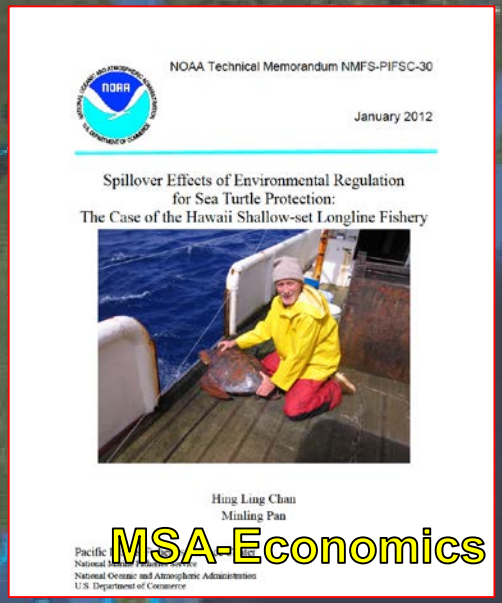
K.1.c.2. SWFSC Swordfish Fishery Research Update

US Swordfish
Consumption 2012
consumption 21,297 mt
Domestic Supply: 19%

tlantic Swordfish:

A.US TAC via NOAA & ICCAT = 3,000 mt dw
B. primary gear SSLL, mackerel, circle hoo
C. landings approaching TAC
D. MSC certified

Pacific Swordfish: West Coast EEZ



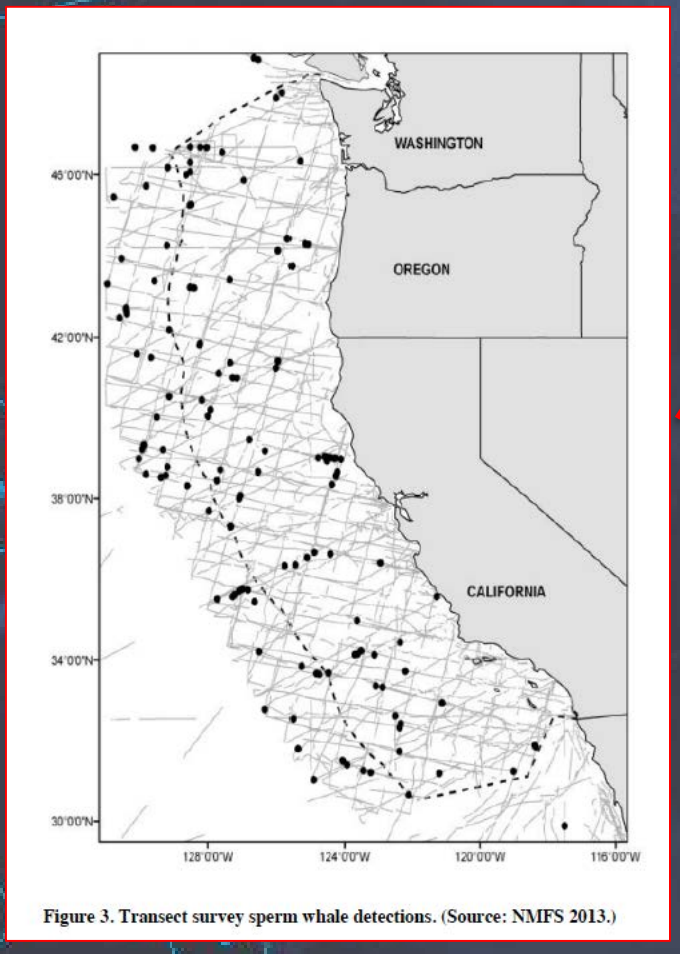
A. ISC assessment
B. no US TAC
C. primary gear DGN
D. 2012 DGN 113 mt rw
E. 2012 total landings 402 mt rw
F. import fresh Mexico, frozen Asia

Pacific Swordfish: Hawaii

A. ISC assessment
B. no US TAC
C. primary gear: SSLL mackerel, circle hook
D. 2012 total landings = 1090 mt rw

K.1.c.2. Swordfish SWFSC Fishery Research Update: Providing a science based approach to balancing competing mandates: MSRA, MMPA, ESA

K.1.c.2. A science based approach to competing goals requires a highly resolved understanding of spatial and temporal aspects of habitat and behavior of target and non-target species.



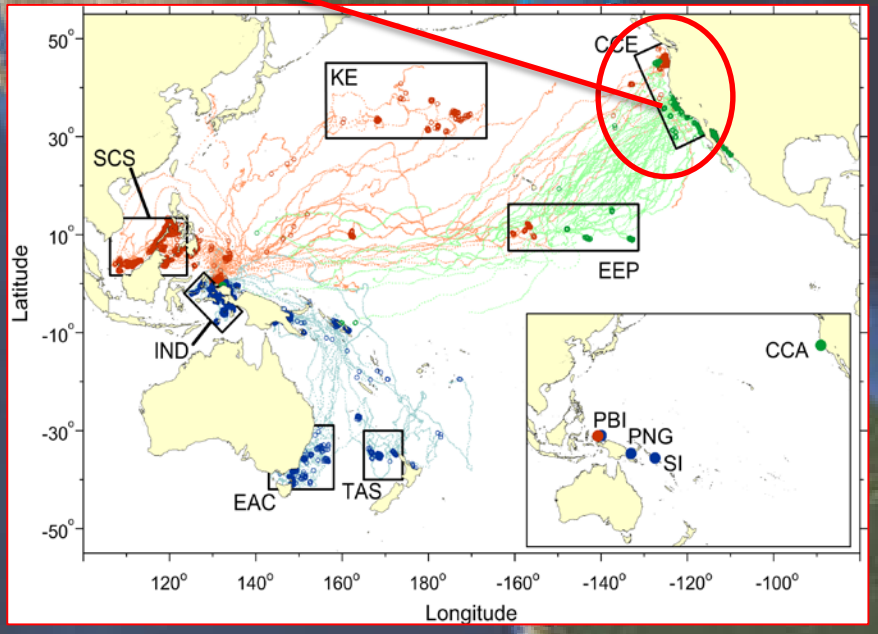


Figure 3. Transect survey sperm whale detections. (Source: NMFS 2013.)

K.1.c.2. The research goal is to maximize sustainable fishing opportunities while minimizing ESA and MMPA interactions.

K.1.c.2. SWFSC 2014 Research Reports:

1. Predicting occurrence of leatherback turtles in the California Current Ecosystem – **Tomo Eguchi et al.**

2. Estimating limit reference points for western Pacific leatherback turtles off the U.S. West Coast – **Jeff Moore and Alex Curtis**

3. Abundance and trend estimation for sperm whales in the California Current, 1981-2008 - **Jeff Moore and Jay Barlow**

4. The effects of time and area closures on the catch and catch rates of HMS shark and swordfish in the CA drift gillnet fishery – **Laura Urbisci et al.**

5. Dynamic Ocean Decision Making Tool: current applications and potential for implementation on the U.S. West Coast – **Rebecca Lewison et al.**

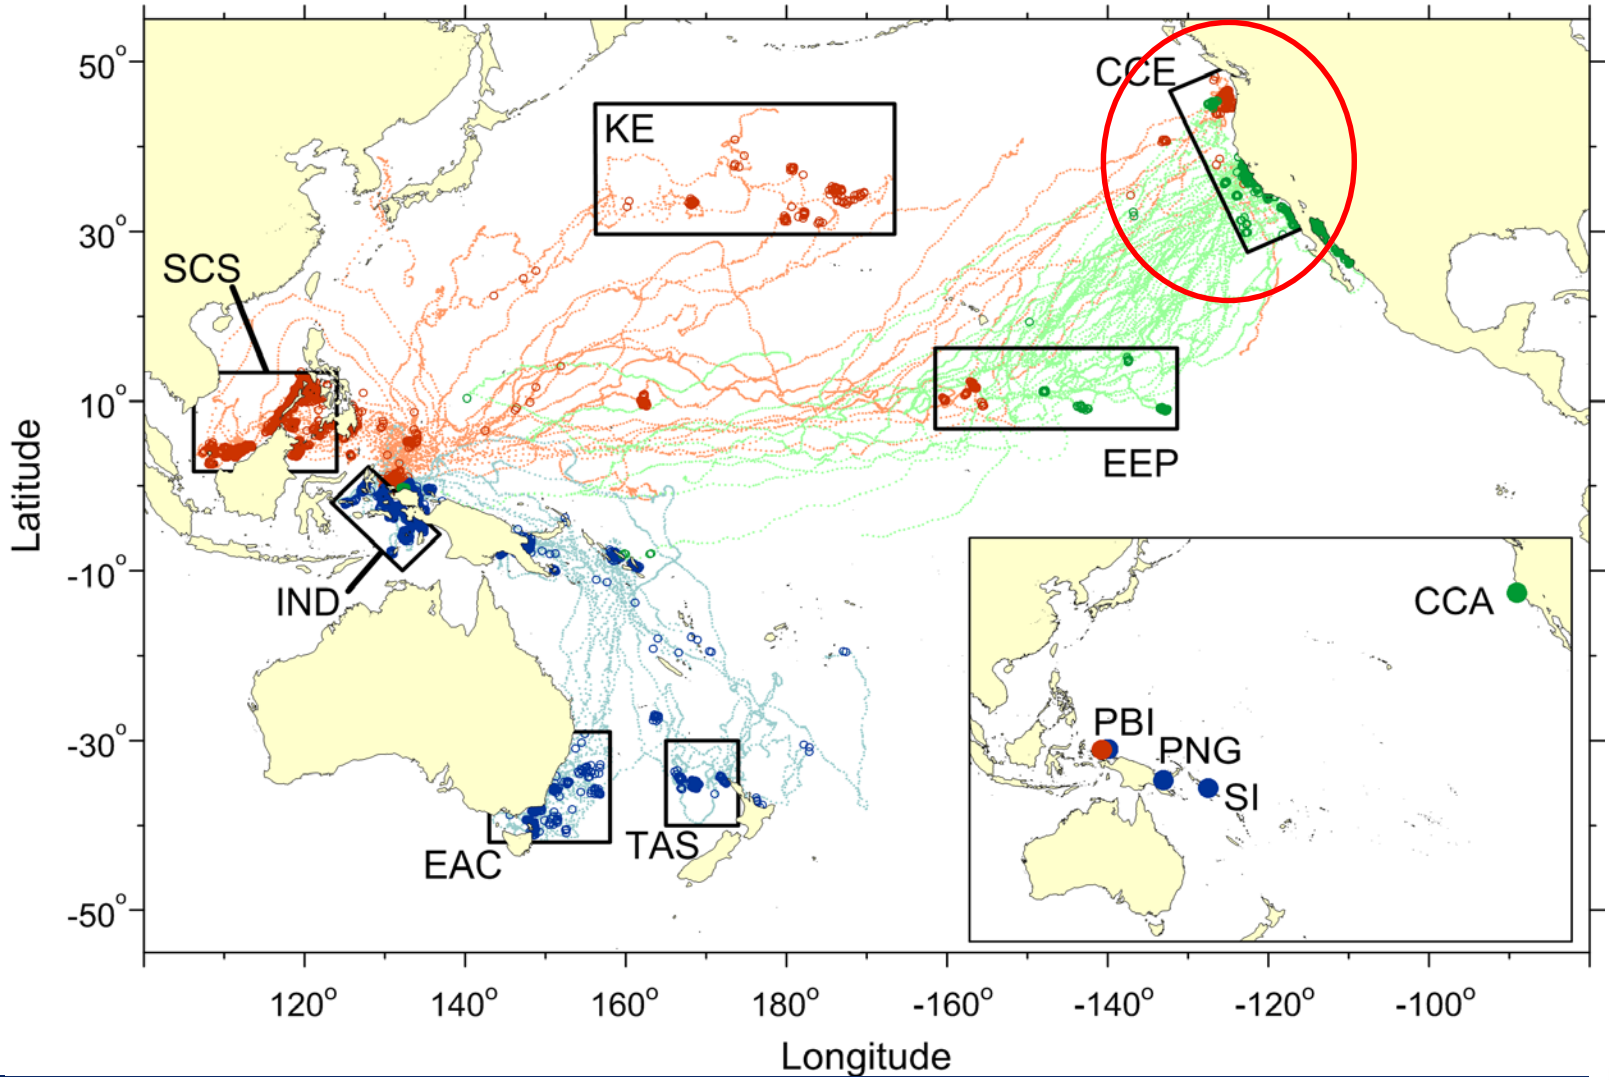
Modeling leatherback turtle occurrence/behavior

Tomo Eguchi et al.

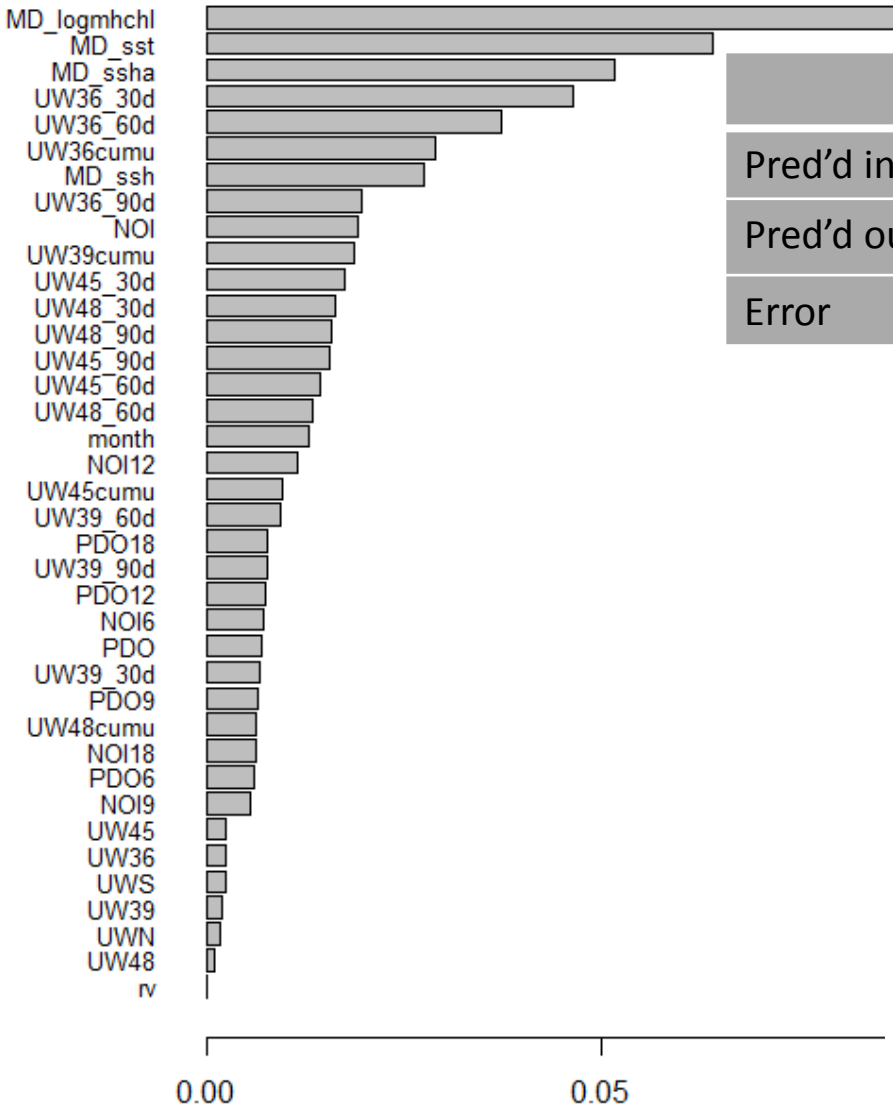
Data

Satellite telemetry tracks of leatherback turtles within the PLCA of the California Current (PLCA + 1 degree buffer)

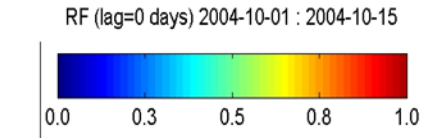
Modeling



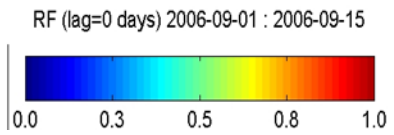
Used Random Forests methods with combinations of environmental data and time lags to come up with optimum prediction models



Applying data from a large scale study (Benson et al. 2011) to a smaller scale



Filled dots indicate locations of presumed foraging



Variable importance and prediction errors:

	Obs'd inside CH	Obs'd outside CH
Pred'd inside CH	226	9
Pred'd outside CH	17	522
Error	0.07	0.02

Comparison of "good habitat" and "bad habitat" periods based on predictions of foraging probability

Estimating limit reference points for western Pacific leatherbacks off the U.S. West Coast

Estimating limit reference points for western Pacific leatherbacks off the U.S. West Coast

Jeff Moore and Alex Curtis

- The SWFSC is conducting studies to help evaluate the potential for using limit reference points for leatherback turtle mortality for HMS conservation and management

- A theoretical Reproductive Value Loss Limit (RVLL) reference point has been developed for sea turtles:

Curtis KA, Moore JE. 2013. Calculating reference points for anthropogenic mortality of marine turtles. Aquatic Conservation DOI: 10.1002/aqc.2308

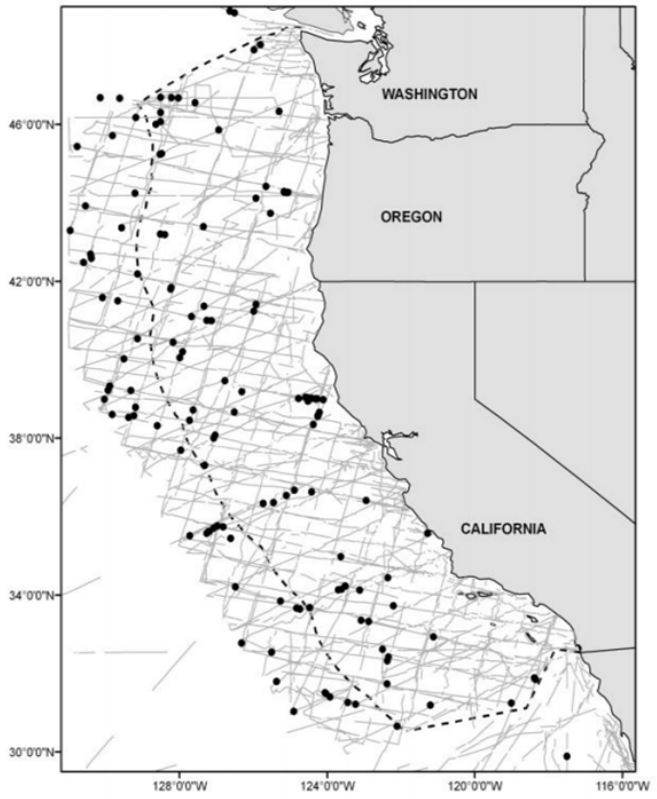
A POTENTIAL MANAGEMENT TOOL

- SWFSC scientists are currently compiling information to apply the RVLL reference point based on life history characteristics specific for leatherbacks

- The RVLL estimator is analogous to a Potential Biological Removal (PBR) estimator used for marine mammals under the MMPA

- It differs from PBR by accounting for the relative reproductive value of individuals in different life stages

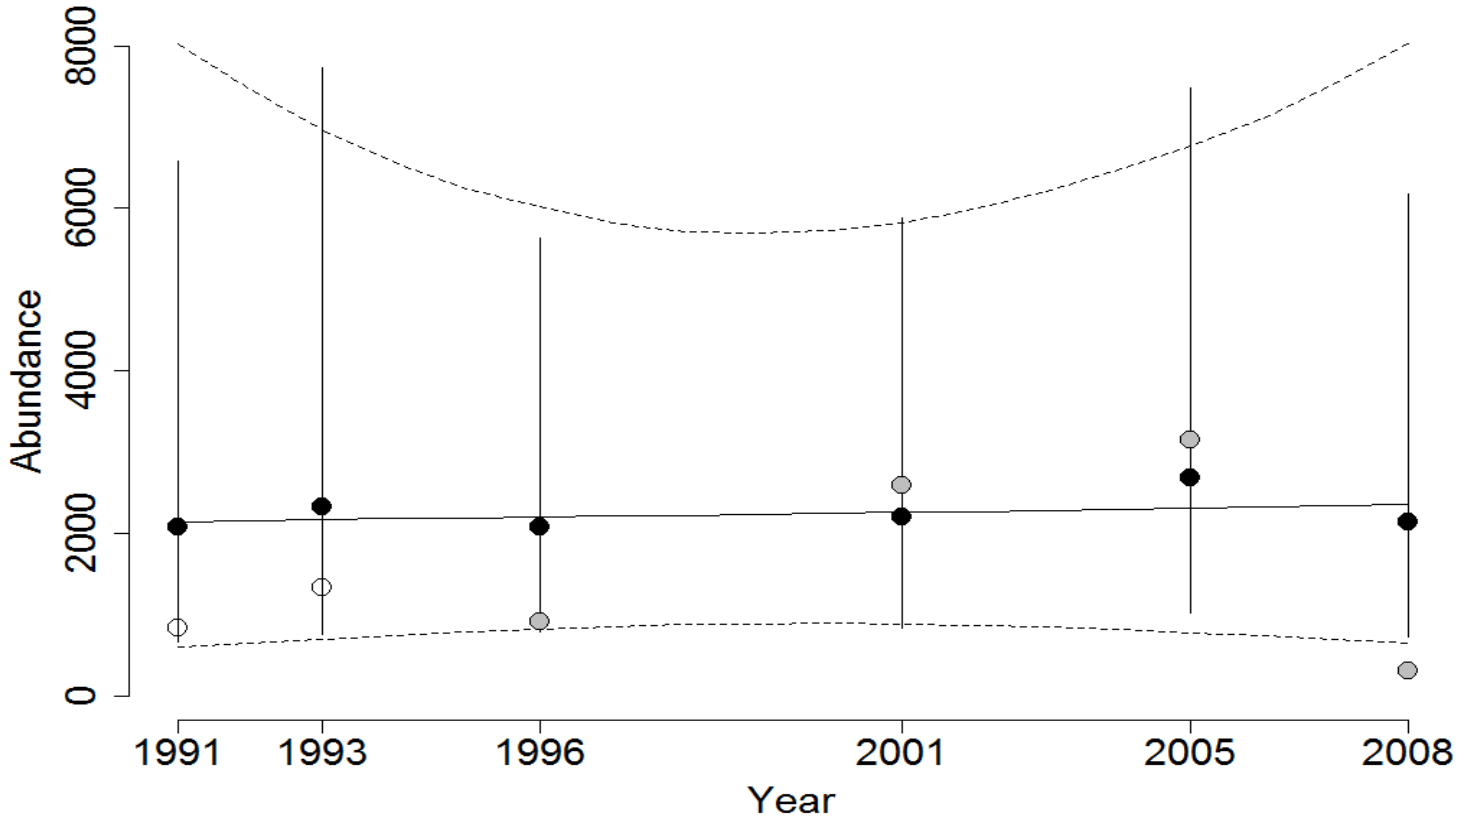
COMMENTS



- Sperm whales were hunted and brought into U.S. Pacific coast stations up until 1971, after which the MMPA ended the practice
- Their theoretical population increase is estimated to be 1-2% annually, so a recovery will take time
- Squid (prey) abundance varied greatly during the observation period
- Sperm whale sightings are rare -- roughly 13 groups sighted annually during the surveys
- A new survey is being conducted in 2014, with hopefully another in 2015

Abundance and Trend Estimation for Sperm Whales in the CA Current, 1991 - 2008

Jeff Moore and Jay Barlow

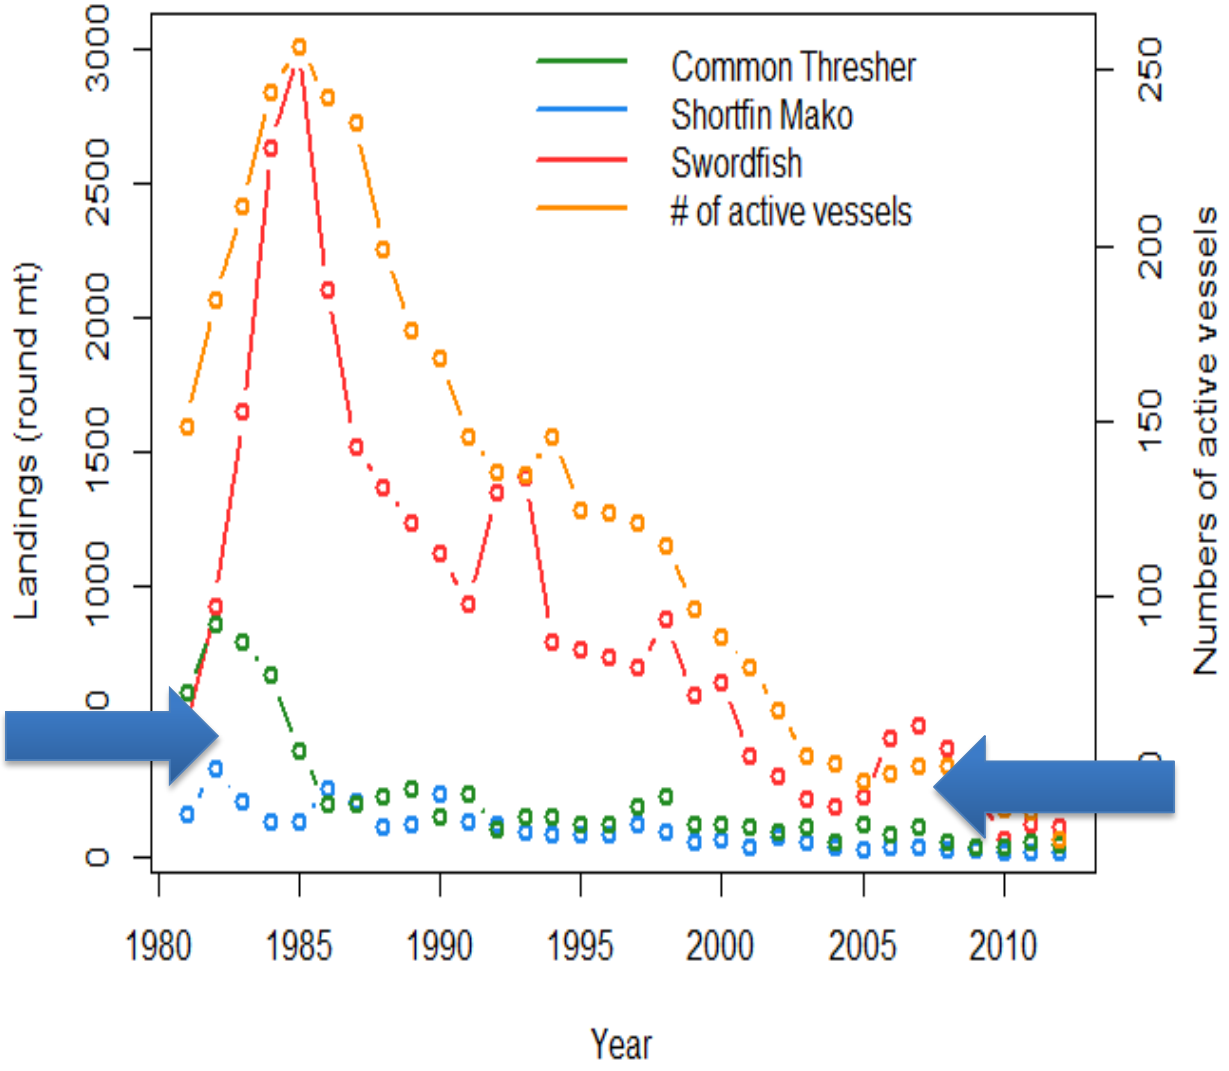


- Sperm whale abundance was estimated using a Bayesian hierarchical trend model based on transect survey data
- Bayesian hierarchical trend models make more efficient use of all information in the time series

Sperm whale sighting locations from shipboard surveys off California, Oregon, and Washington, 1991- 2008

RESULTS

- Annual estimates from the Bayesian heirarchical model are more stable than the prior estimates and have greater precision



Legend

Black Points = Bayesian Posterior Median Estimates of Abundance
Error Bars = 95% Credible Intervals for the Median Estimates
Solid Line = Trend Line for the Bayesian Model
Dotted Lines = 95% Credible Interval for the Trend Line
Shaded Points = Previously Published Estimates

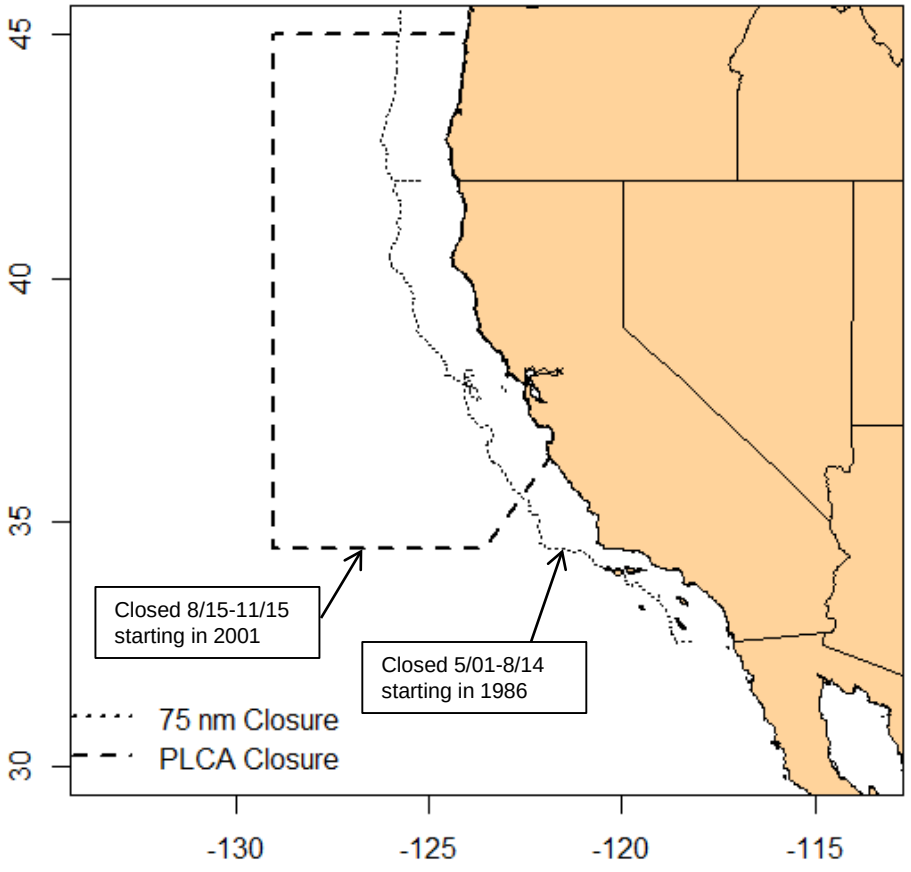
DGN Landings and Active Vessels

(from HMS SAFE Report and PacFIN)

The effects of time and area closures on the catch and catch rates of HMS shark and swordfish in the CA drift gillnet fishery

Laura Urbisci, Stephen Stohs and Kevin Piner

- How did two specific time-and-area closures affect catch and catch rates (CPUE) of swordfish and HMS sharks?



Data

CDFW logbook data (1981-2012): shortfin mako shark, common thresher shark, and swordfish

NMFS observer data (1990-2013): blue shark

Analysis

- Linear regression was used to measure closure impacts on CPUE
- A nonparametric bootstrap was used to measure estimation error

Estimated CPUE Impacts of Closures

- CPUE = numbers of individuals per set
- **The 1986 75 mile thresher shark conservation closure** had
  - negative CPUE effects on common thresher and shortfin mako
  - a positive CPUE effect on swordfish
- **The 2001 PLCA closure** had significant
  - negative CPUE effects on thresher shark and blue shark
  - small positive CPUE effects on shortfin mako shark and swordfish

Species	75 mile closure	PLCA	Overall Impact
Swordfish	0.7	0.1	0.6
Common Thresher Shark	-1.0	-0.4	-1.0
Shortfin Mako Shark	-0.3	+0.0	-0.3
Blue Shark	NA	-0.7	NA

Results

- Total catch of all four species studies has declined over time, mainly due to downtrend in DGN fishing effort

- Interpretation of CPUE as measures of relative abundance for assessment purposes should consider the impact of regulatory changes on the spatial-temporal distribution of effort

K.1.c.2. Effective Management Requires Tools.

1. Predicting occurrence of leatherback turtles in the California Current Ecosystem – **Tomo Eguchi et al.**

2. Estimating limit reference points for western Pacific leatherback turtles off the U.S. West Coast – **Jeff Moore and Alex Curtis**

3. Abundance and trend estimation for sperm whales in the California Current, 1981-2008 – **Jeff Moore and Jay Barlow**

4. The effects of time and area closures on the catch and catch rates of HMS shark and swordfish in the CA drift gillnet fishery – **Laura Urbisci et al.**

5. Dynamic Ocean Decision Making Tool: current applications and potential for implementation on the U.S. West Coast – **Rebecca Lewison et al.**

Developing dynamic ocean decision-making applications for Pacific fisheries

Agenda Item K.1.c
Supplemental SWFSC PowerPoint 2
March 2014

Rebecca Lewison (**SDSU**) & Sara Maxwell (**Stanford Univ**)

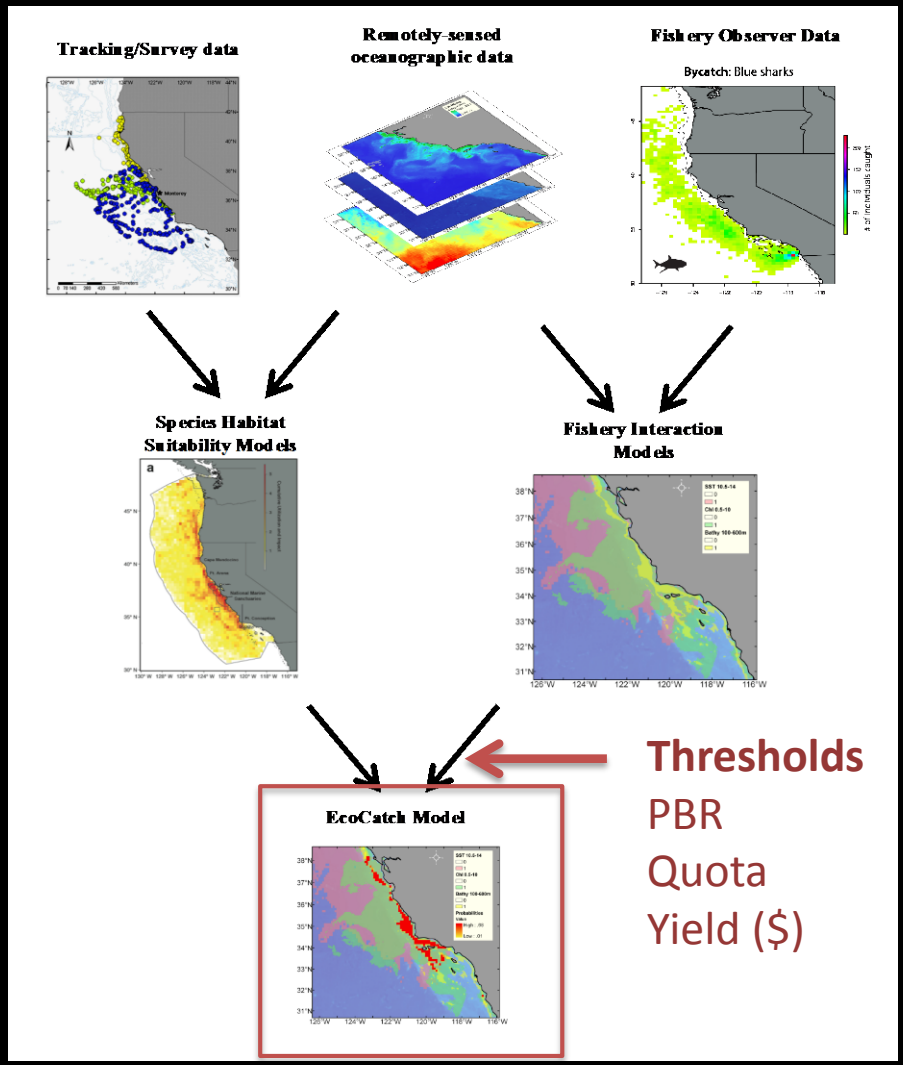
Steven Bograd, Elliott Hazen, Scott Benson, Heidi Dewar, Tomo Eguchi, Dave Foley, Sabrina Fossette, Suzy Kohin, Tim Sippel

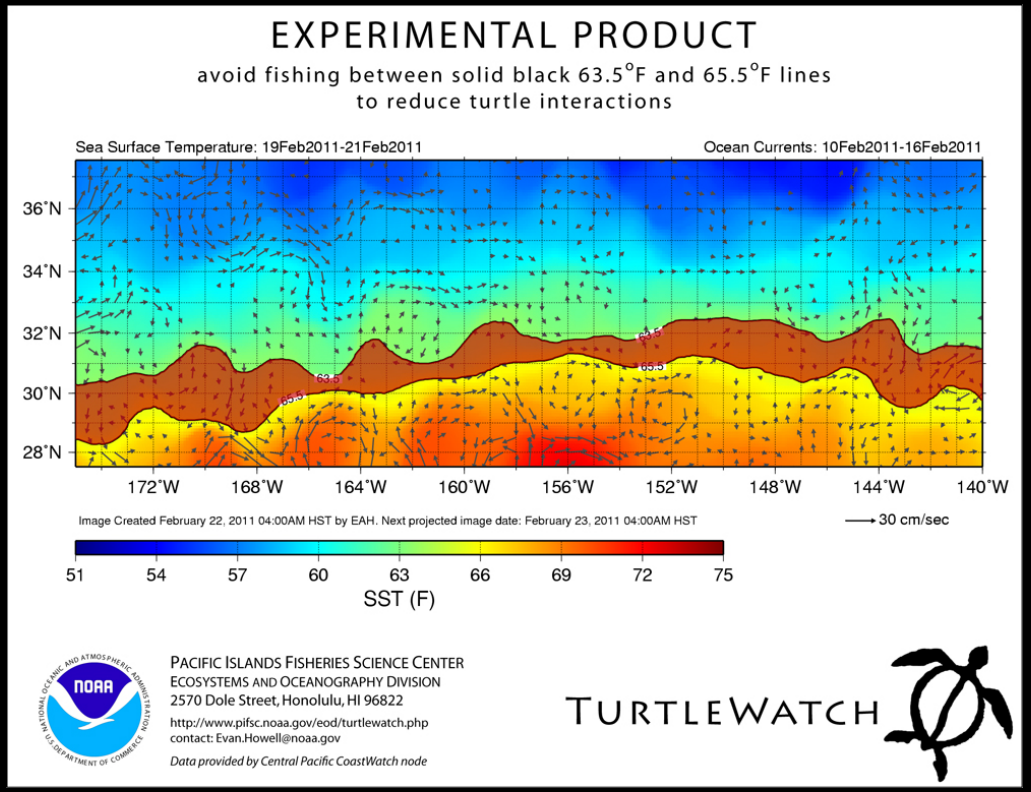
(**NOAA Southwest Fisheries Science Center)**

Larry Crowder, Dana Briscoe (**Stanford Univ**)

Helen Bailey (**U of Maryland**)

Dan Costa (**UC Santa Cruz**)

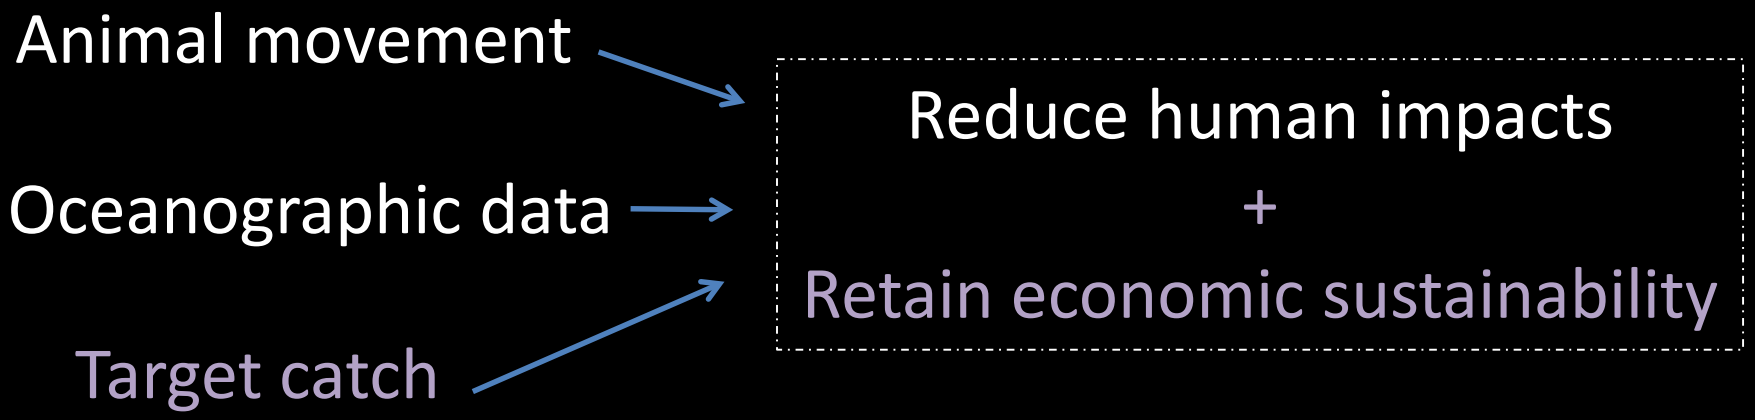




Dynamic ocean decision-making tools: Pacific Fisheries

- Use best-available science
- Develop an application that supports responsive & adaptive strategies
- Can meet changing objectives or criteria (thresholds)
- Generates multi-species, multi-objective solutions

Example - TurtleWatch: Sea turtle bycatch avoidance tool



- Sea turtle temperature-dependent habitat preferences
- Determine areas to avoid to reduce loggerhead bycatch
- Voluntary spatial shift in fleet, reduction of bycatch

Howell et al. 2008 *Endangered Species Research*

Dynamic ocean decision-making tool: DGN fishery

Supporting ecological *and* economic sustainability

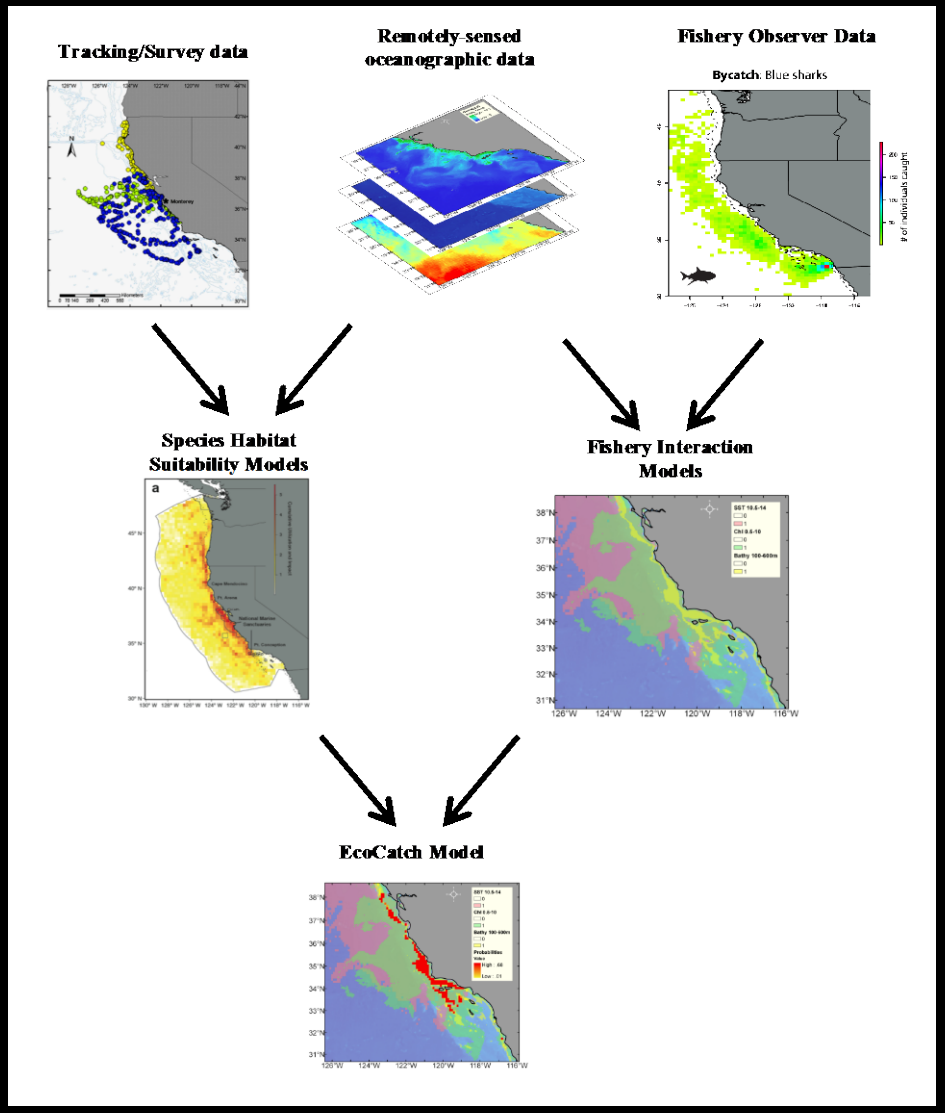
DGN Fishery: 3 Steps

Step 1: Suitable Habitat Models

California sea lions, Blue sharks, Leatherback sea turtles (T. Eguchi, S. Benson)

Fishery independent - Where species are likely to occur in space and time

Step 2: Fishery Interaction Models



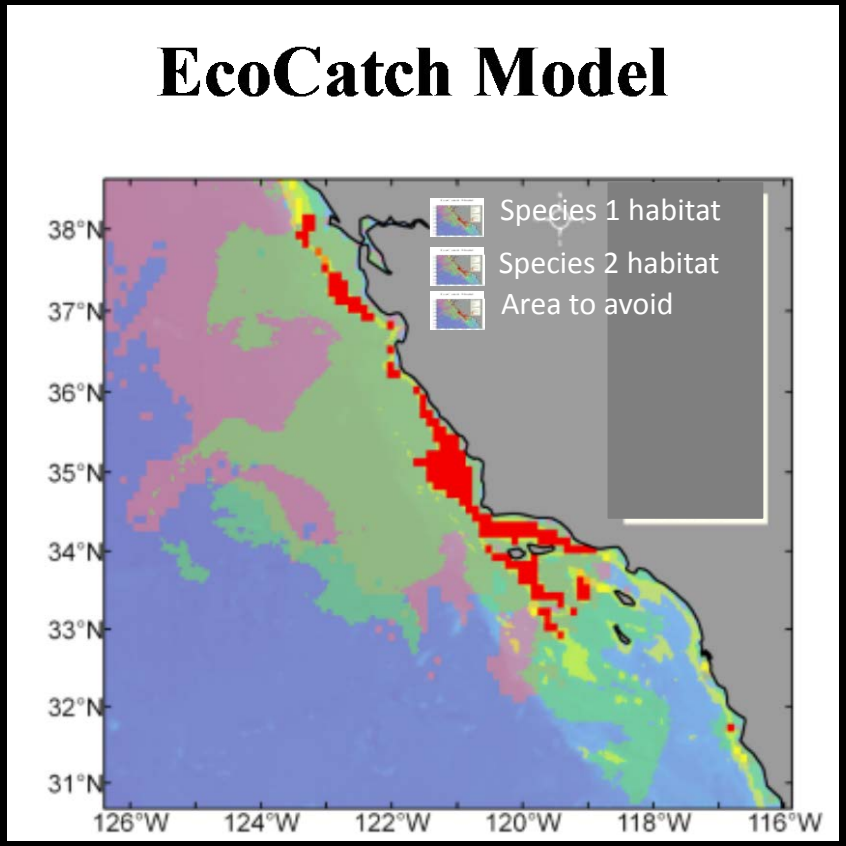
Observer data: bycatch and catch species

Fishery dependent: Association between fishing and species

Step 3: EcoCatch Model:

Suitable Habitat Models + Fishery Interaction Models → **Catch/Bycatch Probability Model**

Where bycatch and catch overlap *and* where they are separated



Dynamic ocean decision-making tool: Timeline, next steps

Timeline: 'Beta' version by Dec 2014 (scenario framework)

Next steps

- Build data layers
- Present to stakeholders
- Work with industry to test tool, and include fishery data and needs
- Tool development

HIGHLY MIGRATORY SPECIES ADVISORY SUBPANEL REPORT ON NATIONAL MARINE FISHERIES SERVICES REPORT

Proposed Rule to Implement Inter-American Tropical Tuna Commission Resolution C-13-01 for the Conservation of Tropical Tunas in the Eastern Pacific Ocean

The Highly Migratory Species Advisory Subpanel (HMSAS) would like to bring to the Council's attention that in 2013, for the first time, our West Coast longline fishermen were shut down three months early because the U.S. quota for bigeye tuna for the Eastern Pacific of 500 mt was reached prior to the end of the season. The reason for closing the Eastern Pacific bigeye fishery early was because the Hawaiian fleet caught the U.S. Western Pacific quota allowance earlier and moved to the Eastern Pacific sooner than usual. The recent actions in further reducing the US Western Pacific bigeye longline quota by the Western and Central Pacific Fisheries Commission in Cairns is going to further exacerbate the situation and lead to longer closures for the Eastern Pacific west coast longline fishermen. We ask the Council to notify National Marine Fisheries Service (NMFS) that this is unfair to our West Coast fishermen, as they do not have access to the Western Pacific bigeye quota and look for ways prevent discrimination against the West Coast fishermen compared to the Hawaiian fishermen as prescribed by the National Standards.

NMFS Southwest Fisheries Science Center Activities

The HMSAS raised a concern regarding a potential movement to declare a critical habitat for loggerhead turtles and fishery restrictions because of an occasional loggerhead turtle in the California Exclusive Economic Zone (EEZ). The HMSAS feels that there may not be scientific justification for this action and requests Highly Migratory Species Management Team to provide guidance on this important concern. Because the Southwest Fisheries Science Center is currently working with the occurrence rate and reference points for leatherback turtles, we suggest that at the same time the scientist should be recording data that will document the occurrence or non-occurrence of loggerhead turtles in the California EEZ.

Re: Agenda Item K.1.b NMFS Report March 2014
Proposed Rule to Implement Resol. C-04-06 VMS 2004

Dear Council Members:

There are several issues that the Council should note with regard to this proposed rule that do not appear in the NMFS Report.

1. This resolution was passed in 2004, prior to the IATTC having any management measures in place for North Pacific albacore.

2. This measure speaks of vessels over 24 meters which is a measurement used to differentiate vessels of the same gear type in one area only – longline vessels to distinguish small longline vessels from larger "freezer" longline vessels.

3. I attended the meeting of the IATTC in 2004 representing the albacore harvesters and know for a fact that this measure was never intended to apply to albacore troll vessels.

4. It is not known whether any countries in the IATTC have implemented this resolution, which has been on the IATTC 'books" for 10 years.

5. In 2013 this Council determined to discuss and then proceed with a regulation of this type under a two meeting process. Because HMS was not on the November Council meeting agenda, the action did not occur. It is not clear why NMFS has decided to go ahead with this resolution despite the Council's earlier action.

6. NMFS professes to proceed with this resolution under the Tuna Conventions Act. This Act requires the Secretary of State and the Secretary of Commerce to consult on the formulation of regulations to put into effect resolutions passed in the IATTC. I do not believe there have been any such consultations, which is a violation of the Tuna Conventions Act. After requesting such information from Amb. Balton, the top fisheries official at the State Department,

WEBSITE www.international-law-offices.com
EMAIL phf@international-law-offices.com

with no success, I filed a Freedom of Information Act request in October of 2013 which has not been responded to yet. If NMFS proceeds with its proposed rule over the objections of the albacore harvesters they are prepared to seek redress in other fora.

7. There is no rational basis to place VMS on albacore troll vessels of whatever size since it is an open access fishery with no marine reptile, mammal, or bird bycatch, with no limited seasons and no closed areas.

It is the hope of the albacore troll harvesters that these issues are discussed and sriously considered by the Council. Thank you for the opportunity to comment on this matter and for your time and attention,

Sincerely,

s/Peter H. Flournoy

VESSEL MONITORING SYSTEMS FOR HIGHLY MIGRATORY SPECIES FISHERIES

The situation summary for Agenda Item E.1, June 2013, included background on National Marine Fisheries Service's (NMFS') intention to require a vessel monitoring system (VMS) on vessels longer than 24 meters (78 feet) fishing for highly migratory species (HMS), as per requirements in Inter-American Tropical Tuna Commission (IATTC) Resolution C-04-06. In March 2013, NMFS Southwest Region (now West Coast Region) requested "the Council add to a future agenda discussion regarding the mechanism by which implementation of this Resolution would occur" and noted that "Implementation of Resolution C-04-06 could occur one of two ways: under the Tuna Convention Act of 1950 or under the Magnuson-Stevens Act through the Council process by regulation under the HMS Plan."

The Council scheduled consideration of this matter at its June 2013 meeting, and after hearing testimony from Rod McInnis (the Federal Commissioner to the IATTC at the time) about the importance of having the VMS rulemaking in place before summer 2014, the Council requested NMFS conduct the rulemaking under the MSA with Council input. At that time, the matter was scheduled for the November 2013 Council meeting, but was subsequently relocated to the March 2014 Council meeting. In the interest of timely implementation of the regulation, NMFS moved forward with rulemaking under the Tuna Convention Act and published the proposed rule on February 6, with a comment deadline of March 10, 2014 (Agenda Item K.2.a, Attachment 1).

The Council will be briefed by NMFS on the status of this rulemaking.

Council Action:

Consider the NMFS Update and Provide Guidance for Implementation of VMS in HMS Fisheries.

Required Determinations

Clarity of the Rule

We are required by Executive Orders 12866 and 12988 and by the Presidential Memorandum of June 1, 1998, to write all rules in plain language. This means that each rule we publish must:

(a) Be logically organized;

(b) Use the active voice to address readers directly;

(c) Use clear language rather than jargon;

(d) Be divided into short sections and sentences; and

(e) Use lists and tables wherever possible.

If you feel that we have not met these requirements, send us comments by one of the methods listed in **ADDRESSES**. To better help us revise the rule, your comments should be as specific as possible. For example, you should tell us the names of the sections or paragraphs that are unclearly written, which sections or sentences are too long, the sections where you feel lists or tables would be useful, etc.

Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.)

This rule does not contain any new collections of information that require approval by the Office of Management and Budget (OMB) under the Paperwork Reduction Act. This rule will not impose recordkeeping or reporting requirements on State or local governments, individuals, businesses, or organizations. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act

We have determined that environmental assessments and environmental impact statements, as defined under the authority of the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), need not be prepared in connection with regulations pursuant to section 4(a) of the Act. We published a notice outlining our reasons for this determination in the **Federal Register** on October 25, 1983 (48 FR 49244).

References Cited

A complete list of all references cited in this final rule is available at *http://www.regulations.gov* at Docket No. FWS–R1–ES–2014–0002, or upon request from the Oregon Fish and Wildlife Office (see **ADDRESSES**).

Authors

The primary authors of this proposed rule are staff members of the Service's Oregon Fish and Wildlife Office (see **ADDRESSES** and **FOR FURTHER INFORMATION CONTACT**).

Proposed Regulation Promulgation

Accordingly, we hereby propose to amend part 17, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as set forth below:

PART 17—ENDANGERED AND THREATENED WILDLIFE AND PLANTS

■ 1. The authority citation for part 17 continues to read as follows:

Authority: 16 U.S.C. 1361–1407; 16 U.S.C. 1531–1544; 16 U.S.C. 4201–4245; unless otherwise noted.

■ 2. Amend § 17.11(h) by removing the entry for ''Chub, Oregon'' under ''Fishes'' from the List of Endangered and Threatened Wildlife.

■ 3. Amend § 17.95(e) by removing the entry for ''Oregon Chub (*Oregonichthys crameri*)''.

Dated: January 27, 2014.

Stephen Guertin,

Acting Director, U.S. Fish and Wildlife Service.

50 CFR Part 300

[Docket No. 130722646–4081–01]

RIN 0648–BD54

International Fisheries; Pacific Tuna Fisheries; Establishment of Tuna Vessel Monitoring System in the Eastern Pacific Ocean

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Proposed rule; request for comments.

SUMMARY: NMFS proposes regulations under the Tuna Conventions Act to implement Resolution C–04–06 of the Inter-American Tropical Tuna Commission (IATTC). The regulations would establish requirements for a satellite-based vessel monitoring system (VMS) for U.S. commercial fishing vessels, 24 meters or more in overall length, used to target any fish of the genus *Thunnus* or of the species *Euthynnus* (*Katsuwonus*) *pelamis* (skipjack tuna) in the area bounded by the west coast of the Americas and on the north, south and west respectively, by the 50° N. and 50° S. parallels, and the 150° W. meridian. This action is necessary for the United States to satisfy its obligations as a member of the IATTC.

DATES: Comments on the proposed rule and the initial regulatory flexibility analysis (IRFA) must be submitted on or before March 10, 2014. A public hearing will be held from 1 p.m. to 4 p.m. PST, February 28, 2014, in Long Beach, CA.

ADDRESSES: You may submit comments on this document, identified by NOAA–NMFS–2013–0117, by any of the following methods:

- *Electronic Submission:* Submit all electronic public comments via the Federal e-Rulemaking Portal. Go to *www.regulations.gov/#!docketDetail;D=NMFS-2013-0117,* click the ''Comment Now!'' icon, complete the required fields, and enter or attach your comments.
- *Mail:* Submit written comments to Rachael Wadsworth, NMFS West Coast Regional Office, 501 W. Ocean Blvd., Suite 4200, Long Beach, CA 90802. Include the identifier ''NOAA–NMFS–2013–0117'' in the comments.
- *Public Hearing:* The public is welcome to attend a public hearing and offer comments on this proposed rule from 1 p.m. to 4 p.m. PST, February 28, 2014 at 501 W. Ocean Boulevard, Suite 4200, Long Beach, CA 90802. The public may also participate in the public hearing via conference line: 888–790–6181; participant passcode: 40810.

Instructions: Comments must be submitted by one of the above methods to ensure they are received, documented, and considered by NMFS. Comments sent by any other method, to any other address or individual, or received after the end of the comment period, may not be considered. All comments received are a part of the public record and will generally be posted for public viewing on *www.regulations.gov* without change. All personal identifying information (e.g., name, address, etc.) submitted voluntarily by the sender will be publicly accessible. Do not submit confidential business information, or

otherwise sensitive or protected information. NMFS will accept anonymous comments (enter ''N/A'' in the required fields if you wish to remain anonymous). Attachments to electronic comments will only be accepted in Microsoft Word or Excel, WordPerfect, or Adobe PDF file formats.

Written comments regarding the burden-hour estimates or other aspects of the collection-of-information requirements contained in this proposed rule may be submitted to NMFS West Coast Region and by email to *OIRA_Submission@omb.eop.gov,* or faxed to (202) 395–7285 by the comment date listed above. Copies of the draft Regulatory Impact Review (RIR) and other supporting documents are available via the Federal eRulemaking Portal: *http://www.regulations.gov,* docket NOAA–NMFS–2013–0117 or contact with the Regional Administrator, William Stelle, Jr., NMFS West Coast Regional Office, 7600 Sand Point Way NE., Bldg 1, Seattle, WA 98115–0070 or by email to *RegionalAdministrator.WCRHMS@noaa.gov*.

FOR FURTHER INFORMATION CONTACT: Heidi Taylor, NMFS West Coast Region, 562–980–4039, or Rachael Wadsworth, NMFS West Coast Region, 562–980–4036.

SUPPLEMENTARY INFORMATION:

Background on the IATTC

The United States is a member of the IATTC, which was established under the 1949 Convention for the Establishment of an Inter-American Tropical Tuna Commission. The full text of the 1949 Convention is available at: *http://www.iattc.org/PDFFiles/IATTC_convention_1949.pdf*.

The IATTC facilitates scientific research into, as well as conservation and management of, highly migratory species of fish in the Convention Area (defined as the waters of the eastern Pacific Ocean (EPO)). Since 1998, conservation resolutions adopted by the IATTC have further defined the Convention Area as the area bounded by the west coast of the Americas, the 50° N. and 50° S. parallels, and the 150° W. meridian. The IATTC has maintained a scientific research and fishery monitoring program for many years, and regularly assesses the status of tuna and billfish stocks in the Convention Area to determine appropriate catch limits and other measures deemed necessary to prevent overexploitation of these stocks and to promote sustainable fisheries. Current IATTC member countries include: Belize, Canada, China, Chinese Taipei (Taiwan), Colombia, Costa Rica, Ecuador, El Salvador, the European Union, France, Guatemala, Japan, Kiribati, the Republic of Korea, Mexico, Nicaragua, Panama, Peru, the United States, Vanuatu, and Venezuela. Bolivia, Honduras, Indonesia and the Cook Islands are cooperating non-members.

International Obligations of the United States under the Convention

As a Contracting Party to the 1949 Convention and a member of the IATTC, the United States is legally bound to implement the decisions of the IATTC. The Tuna Conventions Act (16 U.S.C. 951–962) directs the Secretary of Commerce, after approval by the Secretary of State, to promulgate such regulations as may be necessary to implement recommendations adopted by the IATTC. The Secretary's authority to promulgate such regulations has been delegated to NMFS.

IATTC Vessel Monitoring System (VMS) Resolution

At its 72nd Meeting, in June 2004, the IATTC adopted by consensus Resolution C–04–06: Resolution on the Establishment of a VMS. All resolutions and recommendations of the IATTC are available on the following Web site: *http://iattc.org/ResolutionsActiveENG.htm*. The main objective of Resolution C–04–06 is to establish a satellite-based VMS for tuna-fishing vessels, 24 meters (78.74 feet) or more in length, operating in the EPO and harvesting species for which the IATTC has established conservation and management measures. This regulation would implement Resolution C–04–06 for U.S. fishing vessels and it would broaden U.S. VMS requirements across the Pacific Ocean. VMS requirements in the western and central Pacific Ocean (WCPO) were adopted by the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean (WCPFC), and implemented for U.S. fleets by NMFS under 50 CFR 300.219. VMS requirements exist for U.S. purse seine vessels under regulations implementing the South Pacific Tuna Treaty under 50 CFR 300.45. VMS requirements have also been implemented by NMFS for the West Coast groundfish fisheries under 50 CFR 660.14, for the West Coast longline vessels under 50 CFR 660.712, and for Hawaii and American Samoa longline vessels under 50 CFR 665.19.

Information collected under this VMS would be handled in accordance with NOAA Administrative Order 216–100 for confidential fisheries data.

Proposed Regulations for VMS

The proposed action applies to all owners and operators of U.S. commercial fishing vessels, 24 meters or more in overall length, used to target any fish of the genus *Thunnus* or of the species *Euthynnus* (*Katsuwonus*) *pelamis* (skipjack tuna), in the Convention Area. The proposed action requires these vessels to install, activate, carry and operate VMS units (also known as ''mobile transmitting units'').

The VMS units and mobile communications service providers must be type-approved by NOAA for fisheries in the IATTC Convention Area. Information for current NOAA type-approved VMS units can be obtained from: NOAA, Office of Law Enforcement, 1315 East-West Hwy, Suite 3301, Silver Spring, MD 20910–3282; telephone at (888) 210–9288; fax at (301) 427–0049. Or, by contacting NOAA OLE VMS Helpdesk: Telephone: (888) 219–9228; email: *ole.helpdesk@noaa.gov.* The business hours of the VMS Helpdesk are: Monday through Friday, except Federal holidays, 7 a.m. to 11 p.m., Eastern Time.

A NOAA-approved VMS unit automatically determines the vessels position and transmits it to a NOAA-approved communications service provider. The communications service provider receives the transmission (also called ''position reports'') and relays it to NOAA. The vessel owner and operator must authorize NOAA OLE, the U.S. Coast Guard (USCG) and other authorized entities to receive and relay position reports. The owner and operator must authorize NOAA to set up the reporting interval of the VMS unit and the transmission of automated position reports to occur hourly.

Compliance with the existing VMS requirements at 50 CFR 300.219, 50 CFR part 660, or 50 CFR part 665 would satisfy these new requirements relating to the installation, carrying, and operation of VMS units, provided that the VMS unit and mobile communications service provider are type-approved by NOAA specifically for fisheries in the IATTC Convention Area, the VMS unit is operated continuously at all times while the vessel is at sea, the vessel owner or operator have authorized NOAA to receive and relay transmissions from the VMS unit, and the proposed requirements applicable in case of VMS unit failure are followed.

Under these regulations, the vessel owner and operator would be responsible for all costs associated with the purchase, installation and maintenance of the VMS unit, and for all charges levied by the mobile

communications service provider as necessary to ensure the transmission of automatic position reports to NOAA. The unit cost, physical size, available features, transmission fees, and service packages vary between the different type-approved VMS units. Vessel owners may choose the type-approved unit that best fits their needs. Federal funds may be available for reimbursement of type-approved VMS units up to $3,100.[1] More information on the VMS Reimbursement Program can be obtained from calling the NOAA OLE VMS Helpdesk: Telephone: (888) 219–9228, and online at: *http://www.psmfc.org/program/vessel-monitoring-system-reimbursement-program-vms?pid=17.*

For vessel owners and operators that are carrying and operating VMS units in compliance with the requirements of 50 CFR 300.219, 50 CFR 660.712, or 50 CFR 665.19 relating to the installation, carrying, and operation of VMS units, the vessel owner and operator would not be responsible for costs that are the responsibility of NOAA under those regulations.

Activation of a VMS unit would be required any time the unit is installed or reinstalled, any time the mobile communications service provider has changed, and any time directed by NOAA. Activation would involve submitting to NOAA a report via mail, facsimile or email with information about the vessel, its owner or operator, and the VMS unit, as well as receiving confirmation from NOAA that the VMS unit is transmitting position reports properly. The VMS unit would have to be turned on and operating (i.e., transmitting automated position reports) at all times inside and outside the Convention Area. However, the requirement to operate the VMS unit at all times would not apply in the circumstance described below.

The VMS unit may be turned off while the vessel is in port, but only if the vessel operator or owner notifies NOAA via mail, facsimile or email prior to such shut-down. In such cases, NOAA must also be notified when the VMS unit is subsequently turned back on (these two types of notifications are called ''on/off reports''), and the vessel operator must receive confirmation from NOAA that the VMS unit is functioning properly prior to leaving port.

In the case of failure of the VMS unit while at sea, the vessel operator would be required to contact NOAA and follow the instructions provided by NOAA, which could include, among other actions: Submitting position reports at specified intervals by other means, ceasing fishing, stowing fishing gear, and/or returning to port; and repair or replace the VMS unit and ensure it is operable before starting the next trip.

If the vessel owner or operator informed NOAA in writing that a vessel that had been subject to these VMS requirements would be departing the Convention Area, and not be present in the Convention Area for one year or longer, the VMS requirements of this rule would cease to apply to that vessel only if specifically authorized in writing by NOAA. However, the VMS requirements of this rule would apply again if the vessel were used again to target any fish of the genus *Thunnus* or of the species *Euthynnus* (*Katsuwonus*) *pelamis* (skipjack tuna) in the Convention Area.

Classification

The NMFS Assistant Administrator has determined that this proposed rule is consistent with the Tuna Conventions Act and other applicable laws, subject to further consideration after public comment.

National Environmental Policy Act

This action is categorically excluded from the requirement to prepare an environmental assessment in accordance with NAO 216–6. A memorandum for the file has been prepared that sets forth the decision to use a categorical exclusion.

Executive Order 12866

This proposed rule has been determined to be not significant for purposes of Executive Order 12866.

Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) (5 U.S.C. 601 *et seq.*) requires government agencies to assess the impact of regulatory actions on small businesses and other small organizations. An initial regulatory flexibility analysis (IRFA) was prepared, as required by section 603 of the RFA. The IRFA describes the economic impact that this proposed rule, if adopted, would have on small entities. A description of the action, why it is being considered, and the legal basis for this action are contained at the beginning of this section in the preamble and in the **SUMMARY** section of the preamble. A summary of the analysis follows. A copy of this analysis is available from NMFS (see **ADDRESSES**).

All of the entities impacted by this proposed rule are considered small business entities. All impacted vessels will be affected in a similar way and disproportional economic effect between small and large businesses will not exist. This proposed rule would apply to all owners and operators of U.S. commercial fishing vessels, 24 meters or more in overall length, used to target any fish of the genus *Thunnus* or of the species *Euthynnus* (*Katsuwonus*) *pelamis* (skipjack tuna) in the Convention Area. The proposed action requires these vessels to install, activate, carry and operate NOAA type-approved VMS units and mobile communications service providers for fisheries in the IATTC Convention Area. Gear types that would be impacted include: Purse seine, hook-and-line (i.e., bait and troll/jig) and vessels using combinations of these gear types (i.e., multi-gear vessels).

To estimate the number of affected entities, the number of vessels authorized to fish for highly migratory species in the EPO through fishing permits was considered a reasonable proxy. The permits used to estimate affected entities were those issued under the authority of the Magnuson-Stevens Fishery Conservation and Management Act (16 U.S.C. 1801 *et seq.*) through regulations codified at 50 CFR 660.707 and permits under the authority of the High Seas Fishing Compliance Act of 1995 (16 U.S.C. 5501 *et seq.*) through regulations codified at 50 CFR 300.13. Vessels under 24 meters in overall length and vessels already subject to the existing VMS requirements at 50 CFR 300.219, 50 CFR part 660, or 50 CFR part 665, compliance with which would satisfy this new requirement were excluded from the estimate of impacted entities. As of September 2013, approximately 15 vessels did not have VMS units installed, and 2 vessels have VMS units installed that are not type-approved for these regulations.

The VMS units that have been type-approved range in cost and service features. This allows the vessel owner flexibility in choosing the model that best fits the needs their vessel. Compliance for each of the projected 17 small entities would involve the following approximate annualized costs: $1,000 for the purchase and installation of VMS units (based on $4,000 per unit and a lifespan of 4 years per unit), $250 for VMS unit maintenance, and, based on estimated communication costs of about $1.50 per day (based on hourly reporting cost of some service providers), $547.50 for VMS unit operation (i.e., the transmission of

[1] The availability of these funds for reimbursement for the cost of purchasing a VMS unit is not guaranteed, but the funds are anticipated to be available on a first-come first-served basis.

automatic vessel position reports to NOAA). Thus, the annualized compliance cost would be about $1,797.50 per vessel. The analysis assumes that vessels will pay for the required VMS units. However, Federal funds may be available for reimbursement of type-approved units up to $3,100.[2]

Under the proposed action, the United States would implement the Resolution C–04–06. This would satisfy international obligations of the United States to implement decisions of the IATTC according to the provisions agreed to in the resolution. The reporting, recordkeeping and other compliance requirements of this proposed rule are described earlier in the preamble and under the Paperwork Reduction Act section.

Paperwork Reduction Act

This proposed rule contains a collection-of-information requirement subject to review and approval by the Office of Management and Budget (OMB) under the PRA. This requirement has been submitted to OMB for approval. Public reporting burden for this collection of information is estimated as an average per individual response for each requirement. The estimated time for initial VMS unit installation is 4 hours. The estimated time to maintain or repair a VMS unit is 1 hour annually. The estimated response time for respondents to prepare and submit activation reports is estimated to be 5 minutes per report. The vessel owner and operator must authorize NOAA OLE, the U.S. Coast Guard (USCG) and other authorized entities to receive and relay position reports. The estimated response time to prepare and submit each on/off report is also 5 minutes. These estimates include the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection information.

Public comment is sought regarding: Whether this proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; the accuracy of the burden estimate; ways to enhance the quality, utility, and clarity of the information to be collected; and ways to minimize the burden of the collection of information, including through the use of automated collection techniques or other forms of information technology. Written comments regarding the burden-hour estimates or other aspects of the collection-of-information requirements contained in this proposed rule may be submitted to NMFS West Coast Region at the **ADDRESSES** above, and by email to *OIRA_Submission@omb.eop.gov,* or fax to (202) 395–7285.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

List of Subjects in 50 CFR Part 300

Administrative practice and procedure, Fish, Fisheries, Fishing, Marine resources, Reporting and recordkeeping requirements, Treaties.

Dated: February 3, 2014.

Samuel D. Rauch III,

Deputy Assistant Administrator for Regulatory Programs, National Marine Fisheries Service.

For the reasons set out in the preamble, 50 CFR part 300 is proposed to be amended as follows:

PART 300—INTERNATIONAL FISHERIES REGULATIONS

Subpart C—Eastern Pacific Tuna Fisheries

■ 1. The authority citation for 50 CFR part 300, subpart C continues to read as follows:

Authority: 16 U.S.C. 951–961 *et seq.*

■ 2. In § 300.21, definitions for ''Commercial'', ''Vessel monitoring system (VMS)'' and ''VMS unit'' are added, in alphabetical order, to read as follows:

§ 300.21 Definitions.

* * * * *

Commercial with respect to commercial fishing, means fishing in which the fish harvested, either in whole or in part, are intended to enter commerce through sale, barter or trade.

* * * * *

Vessel monitoring system (VMS) means an automated, remote system that provides information about a vessel's identity, location and activity, for the purposes of routine monitoring, control, surveillance and enforcement of area and time restrictions and other fishery management measures.

VMS unit, sometimes known as a ''mobile transmitting unit,'' means a transceiver or communications device, including all hardware and software that is carried and operated on a vessel as part of a VMS.

■ 3. In § 300.24, paragraphs (u) through (x) are added to read as follows:

§ 300.24 Prohibitions.

* * * * *

(u) Fail to install, activate, or operate a VMS unit as required in § 300.26(c).

(v) In the event of VMS unit failure or interruption, fail to repair or replace a VMS unit, fail to notify the Special-Agent-In-Charge (SAC), NOAA Office of Law Enforcement, Pacific Islands Division (or designee) and follow the instructions provided, or otherwise fail to act as provided in § 300.26(c)(4).

(w) Disable, destroy, damage or operate improperly a VMS unit installed under § 300.26, or attempt to do any of the same, or fail to ensure that its operation is not impeded or interfered with, as provided in § 300.26(e).

(x) Fail to make a VMS unit installed under § 300.26 or the position data obtained from it available for inspection, as provided in § 300.26(f) and (g).

■ 4. Section 300.26 is added to read as follows:

§ 300.26 Vessel monitoring system (VMS).

(a) *Special-Agent-In-Charge (SAC), NOAA Office of Law Enforcement, Pacific Islands Division (or designee), and VMS Helpdesk contact information and business hours:* (1) The contact information for the SAC for the Pacific Islands Division: NOAA/DKIRC, ATTN: OLE/VMS, 1025 Quincy Avenue, Suite 5010, Honolulu, HI 96860–4512; telephone: (808) 725–6100; email: *pidvms@noaa.gov.* The business hours of the SAC for the purpose of this section are: Monday through Friday, except Federal holidays, 8 a.m. to 4:30 p.m., Hawaii Standard Time.

(2) The contact information for the NOAA Office of Law Enforcement's VMS Helpdesk for the purpose of this section is: Telephone: (888) 219–9228; email: *ole.helpdesk@noaa.gov.* The business hours of the VMS Helpdesk for the purpose of this section are: Monday through Friday, except Federal holidays, 7 a.m. to 11 p.m., Eastern Time.

(b) *Applicability.* This section applies to all owners and operators of U.S. commercial fishing vessels, 24 meters or more in overall length, used to target tuna in the Convention Area. If specifically authorized by NOAA OLE in writing, this section shall no longer be applicable to a vessel that departs the Convention Area and remains outside the Convention Area for 1 year or longer.

(c) *Provisions for Installation, Activation and Operation*—(1) *VMS*

[2] The availability of these funds for reimbursement for the cost of purchasing a VMS unit is not guaranteed, but the funds are anticipated to be available on a first-come first-served basis.

Unit Installation. The vessel owner and operator must obtain and have installed on the fishing vessel, in accordance with instructions provided by the SAC, and the VMS unit manufacturer, a VMS unit that is type-approved by NOAA for fisheries in the IATTC Convention Area. The vessel owner and operator shall arrange for a NOAA-approved mobile communications service provider to receive and relay transmissions from the VMS unit to NOAA. The vessel owner and operator shall authorize NOAA OLE, the U.S. Coast Guard (USCG) and other authorized entities to receive and relay position reports. The owner and operator must authorize NOAA to set up the reporting interval of the VMS unit and the transmission of automated position reports to occur hourly. The NOAA OLE VMS Helpdesk is available to provide instructions for VMS installation and a list of the current type-approved VMS units and mobile communication service providers.

(2) *VMS Unit Activation.* If the VMS unit has not yet been activated as described in this paragraph, or if the VMS unit has been newly installed or reinstalled, or if the mobile communications service provider has changed since the previous activation, or if directed by the SAC, the vessel owner and operator must, prior to leaving port:

(i) Turn on the VMS unit to make it operational;

(ii) Submit a written activation report, via mail, facsimile or email, to the SAC, that includes: The vessel's name; the vessel's official number; the VMS unit manufacturer and identification number; and telephone, facsimile or email contact information for the vessel owner or operator; and

(iii) Receive verbal or written confirmation from the SAC that the proper VMS unit transmissions are being received from the VMS unit.

(3) *VMS Unit Operation.* The vessel owner and operator shall continuously operate the VMS unit at all times, except that the VMS unit may be shut down while the vessel is in port or otherwise not at sea, provided that the owner and operator:

(i) Prior to shutting down the VMS unit, report to the SAC or the NOAA Office of Law Enforcement's VMS Helpdesk via facsimile, email, or web-form the following information: The intent to shut down the VMS unit; the vessel's name; the vessel's official number; an estimate for when the vessel's VMS may be turned back on; and telephone, facsimile or email contact information for the vessel owner or operator; and

(ii) When turning the VMS unit back on, report to the SAC or the NOAA Office of Law Enforcement's VMS Helpdesk, via mail, facsimile or email, the following information: That the VMS unit has been turned on; the vessel's name; the vessel's official number; and telephone, facsimile or email contact information for the vessel owner or operator; and

(iii) Prior to leaving port, receive verbal or written confirmation from the SAC that proper transmissions are being received from the VMS unit.

(4) *Failure of VMS unit.* If the VMS unit has become inoperable or transmission of automatic position reports from the VMS unit has been interrupted, or if notified by NOAA or the U.S. Coast Guard (USCG) that automatic position reports are not being received from the VMS unit or that an inspection of the VMS unit has revealed a problem with the performance of the VMS unit, the vessel owner and operator shall comply with the following requirements:

(i) If the vessel is at port: The vessel owner or operator shall repair or replace the VMS unit and ensure it is operable before the vessel leaves port.

(ii) If the vessel is at sea: The vessel owner, operator, or designee shall contact the SAC by telephone, facsimile, or email at the earliest opportunity during the SAC's business hours and identify the caller and vessel. The vessel operator shall follow the instructions provided by the SAC, which could include, but are not limited to: Ceasing fishing, stowing fishing gear, returning to port, and/or submitting periodic position reports at specified intervals by other means; and, repair or replace the VMS unit and ensure it is operable before starting the next trip.

(5) *Related VMS Requirements.* Installing, carrying and operating a VMS unit in compliance with the requirements in 50 CFR 300.219, 50 CFR 660.712, 50 CFR 660.14, or 50 CFR 665.19 relating to the installation, carrying, and operation of VMS units shall be deemed to satisfy the requirements of paragraph (c) of this section, provided that the VMS unit is operated continuously and at all times while the vessel is at sea, the VMS unit and mobile communications service providers are type-approved by NOAA for fisheries in IATTC Convention Area, the owner and operator have authorized NOAA to receive and relay transmissions from the VMS unit, and the specific requirements of paragraph (c)(4) of this section are complied with. If the VMS unit is owned by NOAA, the requirement under paragraph (c)(4) of this section to repair or replace the VMS unit will be the responsibility of NOAA, but the vessel owner and operator shall be responsible for ensuring that the VMS unit is operable before leaving port or starting the next trip.

(d) *Costs.* The vessel owner and operator shall be responsible for all costs associated with the purchase, installation and maintenance of the VMS unit and for all charges levied by the mobile communications service provider as necessary to ensure the transmission of automatic position reports to NOAA as required in paragraph (c) of this section. However, if NOAA is paying for the VMS-associated costs because the VMS unit is carried and operated under a requirement of 50 CFR 300.219, 50 CFR 660.712, or 50 CFR 665.19, the vessel owner and operator shall not be responsible to pay the costs.

(e) *Tampering.* The vessel owner and operator must ensure that the VMS unit is not tampered with, disabled, destroyed, damaged or maintained improperly, and that its operation is not impeded or interfered with.

(f) *Inspection.* The vessel owner and operator must make the VMS unit, including its antenna, connectors and antenna cable, available for inspection by authorized officers.

(g) *Access to data.* The vessel owner and operator must make the vessel's position data obtained from the VMS unit or other means immediately and always available for inspection by NOAA personnel, USCG personnel, and authorized officers.

Pacific Halibut Fisheries; Catch Sharing Plan

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Proposed rule.

SUMMARY: NMFS proposes to approve changes to the Pacific Halibut Catch Sharing Plan (Plan) for the International Pacific Halibut Commission's (IPHC or Commission) regulatory Area 2A off Washington, Oregon, and California

HIGHLY MIGRATORY SPECIES ADVISORY SUBPANEL REPORT
VESSEL MONITORING SYSTEMS FOR HIGHLY MIGRATORY SPECIES FISHERIES

The Highly Migratory Species Advisory Subpanel (HMSAS) notes that Inter-American Tropical Tuna Commission (IATTC) Resolution C-04-06 does not provide a basis to put Vessel Monitoring System (VMS) on the albacore fleet or any part of it. There is no rational basis to place VMS on albacore troll vessels of whatever size, since it is an open access fishery with no marine mammal, turtle, or seabird bycatch, and no limited seasons or closed areas. This resolution was never intended to apply to albacore troll vessels.

The Resolution, C-04-06, was passed in 2004, before the IATTC had discussed or adopted any management or conservation measures for albacore. The measure speaks of vessels over 24 meters, which has a long history as a regulatory criterion for differentiating vessels of the same gear type by length only in the longline fleet. The 24 meter delineation is used to distinguish smaller fresh fish longline vessels from large longline vessels with freezer capacity.

The HMSAS finds it curious that National Marine Fisheries Service (NMFS) has preempted the Council process that was agreed to in June 2013. The IATTC annual meeting does not occur until mid-July in 2014, giving the Council its April and June meetings to pass a regulation in a two-meeting process. In this instance, the HMSAS favors Council action under the Magnuson-Stevens Act rather than NMFS' action under the Tuna Conventions Act. The Tuna Conventions Act is in the process of being amended through the Antigua Convention implementing legislation (S. 69). NMFS' taking action under the Tuna Conventions Act at this time, apparently without adequate consultation with the Department of State as to the meaning and intent of C-04-06, could operate as an extremely bad precedent.

The HMSAS requests the Council comment to NMFS that this rule should be allowed the due process of going through the Council.

RECOMMENDATIONS FOR INTERNATIONAL MANAGEMENT ACTIVITIES

Outcomes of the Tenth Regular Session of the Western and Central Fisheries Commission (WCPFC)

The WCPFC held its Tenth Regular Session December 2-6 in Cairns, Australia and adopted 10 conservation and management measures (CMM). CMM 2013-01, for Bigeye, Yellowfin, and Skipjack in the Western Pacific Ocean, and CMM 2013-09, for Pacific Bluefin Tuna, are of particular interest to the Council.

Bigeye tuna has been subject to persistent overfishing in the Western Pacific and may be overfished. Yellowfin tuna is fully exploited. CMM 2013-01 is a three-year measure through the end of 2017. Because purse seine fleets using fish aggregating devices (FADs) tend to catch more juvenile fish, contributing to overfishing, CMM 2013-01 imposes limits on the number of sets that may be made on FADs along with general effort controls on purse seine vessels. Catch limits are established for longline fisheries. All of these measures represent reductions from limits in the previous three-year measure (CMM 2008-01) and its extension (CMM 2011-01) and one-year replacement (CMM 2012-01). CMM 2013-01 also introduces elements to control capacity in the purse seine fleets. CMM 2013-01 is complicated and gives members latitude in how to implement limits on various fisheries. For that reason, there is concern about whether it will be effective in ending overfishing on bigeye tuna.

CMM 2013-09 builds on previous measures for Pacific bluefin tuna with language that more clearly defines mortality limits, especially for juvenile fish. It also removes the exemptions for Korean fisheries and the Japanese artisanal fishery that were in previous measures.

The full text of these measures and the meeting report may be obtained from the WCPFC website at http://www.wcpfc.int/. A January 2, 2014 letter from National Marine Fisheries Service (NMFS) Pacific Islands Regional Director Michael Tosatto to Council Chair Dorothy Lowman (Agenda Item K.3.a, Attachment 1) summarizes the key measures adopted at the Tenth Regular Session.

International Precautionary Management Framework for North Pacific Albacore

In 2011, the WCPFC Northern Committee adopted into its work plan the development of a precautionary management framework for North Pacific albacore culminating in revisions to the current conservation and management measure, CMM 2005-03. The Council has been briefed on the development of the management framework at previous meetings (see materials from the June meetings in 2012 and 2013). In June 2013, the Council directed staff to consolidate information in Highly Migratory Species Management Team and Scientific and Statistical Committee reports provided on this topic and advance precautionary management concepts to the U.S. delegation to the September 2013 Northern Committee meeting. As one matter of emphasis, the Council recommended that the management framework should adopt Spawner-per-Recruit-based reference points and a linear precautionary reduction in fishing mortality based on stock status. Council Executive Director Dr. Donald McIsaac sent a letter to the U.S.

delegation that included the consolidated report and a conceptual structure for a management framework (Agenda Item K.3.a, Attachment 2). Based in part on these recommendations, the U.S. delegation developed a proposal that was distributed at the Northern Committee meeting and subsequently included in the meeting report (Agenda Item K.3.a, Attachment 3). While there was no floor consideration of this matter at the WCPFC annual meeting, there were discussions about the need for intercessional work prior to the 2014 Northern Committee meeting.

This year, the International Scientific Committee for Tuna and Tuna-Like Species in the North Pacific Ocean (ISC) is conducting a new stock assessment on North Pacific Albacore. The Albacore Working Group will meet April 14-28 in Chinese Taipei to complete the assessment. The assessment will be adopted along with any conservation recommendations at the ISC Plenary, July 16-21. Under this agenda item, the NMFS Southwest Fisheries Science Center will report to the Council on these and other ISC stock assessment activities.

The Northern Committee will consider the assessment results, conservation reservations, and further development of the precautionary management framework at their next meeting in September 2014. The Northern Committee could also propose revisions to the CMM 2005-03, which would then be submitted for adoption at the Eleventh Regular Session of the Commission in December 2014.

The Inter-American Tropical Tuna Commission will hold its 87th meeting July 14-18, 2014, in Lima, Peru. Although this overlaps with the ISC Plenary when the North Pacific albacore stock assessment is formally adopted, the results are likely to be known and could play a role in any action taken by the IATTC on North Pacific albacore management.

Furthermore, at the 85th IATTC meeting, June 10-14, 2013, Resolution C-13-03, Supplemental Resolution on North Pacific Albacore, was adopted (supplementing Resolution C-05-02 on North Pacific albacore). Among other things, it states that:

- "The IATTC scientific staff shall review work undertaken within the ISC and the WCPFC towards the development of a precautionary approach framework for North Pacific albacore that includes target and limit reference points and harvest control rules and make recommendations in respect of such a framework for consideration by the Commission."
- "The Commission shall continue efforts to promote compatibility between the conservation and management measures adopted by the IATTC and the WCPFC in their goals and effectiveness with respect to North Pacific albacore."

Therefore, the precautionary management framework currently under developed in the Northern Committee forum could influence similar efforts by the IATTC. Since the IATTC Convention Area covers the Eastern Pacific including the U.S. Exclusive Economic Zone, any such action would more directly affect management of the west coast albacore fishery. An early indication of action in the IATTC forum is likely to emerge at the next Scientific Advisory Committee meeting, May 12-16, 2014, in La Jolla, California.

Council Action:

Provide Guidance for the Development of the Precautionary Framework for the North Pacific Albacore Tuna Management, Including Biological Reference Points and Decision Rules

Dear Chairs Palacios, Olson, and Lowman:

I am writing to inform you of the outcomes of the Tenth Regular Session of the Western and Central Pacific Fisheries Commission (WCPFC or Commission), held in Cairns, December 2-6, 2013. By way of this letter, I would like to share NMFS' initial assessment of the regulatory actions that will be needed to implement the recent decisions of the Commission.

Conservation and management measure for tropical tunas
The Commission adopted CMM 2013-01, "Conservation and Management Measure for Bigeye, Yellowfin and Skipjack Tuna in the Western and Central Pacific Ocean," as a successor to the existing measure for tropical tunas, CMM 2012-01. Under the new measure, WCPFC Members, Cooperating Non-members and Participating Territories (CCMs) are obligated to implement specific provisions for the years 2014-2017 (inclusive). For the United States, those obligations include a number of requirements for the purse seine fishery that are generally similar to those under CMM 2012-01 and its predecessor measures, and for the longline fishery annual bigeye tuna catch limits of 3,763 mt in 2014, 3,554 mt in each of 2015 and 2016, and 3,345 mt in 2017.

NMFS intends to promulgate regulations under the authority of the Western and Central Pacific Fisheries Convention Implementation Act (WCPFC Implementation Act) to implement both the purse seine and longline elements of the new management measure. Since the Western Pacific Fishery Management Council's Amendment 7 to the Fishery Ecosystem Plan for Pacific Pelagic Fisheries of the Western Pacific Region, regarding arrangements with the U.S. territories, will soon be transmitted for Secretarial review, we will take that amendment into account in the implementing regulations. We note that several of the provisions of CMM 2013-01 are already in effect for 2014 under the regulations at 50 CFR 300 Subpart O.

Conservation and management measure for Pacific bluefin tuna
The Commission adopted a revised conservation and management measure for Pacific bluefin tuna (CMM 2013-09). The main provisions of the measure, which call for effort and catch limits in fisheries that target Pacific bluefin tuna, are applicable only in 2014. The United States does not have any vessels that fish for Pacific bluefin tuna in the Convention Area north of 20° N. latitude, so NMFS does not intend to take any regulatory action to implement the revised measure.

Conservation and management measure for silky shark
The Commission adopted a conservation and management measure that prohibits the retention of silky sharks (CMM 2013-08). NMFS intends to implement this prohibition through regulations under the authority of the WCPFC Implementation Act.

Conservation and management measure for unique vessel identifiers
The Commission adopted a conservation and management measure to require that certain classes of fishing vessels obtain International Maritime Organization numbers by January 1, 2016 (CMM 2013-09). NMFS intends to implement this requirement through regulations under the authority of the WCPFC Implementation Act.

Conservation and management measure on daily catch and effort reporting
The Commission adopted a conservation and management measure that establishes specific requirements with respect to the maintenance of vessel daily logbooks and their submission to national authorities (CMM 2013-05). NMFS will ensure that existing federal logbook requirements are consistent with this measure, and if any regulatory action is needed to attain consistency, NMFS will do so under the authority of the WCPFC Implementation Act.

Other decisions
In addition to the measures described above, the Commission made a number of decisions that dealt with procedural and other matters that require no regulatory action by the United States. These decisions included revising and extending the Commission's compliance monitoring scheme for another year, adopting standards, specifications and procedures for the WCPFC Record of Fishing Vessels, adopting criteria for the Commission to use in considering conservation and management proposals, adopting a measure related to the special requirements of small island developing states and territories, and agreeing to continue work needed to adopt fishery-specific management objectives and associated target reference points.

Sincerely,

Michael D. Tosatto
Regional Administrator

Honolulu, HI 96814

Dear Mr. Tosatto:

I am writing you in your capacity as Head of Delegation for the upcoming Ninth Regular Session of the Northern Committee (NC9) of the Commission for the Conservation and Management of Highly Migratory Fish (HMS) Stocks in the Western and Central Pacific Ocean. At its June 2013 meeting the Pacific Fishery Management Council (Pacific Council) reviewed reports from its Highly Migratory Species Management Team (HMSMT) and the Scientific and Statistical Committee (SSC) as a basis for developing recommendation for NC9. These recommendations are directed towards the development of a precautionary management framework for North Pacific albacore tuna, which the NC intends to complete next year.

The attached report "Pacific Fishery Management Council General Recommendations for the North Pacific Albacore Precautionary Management Framework Proposed by the Western and Central Pacific Commission Northern Committee" combines background information and recommendations from the aforementioned advisory bodies with discussion by the Pacific Council and describes the rationale for the Council's recommendations. In brief these recommendations are:

- The management framework should enumerate its objectives, including recognition of the importance of recreational fisheries for North Pacific albacore and the need for improved data collection at the international level.

- The management framework should include both target and limit biological reference points to guide management responses with respect to excessive fishing mortality (overfishing) and reduced stock status (depletion), in the event they occur.

- Fishing mortality (F) based biological reference points should be defined with respect spawning potential ratio (SPR) and not in terms of historical stock biomass as with the current interim reference point, given uncertainty about the stock-recruit relationship and stock size.

- Biomass based reference points, used to determine stock status, should be chosen with care, recognizing uncertainty in estimates of stock biomass.

- A simple linear sliding scale harvest control rule—similar to the framework elucidated in the Pacific Council's Fishery Management Plan for West Coast Fisheries for Highly Migratory Species—should be considered; under this type of harvest control rule fishing mortality is proportionately reduced when stock biomass falls below the target to allow it to rebuild to the target.

- Catch-based management measures are favored over effort-based measures, because catch can be more directly related to fishing mortality and easier to monitor; however, catch-based measures could trigger a variety of issues related to the allocation of fishing opportunity.

Also attached is a preliminary draft proposal for a precautionary management framework document, for consideration by the U.S. delegation to advance at the upcoming NC meeting under its agenda item 2.3.2. We feel it is important for the U.S. to advance something at the NC9 meeting, so as to move forward in accordance with the 2013 NC Work Program; this represents an early seed effort for a focus document that would be expected to evolve as discussions dictate.

We look forward to discussing these recommendations with the delegation during the anticipated pre-meeting conference call. Ms. Marija Vojkovich and Dr. Kit Dahl, will be attending NC9 to further advance the concepts within the U.S. delegation and assist in the development of NC consensus as appropriate.

Finally, I want to emphasize that the Pacific Council wishes to continue to play a significant role as the precautionary management framework for North Pacific albacore is further developed by the NC over the next year or so.

Sincerely,

D. O. McIsaac, Ph.D.
Executive Director

PACIFIC FISHERY MANAGEMENT COUNCIL RECOMMENDATIONS FOR THE NORTH PACIFIC ALBACORE PRECAUTIONARY MANAGEMENT FRAMEWORK PROPOSED BY THE WESTERN AND CENTRAL PACIFIC COMMISSION NORTHERN COMMITTEE

1. Introduction

At its September 2011 meeting, the Western and Central Pacific Fisheries Commission (WCPFC) Northern Committee (NC) proposed the development of a precautionary management framework for North Pacific albacore in their work plan. The objectives of the precautionary approach-based management framework include: (1) recommending appropriate reference points; (2) agreeing in advance to actions that will be taken in the event each of the particular limit reference points is breached (decision rules, which the HMSMT believes would include a harvest control rule as discussed below); and (3) recommending any changes to Conservation and Management Measure 2005-03 for North Pacific Albacore. The NC intends to complete these tasks by 2014 when the next North Pacific albacore stock assessment is scheduled.

This report combines material in reports provided by the Pacific Fishery Management Council's (Council's) Highly Migratory Species Management Team (HMSMT) and Scientific and Statistical Committee (SSC). It is further tailored to include the intent of the Council regarding the title of this paper. It serves as the basis for Council recommendations to the US delegation at the 9th Regular Session of the Northern Committee, scheduled for September 2-5, 2013, in Fukuoka, Japan, on the NC's proposed precautionary management framework for North Pacific albacore.

According to advice provided to the WCPFC Science Committee (Berger, et al. 2012), a management framework should ideally contain the following elements:

- management objectives
- target and limit reference points consistent with those objectives
- performance metrics
- consideration of systemic uncertainties
- alternative management options (e.g. types of harvest control measures, data to be used, or stock assessment process)
- candidate harvest control rules

2. Management Objectives

Management objectives need to take into account both the manner in which the benefits from the fishery are to be realized, as well as the possible undesirable outcomes that are to be avoided. It is desirable that both the timeframe and likelihood for achieving the target (or avoiding a limit) is included in the formal specification of each management objective (International Seafood Sustainability Foundation, 2013). Using the list of Management Goals and Objectives in the Fishery Management Plan for West Coast Fisheries for Highly Migratory Species (HMS FMP) as a starting point, the Council proposes the following particularly relevant, slightly edited FMP management goals towards consideration of a precautionary management framework for North Pacific albacore.

1. Maintain the long-term conservation and sustainable use of North Pacific albacore. Implement harvest strategies which achieve optimum yield, prevent overfishing, and rebuild overfished stocks, as needed.

2. Maintain and support long-term economic and social benefits for the albacore fishing industry, including both commercial and recreational fishery participants, giving due consideration to traditional participants.
3. Provide a long-term, stable supply of high-quality fish to consumers.
4. Establish procedures to facilitate rapid and successful implementation of future management actions, as necessary.
5. Implement measures to adequately account for total mortalities, including any discards.
6. Implement harvest strategies that are robust with respect to scientific and management uncertainty.

3. Biological Reference Points

Reference points can either be target reference points (used to guide management objectives for achieving a desirable outcome and not to be exceeded on average, or at least 50 percent of the time) or limit reference points (limits beyond which the state of a fishery and/or a resource is not considered desirable and remedial management action is required).

Reference points can be defined in terms of fishing mortality (F) or stock biomass (B). F-based reference points can be related to catch or effort metrics for the purpose of management. In addition, F-based reference points can address growth overfishing – when mortalities by weight exceed weight gains in the population by growth – or recruitment overfishing – fishing mortality above which the recruitment to the exploitable stock becomes significantly reduced. Biomass-based reference points define critical thresholds in terms of stock status (depletion) and can be used to determine when remedial action is needed to rebuild a stock to a more productive size (by reducing F). The Magnuson-Stevens Fishery Conservation and Management Act requires the identification of both biomass reference points (B-limit and B-target) and F reference points. Not all reference points are useful depending upon the stock assessment modeling approach and knowledge of the stock dynamics.

The International Scientific Committee for Tuna and Tuna-Like Species in the North Pacific Ocean (ISC) Albacore Working Group estimated current fishing mortality, or F, ($F_{2006\text{-}2008}$) relative to several F-based reference points used in contemporary fisheries management. In addition to the simulation-based interim reference point, $F_{SSB\text{-}ATHL}$, these included F_{MAX}, F_{MED} and $F_{0.1}$, reference points that are based on yield-per-recruit analysis, and the $F_{20\text{-}50\%}$ reference points that are spawning biomass-based proxies of F_{MSY}. A summary of the results of the 2011 assessment with respect to these reference points and some of the problems identified with using each of the reference points is provided in Table 1. (For description of these reference points see section 7 at the end of this report.)

Table 1. Estimated ratio of Fcurrent to commonly used F reference points, equilibrium spawning biomass and equilibrium yield for the 2011 north Pacific albacore assessment.

Reference Point	$F_{2006\text{-}2008}/F_{ref}$	SSB (t)	Equilibrium Yield (t)	Drawbacks
$F_{SSB\text{-}ATHL}$	0.71	346,382	101,426	Not useful when there is a declining biomass trend because the lowest biomasses during the end of the time series will be contributing to the average of the 10 historic lowest biomass levels (ATHL).
F_{MAX}	0.14	11,186	185,913	Difficult to estimate when Y/R curve is asymptotic, as for the 2011 assessment.
$F_{0.1}$	0.29	107,130	170,334	Not useful for recruitment overfishing; estimates highly sensitive to changes in M.
F_{MED}	0.99	452,897	94,080	Assumes a stock recruitment relationship; may not be robust if number of recruits are estimated from narrow range of SSB.
$F_{20\%}$	0.38	171,427	156,922	Difficult to specify which %SPR is an appropriate proxy; advice in literature based on assumptions about stock productivity; not robust to changes in selectivity; does not consider impacts of environmental change on productivity.
$F_{30\%}$	0.52	257,140	138,248	
$F_{40\%}$	0.68	342,854	119,094	
$F_{50\%}$	0.91	428,567	99,643	

This list also encompasses the reference points that in 2012 the NC directed the ISC to evaluate more closely.[1] Therefore, it seems reasonable to conclude that the NC has narrowed the range of F-based reference points for consideration to this list. The Council recommends that reference points for international management of North Pacific albacore be consistent with the reference points selected for domestic management. Specifically, F_{MSY} (a Level 1 reference point, see box below) should be the fishing mortality limit reference point of choice, if it can be well-estimated with the stock assessment model. However, because of the lack of understanding about the relationship between spawners and recruits (i.e., steepness, a measure of the productivity of the stock), F_{MSY} is not well-estimated in the current assessment and is therefore not recommended as a reference point for management at this time. (In the above table the quantities associated with F_{MAX} are equivalent to F_{MSY}. for the 2011 assessment because of the lack of a stock-recruitment relationship.) For this reason, in the short term at least, a proxy would have to be used for F_{MSY}. Like F_{MSY}/F_{MAX}, F_{MED} requires knowledge of a stock recruitment relationship, so it is not an appropriate choice for a proxy either. The interim reference point, $F_{SSB\text{-}ATHL}$, appears to be reasonably precautionary given the current assessment time series, as the projected simulated median yield and spawning stock biomass (SSB) fall close to the equilibrium yield and SSB for $F_{40\%}$. However, since this reference point is based on historical minimum stock biomass values, it would become progressively less precautionary if stock biomass is on a declining trend.

[1] The NC request additionally included $F_{10\%}$.

Categorizing Biological Reference Points

The WCPFC Scientific Committee has discussed classifying biological reference points into three categories based on the biological information available about the stock in question. (Preece, et al. 2011, p. 18): **Level 1**: If steepness is well-estimated, then F_{MSY} and B_{MSY} are appropriate limit reference points; **Level 2**: If the steepness is not well-estimated (and essentially unknown) and if the relevant life-history and fishery information (natural mortality, selectivity, maturity) are both available and reliably estimated, then $F_{SPRx\%}$ and γSSB_0 are appropriate candidate F and SSB limit reference points, respectively (with an appropriately justified rationale for the selection of the fractions x and γ); **Level 3**: If the relevant life-history and fishery information are not reliably estimated then only use the SSB-based limit reference point, γSSB_0 is appropriate.

The Council recommends the use of one of the $F_{SPR\%}$ proxies (Level 2 reference points), which do not depend on knowledge of a stock recruitment relationship as a potential F_{MSY} proxy for North Pacific albacore. For tuna management, and albacore in particular, which are considered quite productive, $F_{20\%}$ may be a reasonable limit reference point. Reference points expressed relative to stock biomass, like the current, interim F-based reference point ($F_{SSB\text{-}ATHL}$), are problematic given the high uncertainty associated with biomass estimates for this species. SPR-based reference points are more directly related to stock productivity.

For a target reference point to be precautionary, it should be set lower than the limit reference point. This reduces the likelihood that the limit reference point will be breached. Such a precautionary reduction could be determined in several different ways:

- Similar to US domestic annual catch limit (ACL)-based management, it could be selected by taking into account uncertainty in stock assessments. Based on the most recent north Pacific albacore assessment, sources of uncertainty include the lack of understanding about the relationship between spawners and recruits, potential regional differences in growth, conflicts between indices of abundance for fisheries with the same size selectivity, a lack of stockwide indices, and uncertainty about stock structure.
- If an SPR-based F limit is chosen, a more precautionary SPR reference point could be chosen as the target, e.g. $F_{20\%}$ as the limit and $F_{30\%}$ as the target.
- The HMS FMP identifies a 25% reduction from MSY or its proxy for setting the limit reference point for vulnerable stocks. Analogously, such a percentage reduction from the limit reference point could be chosen to determine the target F reference point.

At the international level, biomass reference points have not been explicitly discussed for North Pacific albacore. Biomass reference points are useful for specifying a different, or more precautionary, management response when biomass declines are encountered (e.g., implementation of a stock rebuilding plan). At this stage, the Council only recommends that biomass reference points be taken into account as part of the North Pacific albacore precautionary management framework. The Council's SSC noted that B_{MSY} had been proposed as a potential limit reference point internationally and stated that "while B_{MSY} may be an appropriate target reference point, it is not an appropriate limit reference point. If used as a limit reference point, one would expect the stock to be overfished approximately half the time due to assessment uncertainties and management imprecision when fishing at F_{MSY}" (Agenda Item E.2.b, June 2012). Alternatively, consistent with the HMS FMP framework, a biomass limit reference between B_{MSY} and $0.5B_{MSY}$ could be identified. The management framework could implement a steeper linear reduction in the F limit when biomass falls below this biomass threshold (i.e., such that F is reduced to zero before B equals 0) in the harvest control rule (which we assume is equivalent to the "decision rules" identified by the NC).

The Council's HMS FMP identifies B-limit reference points set lower than B_{MSY} (or B_{MSY} proxy). Until an assessment-derived maximum sustainable yield is provided, a level 2 reference point, such as some fraction of unfished B, could be considered.

The ISC Albacore Working Group is most knowledgeable about the productivity of the stock and the impacts of the fisheries on it, and is expected to recommend reference points to the ISC Plenary at its July 2013 meeting.

4. Harvest Control Rules

Harvest control rules (HCRs) identify a pre-agreed course of action which results from reaching stock status benchmarks (e.g., triggers, thresholds or buffers) or some established economic or environmental conditions relative to reference points. Evaluation of alternative HCRs is best done in consultation with stakeholders and managers.

The Council's HMSMT reviewed six HCR forms outlined in Berger, et al. (2012): constant, threshold (or knife-edge), stair step, and three types of sliding scale HCRs (simple linear, complex linear, and non-linear). Sliding HCRs reduce harvest along a continuum when the stock falls below a threshold, while a constant HCR does not adjust with changes in stock status. Figure 1 shows the simple and complex sliding scale HCRs.

The graphs shown in Figure 1 visualize the relationship between stock status (B) and control measures such as F, catch, or effort. Although the graphs were intended only to conceptualize these functional forms, it is important to distinguish between F and catch- or effort-based measures. Thus an HCR would perform differently if the vertical axis is defined in terms of F, catch, or fishing effort.

The HMS FMP specifies a simple linear HCR with a linear reduction in F when biomass falls below B_{MSY}. A complex sliding scale form can include one or more regions where the fishing mortality rate remains constant across a range of biomass levels.

For fishery management purposes, it may be desirable to build buffers into HCRs such that stakeholders and managers have some indication that reference points are being approached. Buffers allow for both the stochastic elements (e.g., recruitment) and the deterministic elements (e.g., harvest) of the stock to co-occur within some "comfort zone." For example, stock status could be allowed to fall within some range below a threshold for a period of time before triggering a linear reduction in F, catch, or effort (the vertical axis in the figures below). For example, the HMS FMP framework includes a minimum biomass flag, set above the level at which a stock is considered overfished, as a warning that a manage response should be implemented to allow biomass to increase.

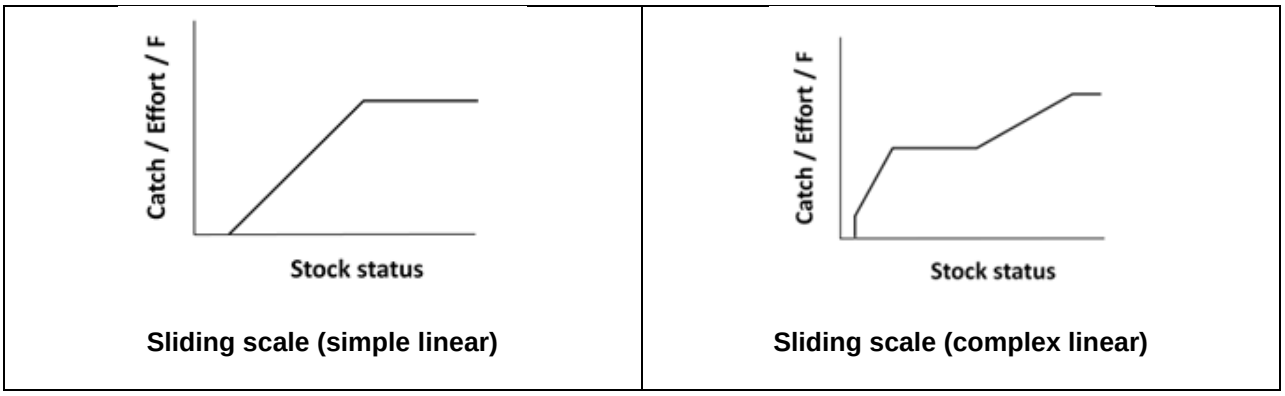

Figure 1. General form of simple and complex sliding scale HCRs. The horizontal axis, "stock status," is relative stock biomass. The vertical axis represents the management response. (Source: Berger, et al. 2012)

In examining the range of HCR forms described in Berger, et al. (2012) the Council recommends the simple linear sliding scale form be considered as a North Pacific albacore HCR. Although either the simple or complex linear forms could be used in a precautionary framework for the management of albacore, with management based on either F or catch, the Council recommends against considering the complex linear sliding scale harvest control rule, because the high uncertainty associated with this stock's parameter estimates and status do not support implementation of a more complex HCR. Nonetheless, a complex linear form could reduce the frequency of management adjustments by including a "plateau" in the region around B_{MSY} (or the target B) but well-above a biomass level that might trigger more aggressive measures to rebuild the stock.

Reference points chosen as HCR thresholds should consider all factors that explain variability in assessed stock levels including not only fishing mortality, but natural environmental variation and assessment uncertainty. HCRs should balance the biological risks of overfishing or overfished stocks against the costs of lost fishing opportunity or unnecessary management.

Berger, et al. (2012) recommend a management strategy matrix to convey management advice and trade-offs associated with different decisions. The matrix is a way to convey the probability of achieving given objectives within a certain timeframe when alternative HCRs are applied. Short of a full management strategy evaluation (MSE), the Council recommends such an approach for evaluating candidate HCRs for the North Pacific albacore precautionary management framework. Because of uncertainty in the fishery system, such as biases in the data, incorrect population assumptions (e.g., growth rates, fecundity) and other aspects, it will be important to more fully test different reference points and control rules through a MSE.

5. Management Measures to Reduce Fishing Mortality

Despite not having an HCR for North Pacific albacore, the fishery has operated under conservation measures since the adoption of international measures to limit effort to 2002-04 levels (WCPFC CMM 2005-03, IATTC Resolution C-05-02). The NC has begun compiling statistics on catch and effort for fisheries targeting North Pacific albacore. The NC has also been monitoring fishing effort with respect to 2002-2004 levels by collecting information by gear type on days fished and number of vessels fishing for North Pacific albacore. At the June 2013 Inter-American Tropical Tuna Commission (IATTC) meeting, a new resolution on North Pacific albacore was adopted, which requires comparable reporting.

Once a control rule is established, management measures are needed to achieve any required fishing mortality reduction in response to declines in biomass below the target or limit. Catch-based and effort-based measures are used as proxies for mortality reduction. Effort-based measures limit fishing mortality

indirectly based on a presumed positive correlation between a given effort measure and catch; effort-based measures would need to relate the effort measure used for regulation to the expected reduction in catch mortality. Potential effort-based measures include time-and-area closures, capital controls (e.g. restrictions on numbers of lines, vessel size, hold capacity or other technological constraints on fishing power), or limits on numbers of vessels permitted to fish or on days fished. Catch-based management measures typically involve establishing a Total Allowable Catch (TAC) in concurrence with the control rule, which may be allocated by season, by sector, or by fishery based on gear selectivity for different age classes of fish.

Each type of mortality-reduction measure has advantages and disadvantages. Days fished or numbers of vessels fishing are conceptually simple, but create incentives to increase fishing power, for example due to changes in vessel capital. In principle, this could be addressed by also imposing gear or other vessel capital restrictions, though such capital restrictions would be difficult to verify, and might also restrict vessels from the most economically efficient fishing methods. Another possibility would be to require a larger-than-proportional reduction in effort compared to the desired reduction in fishing mortality, in anticipation of an offsetting increase in fishing power. Limiting the number of vessels in a fishery would be easier to implement and verify than days fished. Given heterogeneity of fishing power across a fleet, attention would need to be paid to the relative fishing power of vessels which stopped fishing versus those which remained active.

Such effort-based measures serve to limit fishing mortality indirectly based on the relationship between effort and catch. While some nations fishing for North Pacific albacore, including the U.S., have demonstrated the ability to manage based on effort, it has become apparent at the international level that managing all North Pacific albacore fisheries based on effort has been problematic for a number of reasons. There has been little appetite by most nations to agree on a common effort metric, and even the most basic form of data, such as vessels fishing or days fished, has been slow in coming. Furthermore, the submitted data have not been independently verified. The challenge with managing effort under the current resolutions is one of the reasons for the NC work plan to establish a precautionary management framework for NP albacore.

TACs would need to reflect total catch, not just landings. Limiting catch might lead to high-grading or unreported discards, resulting in the need for additional monitoring. The measure of mortality for monitoring and reporting would need to be in comparable terms across fleets and national fisheries, whether by weight, number of fish, economic yield, or population impacts based on fleet selectivity and age structure. A standardized measure of population impacts based on age selectivity for the different methods used and locations fished could provide flexibility in how different national fleets achieve a required mortality reduction. If it is necessary to consider fishery selectivity in allocation decisions, stock assessment results should include: 1) an F-at-age matrix; 2) Y/R analysis by fishery; and 3) a fishery impact analysis. With such information, allocations can be applied by fishery or by life history stage, if needed. Allocations could be made flexible by making them transferable or tradable, allowing an overage in one season to be balanced by a reduced allocation the next, or averaging catch over several seasons. The uncaught portion of one sector's allocation could be reallocated to others later in the season.

Using the simple linear HCR introduced as an example, if B is shown to be some level below the B-target, international managers could apply a catch limit to bring the catch level down to an associated level along the slope of the linear HCR or to some level that is considered sustainable based on the historical B time series. Catch limits could be adjusted iteratively based on the B trajectories of future assessments until annual B estimates remain around the B-target (i.e. the probability of B falling below B-target is approximately 50 percent). Similarly, if F is shown to be at some level above the F-target, catch restrictions could be imposed and adjusted iteratively until future assessments show that F estimates center around the F-target. Catch restrictions, in the form of quotas or total allowable catches could be

applied equitably across fleets or may be more appropriately directed toward fleets having the greatest impact on the stock based on their patterns of selectivity. Likewise, the same example could be used for effort-based measures.

Monitoring, control, and surveillance needs pose a challenge to reducing mortality in an international management context, with respect to costs, feasibility and reciprocal verification. High observer costs might potentially be reduced by using a vessel monitoring system or other electronic surveillance technology as a substitute. Placing observers on board may not be feasible for some vessels. Self-reporting of catch or effort creates incentives for underreporting, suggesting the possible need for reciprocal verification to prove the effectiveness of mortality reduction measures.

The current interim reference point, $F_{SSB\text{-}ATHL}$, is effort-based and provides a status quo reference point that assumes that the current mix of gear types remains constant. The definition of effort is key to any reference point based on fishing effort, and some effort metrics may be more informative than others (e.g., number of vessels or vessel-days vs. number of hooks in the water). Currently, fishing effort for this species is not measured to the degree needed to support reference points based on fishing effort.

In conclusion, given that the effort information submitted to the NC is incomplete and the challenges with managing effort, it may be preferable to develop catch-based measures at the international level.

7. Description of Candidate Reference Points

Reference Point	Description
$F_{SSB-ATHL}$	Fishing mortality rate that maintain the spawning stock biomass (SSB) above the average level of its ten historically lowest points (ATHL) with a probability greater than 50%
F_{MAX}	F corresponding to maximum yield per recruit
$F_{0.1}$	F at which slope of Y/R is 10% of value at origin
F_{MED}	Fishing mortality rate corresponding to the median observed recruit/SSB ratio
$F_{x\%}$	F that reduces SSB/R to x% of unfished state

Framework for a Precautionary Management Approach for North Pacific Albacore

Preliminary Draft Proposal
Version U.S. 1

The following should be considered an early draft seed effort of a North Pacific Albacore precautionary management approach framework document, with the expectation that it will evolve or engender a similar document to fulfill the schedule in the Northern Committee Work Programme. This draft document is organized according to the following section headers, each of which contains a description of the future content of such a section (blue font) or draft language proposed for consideration (black font).

DRAFT

Purpose
Goals and Objectives
Scope
Fishery Data Requirements
Biological Reference Points
Fishery Decision Control Rules
Fishery Management Measures
Exceptions, Reviews, and Enforcement
Assumptions and Attachments

Purpose

This section should contain a Purpose Statement reflecting the precautionary intent and justification reasoning on the Northern Committee (NC) record, together with appropriate refinements.

Goals and Objectives

The goals and objectives of this North Pacific Albacore Precautionary Management Approach Framework (APMA) are as follows.

1. Maintain the long-term conservation and sustainable catch of North Pacific Albacore (NP Albacore) by implementing precautionary fishery management strategies that significantly reduce the risk of

overfishing; provide for rapid recovery from an overfished condition, should it occur; and achieve an optimum level of average yield relative to the biologically sustainable maximum.

2. Implement harvest strategies that are robust with respect to scientific and management uncertainty.
3. Establish measures to facilitate rapid and successful implementation of any necessary future management actions, in an equitable manner to all Members, Co-operating Non-Members, and, if appropriate, Participating Territories (CCM) fishing for NP Alabacore or incidentally taking NP Albacore, and in a manner that provides a disincentive to any CCM that does not comply with the provisions of this APMA.
4. Maintain and support long-term economic and social benefits to the various NP Albacore fishery participants of CCMs.
5. Provide a long-term, stable supply of high-quality NP Albacore to consumers.
6. Implement measures to adequately account and manage for total fishery-related mortalities, including directed and incidental fishery impacts, and discarded fish not landed.

Scope

This PMA applies directly to CCM with registered or authorized vessels fishing for NP Albacore, and is structured to apply also to those with vessels that have incidental or non-directed catches as well as those with vessels that do not now but may enter directed or incidental fisheries in the future.

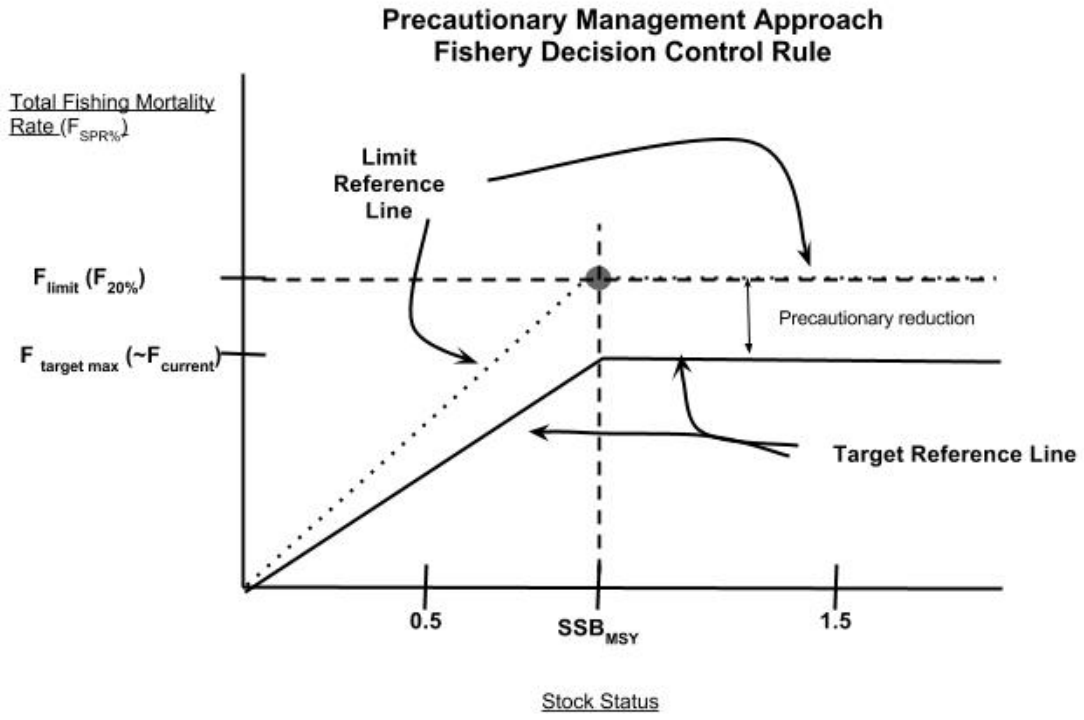
This APMA is intended to align with essentially similar precautionary approach elements presumed at some point to be adopted by the Inter-American Tropical Tuna Commission (IATTC) for waters of its jurisdiction (see IATTC Resolution C-13-03, points 5 and 6).

Fishery Data Requirements

This section should describe and list catch and effort accounting and reporting necessities, and any associated fishery data obligations, of all CCM fishing for or otherwise catching NP Albacore. It will note Western and Central Pacific Fisheries Commission (WCPFC) CMMs (such as 2005-03) and IATTC Resolutions as appropriate and replicate critical wording as appropriate.

Biological Reference Points

This section should have a description of the specific proposal for reference points, with citation to an Appendix that would include background material and candidate reference points the proposal was selected from (much of the material from the PFMC general recommendations paper and ISC reports).



This section should provide specifics of both fishery limit and stock status biological reference points proposed to be adopted by this APMA. The draft fishery limit reference point proposed in this document, in the spirit of a starter for serious discussions, is an SPR-based F limit: $F_{20\%}$. $F_{current}$ would also be presented as a reference point, with the selection of a recent base period defining "current"to be completed at some future point. A reference point of $F_{target\ max}$, a primary precautionary "ACL-below-OFL type" buffer feature of this approach, would also be discussed in an introductory manner in this section, relative to a fuller description within the Fishery Decision Control Rules section. The draft proposal for primary stock status reference point is SSB_{MSY}.

DRAFT

Fishery Decision Control Rules

This section should include introductory narrative that notes the decision control rule is intended to cover the current stock status, considered to be in good condition, as well as situations where the stock status increases, declines, and collapses unexpectedly. The introductory narrative should also include reference to the precautionary target catch buffer concept (ACL-like) relative to the limit reference point of $F_{20\%}$.

The graphic below represents a fishery decision control rule for the total aggregate catch, with the Y axis showing spawning potential ratio (SPR) fishing rates and the X axis showing stock status. The horizontal dashed line is intended to represent the best available scientific estimate of the biological reference point associated with the aggregate sustainable spawning-adult-equivalent SPR fishing rate, while the vertical dashed line is intended to represent the maximum yield spawner biomass point. Thus, the diagonal dotted line is intended to represent a limit reference associated with overfishing at spawner biomass levels less than the MSY point. The solid line represents the precautionary fishing target rates to be observed by aggregate CCMs. The target fishing rate intercepts the X axis at zero in recognition of the need for an incidental *de minimis* catch at stock collapse levels.

This section should describe the precautionary "ACL-below-OFL" buffer concept in specific detail and what it is supposed to accomplish as a cushion for management and scientific uncertainty. As a seed idea to promote further dialogue, this buffer should be considered as a straight percentage, such as 5 percent or 20 percent, representing a contemporary estimate of uncertainty, as opposed to a formulaic calculation based on annual or updated assessments of management precision and stock assessment or other scientific variability.

Individual CCM fishery decision control rules are to be based on a similar CCM-specific graph with fishing rates that are a subset of the total aggregate fishing rate. CCM-specific "partial F" fishing rates should be developed at some point reflective of base period data, together with a description of how a CCM specific fishing rate translates to an annual catch via a stock assessment; a three-year average catch limit should also be considered. It also would be useful to construct an Appendix showing three hypothetical CCM-specific catch limits associated with three hypothetical stock assessments.

There are no detailed fishery decision rules associated with fishing effort, such as a vessel-day scheme, because this APMA relies on catch control as the essential mechanism. However, there is an overarching management measure described below precluding significant increases in net effort capacity by any CCM directed at NP Albacore.

Fishery Management Measures

This section should describe the use of a total allowable catch (TAC) for each CCM and associated fishery management measures responsive to fishery decision control rule thresholds. It should include the concept that incidental non-target catches are to be accounted for and taken off the top of each CCM's TAC. The following represent some things that could be included at some future point.

Stock Category: Current stock status (good) and if stock status increases

Catch Management Measure

- Insert definition as to what this category is relative to X axis on the control rule graph, and how it translates to an individual CCM catch level, across gear types.
- This section should provide for the flexibility for each CCM to manage for its individual F_{target} catch limit, be it via seasonal closures, area closures, quotas, or other measures it is confident can control total catch.
- At some point in the future, this subsection should address the question of catch management precision, such as consideration of an annual slippage allowance for F_{target} exceedance with three-year averaging; carry-over and overage payback provisions, etc.

Effort Management Measure

- This section will describe a provision intended to accomplish no net increase in fishing effort or capacity. While this could be viewed as a "no new boats" concept that allows for replacement of vessels lost or decommissioned, effort measurements may be in metrics different than vessel or tonnage capacity, e.g. vessel days fished, hooks deployed, etc. The intent of this effort management measure is to prevent acute increases in fishing effort while relying on catch-based management measures as the primary management measure.

Stock Category: Declining stock status and collapsed stock status

Catch MM

Effort MM

Exceptions, Reviews, and Enforcement

This section should describe the principle that full accounting of fishery impacts to NP Albacore, with no exceptions or exclusions such as artisanal fishery exceptions. In the event there is a claim under WCPFC Article 30 from small island developing States, arrangements for full accounting and compliance with the overall fishery control rule need to be assured.

DRAFT

There shall be an effectiveness review of this APMA after every NP Albacore stock assessment, or after five years in the event a stock assessment is delayed for that period of time.

Compliance monitoring reporting and enforcement shall be done in accordance with proposed CMM 2012-2, presuming it is finalized and adopted in a timely manner. However, if there is not clarity within CMM 2012-2, Section VI, paragraph 23 by August, 2014 about a penalty for exceeding the allowable catch limit, insufficiency in reporting directed catch amounts, or the building of new boats directed towards entering this fishery, then the Northern Committee shall develop penalty language to accomplish Goal 3 above regarding (1) insuring equitable treatment for those countries that comply and (2) instituting an obvious disincentive for significant non-compliance.

PRECAUTIONARY MANAGEMENT FRAMEWORK FOR NORTH PACIFIC ALBACORE

(USA Concept paper)

Introduction

At the Sixth Regular Session of the Northern Committee (NC), Canada submitted a paper (WCPFC-NC6-DP02) on the development of a precautionary fishery management regime for the northern stocks. Building on this paper, NC7 agreed to a three-year work programme to develop a precautionary management framework for North Pacific (NP) albacore.

Important elements of a precautionary management framework including management objectives, limit and target reference points for stock size and fishing mortality, and associated decision rules (e.g. pre-agreed actions that will be taken in the event that a limit reference point is breached). Under the NC's work programme, NC9 is tasked with agreeing on appropriate reference points and decision rules.

In accordance with Convention Article 6, and as set out in the Northern Committee work programme, NC will further develop a precautionary management framework for North Pacific albacore as follows:

1. Management objectives

To build upon the fundamental management objectives for highly migratory fish stocks as set out in the Convention, NC will work to establish specific management objectives for NP albacore fisheries. In doing so, NC will contribute to, and consider the outcomes of, the Commission's "Management Objectives Workshop" initiative.

2. Biological reference points

Following the hierarchical approach adopted by the Commission:

Level	Condition	LRPs
Level 1	A reliable estimate of steepness is available.	F_{MSY} and B_{MSY}
Level 2	Steepness is not known well, if at all, but the key biological (natural mortality, maturity) and fishery (selectivity) variables are reasonably well estimated.	$F_{X\%SPR_o}$ and either X%SB_o or X%$SB_{current,F=0}$
Level 3	The key biological and fishery variables are not well estimated or understood.	X%SB_o or X%$SB_{current,F=0}$

- NP albacore is to be treated as a Level 2 stock.[1]
- The limit reference point for the fishing mortality rate, or F-limit, is $F_{[\ ]\%SPR}$.[2]
- The limit reference point for the stock size, or B-limit, is [ ]$\%SB_{current,F=0}$.[3,4]

NC will work to establish a control rule in which the F-limit decreases with decreasing B, of the type illustrated in Canada's 2010 paper (WCPFC-NC6-DP02).

Once specific fishery management objectives have been adopted, NC will work to establish target reference points for F and/or B, the purpose of which will be to guide the formulation of management strategies such that the fishery management objectives are achieved.

3. Decision rules

NC will develop and recommend management strategies for the stock that ensure that the risk of F exceeding F-limit and of B decreasing below B-limit is very low. With respect to the B-limit, NC will use a risk level of [ ] percent. With respect to the F-limit, until target reference points are established, NC will account for risk by designing management strategies such that F is unlikely to exceed [ ] percent of the F-limit. NC will periodically request the International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean (ISC) to evaluate the performance of a suitable range of alternative management strategies with respect to these limits and risk levels.

In the event that, based on information from ISC, the fishing mortality rate exceeds the F-limit for at least one year, NC will, at its next regular session, or intersessionally if warranted, recommend a conservation and management measure that can be expected to reduce F to less than the F-limit within one year of its adoption.

In the event that, based on information from ISC, the spawning stock size decreases below the B-limit at any time, NC will, at its next regular session, or intersessionally if warranted, adopt a reasonable timeline for rebuilding the spawning stock to at least the B-limit and recommend a conservation and management measure that can be expected to achieve such rebuilding within that timeline. Furthermore, NC will develop management strategies that are consistent with pre-agreed on levels of F specified in any adopted control rule.

NC will work to establish specific pre-agreed on management measures that would be automatically triggered upon breaching a limit and/or warning reference point.

---

[1] This determination is based on the information provided by ISC (see NC9-IP-03).

[2] This F-limit replaces the interim F-limit, $F_{SB\text{-}ATHL}$.

[3] Based on the information provided by ISC (see NC9-IP-03), B-limit should be X$\%SB_{current,F=0}$ (unfished SB) rather than X%SB_0 (initial SB) because the estimate of the latter is highly uncertain.

[4] The F-limit and B-limit are specified such that the B-limit serves as a second line of defense behind the F-limit, as follows: If the stock were fished at the F-limit, SB would be expected to average about a particular level associated with that level of F, but would vary above and below that level due to variation in recruitment, natural mortality, and other environmental factors. To accommodate such expected natural variation, it is appropriate that SB be allowed to decrease some amount below the level associated with the F-limit before taking the serious corrective action that would be triggered by breaching the B-limit. The greater the stock's expected natural variation, the greater that allowance should be (to a certain point). A stock's natural mortality rate, M, is a crude indicator of the degree of natural variation in SB that would be expected under a constant fishing mortality rate. Therefore, it is appropriate to set the B-limit at (1-M) times the proportion of unfished SB that would be expected, on average, when fishing at the F-limit. For NP albacore, M is estimated to be 0.25, so the B-limit is set at [ ]% of unfished SB.

HIGHLY MIGRATORY SPECIES ADVISORY SUBPANEL REPORT ON RECOMMENDATIONS FOR INTERNATIONAL MANAGEMENT ACTIVITIES

The Highly Migratory Species Advisory Subpanel (HMSAS) reviewed the proposed management regime for North Pacific albacore that was submitted to the U.S. delegation to the Northern Committee of the Western and Central Pacific Fisheries Commission (WCPFC). The HMSAS received information on the status of Biological Reference Points (BRPs) and Harvest Control Rules (HCRs) included in the Northern Committee presentation. The HMSAS notes that there is a WCPFC limit reference point in place for albacore that would halt fishing if the stock fell into the range of the 10 lowest levels of abundance. A range of BRPs have been evaluated by the International Scientific Committee (ISC) and presented to the Northern Committee of the WCPFC for their consideration. The Northern committee is currently evaluating these BRPs. The National Marine Fisheries Service informed the HMSAS that the U.S. preference is to adopt a B20 target reference point, but that Canada is proposing a more conservative target reference point.

The HMSAS is supportive of establishment of a target reference point for albacore that maintains albacore at a sustainable harvest level. It was noted by HMSAS members that establishment of a target BRP is a condition of the Marine Stewardship Council (MSC) certification that U.S. vessels fish under and must be met to continue certification. The HMSAS is concerned that most of the effort toward establishing a BRP has been through WCPFC process and that the Inter-American Tropical Tuna Commission (IATTC) has yet to establish a BRP and may establish a target different than WCFMC. We think the Council should comment on the need to insure uniform management among all fisheries.

The HMSAS finds the process is moving forward and that the Council may want to comment on specific BRPs under consideration. Also, it would be helpful to communicate the need for coordination and uniformity between the Regional Fishery Management Organizations (RFMOs).

The HMSAS also received information on the increasing harvest of Chinese albacore catches. It was reported that this fish is entering the international market and causing a major market distortion. We were informed that the U.S. and Canada are requesting additional information on the magnitude of the Chinese catch. The HMSAS hopes the Council adds it voice to the call for improved reporting of the quantity and distribution of albacore and other HMS species in the North and South Pacific.

Agenda Item K.4
Situation Summary
March 2014

U.S.-CANADA ALBACORE TREATY UPDATE

At a meeting April 16-17, 2013, the U.S. and Canada agreed to a one-year fishing regime, as described in Annex C of the U.S.-Canada Albacore Treaty, governing reciprocal access to each country's Exclusive Economic Zone (EEZ) by albacore vessels from the other country for the 2013 fishing season. Agenda Item D.2.a, Situation Summary, June 2013, summarizes the elements of the 2013 regime. During those negotiations, the U.S. expressed the predicate that any future regime would include a progress phase out of access to the U.S. EEZ by Canadian albacore vessels. The Canadians expressed their preference for a multi-year regime, if area fishing reciprocity is to be phased out. The 2013 negotiations ended under the expectation that any agreement reached before the beginning of the 2014 fishing season will likely include such a multi-year phase out.

The two parties met in Vancouver, British Columbia, on January 21, 2014. The attached NMFS Report describes the discussions at that meeting. A letter from the Canadian Consulate General in Seattle, Washington, (attached as Agenda Item K.1.b, Government of Canada Report on the 2013 Fishing Season) describes the results of the 2013 fishing season, during which Canadian vessels fished in U.S. waters, and, from Canada's perspective, the positive benefits accruing from this bilateral agreement.

Council Action:

Adopt, as Necessary, Recommendations for the Fishery Regime Pursuant to the U.S.-Canada Albacore Treaty.

Mr. Dan Wolford, Chairman
Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Dear Mr. Wolford,

I am writing to provide the Pacific Fisheries Management Council with an update on the 2013 fishing season under the Canada-U.S. Pacific Albacore Tuna Treaty. Representatives from Canada and the U.S. are in the process of discussing a further renewal of the fishing regime under the Treaty and we would appreciate the support of the Council to ensure its continued success.

As you know, the fishing regime was renewed for one year for the 2013 season following the absence of a fishing regime in 2012. The renewed regime allowed albacore tuna harvesters from both countries to fish in each other's waters and land at designated ports providing benefits to Canadians and Americans on both sides of the border.

According to information from Canada's Department of Fisheries and Oceans, 43 Canadian vessels accessed U.S. waters to fish and land at U.S. ports. U.S. fishermen made use of Canadian waters and ports in 2013 with preliminary information showing that 44 American vessels fishing and landing in Canada, including 19 vessels accessing Canadian ports to undertake a variety of activities, such as offloading tuna and exchanging crew. The nearly identical access numbers demonstrates the importance the fishing regime provides to the albacore tuna fleets. It should be noted that U.S. tuna harvesters had port access privileges extended until December 31, 2013.

Preliminary information also shows that catches were strong for the fleets of both countries in 2013, demonstrating that reciprocal fishing does not negatively impact catch levels. The Data Working Group established under the Treaty has been tasked with finalizing catch and effort data as soon as the information is available for the U.S. fleet. We expect this work to be completed in early April 2014.
I am also pleased to report that the 2013 fishing season saw both sides engage in positive and respectful fishing practices. In past years, there were reports of aggressive fishing behavior and crowding on the waters. This season no such incidences were reported.

The Treaty, which has been in place since 1981, is a foundation of our two countries' overall positive fisheries relationship. Canada and the U.S. have a similar approach to protecting and sustainably managing fish stocks and this is seen in our cooperative work bilaterally and in multilateral fisheries organizations. For Pacific albacore tuna, this cooperation will be increasingly important as other countries move to further exploit and exert pressure on the stock. Although the Pacific albacore tuna stock is currently considered to be healthy, Canada and the U.S. will need to work closely together within the Inter-American Tropical Tuna Commission and the Western and Central Pacific Fisheries Commission to ensure the fishery remains sustainable.

I would like to thank the Pacific Fisheries Management Council for its long-term support for the Canada-United States Pacific Albacore Tuna Treaty. Canada's continues to view the Treaty as an important component of a strong bilateral fisheries relationship on the west coast which spans multiple fisheries, including salmon, hake, and halibut. Canada and the U.S. have a shared interest in the sustainable use of albacore tuna and your support will help ensure that this Treaty will continue to bring benefits to Canadians and Americans.

Yours truly,

Edith St-Hilaire

Canada-United States Pacific Albacore Tuna Treaty Discussion

An initial consultation with Canada on the next steps for the U.S.-Canada Albacore Treaty was held in Vancouver, British Columbia on January 21, 2014. The meeting was intended to present an exchange of views on the idea of a multi-year regime for 2014 and beyond with an understanding that the United States would not pursue a future reciprocal access regime after that. There was also a review of the 2013 season's enforcement actions, crowding issues and port access needs. Areas of bilateral cooperation were identified and data was exchanged.

The United States delegation was lead by U.S. Department of State with representatives from NOAA Fisheries, U.S. Coast Guard, Pacific Fishery Management Council, Washington Trollers, the American Albacore Fishing Association, the American Fishermen's Research Foundation, Oregon Albacore Commission, and West Coast Seafood Processors Association.

Several key topics were covered. The first was an update on the Data Working Group that had finalized the data template for years 1995-2012 during last summer. Both heads of delegation agreed that the data should be made public. The Working Group plans to meet once comprehensive 2013 data become available and that is expected in April 2014. Both countries also provided a review of the preliminary catch and effort data for their respective fleets for the 2013 fishing season. The United States noted that a more reliable account of their fishing season will not be available until April 2014.

There was discussion that the International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean's (ISC) Albacore Working Group plans to produce an updated stock assessment in July 2014. Concern was expressed that China is increasing its catch of North Pacific Albacore (both in directed fisheries and as bycatch) and not providing detailed catch and effort data to the ISC, the Inter-American Tropical Tuna Commission, or the Western and Central Pacific Fisheries. Both parties agreed that consideration should be given to bilateral engagement with China, potentially through a diplomatic letter of which Canada offered to prepare an initial draft.

The United States also asked if Canadian harvesters had noticed net markings on albacore this season that U.S. harvesters have documented. Both countries agreed to cooperate bilaterally on the issue.

Enforcement officials from both delegations did not report any substantial problems relating to the treaty. The Canadian officials did report some "administrative" infractions by U.S. vessels which are being followed up on by NOAA OLE.

Finally, both heads of delegation expressed their preliminary views on a new fishing regime for 2014 and beyond. Canada indicated that it is supportive of a multiyear

agreement to provide some certainty to the Canadian fleet and preclude the need to renegotiate each year. Interest was also expressed about revisiting the length of the season and participation for the Canadian fleet. The United States also spoke in general terms and reiterated its concern with the long-term future of the treaty, noting the continued lack of support from its industry. While the United States noted that terms and levels of a new regime still needed to be discussed, it also affirmed that the regime would include a phased-out approach with an understanding that by default there would not be a subsequent regime unless positions changed.

Canada indicated some concern over unlimited access to their EEZ by U.S vessels during a future regime. They suggested constraints be placed on U.S. vessels during the upcoming negotiations to prevent crowding in their zone.

The meeting concluded with an agreement to hold a formal negotiating session in Portland, Oregon, in April 2014. Canada indicated its strong preference for the meeting to take place in early April.

HIGHLY MIGRATORY SPECIES ADVISORY SUBPANEL REPORT ON U.S.-CANADA ALBACORE TREATY UPDATES

The Highly Migratory Species Advisory Subpanel (HMSAS) requests the Council to continue to monitor the U.S.-Canada Albacore Treaty negotiations for 2014. The majority of the HMSAS also requests that the Council consider the joint letter from harvesters to Council Chair Dorothy Lowman dated March 7, 2014, which will be read as part the record at the end of this report. While a phase-out of the fishing regime under the Treaty continues to be the ultimate goal of US harvesters; equity in capacity and catch similar to the time period prior to 1998 should be a priority. Vessel numbers alone cannot achieve this goal as boats get larger with more capacity and range. The HMSAS also desires that the Council continue to encourage both nations work together on mutual research and international management goals affecting their respective fishing communities.

There is a minority of the HMSAS who feel that access to Canadian waters may be important and beneficial in the future.

Re: U.S. - Canada Albacore Treaty – Joint Position of Albacore Harvesters

The American Albacore Fishing Association (AAFA), Oregon Albacore Commission (OAC), Washington Trollers Association (WTA) Western Fishboat Owners Association (WFOA) represent U.S. commercial albacore harvesters who participate in the traditional pole & troll albacore fishery in the exclusive economic zone (EEZ) of the United States and on the high seas.

As you have been made aware over the past few years, our associations have long criticized the imbalance of benefits of the U.S./Canada albacore treaty. Despite a suspension of the fishing regime in 2012, followed by a one-year regime in 2013 limiting Canadian access to 45 vessels, we still are very concerned over Canadian effort, increased capacity of vessels fishing in the U.S. EEZ, and imbalance of Canadian catch from the U.S. EEZ when compared to the U.S. catch in the Canadian EEZ. In recent years, Treaty negotiations have not solved many of the concerns of those U.S. stakeholders most directly, negatively impacting American albacore harvesters.

All of our organizations recognize certain political, economic, and historical issues that make the process cumbersome. However, we do expect the U.S. government to stand on the side of a longtime U.S. fishery that is self sufficient; clean in its methods, and harvests albacore from a sustainable stock.

The Treaty has deviated from its stated intent and has corrupted its original purpose. The history of these terms and conditions demonstrates the regime's inability to advance the spirit of the Treaty. It is worth noting that between 1992 and the 2002 treaty amendment; the Canadian fishery had already increased over 580%.

The first treaty amendment was approved by Congress and signed by the President in 2004. In presenting the treaty amendment before the Senate Foreign Relations Committee, the State Department explained that this significant reduction in Canada's fishing effort was necessary to protect U.S. harvesters. There was no mention of protecting other economic interests or other fishery relations. The reduction of Canada's effort to the pre-1998 average level was deemed an important and necessary goal.

U.S. harvesters are still seeking that protection. The reduction in Canadian effort that was necessary in the 1990s was never achieved. Congress has not reviewed the performance of the Treaty amendment, but it is evident it was not successful at achieving its goals. In the decade that followed the amendment, Canada's fleet continued to increase operations in the U.S. EEZ and continued to have significant negative impacts on U.S. harvesters.

In summary, American Albacore Fishing Association, Oregon Albacore Commission, Washington Trollers Association, and Western Fishboat Owners Association strongly believe that continued fishing under the Treaty should be ended, and any future regime should reflect the 2004 treaty amendments' goals. Together and united, all of our organizations requests the U.S. Department of State proceed with actions necessary to ensure there is continued progress toward this outcome beginning in 2014.

Sincerely,

Jack Webster, President
American Albacore Fishing Association

Rick Goche, Chair
Oregon Albacore Commission

Greg Mueller
Washington Trollers Association

Lewis Hill, President
Western Fishboat Owners Association

Ellensburg, WA Daily Record
Sept 5 1979

VANCOUVER (UPC) — The skippers of 11 U.S. tuna boats seized by Canadian fisheries authorities were charged in provincial court Tuesday with illegally entering and fishing in Canada's territorial waters.

The 11 men were each ordered to post $5,000 cash bond before they sail and remanded to Nov. 20.

Defense cousel R.A. Higinbotham argued unsuccessfully to have the trial delayed until January, during a slacker fishing period.

Higinbotham said the fishermen already had lost money because of their court appearance and they would suffer undue hardship if they had to stop fishing in November to appear again. But Judge J.L. McCarthy was unmoved, saying the matter "should be dealt with expeditiously."

Outside the courtroom one of the fishermen, who refused to give his name, said he had lost $16,000 because "they took my fish" — worth $8,000 — and an equal amount in lost fishing time.

moved, saying the matter "should be dealt with expeditiously."

Outside the courtroom one of the fishermen, who refused to give his name, said he had lost $16,000 because "they took my fish" — worth $8,000 — and an equal amount in lost fishing time.

He added it would be difficult to raise his $5,000 bail.

The captains are: Russell Tarailo of the Threescore, Arthur Welsh of the Velma J., both out of San Francisco, Calif.; Vardon Tremain of the Banshee Drew, William Lloyd Szabo of the Lucky Strike, William Szabo Sr. of the Spirit, all out of Coos Bay, Ore.

Greg Boy of the Sueboy out of San Pedro, Calif.; Donald Lusk of the Cecilia B. out of Monterey, Calif.; Wallace Gordon of the Proud Mary, and Humberto Hikel of the Seabreeze, both out of San Diego, Calif.; Mark Sehlbach of the Santa Innes out of Aberdeen, Wash.; Douglas Daykin of the Miss Bright out of Astoria, Ore.

As the 11 appeared in court, the United States government announced a

couver because they had already made arrangements to stay in their expected destination of Victoria.

Canadian officials have seized 19 American ships since Aug. 26 and Friend said Tuesday, "We have patrols out there and if there are more (Americans) fishing, we'll take them."

Eight ships and crews were released last week after fishermen pleaded not guilty to charges of illegal entry into Canadian waters and illegal fishing within the 360-kilometer (200-mile) territorial limit. The captains were ordered to post $5,000 bonds and return for a court appearance Feb. 13.

The U.S. government has said it does not recognise Canada's jurisdiction over fish like the albacore tuna that migrate great distances and retaliated Tuesday by banning importation of all tuna from Canada.

U.S. State Department spokesman Hodding Carter said the U.S. also is

on tuna fishing

WASHINGTON (AP) — Canadian and U.S. negotiators have announced that a temporary agreement has been reached to avoid a new West Coast tuna fishing dispute and negotiations for a full-scale treaty are to start soon.

During the 1980 fishing season for albacore tuna, U.S. boats will be permitted to freely enter Canada's 200-mile fishing zone. In return, Canadian fishermen will be given rights to land their catches at specified American ports.

Canadian officials emphasized that they continue to feel that Canada has a right to manage all fish species within its 200-mile zone but that they want to avoid a repeat of last year when 19 U.S. boats were seized in Canadian waters and a U.S. trade embargo was imposed against Canadian-exported tuna.

The United States refuses to recognize a 200-mile jurisdiction for highly migratory species like albacore tuna, which again are moving north. Because of this position, the United States also is involved in a dispute with Mexico, which has seized U.S. boats this year.

DRIFT GILLNET MONITORING, MANAGEMENT, AND ALTERNATIVE GEAR REPORT

In March 2012 the National Marine Fisheries Service (NMFS), the Highly Migratory Species Management Team (HMSMT), and the Highly Migratory Species Advisory Subpanel (HMSAS) presented information to the Council on the status and prospects for the west coast swordfish fishery. In response, the Council directed the HMSMT to determine if any changes can be made to the closure dates for, or the southern boundary of, the Pacific Leatherback Conservation Area (PLCA) in order to enhance fishing opportunity in the drift gillnet (DGN) fishery. In March 2013 the HMSMT presented a preliminary analysis of opening the area south of Point Sur for specified portions of the closure period. The Council then passed a motion, based in part on an HMSAS-sponsored concept, that would open a triangle-shaped area out to 100 miles from the coast with fishing in that area subject to several conditions.

Subsequently, NMFS published a temporary rule in the *Federal Register* (78 FR 54548, September 4, 2013, see Agenda Item K.5.a, Attachment 1) implementing emergency actions for the DGN fishery. These actions respond to the take of two sperm whales in the DGN fishery observed from a single set during the 2010-2011 fishing season. This prevented NMFS from issuing a new Marine Mammal Protection Act (MMPA) 101(a)(5)(E) permit for the fishery under the current management regime so a meeting of the Pacific Offshore Cetacean Take Reduction Team (POCTRT) was convened in mid-2013 to recommend mitigation measures that would allow NMFS to issue the permit. Since this temporary rule expired on January 31, 2014, NMFS must issue permanent regulations before the start of the next fishing season on August 15, 2014. The POCTRT met again February 4-6, 2014, to consider elements in the permanent rule. A summary of their recommendations is attached as Agenda Item K.5.b, NMFS Report. As with the temporary rule, NMFS intends to promulgate this permanent rule under the authority of the MMPA. For this reason the Council cannot be directly involved in the development of the regulations. However, under the Magnuson-Stevens Act the Council can consider other measures to balance environmental stewardship and socioeconomic objectives with regard to managing the fishery.

The HMSMT met January 23-25, 2014, at the Southwest Fisheries Science Center (SWFSC) in La Jolla, California, to compile information and analysis to help the Council further consider the proposed modification of the PLCA. The results may be found in the attached HMSMT Report (Agenda Item K.5.b, HMSMT Report). The HMSMT also heard presentation on current research relevant to interactions between the swordfish fishery and protected species. Since this information is relevant to future management of the drift gillnet fishery, Council members may wish to refer to Agenda Item K.1.c, NMFS SWFSC Report for summaries of these presentations.

The SWFSC has been providing the Council with periodic updates on alternative swordfish gear, specifically buoy gear and the use of deep-set longline during daytime to target swordfish. The NMFS SWFSC Report included under this agenda item (Agenda Item K.5.b, NMFS SWFSC Report) provides an introduction to material the researchers intend to present to the Council as part of this agenda item.

This agenda item has stimulated a considerable amount of written public comment. The Office of Mark Stone, Assembly member for the Twenty-Ninth District in the California Legislature, submitted a letter co-signed by 14 Assembly members expressing their concern about the proposed modification to the PLCA and posing several questions that they request NMFS and the Council respond to in writing. Both the Turtle Island Restoration Network and Oceana have submitted statements signed by over 10,000 and 39,252 individuals, respectively. The statements are included in the printed materials while the full list of those who signed them may be found on the Council website.

Council Action:

1. **Provide Guidance on Potential Changes in the Drift Gillnet Fishery.**
2. **Provide Guidance on Further Process for Alternative Gear Fishery Development.**

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

50 CFR Part 660

RIN 0648–BD57

[Docket No. 130802674–3749–01]

Fisheries Off West Coast States; Highly Migratory Fisheries; California Drift Gillnet Fishery; Sperm Whale Interaction Restriction

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Temporary rule; emergency action; request for comments.

SUMMARY: NMFS is issuing temporary regulations under the authority of Section 305(c) of the Magnuson-Stevens Fishery Conservation and Management Act (MSA) to: implement an immediate closure of the California thresher shark/swordfish drift gillnet (mesh size ≥14 inches) (DGN) fishery if one sperm whale is observed killed or seriously injured in DGN gear off California, and require all DGN fishing vessels to carry a NMFS-trained observer from August 15, 2013 to January 31, 2014 in a 100% observer coverage area (Zone). The Zone covers nearly all areas in the U.S. exclusive economic zone (EEZ) deeper than the 1,100 fathoms (fm) (2,012 meters (m)) depth contour. Owners/operators of vessels intending to fish with DGN gear will be required to install, activate, carry and operate a vessel monitoring system (VMS) prior to embarking on a DGN fishing trip after the effective date of this rule.

DATES: This rule is effective September 4, 2013 through January 31, 2014. Comments must be received on or before October 4, 2013.

ADDRESSES: You may submit comments on the temporary rule, identified by NOAA–NMFS–2013–0131 by any of the following methods:

- *Electronic Submission:* Submit all electronic public comments via the Federal e-Rulemaking Portal. Go to *www.regulations.gov/#!docketDetail;D=NOAA-NMFS-2013-0131*, click the ''Comment Now!'' icon, complete the required fields, and enter or attach your comments.
- *Fax:* 562–980–4047; Attention: Craig Heberer.
- *Mail:* Craig Heberer, Southwest Regional Office, NMFS, 501 W. Ocean Blvd., Ste. 4200, Long Beach, CA 90802.

Instructions: Comments sent by any other method, to any other address or individual, or received after the end of the comment period, may not be considered by NMFS. All comments received are a part of the public record and will generally be posted for public viewing on *www.regulations.gov* without change. All personal identifying information (e.g., name, address, etc.), confidential business information, or otherwise sensitive information submitted voluntarily by the sender will be publicly accessible. NMFS will accept anonymous comments (enter ''N/A'' in the required fields if you wish to remain anonymous). Attachments to electronic comments will be accepted in Microsoft Word, Excel, or Adobe PDF file formats only.

Requests for copies of documents supporting this rule may be obtained from the Southwest Regional Office, NMFS, 501 W Ocean Blvd., Ste. 4200, Long Beach, CA 90802.

FOR FURTHER INFORMATION CONTACT: Craig Heberer, telephone: 706–431–9440 (#303), fax: 562–980–4047, email: *craig.heberer@noaa.gov*.

SUPPLEMENTARY INFORMATION: The DGN fishery is managed under the Federal Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species (HMS FMP). The HMS FMP was prepared by the Pacific Fishery Management Council (Council) and is implemented under the authority of the MSA by regulations at 50 CFR part 660.

Background

NMFS takes this action in accordance with the MSA, the Endangered Species Act (ESA), and the Marine Mammal Protection Act (MMPA). The ESA requires the Federal government to protect and conserve species and populations that are endangered, or threatened with extinction, and to conserve the ecosystems on which these species depend. The MMPA prohibits, with certain exceptions, the ''take'' of marine mammals in U.S. waters and by U.S. citizens on the high seas, and the importation of marine mammals and products into the United States. All marine mammals are protected under the MMPA.

During the 2010–2011 fishing season, a NMFS-trained observer recorded two sperm whales caught in the DGN fishery in U.S. Federal waters near the border with Mexico. One animal was dead when retrieved, the other was seriously injured. Sperm whales are listed as endangered under the ESA and are designated as depleted under the MMPA. In 2004, NMFS issued a biological opinion on the HMS FMP, including the DGN fishery, and an incidental take statement (ITS) for the FMP. The NMFS Sustainable Fisheries Division engaged in pre-consultation with the NMFS Protected Resources Division upon notice in June 2011 that the takes of two sperm whales during the 2010–2011 fishing season likely exceeded the ITS for the DGN fishery. As a result, consultation was reinitiated in July of 2012, with NMFS completing a biological assessment in September 2012 and a biological opinion in May 2013 (*http://swr.nmfs.noaa.gov/mm/Signed_DGN_BiOp_050213.pdf*) that included a new ITS pertaining to whale bycatch contingent on the issuance of a MMPA 101(a)(5)(E) permit.

The ESA exempts take of listed marine mammals through the issuance of an ITS only if such take is also permitted by section 101(a)(5)(E) of the MMPA. Without a permit under the MMPA, any incidental, but not intentional, take of ESA-listed marine mammals is not exempt from ESA Section 9 take prohibitions. The potential biological removal (PBR) is the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population. Given the determination that incidental takes of sperm whales by the DGN fishery during the 2010–2011 fishing season exceeded the PBR for the California-Oregon-Washington stock of sperm whales, the fishery, as currently configured, could not be issued an MMPA 101(a)(5)(E) permit. As a result, the ITS listed in the 2013 biological opinion for the DGN fishery would not exempt the fishery, as currently configured, from ESA Section 9. This situation also presents serious conservation and management problems in the fishery. If mortality and serious injury of the California-Oregon-Washington stock of sperm whales incidental to this fishery continues to exceed PBR, it could have a long-term adverse effect on the marine environment by preventing the California-Oregon-Washington stock of sperm whales from reaching their optimum sustainable population level and existing as a significant functioning element in the ecosystem.

Based on this information, NMFS is issuing short-term measures to reduce interactions with sperm whales during the 2013–14 fishing season in the DGN fishery. These measures for the 2013–2014 fishing season are needed to ensure that any serious injury or mortality to sperm whales in the DGN fishery does not exceed the PBR and to allow the provision of incidental take coverage under the ESA and MMPA for fishermen in the fishery. NMFS

currently has regulations addressing interactions with several species of marine mammals in the DGN fishery. The Pacific Offshore Cetacean Take Reduction Plan (Plan) at 50 CFR 229.31 includes measures (e.g., pingers, net extenders) to reduce serious injury and mortality of marine mammals in the fishery. NMFS reconvened the Pacific Offshore Take Reduction Team (Team) to recommend measures for the 2013–2014 fishing season that reduce risks to sperm whales, in light of their potential biological removal level and the fishery's 2010 takes, such that the negligible impact determination conditions of MMPA 101(a)(5)(E) could be met. The measures in this rule emerged from the two Team meetings that NMFS convened on July 31, 2013, and August 7, 2013 for the purpose of developing recommendations for reducing sperm whale mortality/serious injury in the DGN fishery to below PBR. NMFS intends to convene the Team later this year or in early 2014 to develop long-term measures for reducing sperm whale (and other strategic stocks, as appropriate) mortality and serious injury in the fishery. NMFS would then amend the Plan's regulations pursuant to Section 118 of the MMPA, and advise the Council should an amendment to the FMP be required.

Management Measures Established by This Temporary Rule

Consistent with ESA, MMPA, and MSA requirements, this rule will establish a fixed cap of one serious injury or mortality for sperm whales in the DGN fishery as determined by NMFS. If the cap is met, the DGN fishery will be closed for the remainder of the season (i.e., until January 31, 2014) consistent with this action being a short-term measure. The rule will also establish a ''100 percent observer-coverage zone'' (Zone) for the 2013–2014 DGN fishing season that is closed to DGN fishing unless the fishing vessel is carrying a NMFS-trained observer. This Zone is specifically defined by latitude and longitude coordinates set out at § 660.713 (f). The Zone covers nearly all areas of the U.S. EEZ that are deeper than the 1,100 fm (2,012 m) depth contour; however, the boundary lines that define the Zone close some areas that are deeper or shallower than the 1,100 fm depth contour. The Zone runs both north and south of Point Conception from the Oregon-California border to the Mexico-California border, generally along the 1,100 fm (2,012 m) depth contour, with the exception of an area seaward of the Santa Lucia Escarpment, and any canyons/basins shoreward of the main north-south 1,100 fm (2,012 m) depth contour (regardless of depth) to facilitate monitoring and enforcement. Vessels that are not carrying a NMFS-trained observer may not conduct DGN fishing in the Zone. Vessels not carrying observers will need to take precautions in setting and retrieving nets when fishing proximate to the Zone to ensure vessels remain shoreward of the boundary. This restriction is being implemented because NMFS long term survey data indicate that on average 90 percent of research vessel sightings of sperm whales in the California Current occurred in waters deeper than 2,000 m. Additionally, observer records indicate that only one interaction between the DGN fishery and sperm whales occurred in waters shallower than 1,100 fm since 1990; and this interaction was adjacent to the 1,100 fm depth contour.

Implementation

Vessel Monitoring System

Owners/operators of vessels intending to fish with large-mesh DGN gear will be required to have installed, activate, carry and operate vessel monitoring system (VMS) units that are type-approved by NMFS during the period of the DGN emergency rule. Owners and operators of vessels in the DGN fishery must: (1) Obtain a NOAA Office of Law Enforcement (OLE) type-approved mobile transceiver unit and have it installed on board the DGN fishing vessel in accordance with the instructions provided by NOAA OLE. You may obtain VMS installation and operation instructions from the NOAA OLE Northwest Division by calling 888–585–5518; and (2) activate the mobile transceiver unit, submit an activation report at least 72 hours prior to leaving port on a DGN fishing trip, and receive confirmation from NOAA OLE that the VMS transmissions are being received before participating in the DGN fishery. Instructions for submitting an activation report may be obtained from the NOAA, OLE Northwest Division office by calling 888–585–5518. An activation report must be submitted to NOAA OLE following reinstallation of a mobile transceiver unit or change in service provider before the vessel may be used to fish in a fishery requiring the VMS.

Activation Reports

If you are a vessel owner who must use VMS and are activating a VMS transceiver unit for the first time or reactivating a VMS transceiver unit following a reinstallation of a mobile transceiver unit or change in service provider, you must fax NOAA OLE (206–526–6528) an activation report that includes: Vessel name; vessel owner's name, address and telephone number, vessel operator's name, address and telephone number, USCG vessel documentation number/state registration number; if applicable, the permit number the vessel is registered to; VMS transceiver unit manufacturer; VMS communications service provider; VMS transceiver identification; identification of the unit as primary or backup; and a statement signed and dated by the vessel owner confirming compliance with the installation procedures provided by NOAA OLE.

Transferring Ownership of VMS Unit

Ownership of the VMS transceiver unit may be transferred from one vessel owner to another vessel owner if all of the following documents are provided to NOAA OLE: A new activation report, which identifies that the transceiver unit was previously registered to another vessel; a notarized bill of sale showing proof of ownership of the VMS transceiver unit; and documentation from the communications service provider showing proof that the service agreement for the previous vessel was terminated and that a service agreement was established for the new vessel.

Transceiver Unit Operation

Operate and maintain the mobile transceiver unit in good working order continuously, 24 hours a day throughout the duration of the emergency rule. The mobile transceiver unit must transmit a signal accurately indicating the vessel's position at least once every hour, 24 hours a day, throughout the duration of the emergency rule. Once a vessel remains in port for seven days or more, position reporting is required at least once every four hours; however, the mobile transceiver unit must remain in continuous operation at all times. Once the vessel leaves port, the position reporting frequency must resume to at least once every hour, 24 hours a day.

When aware that transmission of automatic position reports has been interrupted, or when notified by NOAA OLE that automatic position reports are not being received, contact NOAA OLE by calling 888–585–5518 and follow the instructions provided. Such instructions may include manually communicating the vessel's position to NOAA OLE or returning to port until the VMS is operable.

After a fishing trip during which interruption of automatic position reports has occurred, replace or repair the mobile transceiver unit prior to the vessel's next fishing trip. Repair or

reinstallation of a mobile transceiver unit or installation of a replacement, including change of communications service provider, shall be in accordance with the instructions provided by NOAA OLE and require the same certification. Make the mobile transceiver units available for inspection by NOAA OLE personnel, USCG personnel, state enforcement personnel or any authorized officer. Ensure that the mobile transceiver unit is not tampered with, disabled, destroyed, operated, or maintained improperly. Pay all charges levied by the communication service provider as necessary to ensure continuous operation of the VMS transceiver units.

Declaration Reporting Requirements

The operator of any vessel fishing with large mesh DGN gear (mesh size ≥14 inches) for thresher shark/swordfish must provide NOAA OLE with a declaration report before the vessel leaves port on a trip in which the vessel is used to fish in U.S. ocean waters between 0 and 200 nm offshore of California. Gear code declarations are made by calling NOAA OLE NW Division at 888–585–5518.

The operator of a vessel fishing with DGN gear must provide a declaration report to NOAA OLE prior to leaving port on the first trip in which the vessel meets the requirement to install, activate, carry and operate a vessel monitoring system (VMS) unit. The vessel operator must send a new declaration report before leaving port on a trip in which a gear type that is different from the gear type most recently declared for the vessel will be used. A declaration report will be valid until another declaration report revising the existing gear declaration is received by NOAA OLE. During the period of time that a vessel has a valid declaration report on file with NOAA OLE, it cannot fish with a gear other than a gear type declared by the vessel. Declaration reports will include the vessel name and/or identification number, gear type to be used, and whether or not an observer will be present on the fishing trip. Upon receipt of a declaration report, NMFS will provide a confirmation code to confirm that a valid declaration report was received for the vessel. Vessel owners or operators must retain the confirmation code to verify that a valid declaration report was filed and the declaration requirement was met.

Vessels fishing with DGN gear may declare more than one gear type. If a vessel fishing with DGN gear has an observer on board, the vessel may fish with declared gear types seaward of the eastern boundary of the Zone (generally, in areas seaward of the 1,100 fm (2,012 m) depth contour). However, if a vessel fishing with DGN gear does not have an observer on board, the vessel may only fish with declared gear types shoreward of the eastern boundary of the Zone (generally, in areas shoreward of the 1,100 fm (2,012 m) depth contour. The following gear type declaration codes are available for the thresher shark/swordfish DGN fishery: Open access highly migratory species line gear (Gear Code 66 for Tuna); and other gear (Gear Code 69 for DGN or harpoon).

Pre-Trip Notification

This rule establishes a pre-trip notification requirement for all DGN fishing trips. This requirement will assist the observer provider in deploying observers to cover 100 percent of fishing effort in the Zone and ensure representative observer coverage of the DGN fleet outside of the Zone. DGN vessel owners/operators will be required to notify the NMFS-designated observer provider at least 48 hours prior to departing on all fishing trips. Vessel owners/operators must provide their name, contact information, vessel name, port of departure, and estimated date and time of departure to the observer provider. Upon receipt of a pre-trip notification, the observer provider will notify the DGN vessel owner/operator whether their fishing trip has been selected for observer coverage. Frank Orth & Associates is the NMFS-designated observer provider. Frank Orth & Associates will receive pre-trip notifications at (800) 522–7622 or (562) 427–1822. Pre-trip notifications must be made between 8:00 a.m. and 5:00 p.m. Pacific time, Monday through Friday.

Fishery Closure Procedures

In the event of a serious injury or mortality to a sperm whale, as determined by NMFS, during DGN fishing operations, the fishery will be closed through January 31, 2014. NMFS will notify vessel owners/operators of a DGN fishery closure by VMS communication to the fleet stating when nets may no longer be deployed. Notification will also be made in the **Federal Register**, by postal mail, and a posting on the NMFS regional Web site.

NMFS publishes this emergency action for implementing these short-term management measures for 180 days, the maximum allowed without an extension, under MSA. NMFS does not expect the Zone to adversely impact the DGN fleet, because vessels without observers have flexibility to fish shoreward of the eastern boundary of the Zone (roughly, the 1,100 fm (2,012 m) depth contour) to make up for lost fishing opportunities inside the Zone should an observer be unavailable.

NMFS' policy guidelines for the use of emergency rules (62 FR 44421; August 21, 1997) specify the following three criteria that define what an emergency situation is, and justification for final rulemaking: (1) The emergency results from recent, unforeseen events or recently discovered circumstances; (2) the emergency presents serious conservation or management problems in the fishery; and (3) the emergency can be addressed through emergency regulations for which the immediate benefits outweigh the value of advance notice, public comment, and deliberative consideration of the impacts on participants to the same extent as would be expected under the normal rulemaking process. NMFS' policy guidelines further provide that emergency action is justified for certain situations where it would prevent significant direct economic loss, or to preserve a significant economic opportunity that otherwise might be foregone. NMFS has determined that the issue of setting a cap of one serious injury/mortality for sperm whales, the exclusion of DGN fishing in the Zone without observers, and the VMS requirement meets the three criteria for emergency action for the reasons outlined below.

The emergency results from recent, unforeseen events or recently discovered circumstances. NMFS' decision to not issue an MMPA 101(a)(5)(E) permit for sperm whales in the DGN fishery in its current configuration and close to the August 15 start date of the fishery in nearshore waters presents an unforeseen event and therefore warrants emergency action. The agency was poised to issue the permit prior to requesting public comments and then revised its anticipated course during the decision-making process based on new information that indicated that take of sperm whales in the fishery exceeded PBR.

This situation also presents serious conservation and management problems in the fishery. Serious injury or mortality of sperm whales at a level above PBR poses problems to the marine environment. Without issuance of a MMPA 101(a)(5)(E) permit, fishermen that incidentally seriously injure or kill any sperm whales during DGN fishing operations would not have incidental take coverage exempting the fishermen from take prohibitions under the ESA, predicated on MMPA requirements. This emergency action essentially establishes short-term measures for the

fishery, with the provision that one sperm whale interaction resulting from DGN fishing operations that has been determined by NMFS to be one serious injury or mortality would immediately close the fishery through January 31, 2014. Sperm whale interactions with the DGN fleet are rare, with sperm whale bycatch observed six times (10 animals) in over 8,300 net sets since 1990. According to NMFS' Southwest Fisheries Science Center (SWFSC) scientists, published data, and recorded depths of observed takes in the DGN fishery, sperm whales are more likely to occur in waters deeper than 1,100 fm (2,012 m). This emergency action would require 100 percent observer coverage of DGN vessels fishing in the Zone (generally, seaward of the 1,100 fm (2,012 m) depth contour running both north and south of Point Conception) and therefore, would increase the likelihood of observing any sperm whale interactions and determining the resulting condition of the animal.

The emergency can be addressed through emergency regulations for which the immediate benefits outweigh the value of advance notice, public comment, and deliberative consideration of the impacts on participants to the same extent as would be expected under the normal rulemaking process. The Team has the authority to develop management recommendations to NMFS to address sperm whale interactions, but this process would not promptly address sperm whale protection for the upcoming fishing season. There is no other action that NMFS can take through the normal rulemaking process that would enable the agency to implement the short-term management measures in time to reduce the risk of sperm whale mortality/serious injury in the DGN fishery to below PBR for the current DGN fishing season. An emergency action enables NMFS to monitor effort for the current fishing season in areas where sperm whales are most likely to occur. Therefore, the urgency to protect sperm whales through a final rule outweighs the value of providing prior public comment.

Classification

The Assistant Administrator for Fisheries, NOAA, (AA) has determined that this emergency action to promulgate temporary regulations under the authority of section 305(c) of the MSA is necessary to respond to efforts for reducing serious injury/mortality to sperm whales in the DGN fishery and is consistent with the MSA, ESA, MMPA, and other applicable laws. The rule may be extended for a period of not more than 186 days as provided under section 305(c)(3)(B) of the MSA.

Pursuant to 5 U.S.C. 553(b)(B), the AA finds good cause to waive prior notice and opportunity for advanced public comment. Prior notice and opportunity for advanced public comment would be contrary to the public interest, as delaying action intended to reduce serious injury/mortality to sperm whales in the DGN fishery would increase the likelihood of exceeding PBR for the California-Oregon-Washington stock of sperm whales as established under the MMPA.

The AA finds good cause under 5 U.S.C. 553(b)(B) that it is contrary to the public interest and impracticable to provide for prior notice and opportunity for the public to comment. As more fully explained above, the reasons justifying promulgation of this rule on an emergency basis make solicitation of public comment contrary to the public interest.

Closing the exclusive economic zone off California to fishing in waters seaward of the 1,100 fm (2,012 m) depth contour to unobserved DGN vessels and setting a limit of one serious injury/mortality to sperm whales interacting with DGN gear provides for sperm whale protections. NMFS' long term research vessel sightings of sperm whales in the California Current indicate that 90 percent of sightings occurred in waters deeper than 1,100 fm (2,012 m). Further, NMFS' analyses of DGN observer data indicate that an average of approximately 13 percent of total annual DGN fishing occurred in the Zone in years 2009 through 2011. NMFS' SWFSC scientists have suggested that reducing spatial overlap of fishing effort and sperm whale habitat may be an effective means to reduce the risk of sperm whale bycatch. There is no action that NMFS can take through the normal rulemaking process that would enable NMFS to implement the requirement for observer monitoring of DGN vessels in the Zone and the cap of one sperm whale serious injury/mortality for the DGN fishery to reduce the bycatch risk of this species. This emergency action enables NMFS to keep the fishery operating while avoiding unnecessary adverse biological and economic impacts. Therefore, the urgency to protect sperm whales through a final rule outweighs the value of providing prior public comment. Although this action is being implemented without notice and request for advanced public comment, NMFS is seeking public comment on this rule for purposes of assessing the need to extend the rule or to identify other possible measures for long-term management.

For these same reasons stated above, pursuant to 5 U.S.C. 553(d)(3), the AA finds good cause to waive the full 30-day delay in effectiveness for this rule. It would be contrary to the public interest if this rule does not become effective immediately, because the DGN fishery prohibition to fish beyond of 75 nautical miles of shore is no longer in effect from August 15 through the following January 31 which coincides with swordfish becoming more prevalent in the California Current. Without this emergency rule, NMFS would not provide100 percent observer coverage in an area (the Zone) with higher concentrations of sperm whales and close the fishery in the event that there is one serious injury or mortality to a sperm whale in the DGN fishery. These measures are needed to provide adequate protections for sperm whales during the 2013–2014 DGN fishing season. For these reasons, there is good cause to waive the requirement for delayed effectiveness.

Because notice and opportunity for comment are not required pursuant to 5 U.S.C. 553 or any other law, the analytical requirements of the Regulatory Flexibility Act (5 U.S.C. 601 et seq.) are inapplicable. Therefore, a regulatory flexibility analysis is not required and has not been prepared.

This rule has been determined to be not significant for purposes of Executive Order 12866. A Regulatory Impact Review was completed and is available upon request from the NMFS, Southwest Region (see **ADDRESSES**).

List of Subjects in 50 CFR Part 660

Fisheries, Fishing, Reporting and recordkeeping requirements.

Dated: August 28, 2013.

Alan D. Risenhoover,

Director, Office of Sustainable Fisheries, performing the functions and duties of the Deputy Assistant Administrator for Regulatory Programs, National Marine Fisheries Service.

For the reasons set out in the preamble, 50 CFR part 660 is amended as follows:

PART 660—FISHERIES OFF WEST COAST STATES

■ 1. The authority citation for part 660 continues to read as follows:

Authority: 16 U.S.C. 1801 *et seq.*

■ 2. In § 660.713, paragraph (f) is added to read as follows:

§ 660.713 Drift gillnet fishery.

* * * * *

(f) *Sperm whale take mitigation measures.* (1) Drift gillnet (mesh size ≥14 inches) fishing without a NMFS-trained observer is prohibited in the portion of the California EEZ bounded by lines connecting, in order, the following points:

Point	North lat.	West long.	
A	42°0′0″	125°10′12′	Oregon Border at 1100 fm.
B	40°22′12″	124°45′0″	
C	40°22′12″	125°45′0″	
D	38°21′0″	123°52′12″	
E	37°29′24″	123°18′0″	
F	37°29′24″	123°30′36″	
G	37°0′0″	123°30′0″	
H	36°36′0″	122°27′0″	
I	36°16′12″	122°31′12″	
J	35°52′30″	122°16′48″	
K	35°0′0″	121°45′0″	
L	34°54′0″	122°0′0″ ...	
M	34°0′0″	122°0′0″ ...	
N	34°0′0″	121°9′0″ ...	
O	32°21′0″	120°0′0″ ...	
P	31°6′0″	118°45′0″	
Q	30°32′31″	121°52′1″	SW corner of CA EEZ.
R	EEZ Western Edge ..	.....	200nm buffer from the U.S. Pacific Coast Shoreline.
S	42°0′0″	129°0′0″ ...	NW border of OR EEZ.
A	42°0′0″	125°10′12′	Finish back at Point A.

(2) As soon as practicable following determination by the Regional Administrator that one serious injury to, or mortality of, a sperm whale has resulted from drift gillnet fishing during the period of this emergency rule, the Regional Administrator will contact the fleet via VMS communication and provide the effective date and time that all fishing by vessels registered for use under a drift gillnet permit are prohibited from swordfish fishing until January 31, 2014. Coincidental with the VMS communication, the Regional Administrator will also file a closure notice with the Office of the Federal Register for publication; notify all permit holders by postal mail, and a post a notice on the NMFS regional website.

(3) Drift gillnet vessel owners/operators are required to notify the NMFS-designated observer provider at least 48 hours prior to departing on all fishing trips. Vessel owners/operators must provide to the observer provider their name, contact information, vessel name, port of departure, and estimated date and time of departure, and a telephone number at which the owner or operator may be contacted during the business day (8 a.m. to 5 p.m.) to indicate whether an observer will be required on the subject fishing trip.

(4) Drift gillnet vessel owners/operators must provide NOAA OLE with a declaration report before the vessel leaves port on a trip in which the vessel will be used to fish swordfish with drift gillnet gear in U.S. ocean waters between 0 and 200 nm offshore of California.

(5) Drift gillnet vessel owners are required to install a NMFS OLE type-approved mobile transceiver unit and to arrange for a NMFS OLE type-approved communications service provider to receive and relay transmissions to NMFS OLE prior to swordfish fishing during the period of this emergency rule. Vessel owners/operators shall perform the same requirements consistent with 50 CFR 660.14.

California Ocean Protection Council Members
California Resources Agency
1416 Ninth Street, Suite 1311
Sacramento, CA 95814

Re: Recent comments by Turtle Island Restoration Network on NOAA Fisheries Swordfish Research and Collaborative Fisheries Research (CFR) West Project

Dear Secretary Laird and California Ocean Protection Council Members,

I am writing this letter to correct inaccuracies in the Turtle Island Restoration Network (TIRN) letter provided as part of their testimony to the Ocean Protection Council (OPC) on 11/21/2013. As you know, the National Oceanic and Atmospheric Administration (NOAA), National Marine Fisheries Service (NMFS) is charged with carrying out the legal mandates of the Magnuson-Stevens Fishery Conservation and Management Act, the Endangered Species Act (ESA) and the Marine Mammal Protection Act (MMPA). While public comment is an important part of the regulatory process, in the end NOAA must make science-based decisions that reflect the population status of target species while evaluating risks to protected species and implementing the ESA and MMPA. This can only be done through research and technical innovation to improve fisheries.

The TIRN letter cites results of a recent NOAA Fisheries Southwest Fisheries Science Center (SWFSC) experiment, partially funded by CFR West, and provides interpretations of NOAA-collected fishery data. The inaccuracies reported relate to both the supporting and background information presented and to the research being conducted by SWFSC scientists and the Pfleger Institute of Environmental Research (PIER). In an attachment to this letter, we provide clarification regarding the research. We also provide relevant background information on swordfish fisheries and sustainable fisheries management. NOAA Fisheries does not promote a particular type of fishing gear or fishing sector; however we do encourage science-based research on innovative solutions to existing gear conflicts and seek to evaluate technical solutions that allow the nation to harvest healthy fishery resources while protecting non-target species.

Background: Swordfish is a commercially valuable species that is in high demand globally. Recent assessments of swordfish stock status in the northeast Pacific indicate the population is

healthy and fished at a level that is below maximum sustainable yield (MSY), meaning that higher catch levels would be sustainable[1]. Of all the major swordfish fishing areas in close proximity to the United States, only the West Coast lacks a commercially viable swordfish fishery operating at or near MSY levels. Landings of the drift gillnet (DGN) fishery currently operating off California declined by 68% from 2001-2011 due to regulations implemented to reduce protected species bycatch[2]. Consequently, remaining market demand is met in part by fisheries operating out of Hawaii and the U.S. Atlantic but predominantly from imports harvested by international fleets.

Globally, the majority of swordfish are taken in longline fisheries where they are mostly targeted at night in surface waters. During the 1990s and early 2000s there were a number of regulatory changes including closures imposed on U.S. longline fisheries due to concerns about bycatch. As a result, the U.S. conducted experiments with commercial fishers in the Atlantic to test gear modifications aimed at reducing bycatch. The most effective changes included switching from J-hooks to circle hooks and using finfish or a mackerel-type bait rather than squid. In the Central Pacific, the same gear and bait modifications were introduced in 2004 in the Hawaii shallow-set longline swordfish fishery. As a result, capture rates of leatherback and loggerhead turtles declined by 83% and 90%, respectively[3]. The effectiveness of the gear and bait modifications in reducing bycatch certainly contributed to the U.S. North Atlantic swordfish pelagic longline fishery obtaining the Marine Stewardship Council (MSC) certification in 2011.

The Magnuson-Stevens Reauthorization Act of 2006 (MSRA) stipulates that NOAA sustainably manage both target and bycatch species populations. NOAA's federal mandate under the MSRA **is not to** eliminate all bycatch, but rather to minimize bycatch while enabling the sustainable catch of marketable species to meet the demand of consumers for locally sourced seafood. Outside of the context of population assessments or fishery evaluations under the ESA or MMPA, listing catch of individuals by number does not indicate whether take levels pose a risk to the populations. NOAA's role **is to** minimize bycatch and ensure that at-risk-species do not fall below levels that support population replacement or growth. In the case of protected species, NOAA's role is to ensure that species are not likely to be jeopardized and that MMPA requirements to reduce fisheries bycatch of marine mammals are met. One important management tool to achieve all of these goals is using take caps that stop fishing activity if a certain number of individuals are caught.

To help meet the mandates of the MSRA, ESA, and MMPA, the NOAA SWFSC has been conducting research on swordfish biology and fisheries for several decades. Recent efforts have focused on: 1) characterizing the movement patterns and stock structure of the swordfish

[2] PFMC (2012a). Pacific Fishery Management Council: Status of the U.S. West Coast Fisheries for Highly Migratory Species Through 2011. http://www.pcouncil.org/wp-content/uploads/HMS_SAFE_2011_FINAL.pdf

[3] Gilman, E., Kobayashi, D., Swenarton, T., Brothers, N., Dalzell, P., & Kinan-Kelly, I. (2007). Reducing sea turtle interactions in the Hawaii-based longline swordfish fishery. *Biological Conservation*, 139(1), 19-28.

population in the Northeast Pacific using electronic tagging, fishery data analysis and otolith chemistry; 2) examining the economics of the existing swordfish fisheries including those off the U.S. West Coast, Hawaii and of international fleets; and 3) studying the vertical and horizontal distribution of swordfish in relation to many important incidentally caught species in the U.S. west coast fisheries, with the goal of improving fishery selectivity and thus reducing unwanted bycatch while maintaining or increasing swordfish landings.

One of the main objectives of the OPC funded project mentioned in the TIRN letter was to determine whether swordfish could be caught at-depth during the day when vertical habitat separation between sea turtles and swordfish is maximized. As mentioned above, most current swordfish longline fisheries operate at night in surface waters when vertical habitat overlap is greatest.

Specific responses to several incorrect statements made in the TIRN letter are attached. NOAA Fisheries appreciates the support of the OPC in examining ways to improve the harvest of swordfish off California and respectfully submits this letter so that you and Council members are clear on the facts. We appreciate the OPC's commitment to promoting practical and innovative approaches based on best available science. The development of adaptive management protocols that best serve the long-term health of fish stocks, marine resources and economic opportunities in our coastal communities are facilitated through scientific research. We feel that working with fishers is part of a balanced approach to mitigate bycatch and impact on protected species, while also promoting the important economic benefits of sustainable fishing.

Sincerely,

Francisco Werner
Director
NOAA Southwest Fisheries Science Center

Content of this Attachment:

In order of appearance in the TIRN letter, we address factual errors, although some corrections are relevant multiple times in the text.

1) The TIRN statement claims that pelagic longline fishing has been banned in state waters since 1989 and in the adjacent high seas since 2004. However, under the federal Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species (HMS FMP), deep-set (tuna) longline fishing has remained permissible outside the west coast exclusive economic zone (EEZ) since the 2004 effective date. Similarly, shallow-set longline fishing for swordfish with a Hawaii Pelagics Plan permit has been allowed since the Hawaii fishery reopened in 2004 subject to requirements to use circle hooks and mackerel-type bait.

2) While blue sharks are vulnerable to longline gear, vulnerability is not tantamount to a management problem. Survival rates for blue sharks released from longlines are very high (Moyes et al. 2006, Musyl et al. 2011). Also, research shows some habitat separation, both spatially and temporally, between swordfish and blue sharks in other areas (Bigelow et al. 1999, Aires-da-Silva et al. 2008). Characterizing habitat differences off California will aid in making any fisheries for swordfish more selective for target species. The results from the OPC research project will help to quantify potential habitat differences.

3) The Magnuson-Stevens Act defines bycatch as "fish which are harvested in a fishery, but which are not sold or kept for personal use". Under this definition, animals that have market value and are retained are not considered bycatch. In citing the NOAA deep-set longline experiment, TIRN artificially inflated bycatch estimates by defining all non-swordfish catch as bycatch. Using three years of data, the bycatch represented 68.5% of total catch (Table 1). It should be highlighted that this is an experiment, not a fishery, and any fishery would be informed by our experimental results to minimize bycatch, including blue sharks. Also, given the small scale of this experiment it is inappropriate to extrapolate to an entire fishery.

Table 1: Total catch during NOAA SWFSC deep-set longline experiment, 2011-2013.

Species	2011-2013	Mortality*
Marketable		
Swordfish	8	5
Opah	67	64
Pomfret	23	23
Albacore	4	3
Bluefin	6	6
Mako	2	1
Dolphin fish	1	1
TOTAL	**111**	

Species	2011-2013	Mortality*
Non-Marketable		
Blue shark	328	31-62
Lancetfish	5	5
King of the Salmon	17	17
Mola	1	0
Oil fish	1	1
TOTAL	**352**	

*Not all marketable catch was landed; several fish were tagged and released as part of the experiment. Mortality was estimated as 100% for fish that were landed or that died after release based on the tagging data, and for those species that were more delicate, deep water species that would not be expected to survive after release. The estimate for blue sharks is based on 15 observed mortalities and the added mortality of 5-15% of sharks that were released alive (Musyl et al. 2011, Moyes et al. 2006, see below).

4) The data represented as bycatch in the TIRN letter offers no information on the survivorship of released fish. The survival rates of blue shark released from longlines are estimated by a number of studies. Moyes et al. (2006) projected a 95% post-release survival rate based on blood chemistry and satellite tagging data. The same study reported that 5% of blue sharks came up in poor condition and would likely not survive. This results in an overall mortality rate of ~10%. In a more recent paper, Musyl et al. (2011) estimated post-release mortality of blue sharks at 15% based on meta-analyses of satellite tagging data from four studies. In NOAA's deep-set longline study, 95% of sharks were released alive (15 of 328 were moribund). Of the sharks released alive, mortalities would be expected to range from 16-47 based on mortality rates ranging from 5 to 15%. This would give a total estimated mortality of 31-62 blue sharks.

5) OPC funding to PIER was for buoy gear trials and tagging swordfish. PIER had no role in conducting longline experiments, contrary to the suggestion in the TIRN statement.

6) The Hawaii shallow-set longline (SSLL) swordfish fishery uses annual hard caps of 26 leatherback turtles and 34 loggerhead turtles, and has 100% observer coverage to strictly limit bycatch of these species to levels in compliance with the Endangered Species Act (CFR § 665.813, revised Oct. 2012). Before the regulatory changes to increase the leatherback cap from 16 to 26 and the loggerhead cap from 17 to 34, the fishery closed twice: early in March 2006 when the loggerhead cap of 17 was reached and again in November 2011 when the leatherback cap of 16 was reached. The Hawaii SSLL fishery never exceeded either take cap, contrary to the TIRN statement. Also see comment on turtle survival rates below.

7) The TIRN letter states that the Hawaii-based, deep-set longline fleet targeting tuna has caught 35 leatherback turtles since 2011 and is approaching its three-year cap. First, there is no three-year turtle take cap for the deep-set longline fishery. And second, there have been 7 observed takes of leatherback turtles in this fishery since 2011 through the third quarter of 2013 (NMFS 2013), which could be projected to an estimate of 35 based on 20% observer coverage. However, a more appropriate range of estimates would be derived by accounting for the variation in catch rates of this rare event (Carretta et al. 2004, McCracken 2004).

8) The letter states that the Hawaii SSLL fishery is a Category 1 fishery due to interactions with marine mammals. It is in fact a Category II fishery, indicating fewer interactions with protected species than a Category I fishery. See https://www.federalregister.gov/articles/2013/08/29/2013-21054/list-of-fisheries-for-2013 for the list of fisheries and explanations of the categories.

9) TIRN wrote that sea turtle post-hooking mortality is "typically estimated at 60-80%". There is no reference to post-hooking mortality rates in their citation #4 (PFMC 2012b) and it is unclear from where these numbers were derived. They may have come from Table 5 in a workshop report from 2012 (Swimmer and Gilman, see Table 2) where experts reviewed current NMFS methods for estimating bycatch based on earlier expert opinion (see Ryder et al. 2006). The published range of values is 0-82% (See Table 2), and 60-80% is close to the highest reported estimated mortalities (from Casale et al. 2008). Unlike the majority of published mortality studies where turtles were tracked with satellite transmitters at sea and

monitored over time, Casale and colleagues derived their numbers from stranded and floating turtles brought into captivity and turtles caught at sea. Based on a recent quantitative and qualitative study by Swimmer et al. (2013), post-hooking mortality of loggerheads in the Hawaii SSLL fishery is 28%, which is consistent with the estimates used to shape fisheries management in the U.S. The 60-80% range is not typical.

Table 2 (From Swimmer and Gilman 2012): Estimates of sea turtle mortality from the literature.

Author, Year	Mortality rate	Comments	Method
Aguilar et al., 1995	c. 20–30%		Captivity
Casale et al., 2008	65–82%	Some speculation based on floating turtles	Captivity
Hays et al., 2003	31%		PTT
Parker et al., 2005	20–40%	Depends on hook status	PTT
Chaloupka et al., 2004a	34%; 8%	Deep hook; shallow hook (within 1 week)	PTT
Swimmer et al., 2006	Unobserved (0%) within 6 weeks	Low rates in shallow gear	PSAT
Sasso and Epperly, 2007	19%	Depends on how much gear is removed	PSAT

10) TIRN incorrectly cites the numbers of cetacean and sea bird interactions and live releases observed aboard Hawaii SSLL vessels originating from or landing into California ports. For example, 18 of 25 albatross caught were released alive, not dead (PFMC 2012b). Also, 11 dolphins and one beaked whale were caught as opposed to 13 dolphins, and two of the dolphins were not released alive.

11) TIRN states that the Hawaii vessels landing in California create a disadvantage for California fishers. Many of the current participants in the Hawaii longline fishery used to operate seasonally out of California before regulations disallowed the practice. Furthermore, TIRN also urges California to shut down the drift gillnet (DGN) fishery. With the ever dwindling California DGN fleet (see below for changes in fleet size), the Hawaii landings may actually be important in helping maintain market infrastructure (at points of landing, processing and sale) for west coast fishing communities. Disallowing DGN and Hawaii longline landings, as proposed in the letter, would create a much greater disadvantage for California fishers and increase the demand for imports from foreign fleets. Foreign fleets likely have a higher rate of turtle bycatch relative to target species catch (Bartram and Kaneko 2004, Bartram et al. 2010). The harpoon fishery and the experimental deep-set buoy gear research under way serve distinct market niches that are artisanal in nature and cannot meet consumer demand like the DGN or pelagic longline fisheries.

12) TIRN states that "more than 90% of the ocean life" caught in DGN gear is "neither swordfish nor shark, but dozens of other fish species", and then proceeds to state that only 1/3 of finfish caught are kept. There is no reference provided for this statement. The five most recent years (2008-2012) of observer data show that by number, 28% of the catch was sharks and swordfish and 58% of the catch was bycatch of which 78% was *Mola mola* (ocean sunfish). The vast majority of ocean sunfish are released alive. Eleven percent of the total catch was discarded dead (NMFS Southwest Region observer data, http://www.westcoast.fisheries.noaa.gov/fisheries/wc_observer_programs).

13) The TIRN clearly states that they would like to see the last remaining vestiges of the commercially viable DGN swordfish fishery, which has been in a steady decline since implementation of current regulations, shut down. This would eliminate important economic activity by preventing utilization of a healthy (ISC 2012) and biologically

resilient (Neilson et al. 2013) resource. The number of active permits in the DGN fishery has dropped from 134 in 1990 to 78 in 2000 (PFMC 2012a), and further to 17 vessels participating in 2013 (C. Villafana, pers. comm.). The DGN fishery has been subject to numerous Endangered Species Act and Marine Mammal Protection Act regulations since the late 1990s. With the combination of gear modifications, including the use of pingers, and the substantial reductions in fleet size, the amount of bycatch in this fishery has declined dramatically. Results from 10 years ago are no longer relevant today. The DGN fleet currently meets the MMPA compliance standards indicating that it does not pose a serious threat to endangered marine mammals contrary to statements issued by the TIRN.

14) The TIRN letter advocates that the OPC not promote or fund fisheries that target swordfish or sharks due to the public health risk associated with mercury levels in these species. Mercury in seafood is a complicated issue and full treatment is beyond the scope of this letter. Briefly, the guidelines on mercury listed by the FDA/EPA are only for a subset of the population rather than the entire population, i.e., women who might become pregnant, women who are pregnant, nursing mothers and young children. The action level threshold above which fish are considered higher in mercury and therefore potentially unhealthful for that subset of the population is 1 part per million (ppm). Based on research at the SWFSC, mako sharks less than 150 cm fork length and thresher sharks across all size classes have average mercury concentrations that fall below 1 ppm (Suk et al. 2009). Other studies address mercury levels in swordfish (FDA 1990-2010, Mendez et al. 2001) where the average values also fall close to 1 ppm.

HIGHLY MIGRATORY SPECIES MANAGEMENT TEAM REPORT ON DRIFT GILLNET MANAGEMENT

1. Introduction

The Pacific Leatherback Conservation Area (PLCA) was established in 2001 to mitigate takes of Endangered Species Act (ESA) listed leatherback sea turtles in the California swordfish drift gillnet (DGN) fishery[1]. The southern boundary of the PLCA is defined by a line from the shore at Point Arena (36°18.5' N. latitude) trending to the southwest. The PLCA is closed to DGN fishing from August 15 to November 15 each year. Participants in the DGN fishery have commented that the area of the PLCA south of Point Arena has the potential to be especially productive for fishing during the closure period.

The PCLA is known to include feeding and migratory areas for leatherbacks. Figure 1 shows the extent of the PLCA and leatherback critical habitat. Critical habitat was designated by NMFS in 2012 (77 FR 4170, January 26, 2012). The importance of this area was identified by NMFS during the ESA consultation and subsequent Biological Opinion (BO) on the issuance of a permit under section 101(a)(5)(E) of the Marine Mammal Protection Act for four marine mammal stocks. (This permit authorizes the incidental take of ESA-listed marine mammals if the National Marine Fisheries Service (NMFS) determines that any incidental mortality and serious injury from commercial fisheries which occurs will have a negligible impact on the affected species or stock.) The PLCA was originally developed as a reasonable and prudent alternative (RPA) in the October 23, 2000, biological opinion that would close the area during the late summer and fall between Point Conception (34°27' N. latitude) and the mid-Oregon coast at 45° N. latitude. This created a polygon area intended to significantly reduce leatherback sea turtle takes in the DGN fishery.

As part of the rulemaking implementing the RPA, NMFS completed an environmental assessment (EA). This EA examined a new DGN fishery option, proposed by the Pacific Offshore Cetacean Take Reduction Team (POCTRT) and modified by NMFS, which would allow part of the fishery to remain open off central California. In this modified option, the closure was extended from August 15 to November 15 but excluded the area defined by the line from Point Sur to 34°27' N latitude, 123°35' W longitude (an area identified by fishermen as very productive for swordfish). NMFS did not accept this recommendation due in part to tracks from two satellite-tagged leatherbacks suggesting they move into the area south of Point Sur. The interim rule was published in the Federal Register on August 24, 2001 (66 FR 44549).

Since publication of the rule, new information has come to light that suggests that re-examination of the existing closure may be warranted. Regarding the southern extent of the closure, Dr. Tomo Eguchi of the Southwest Fisheries Science Center mentioned that ongoing work on satellite tagging of leatherbacks demonstrates that the harnesses previously used to affix the tags affects the turtles' behavior. Likely because of the discomfort of the harnesses the turtles tended to immediately swim away from the inshore foraging areas where they were tagged. The HMSMT discussed whether the southwest trending track used as the basis for this modification in the proposed boundary is representative of normal migratory behavior, although other research (e.g., Benson et al., 2011) supports a migratory corridor trending southwest from the Monterey region.

[1] At the time the HMS FMP was implemented this fishery was called the California/Oregon DGN fishery but subsequently Oregon stopped issuing permits so the fishery now only operates out of California.

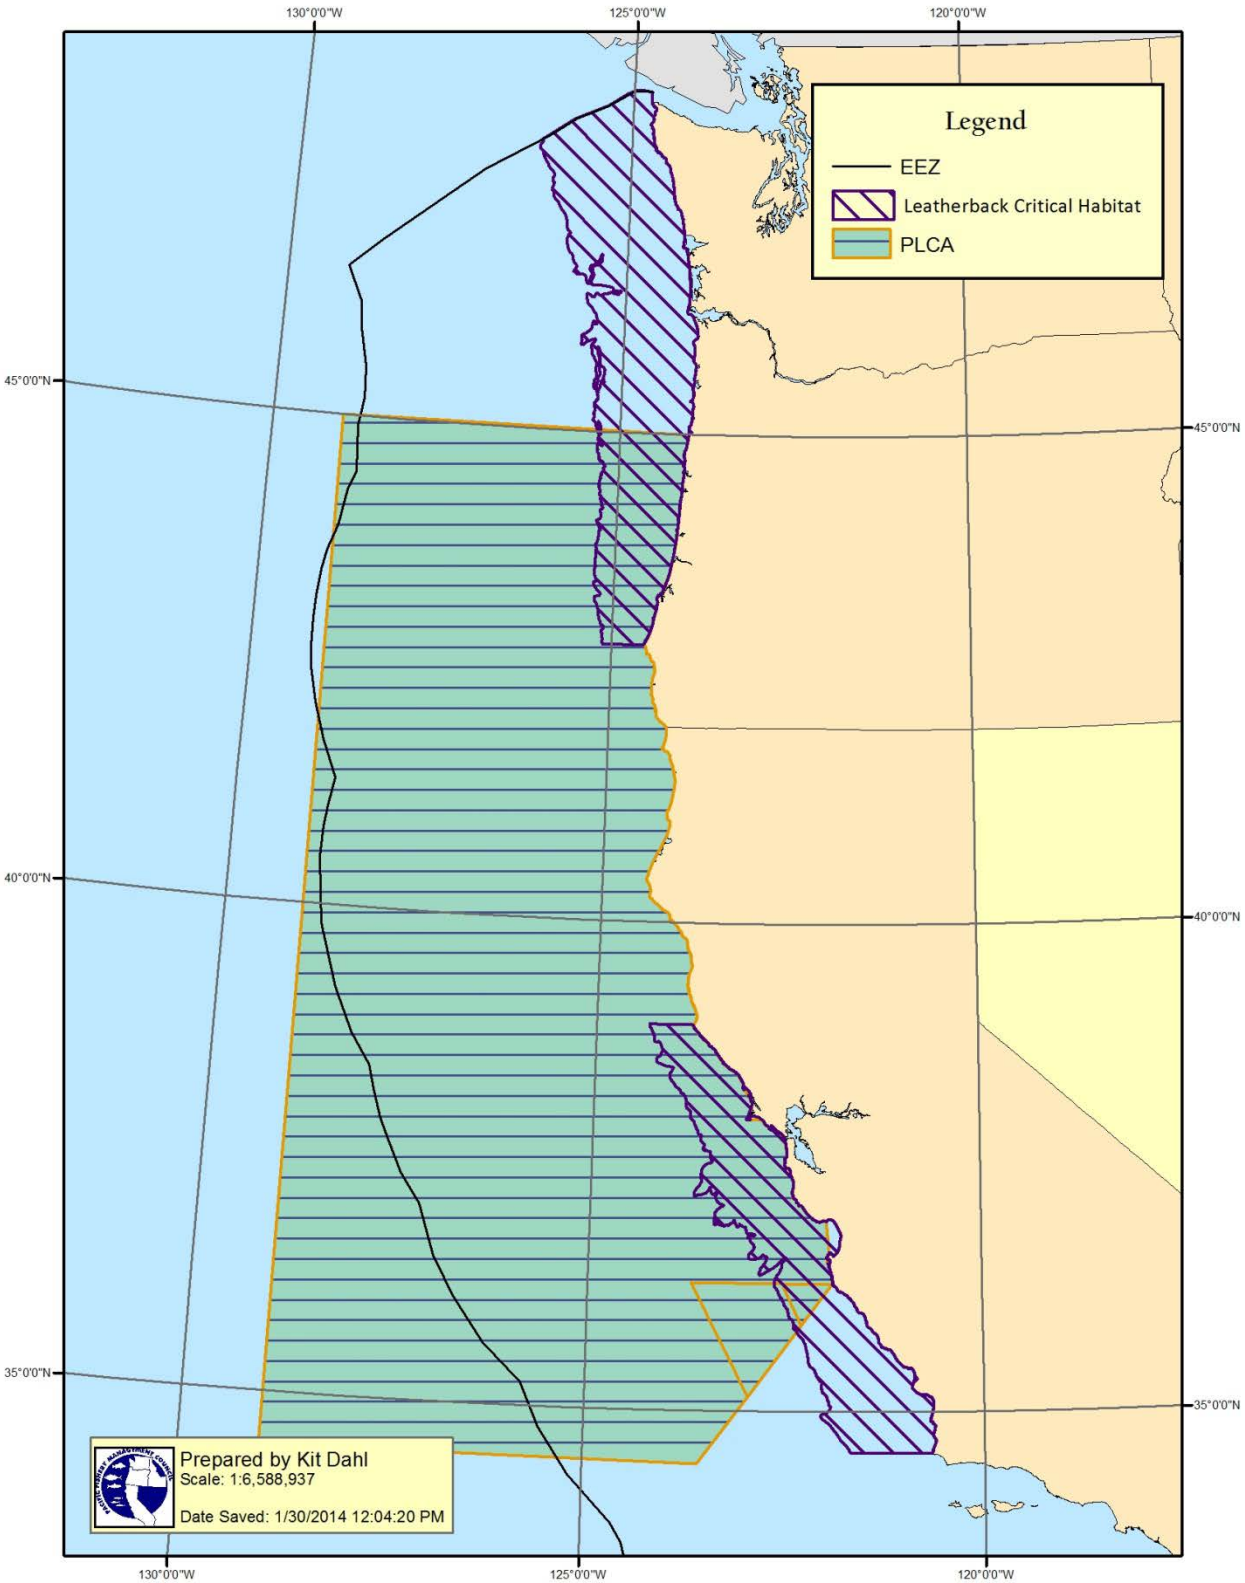

Figure 1. PLCA and leatherback critical habitat.

In March 2011 NMFS and the HMSMT and the HMSAS presented information to the Council on the status and prospects for the west coast swordfish fishery. In response the Council directed the HMSMT

to determine if any changes can be made to the closure dates for, or the southern boundary of, the PLCA in order to enhance fishing opportunity in the DGN fishery. In March 2013 the HMSMT presented a preliminary analysis of opening the area south of Point Sur for specified portions of the closure period. The Council then passed a motion, based in part on an HMSAS-sponsored concept, directing the HMSMT to consider a proposal with the following elements:

- Open the area of the PLCA south of Point Arena out to 100 miles to DGN fishing
- Authorize access to this portion of the PLCA only for vessels with both an onboard observer and VMS
- Estimate future effort levels in the area with these constraints
- Evaluate both present and past catch and turtle bycatch and interactions rates in this portion of the PLCA
- Explore the possibility of managing the DGN fishery with hard caps on incidental sea turtle take and other listed species, modeled after the Hawaii shallow-set longline fishery
- Evaluate whether the current 20% observer coverage is adequate for estimating bycatch for compliance
- Evaluate the use of VMS for compliance

On September 4, 2013, NMFS published a temporary rule in the Federal Register (78 FR 54548, see Agenda Item K.5.a, Attachment 1, March 2014) implementing emergency actions for the DGN fishery. These actions respond to the take of two sperm whales in the DGN fishery observed from a single set during the 2010-2011 fishing season. These takes exceeded the potential biological removal level for the California-Oregon-Washington stock of sperm whales, preventing NMFS from issuing a new MMPA 101(a)(5)(E) permit for the fishery under the current management regime. NMFS reconvened the POCTRT in mid-2013 to develop measures for the DGN fishery that would allow NMFS to make a negligible impact determination and issue the MMPA permit. The temporary rule established the following new measures for the 2013-2014 season:

- A "hard cap" of one sperm whale; if one whale is taken the DGN fishery would then close for the remainder of the season (this did not happen during the 2013-2014 season)
- A 100% observer coverage zone where DGN vessels are required to carry an observer to fish; this zone covers nearly all of the CA portion of the west coast EEZ seaward of a line approximating the 1,100 fathom depth contour
- A requirement that DGN vessel operators install, activate, carry, and operate vessel monitoring system (VMS) units.

A temporary rule may only stay in place for 180 days without an extension and may only be extended for one additional period of up to 186 days (MSA sec. 305(c)). The temporary rule for the DGN fishery expired January 31, 2014. Therefore, NMFS will undergo rulemaking to develop permanent regulations to replace the expired temporary regulations. For this purpose NMFS reconvened the POCTRT on February 4-6, 2014. Because of the limited duration of the temporary rule the permanent rule must be implemented by the beginning of the next fishing season in the DGN fishery on August 15, 2014.

These measures address some of the provisions in the Council's March 2013 motion. VMS was required in the DGN fishery as part of the temporary rule and the 100% observer coverage zone overlaps with part of the area identified in the motion, henceforth referred to as the "area under consideration" (AUC). The Council also requested more information on the use of hard caps for leatherback sea turtles and other protected species; the emergency rule includes a cap for sperm whales.

2. Area Under Consideration

Figure 2 shows the AUC, leatherback critical habitat boundaries, and the boundaries of the Monterey Bay National Marine Sanctuary. As noted above, the temporary rule defined a line approximating the 1,100 fathom depth contour where 100% observer coverage was required seaward of this line. The AUC comprises about 4,150 square miles (10,748 sq. km.) or 2% of the entire extent of the PLCA. Three subareas can be identified within the AUC based on these other management zones: 83% of the AUC is outside of critical habitat and seaward of the 1,100 fm depth contour line, 4% is inside leatherback critical habitat but seaward of the 1,100 fm line, and 13% is inside critical habitat and shoreward of the 1,100 fm line.

If the measures in the temporary rule are made permanent, 100% observer coverage would be required in the 87% of the AUC that is seaward of the 1,100 fm line. The HMSMT discussed the merits of truncating the AUC so that it would just apply to the area outside of this line or the seaward leatherback critical habitat boundary. Since this area is already subject to 100% observer coverage, that stipulation in the proposal would already be met. As part of the evaluation leading up to critical habitat designation NMFS found that fishing was not a threat to the primary constituent elements of leatherback critical habitat (see Agenda Item G.4, Situation Summary, April 2010, for an overview of the designation process). The HMSMT asks that the HMSAS weigh in on the tradeoffs involved in limiting AUC to the seaward portion of either of these boundaries.

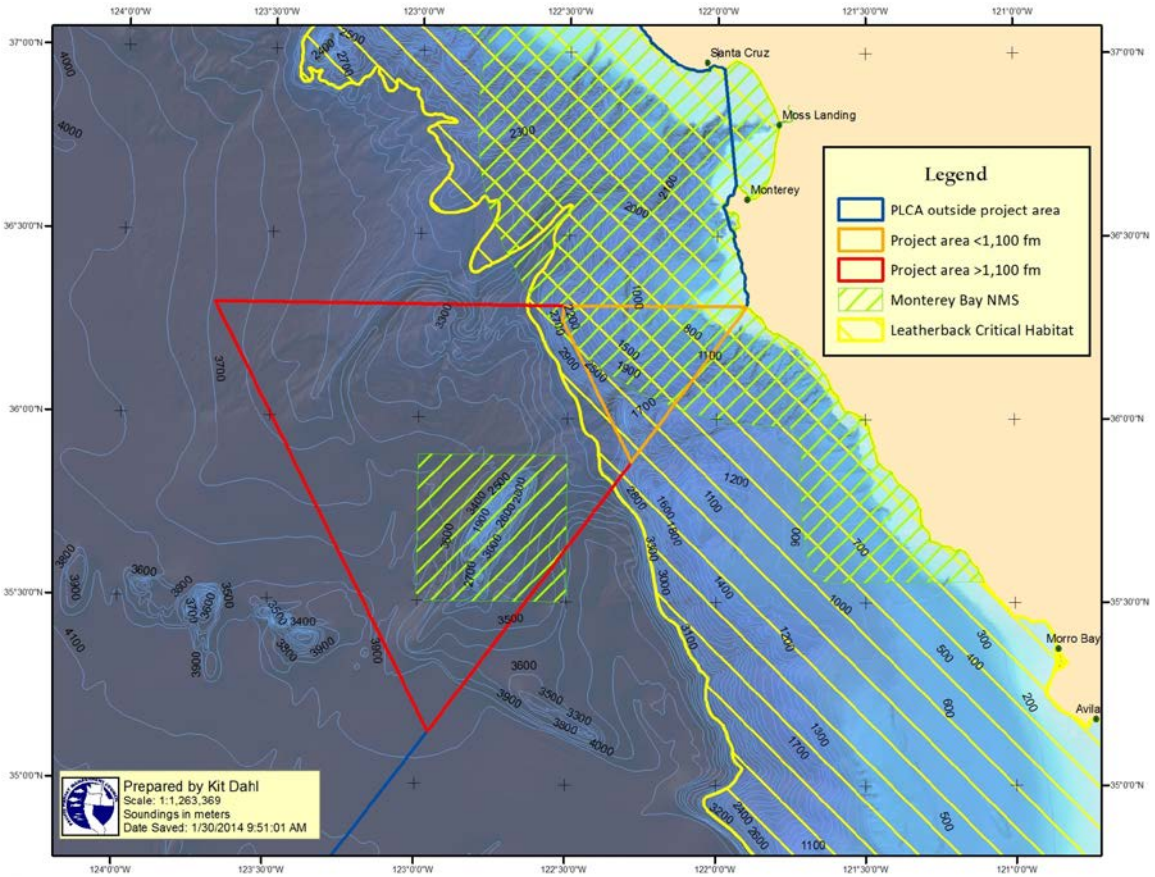

Figure 2. Site map for area of the PLCA under consideration (AUC).

As shown in Figure 2, a portion of the AUC overlaps with the Monterey Bay National Marine Sanctuary. However, commercial fishing is allowed within its limits, though oil drilling, waste dumping, and mining are prohibited (http://montereybay.noaa.gov/intro/welcome.html).

3. Considerations Regarding the Use of Observers

SWFSC scientist Jay Barlow conducted a sampling design study in 1989 to inform and guide the creation of the Southwest Region's Observer Program (Barlow, 1989). The program was initiated based on the need to cover two separate gillnet fisheries in California (small mesh set gillnet, large mesh DGN). Barlow noted that 20% observer coverage would provide sufficient sample sizes for species such as sea lions, which were a common bycatch species in both these net fisheries. Barlow also noted that 35% observer coverage would have been required in the set gillnet fishery to make statistically reliable estimates of relatively less frequent harbor porpoise bycatch. His estimates of "statistically reliable" were based on attaining a coefficient of variation (CV) of 10%, which is much better than normally achieved. Commonly, a 30% CV is considered a threshold under the MMPA. When CVs of bycatch estimates exceed 30%, management parameters are typically reviewed and modifications considered to account for the increased uncertainty in estimated bycatch levels. This is explicitly stated in the guidelines for preparing marine mammal stock assessments. In summary, the 20% observer coverage policy was adopted as a standard for the DGN fishery based in part on Barlow's work and in recognition of available funding.

NMFS convened an Observer Coverage Level Workshop in 2004 (NMFS, 2004) that addressed the minimum observer coverage level question with explicit reference to available funding as a limiting factor in observer coverage. The report does not mention any preferred value of observer coverage necessary to meet selected goals (e.g., the 30% observer coverage level recommendation is a rule of thumb not based on a formal statistical analysis). The 30% recommendation came out of the NMFS U.S. National Bycatch Report (NMFS, 2011) development process, as recognition that additional coverage was better, funding dependent, given the rare event sampling issues in play with many fishery sampling programs. Further, as explained in Appendix 4 to the NMFS 2004 National Bycatch Report, precision requirements for rare event species differ from levels which are sufficient to obtain a CV between 20% and 30% for more frequently encountered species. For example, coverage levels above 80% may be needed to obtain a CV below 30% for endangered leatherback or loggerhead sea turtle bycatch at low rates of encounters. It may not be worth the expense of such a high level of observer coverage to monitor bycatch within a standard error of one or two individuals. The NBR also mentions the large percentage of fishing effort that could not be observed in the DGN fishery, mentioning safety and space issues as explicit concerns. Preliminary estimates of unobservable effort in the DGN fishery for the 2013-14 season dropped to roughly 10% from the 2012-13 season estimate of approximately 24%. One of the factors for this decline was the need for all DGN vessels to carry observers if they wanted to fish in the deeper water zone (greater than 1,100 fathoms) per the sperm whale temporary rule (78 FR 54548).

The WCR Observer Program secured additional funding to enhance DGN coverage levels for the 2013-14 fishing season. Preliminary observer coverage for 2013-14 fishing season was approximately 34%. Preliminary participation and effort estimates for the 2013-14 season included 19 active vessels accounting for 559 sets. The supplemental observer funds were available for the 2013-14 season only. Although a request will be made to secure additional funding for the 2014-15 fishing season and beyond, it is unclear at this time what level of additional funding, if any, will be available. Observer coverage for both the existing DGN fishery centered in the Southern California Bight (~20% coverage rate) and any future re-opened area option (most likely with a 100% coverage requirement) would need to be allocated such that coverage is adequately spread throughout the season.

In lieu of adequate observer funding to fulfill the potential DGN coverage needs, other options could be explored, such as electronic monitoring or a privately funded program:

(1) Electronic monitoring (EM) technology has been under development for the past decade and several commercial fisheries on the west coast now successfully employ this technology in place of, or in tandem with, at-sea observers. In 2006, NMFS contracted Archipelago Marine Research Ltd. to design and implement a pilot EM project to test the efficacy of detecting target and non-target species captured in DGN gear. EM systems and observers were simultaneously in place on five vessels for 11 trips and 53 fishing sets, resulting in observation of over 450 animals caught by both methods. When comparing catches observed, EM and observer methods were within 4% of one another and detection of protected species categories was identical. Catch totals by set were very close for most sets and the major cause for outliers was with the ability of EM to detect tunas and mackerel (Archipelago Marine Research Ltd., 2007). Since this pilot study was completed there have been numerous advancements in EM technology that may render this type of system feasible for the needs identified in the Council motion.

(2) Privately-funded supplement observer coverage has been used in several west coast fisheries and could be considered as an option for meeting the additional coverage needs for the DGN fishery should the expanded area option be exercised. The HMSMT would look to the HMSAS for guidance and recommendations on how such a program would be conducted.

To gain a better understanding of possible future DGN fishing effort if the AUC in the Council motion were to be adopted and approved, CDFW HMS staff has initiated a phone survey with active and latent DGN permit holders. The results of this survey were not available prior to the briefing book deadline but should be available in time for the March Council meeting.

4. Protected Species Bycatch (Focusing on Sperm Whales and Leatherbacks) Compared to Target species CPUE in the AUC

The Council motion directed the HMSMT to evaluate both present and past catch and turtle bycatch and interactions rates in the AUC. The HMSMT heard a presentation at their January 2014 meeting by Jim Carretta on potential bycatch in the AUC, which is summarized below. In addition, the HMSMT updated a portion of the analysis for Agenda Item I.2.b, Supplemental HMSMT Report 2 in the March 2013 Council briefing book to analyze potential effort, finfish catch and relative bycatch rates for the AUC.

Marine Mammal and Sea Turtle Bycatch as related to the Council Proposal (Summarizing a Presentation to the HMSMT by Dr. Jim Carretta, SWFSC)

NMFS has had an observer program for the DGN fishery since 1990 and a total of 8,365 sets have been observed through calendar year 2012. Of these 8,365 sets, only 389 sets were observed in the AUC (prior to 2001), which represents 4% of observed fishing sets to date.

Table 1 shows a comparison of bycatch rates of all cetaceans, sperm whales, and leatherback sea turtles between the AUC and the larger PLCA (labeled Other PLCA in Table 1), as well as between the AUC and areas outside of the PLCA which have always been open to DGN fishing (labeled Open Area in Table 1). There was particular emphasis on sperm whales and leatherback turtles, as these two protected species are known to be vulnerable to DGN gear. Coefficients of variation (CV) for bycatch rates were estimated via bootstrap resampling. Although it is possible to examine statistical differences in bycatch rates between areas, the small spatial footprint and resulting small sample sizes within the AUC makes any statistical inference equivocal and unreliable. Bycatch rates of all cetaceans and sperm whales were

higher in the AUC compared to the PLCA and areas currently open to fishing. Bycatch rates of leatherback sea turtles were lower in the AUC than in other areas.

A more holistic evaluation of bycatch risk in the AUC is recommended to avoid the risk of reaching misguided conclusions based on the low statistical power of significance testing obtained using small observer samples to estimate rare event bycatch rates. The AUC is located in a region of high oceanographic productivity, adjacent to submarine canyons and seamounts which are common sperm whale habitat and are part of the Monterey Bay National Marine Sanctuary. Of the six sperm whale bycatch events observed in the 23-year observer program sample analyzed, four events occurred either within or in the immediate vicinity of the AUC. While this cluster of sperm whale interactions could represent a statistical artifact, this seems doubtful, especially given that they occurred in separate years (1992, 1993, 1996 and 1998). The AUC also overlaps with designated critical habitat for the leatherback sea turtle. Evaluation of the AUC for potential fishing activity should also include consideration of the degree of observer coverage that will be available for vessels allowed to fish here. To reduce uncertainty of bycatch risk in the AUC, a high level of observer coverage would be required.

Table 1. Estimated bycatch rates in the AUC for selected Species of Concern. (CV = coefficient of variation.)

	Open Area	Other PLCA	AUC
All Cetaceans			
Observed bycatch	486	170	46
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	7.9 (0.06)	7.6 (0.10)	11.8 (0.22)
Leatherbacks			
Observed bycatch	6	19	2
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	0.098 (0.41)	0.85 (0.22)	0.51 (0.68)
Sperm Whale			
Observed bycatch	4	6	3
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	0.065 (0.71)	0.27 (0.57)	0.77 (0.58)

The HMSMT also saw a separate presentation on sperm whale assessment by NMFS SWFSC researcher Jeff Moore, which included Figure 3 illustrating transect survey sightings of sperm whales. Eighty-four total sperm whale sightings were detected within 5.5 km from the survey vessel over the 1991–2008 period. The transact survey is fishery independent and designed as a representative sample of the survey area. Transect survey results did not appear to suggest a higher rate of sperm whale sightings near the canyon compared to areas towards the western end of the survey range. By contrast, the fishery dependent observer data do not constitute a representative sample of sperm whale abundance in the area where the DGN fishery historically operated. Bycatch rates per 100 sets shown in Table 1 do indicate a higher historically observed sperm whale bycatch rate occurred for the AUC than for the area that remained open. However, these generally occurred before the implementation of marine mammal bycatch mitigation measures in the late-1990s based on the recommendations of the Pacific Offshore Cetacean Take Reduction Team, as the AUC was closed from August 15-November 15 for all years after 2000. By contrast, the rate calculation for the open area is based on effort before and after take reduction measures went into effect in the late 1990s.

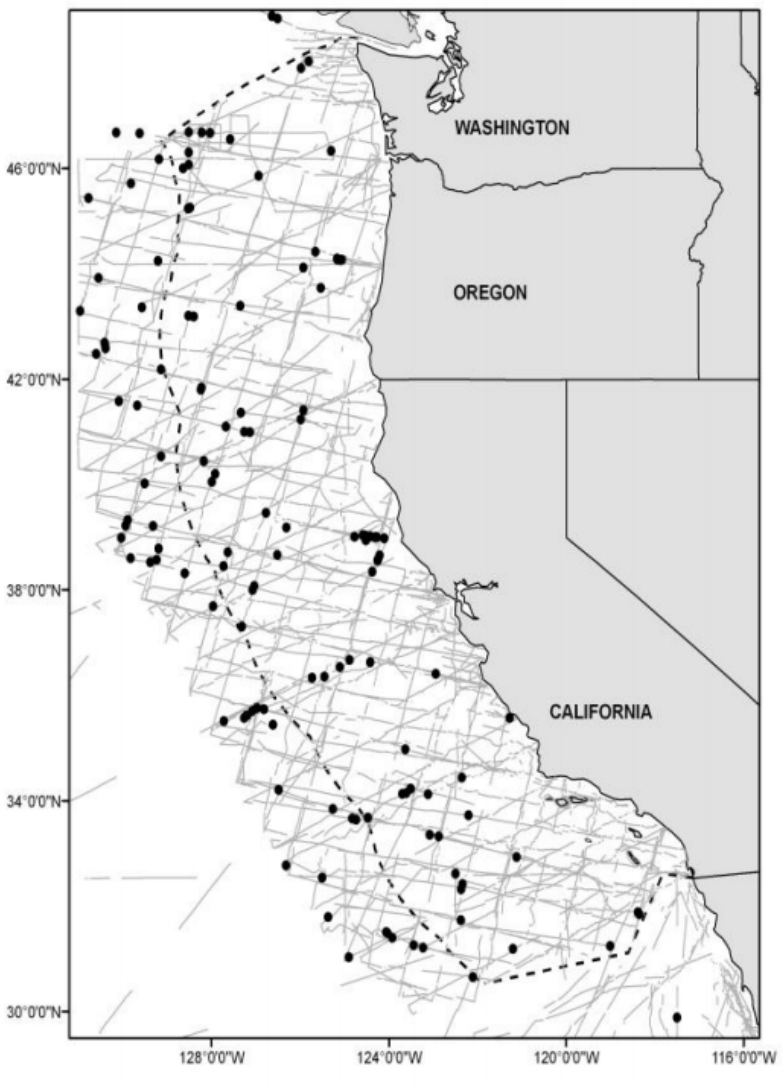

Figure 3. Transect survey sperm whale detections. (Source: NMFS 2013.)

Analysis of Potential Effort, Finfish Catch and Relative Bycatch Rates for the AUC

An analysis of potential effort, recent and past catch finfish catch and relative bycatch rates in the AUC is planned for inclusion in a supplemental HMSMT report for the March 2014 Council meeting.

The HMSMT suggests the HMSAS should weigh in on the potential benefit of increased potential target species catch inside the AUC relative to potential costs due to the impact of any new regulatory limits on the fishery due to any new regulatory requirements imposed to mitigate protected species bycatch risk inside the AUC.

5. Trends in Fishery Participation

Consideration of the motion to open part of the PLCA requires an examination of both current fishing effort and potential effort were the fishery to experience an increase in participation due to return of latent permits into active use. From 2000 to 2013, the number of permits issued dropped from 126 to 73,

reducing the potential fleet to 58 percent of the 2000 capacity[2]. However, during the same time period, the number of actively fished permits dropped from 119 to 19, an 84 percent decrease (Figure 4).

Starting in 2000, the swordfish DGN fishery began to experience a substantial decrease in landings, which in-turn led to a decrease in permittee participation in the fishery. When landings jumped in between 2005 and 2006 despite a low in permittee participation, the 2007 active fleet size increased temporarily. As landings once again continued to drop around 2008, participation in the fishery by permit holders steadily declined (Figure 4).

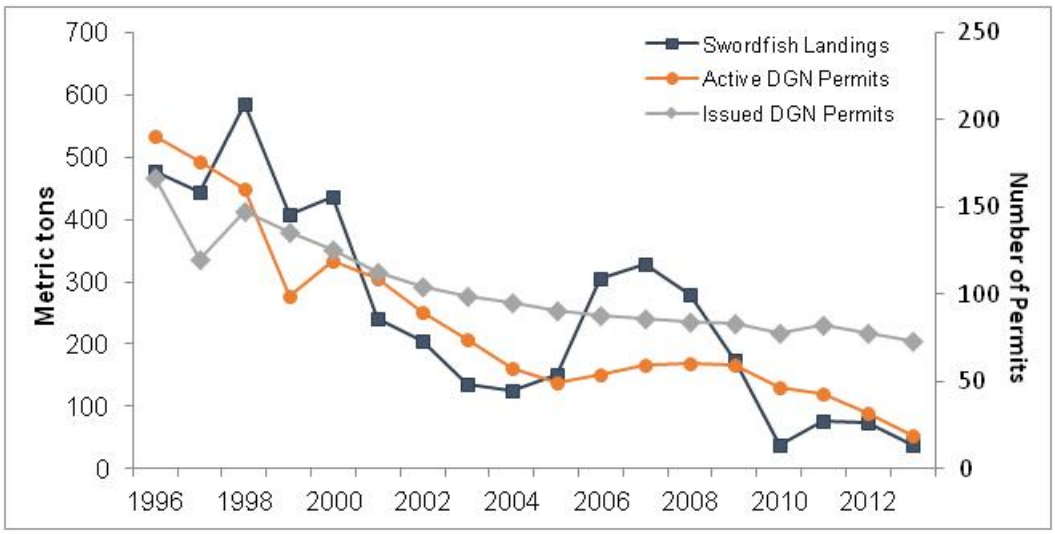

Figure 4. Annual swordfish landings, number of issued permits (, and active 2011 DGN permits, 1996-2013 (CFIS).

Based in part on information presented at a NMFS-sponsored swordfish workshop held in 2011, the HMSMT started to examine the latency of permits in the DGN fishery. To better understand these trends in permit activity, CDFW tracked the history of active participation in the DGN fishery of all permits issued in 2011. Table 2 and Figure 5 summarize the fishing activity from 1996–2013 of the 84 DGN permits issued in 2011 by CDFW. In Figure 5 the years highlighted in red indicate that the permit was actively used and the years highlighted in grey indicate that the permit was latent. In 2012 and 2013, white indicates the permit was allowed to lapse or transfer and the permit holder is no longer a potential component in the DGN fishery. In 2013, only 73 of the 84 2011 permittees still held their permits, a decline of 13 percent . Of these, only 19 actively fished, 22.6% of the potential fleet. Nine permit holders had no activity in the 24 years examined.

[2] 2010 represents an outlier in the data that CDFW is investigating. Once there is a lag in a permit (not renewed), the permit is no longer available for issuance. Therefore, there should be no increase in permit numbers across years, as seen in 2010-2011. This could be a data entry mistake or an error in the licensing branch resulting from a mistaken reissuance of an expired permit.

Table 2. Annual swordfish landings, number of issued permits, and active 2011 DGN permits, 1996-2013 (CFIS).

YEAR	No. Issued Permits	No. Active Permits	No. Latent Permits	Swordfish Landings (mt)
1996	167	191	0	478.5
1997	120	176	0	445.1
1998	148	160	0	585.1
1999	136	99	37	407.7
2000	126	119	7	437.0
2001	113	109	4	241.9
2002	104	90	14	205.7
2003	99	74	25	136.7
2004	95	58	37	125.6
2005	91	49	42	151.4
2006	88	54	34	305.9
2007	86	59	27	329.5
2008	84	60	24	279.6
2009	83	59	24	173.3
2010	78	47	31	36.9
2011	82	43	39	77.4
2012	78	32	46	73.5
2013*	73	19	54	38.2

*2013 data is preliminary and subject to change

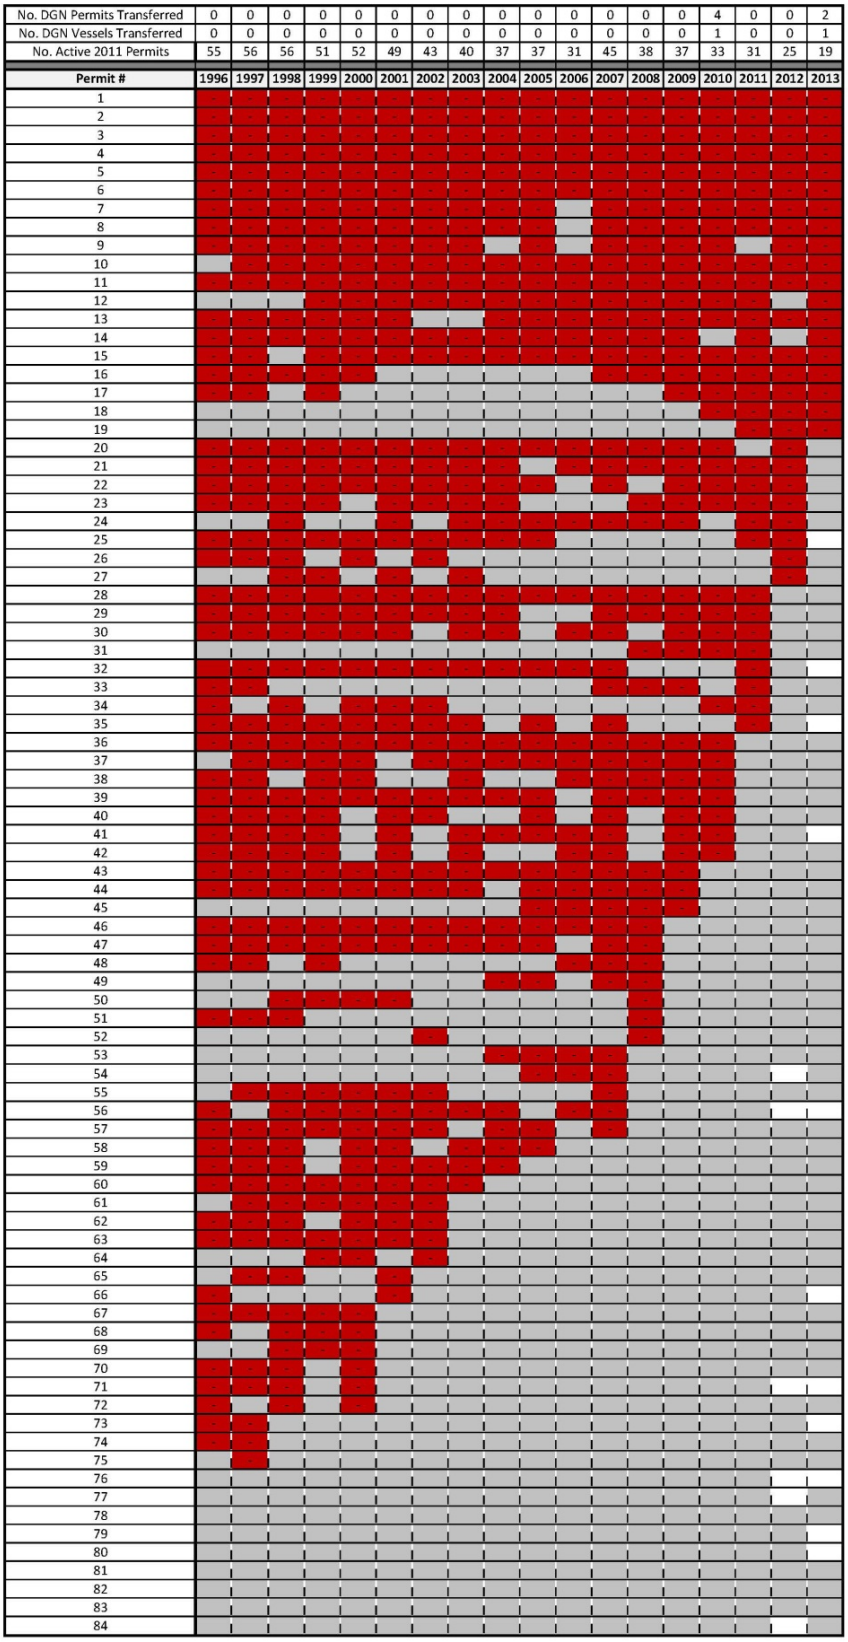

Figure 5. Permit activity 1996-2013* for the 84 permits issued in 2011 (CFIS, LRB).

Figure 6 shows a breakdown of the 2011 permits by total number of years each permit has been latent since 1990 (black), and the maximum number of consecutive years during which each permit was not fished (white).

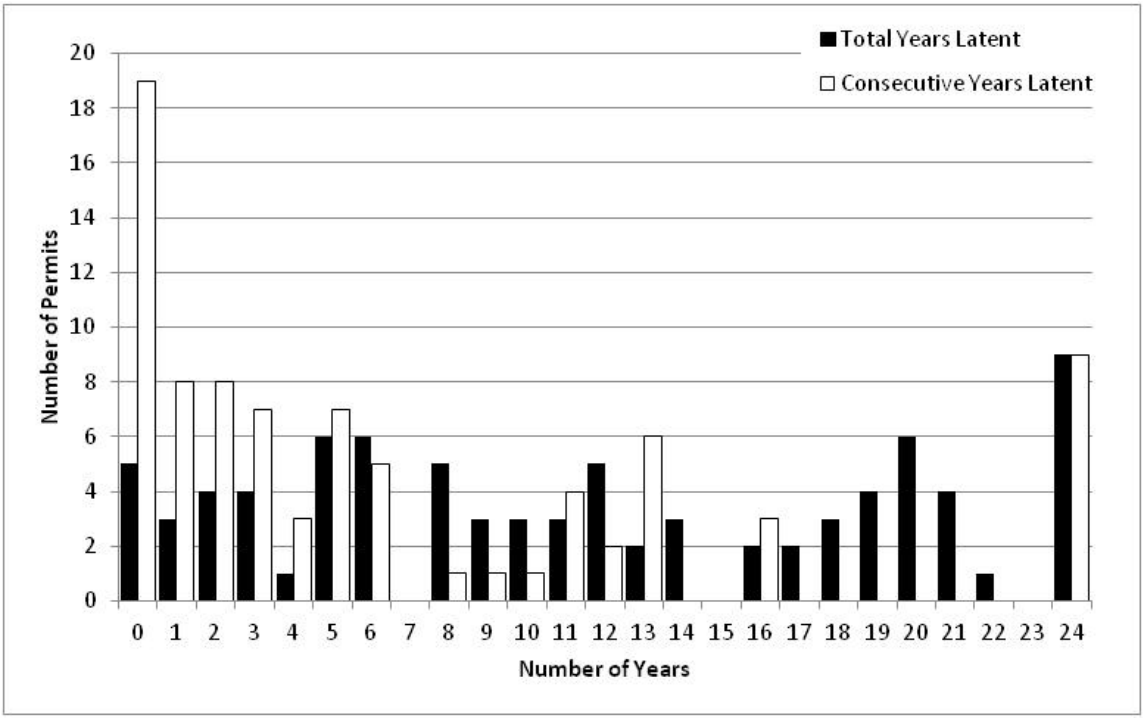

Figure 6. DGN Permit Latency 1990-2013 for permits issued in 2011 (CFIS).

6. Hard Caps for Sea Turtles and Other Listed Species

The Council requested the HMSMT to evaluate the use of "hard caps," or take caps, to address the impacts of protected species take in the DGN fishery. The concept of establishing a regulatory limit on protected species takes was first implemented in the Hawaii shallow-set longline fishery (which targets swordfish) in 2004. In 2008 and 2009 the Council considered amending the HMS FMP to reopen the west coast-based shallow-set longline fishery operating on the high seas outside the EEZ. Although the Council ultimately decided not to move forward with this proposal, the preliminary draft supplemental environmental impact statement prepared for the Council decision contains a summary of developments in the Hawaii fishery (see Agenda Item D.2.a, Attachment 1, April 2009). These incidental take caps are derived from the incidental take statements prepared for the fishery. Pursuant to the ESA, if consultation is initiated between an action agency and the NMFS Protected Resources Division (PRD), a biological opinion is usually prepared evaluating the effects of the proposed action on ESA-listed species. As part of the evaluation an incidental take statement (ITS) is developed. This section of the BO first estimates taking that is incidental to and not the purpose of the proposed action. Based on this estimate and other factors NMFS PRD determines whether the level of anticipated take is likely to result in jeopardy to the continued existence of the listed species subject to the consultation. The ITS may contain reasonable and prudent measures (if the action is not anticipated to cause jeopardy) or alternatives (if a jeopardy determination is made). Implementation of these nondiscretionary measures is anticipated to prevent the proposed action from jeopardizing the listed species. If the numbers in the ITS are exceeded, NMFS reinitiates formal consultation, which may result in additional measures or alternatives being imposed (up to and including measures that effectively prohibit the action from continuing).

Incidental take caps are implemented as a management measure and are intended to prevent the ITS numbers from being exceeded, thus reducing the likelihood the consultation will be reinitiated and that a jeopardy determination is made. The Hawaii fishery opened in 2004 with take caps of 16 leatherbacks and 17 loggerheads in any one year. However, in 2008 the Western Pacific Fishery Management Council took action to expand the fishery (by lifting limits on fishing effort), which meant that the incidental take estimates had to be revaluated. In taking final action, that Council was able to use information from the ITS for the expanded fishery and recommended retaining the existing take cap for leatherbacks but increasing the cap for loggerheads up to the level estimated in the BO: 46 animals. It is important to keep in mind the logic behind establishing take caps. First, under the ESA, NMFS PRD estimates take levels for the action and makes the jeopardy determination (imposing reasonable and prudent measures or alternatives as necessary). Then fishery managers (i.e., the Council) establish take caps as a management measure to prevent the ITS level from being exceeded. The framework allows a finding that the action will not cause jeopardy.

The Council has considered using take caps for two previous proposals. The first, from 2006, was a recommendation for an exempted fishing permit that would have allowed a limited number of DGN vessels to fish in the PLCA under an effort limit. The Council recommended take caps of two leatherbacks and a cap of one for any of three ESA-listed marine mammal species. The second was the aforementioned FMP amendment to reopen the west coast shallow-set longline fishery. For that action the preliminary draft SEIS states "Take caps for loggerhead and leatherback sea turtles would be established, at sufficiently low levels so that the proposed action is not found to jeopardize the continued existence of these or any other ESA-listed species. These take caps would be based on the anticipated take amounts estimated in the biological opinion that will be completed for this proposed action."

As noted above, a take cap of one sperm whale applied to the DGN fishery as part of the recently expired temporary rule.

The May 2, 2013, BO for the California DGN fishery includes an ITS with the numbers shown in Table 3

Table 3. Amount and extent of take on individuals expected in the DGN fishery (from Table 12 in NMFS 2013).

	Annual take	5-year take total	Expected mortalities* during 5-year period
Fin whale	up to 1	up to 2	up to 1
Humpback	up to 2	up to 4	up to 2
Sperm whale	up to 2	up to 8	up to 6
Leatherback turtle	up to 3	up to 10	up to 7
Loggerhead turtle	up to 3	up to 7	up to 4
Olive ridley turtle	up to 1	up to 2	up to 1
Green turtle	up to 1	up to 2	up to 1

*Includes animals that may be determined to have experienced either serious injury or mortality as a result of interaction with the fishing gear.

Although the observer coverage level in the DGN fishery is less than 100%, the BO concludes that the observed record of interactions will be approximately proportional to the actual level of take in the entire fishery. Based on this finding, the ITS includes an expected level of documented take in the fishery, reproduced here as Table 4.

Table 4. Amount of take expected to be documented by fishery observers over a 5-year period (from Table 13 in NMFS 2013).

	Observed take during 5-year period
Fin whale	1
Humpback	1
Sperm whale	up to 2
Leatherback turtle	up to 2
Loggerhead turtle	up to 2
Olive ridley turtle	1
Green turtle	1

These numbers could be used by the Council in considering hard take caps for the proposal. The HMSMT discussed whether it would be better to establish a hard cap just for DGN vessels fishing in the AUC or for the fishery as a whole. Although vessels in the AUC would be subject to 100% observer coverage, any fishing outside that area and the rest of the 100% observer coverage zone would be subject to only partial observer coverage. In this situation the assumption in the BO that observed take is approximately proportional to actual take may not apply, because of the very different levels of observation in different segments of the fishery. (Note that this applies equally to the temporary rule framework where different levels of observer coverage apply depending on fishing location.) It would be necessary to discuss with NMFS PRD how takes in the segments of the fishery with different observer coverage levels will be treated with respect to estimates of fishery-wide takes in relation to the ITS.

As part of the implementation process for this action it is likely that NMFS PRD would reinitiate consultation, which would result in a new ITS, possibly with different estimates of take and a new jeopardy determination.

7. Summary of Science Presentations

The HMSMT heard a series of science reports at its January 2014 meeting on research that is of potential relevance to the DGN fishery and the related Council agenda item. Summaries of these presentations may be found in Agenda Item K.5.b NMFS SWFSC Report 1.

8. Alternative Gear Report

The HMSMT heard updates on experiments currently underway to test alternative methods of catching swordfish off the West Coast, through use of deep-set swordfish longline gear (Heidi Dewar) or deep-set swordfish buoy gear (Chugey Sepulveda). Formal presentations were made at the HMSMT meeting on January 22, 2014, followed by informal discussion with potential future users of these fishing methods at an evening barbecue hosted by the Pfleger Institute for Environment Research. Presentations to update the Council on these projects are scheduled for the March 2014 Council Meeting in Sacramento. Agenda Item K.5.b, NMFS SWFSC Report 2 contains brief summaries of these projects.

RECOMMENDATIONS FROM THE PACIFIC OFFSHORE CETACEAN TAKE REDUCTION TEAM TO MINIMIZE SPERM WHALE INTERACTIONS IN THE WEST COAST SWORDFISH DRIFT GILLNET FISHERY

The MSA Temporary Regulation to Minimize Sperm Whale Interactions by the DGN fleet during the 2013-14 fishing season (78 FR 54548) expired on January 31, 2014. The Pacific Offshore Cetacean Take Reduction Team (POCTRT) met February 4-6, 2014 in Long Beach, California to assist NMFS in developing permanent regulations to minimize sperm whale interactions in the DGN fishery for the 2014-15 season and beyond as required under the Marine Mammal Protection Act.

Background of the Marine Mammal Protection Act Requirements Establishing the Pacific Offshore Cetacean Take Reduction Team/Plan

In the 1994 amendments to the Marine Mammal Protection Act (MMPA), section 118 established the immediate goal that the incidental mortality or serious injury of marine mammals occurring in the course of commercial fishing operations be reduced to insignificant levels approaching a zero mortality and serious injury rate (defined by NMFS as 10% of the potential biological removal (PBR) of a marine mammal stock). The PBR is the maximum number of animals, not including natural mortalities, that may be annually removed from a marine mammal stock while allowing that stock to reach or maintain its optimum population. Section 118(f) requires that NMFS develop and implement take reduction plans (TRPs) designed to assist in the recovery, or prevent the depletion of, strategic marine mammal stock(s) which interact with fisheries listed as Category I or Category II on the annual List of Fisheries. Because the California large mesh drift gillnet fishery targeting thresher shark and swordfish (CA DGN fishery) was classified as a Category I fishery and was observed to incidentally take several marine mammal stocks at levels that were estimated to be above their PBR levels, NMFS convened the Pacific Offshore Cetacean Take Reduction Team (POCTRT or Team) in 1996. Members on the TRT included representatives of the CA DGN fishery, environmental groups, the CA Department of Fish and Wildlife, the Pacific States Marine Fisheries Commission, independent fisheries scientists and whale biologists, and NMFS. Following several meetings of this Team, in 1997, NMFS promulgated regulations under the MMPA to reduce the mortalities and serious injuries of several marine mammal stocks, including the mandatory use of pingers and minimum length of buoy line extenders (50 CFR 229.30). The TRP, particularly the use of pingers in the CA DGN fishery, has been largely successful, with bycatch rates of cetaceans reduced by nearly 50% (Carretta and Barlow 2011) and the apparent elimination of beaked whale entanglements (Carretta and Barlow 2008).

Recent Updates of POCTRT Activities

In 2010, the CA DGN fishery was observed to take (serious injury/mortality) two sperm whales which resulted in a 5-year average annual serious injury/mortality estimate of 3.2 sperm whales (CA/OR/WA stock). Because this estimated mortality exceeded the stock's PBR (1.5 animals), NMFS reconvened the Team in the summer of 2013 to develop recommendations to reduce

mortalities and serious injuries to below the stock's PBR level. NMFS considered these recommendations and promulgated emergency regulations under the MSA to allow the fishery to continue for the season, while reducing risk to sperm whales. Because the emergency regulations expired on January 31, 2014, NMFS reconvened the Team on February 4-6, 2014 in Long Beach, California to assist NMFS in developing a permanent amendment to the existing TRP. The Team considered the measures outlined in the emergency rule as a starting point for developing their recommendations to NMFS. The Team agreed with many of the measures, and a key outcomes memorandum along with the Team's recommendations to the agency is being finalized and will be provided to the Council in a supplement to the NMFS briefing book. NMFS will consider these recommendations as the agency moves forward with promulgating regulations to reduce the take of sperm whales.

ALTERNATIVE GEAR RESEARCH UPDATE

NOAA Southwest Fisheries Science Center's Deep-set Longline Experiments

Heightened focus on minimizing bycatch of protected species has lead U.S. fisheries managers to implement combinations of gear restrictions and time-area closures. For example in 2001, to reduce sea turtle bycatch is swordfish fisheries, shallow-set longline (SSLL) fisheries were closed in the Atlantic and Central Pacific and a time-area closure was imposed on California pelagic drift gillnet (DGN) fisheries. In response to the SSLL closures, fishers and scientists collaborated to develop gear modifications that reduced loggerhead and leatherback bycatch by 90% and 65%, respectively, leading to MSC certification of the Atlantic SSLL fishery. In contrast, the California DGN fishery has declined dramatically since the 2001 time area closure. The goal of this project was to explore potential gear alternatives for targeting swordfish off California building on previous efforts to reduce turtle bycatch in LL fisheries. The idea was to shift the longline gear to deeper water to capitalize on the difference is daytime depths; swordfish typically spend the daylight hours in waters deeper than 200m whereas leatherbacks remain above 120m.

On three cruises from 2011-2013, NOAA collaborated with longline fishers off central and southern California to investigate the efficacy of targeting swordfish during the day using a deep-set longline (DSLL). During 47 sets, with average hook depths of 230-247m and soak times 2.7-4 hours, 111 marketable fish (including 8 swordfish, 67 opah and 23 pomfret) and 352 non-marketable fish (including 328 blue sharks and 17 king of the salmon) were caught. Short soak times were used to maximize fish condition for tagging; two swordfish, five opah and five blue sharks were released with satellite tags and the majority of the remaining blue sharks were tagged with conventional tags. Based on previous research on blue shark post-release mortality, 81%-91% of blue sharks would be expected to survive after release. This study concluded that it is possible to catch swordfish and other marketable species below turtle habitat with a DSLL however, swordfish catch was low. Fishing conditions during these cruises were probably impacted by anomalous oceanographic conditions; catch for the DGN fleet was very low over the same time periods. Efforts to collect additional data under more realistic fishing operations (i.e. fishing when and where conditions are best, over longer time periods) would provide a further test of the gear's potential. Given the experimental and small-scale nature of this research, these results are promising, but should not be projected beyond the study and warrant more research.

Deep-set Buoy Gear Trials off Southern California – Progress Report

Dr. Chugey Sepulveda, Pfleger Institute of Environmental Research (PIER)

Dr. Sepulveda will provide an update to the Council on the progress of recent swordfish alternative gear performance trials conducted by the Pfleger Institute of Environmental Research (PIER) and NOAA (SWR)[1,2,3,4]. The progression of these research efforts is directed at developing deep-set buoy gear off southern California. The presentation will include information on the collective catch (target and non-target) for all trials and discuss findings from

recent gear modification experiments focused on increasing feasibility, gear efficiency and the prevention of lost gear. Data will also be presented on the swordfish tagging and gear trial efforts within the Pacific Leatherback Closure Area (PLCA)[3,4] and its relevance towards fishery development within the region. Future buoy gear research plans for 2014 and beyond will also be presented.

HIGHLY MIGRATORY SPECIES ADVISORY SUBPANEL REPORT ON DRIFT GILLNET MONITORING, MANAGEMENT, AND ALTERNATIVE GEAR REPORT

General Comments on Alternative Gear Report

Because of numerous misconceptions of the term "bycatch," Highly Migratory Advisory Subpanel (HMSAS) would like to remind everyone that bycatch is defined by the Magnuson-Stevens Act in Section 3. 401-297:

"The term bycatch means fish which are harvested in a fishery, but which are not sold or kept for personal use, and includes economic discards and regulatory discards. Such term does not include fish released alive under a recreational catch and release fishery management program."

We want to clear up misconceptions that fish that are not targeted but are sold are often wrongly represented as bycatch.

There are fish released alive such as mola mola that should not be considered bycatch.

Comments on Drift Gill Net Monitoring And Management

The Council passed a motion to have the Highly Migratory Species Management Team (HMSMT) review opening of an area of the Pacific Leatherback Conservation Area. The HMSAS supports the preliminary analysis of the Team to open the small triangle area out to 100 miles south of Point Sur, that is only 2 percent of the Pacific Leatherback Conservation Area (PLCA) including the provisions in the emergency rule allowing National Marine Fisheries Service (NMFS) to issue a Marine Mammal Protection Act 101(a)(5)(E) permit for the drift gillnet (DGN) fishery. Fishermen have participated in reducing bycatch in the fishery. The DGN fishery is an excellent way to target swordfish and agrees longline as an alternative could be considered.

We support opening the triangle area to allow fishing August 15, when the historical season began before the PLCA was implemented to allow fishermen the opportunity to access swordfish when water conditions are favorable. It is understood that new requirements may be needed, including observers and Vessel Monitoring System.

We support further modifications in the PLCA as indicated in the NMFS Southwest Fisheries Science Center report with research results showing effects of closures on the catch per uinit of effort.

We support alternative fishing gear. But, realize that buoy gear will not provide commercial quantities of swordfish for the west coast market. West coast swordfish need to be harvested and our fleet needs to fish them either by DGN or longlines. We need to try deep-set longlines for swordfish during the day or shallow-set at night. NMFS research projects are supported by the HMSAS.

We encourage the Council to respond to California Assembly member Mark Stone, explaining the Council regulatory process and regulations in the Fishery Management Plan (FMP). This

may include adaptive management oversight, Protected Resource regulations, and clarification of the merits of the fishery to the Assembly members. The Council should include NMFS research to reduce bycatch impacts by longlines and DGN supported by data reports designed to improve the fishery. The interpretation of this information is needed to understand the data.

The HMSAS discussed the current California State legislation to ban the DGN fishery. Priority should be given to coordinating with the Council, NMFS, and the States to move permitting the DGN fishery over to a Federal process to consolidate the permits under the HMS FMP. We recommend the fishery be moved completely to the Federal plan to simplify management, as the fishery is conducted in Federal waters.

In summary, the HMSAS strongly believes this fishery can continue in a sustainable manner and that the Council should continue authorization of the DGN fishery.

Agenda Item K.5.b
Supplemental HMSMT PowerPoint
March 2014

HMSMT Report on Drift Gillnet Management

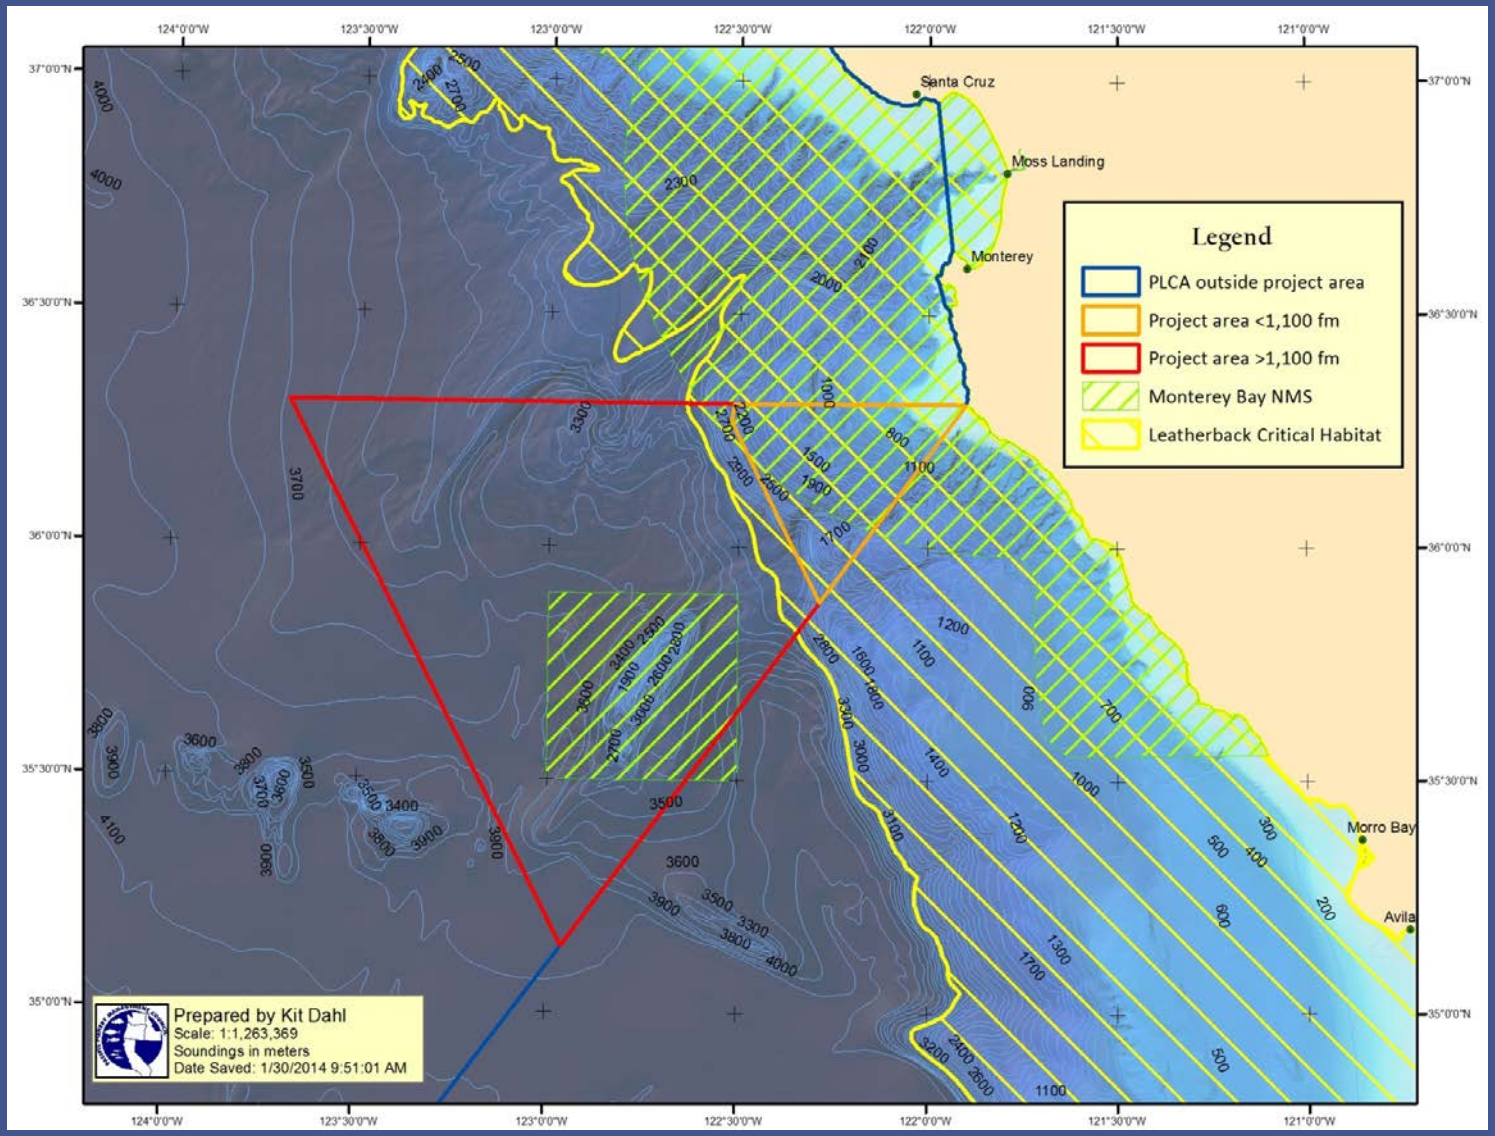
Highly Migratory Species Management Team

March 2014 Pacific Fishery Council Meeting

Sacramento, California

Overview

- Background on Motion
- Elements HMSMT was asked to address
- Recommendations



Background

- In March 2012, the Council received information on the status and prospects of the west coast swordfish fishery.
- The Council directed the HMSMT to determine if any changes could be made for the closure dates or the southern boundary of the PLCA.

Background

- In March 2013 the HMSMT presented a preliminary analysis of opening the area south of Point Sur for specified portions of the closure period.
- The Council asked the HMSMT to analyze the impact of opening up a triangle-shaped area south of Pt. Sur out to 100 miles (Area Under Consideration).

Area Under Consideration (AUC)

Elements for HMSMT to address

- Access to AUC for vessels with both observer and VMS coverage
- Estimate future effort levels in the AUC
- Evaluate present and past target and non-target interaction rates in the AUC
- Explore managing DGN fishery with hard caps on incidental takes
- Evaluate whether 20% observer coverage is adequate for estimating bycatch
- Evaluate the use of VMS for compliance

Observed Leatherback and Swordfish BPUE/CPUE by Area and Season, 1990-2000

	Closed Season, AUC (Aug 15-Nov 15)	Open Season, AUC (Nov 16-Jan 31)	Non-PLCA
Observed Effort (Sets)	321	49	3889
Swordfish Catch (Counts)	976	102	6368
Swordfish CPUE	3.0405	2.0816	1.6374
Leatherback Takes (Counts)	2	0	4
Leatherback BPUE	0.006231	0	0.001029
Leatherback-Swordfish BPUE/CPUE	0.002049	0	0.0006281

Estimated bycatch rates for selected Species of Concern (1990-2012)

All Cetaceans

	Open Area	PLCA	AUC
Observed bycatch	486	170	46
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	7.9 (0.06)	7.6 (0.10)	11.8 (0.22)

Leatherback turtles

	Open Area	PLCA	AUC
Observed bycatch	6	19	2
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	0.098 (0.41)	0.85 (0.22)	0.51 (0.68)

Sperm Whale

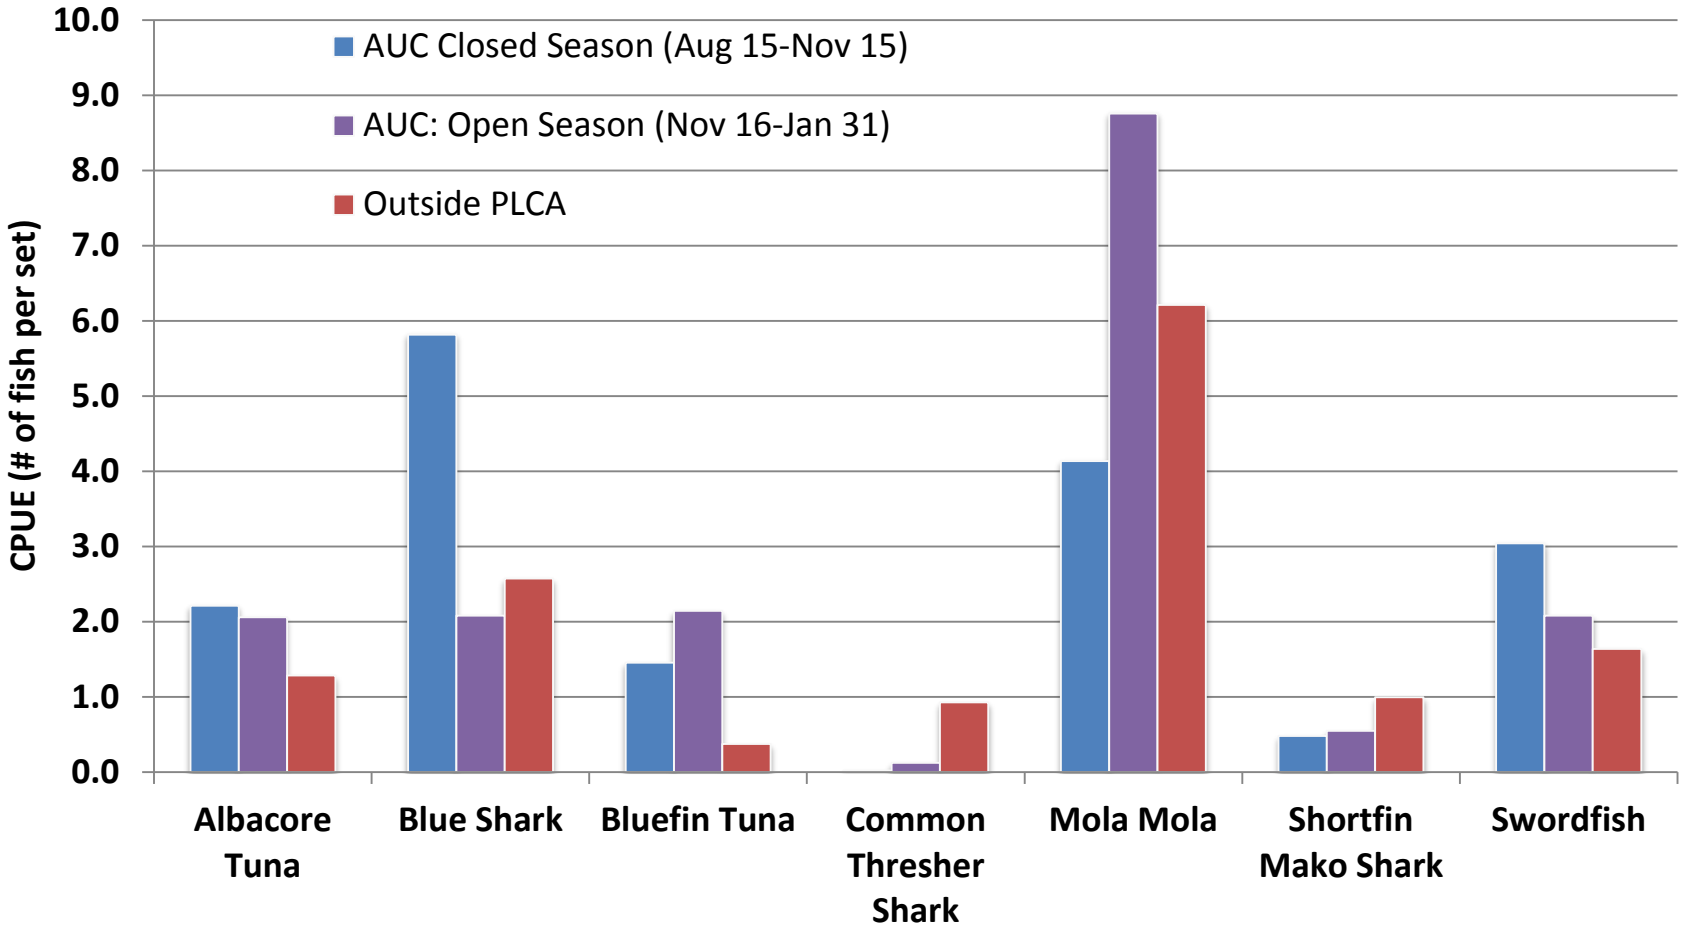
	Open Area	PLCA	AUC
Observed bycatch	4	6	3
Observed sets	6,139	2,226	389
Bycatch per 100 sets (CV)	0.065 (0.71)	0.27 (0.57)	0.77 (0.58)

Observer Coverage and VMS

- 20% observer coverage is a target based on rare-event sampling design study (Barlow, 1989)
- 30% coverage rate is a target based on NMFS National Bycatch Report (more is better)
- Approximately 34% observer coverage rate for 2013-14 season (one season funding infusion)
- Preliminary estimates show 19 active vessels made 559 sets in 2013-14 season so far
- All 19 vessels had operational VMS units

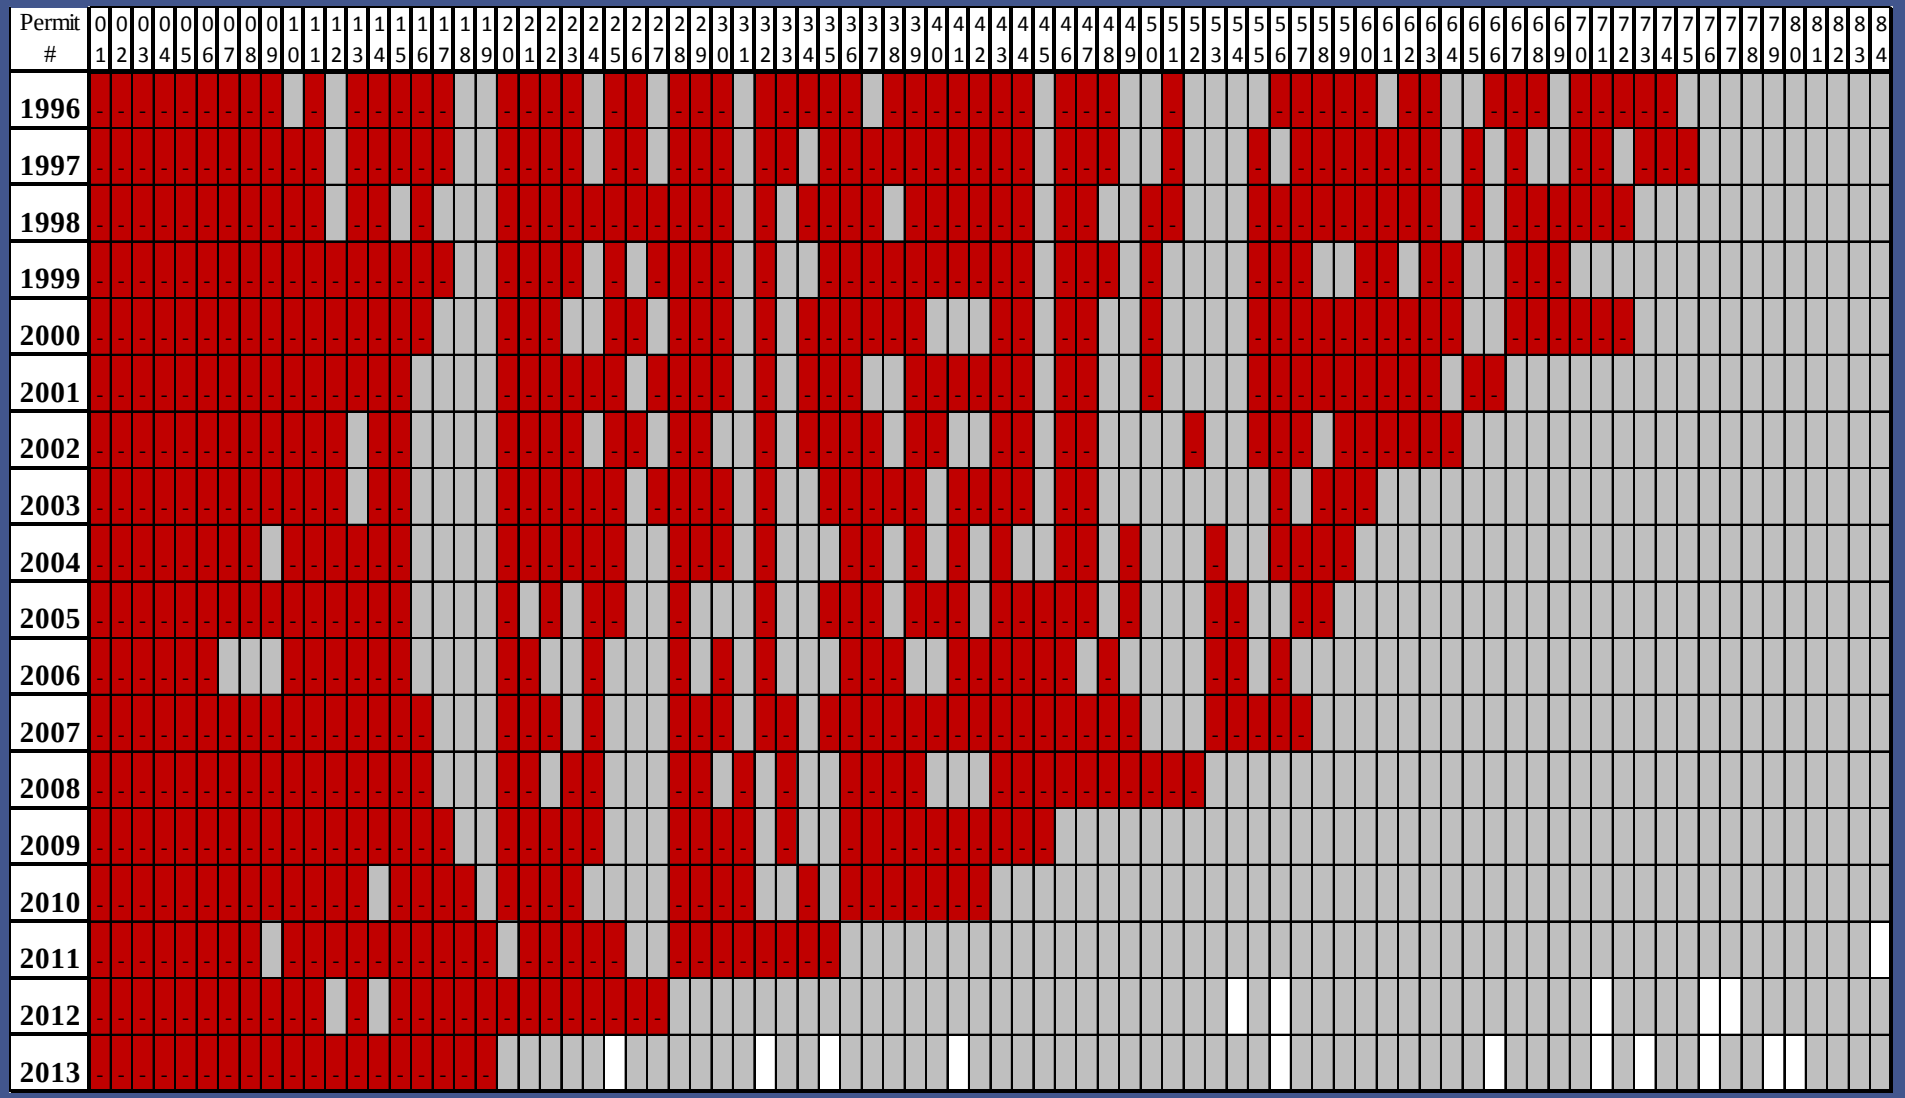
Comparison of Bycatch Rates Pre-2001 and Post-2000 (Bycatch per 100 sets)*

Period	All Cetaceans	Leatherbacks	Sperm Whales
Pre-2001	8.77	0.385	0.134
Post-2000	5.52	0.084	0.084
Pct Change	-37.1%	-78.3%	-37.5%



* HMSAS requested information

HMSMT Recommendation



- If the Council choses to open the AUC, exclude leatherback critical habitat from the AUC

Catch rates for selected finfish in the AUC compared to the area outside PLCA

- Swordfish catch rate ↑ inside closed area

Permit activity 1996-2013* for the 84 permits issued in 2011 (CFIS, LRB).

HIGHLY MIGRATORY SPECIES MANAGEMENT TEAM REPORT ON DRIFT GILLNET MONITORING, MANAGEMENT, AND ALTERNATIVE GEAR REPORT

1. Analysis of Potential Effort, Finfish Catch and Relative Bycatch Rates

The Highly Migratory Species Management Team (HMSMT) provided a placeholder in its March 2014 report on drift gillnet (DGN) management for an analysis of potential effort, finfish catch, and relative bycatch rates in the area under consideration (AUC) for reopening. This information is summarized here.

DGN observer data[1] from 1990-2000 were used to compute ratios of leatherback turtle bycatch-per-unit-effort (BPUE) to swordfish catch-per-unit-effort (CPUE) inside the AUC during two time periods. The first, August 15 – November 15 (left column of Table 1), has been closed since 2001; the second November 16 – January 31 has remained open (middle column of Table 1). The third column reports BPUE/CPUE where DGN effort was observed outside the PLCA. This breakdown contrasts finfish catch rates and protected species bycatch rates within the AUC during the current open and closed periods and outside the PLCA. The estimates demonstrate a considerably higher swordfish CPUE for effort inside the AUC during the closed season. However, the observed leatherback bycatch rate was also higher, as is the ratio of leatherback bycatch to swordfish catch (BPUE/CPUE). It should be noted however that the two observed leatherback interactions within the AUC since it closed are insufficient to test for statistical significance.

Table 1. Observed Leatherback/Swordfish (BPUE/CPUE) Ratio by Area and Season, 1990-2000.

Observed Leatherback and Swordfish BPUE/CPUE Ratio by Area and Season, 1990-2000

	Closed Season, AUC (Aug 15-Nov 15)	Open Season, AUC (Nov 16-Jan 31)	Non-PLCA
Observed Effort (Sets)	321	49	3889
Swordfish Catch (Counts)	976	102	6368
Swordfish CPUE	3.0405	2.0816	1.6374
Leatherback Takes (Counts)	2	0	4
Leatherback BPUE	0.006231	0	0.001029
Leatherback-Swordfish BPUE/CPUE	0.002049	0	0.0006281

[1] Observer coverage of drift gillnet effort from 1990 to 2000 was 16.4% of the total number of sets fished over the period.

Appendix 1 includes a summary of potential effort, revenues, finfish, and protected species impacts by area and season. A medium effort scenario based on 19 participating vessels was used to estimate expected effort in sets, which was then allocated in proportion to historical effort and catch from 1990 to 2000 inside the AUC or outside the PLCA. Revenues per-set within the fishery were estimated for the 1990s and inflation adjusted to 2013 dollars. Potential impacts were calculated by scaling revenue per set, CPUE, and BPUE rates to low (-25% of the baseline), medium and high (+25% of the baseline) effort scenarios.

Figure 1 highlight some of the most relevant statistics from Appendix 1. Swordfish and blue shark CPUE were both higher inside the AUC during the closed season than for either inside the AUC during the period it remained open or outside the PLCA. Common mola, common thresher shark and shortfin mako shark were caught at lower CPUE inside the AUC during the closed season than for other AUC or non-PLCA effort.

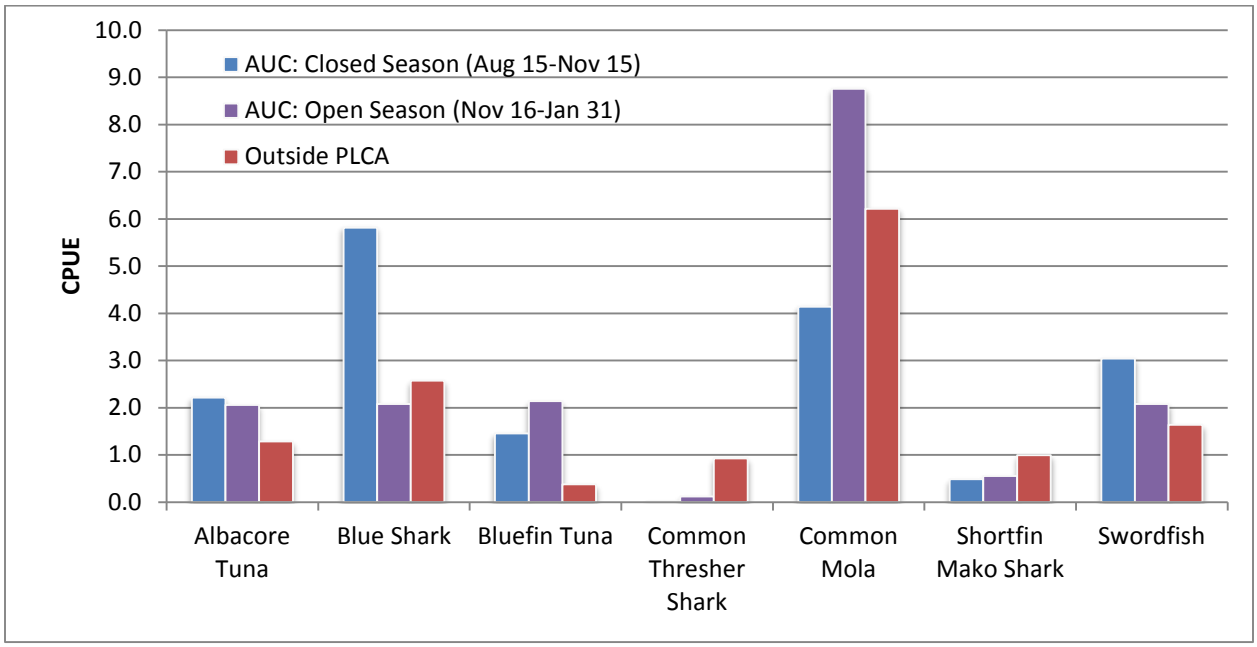


Figure 1. Catch rates for selected finfish in the Area Under Consideration (AUC) compared to the area outside PLCA

As indicated in Appendix 1, the leatherback turtle bycatch rate was higher while the sperm whale bycatch rate was appreciably lower for AUC effort during the season that closed after 2000 compared to time-area combinations which remained open to DGN after 2000. These results should be considered subject to the caveats that they are only representative of relative bycatch rates in observer data before 2001 and that rare event bycatch rates are difficult to reliably quantify.

HMSMT Discussion of DGN Management with HMSAS

The HMSMT held a joint session with the HMSAS at the March 2014 Council meeting to present the HMSMT Report on DGN management and take questions from constituents. The discussion clarified that a total of 25 leatherback sea turtle bycatch observations were made in the history of

the NMFS DGN observer program dating back to 1990, and that 10 sperm whales were observed taken over six different sets.

A member of the HMSAS asked whether bycatch rates presented in Table 1 of the HMSMT Report on Agenda Item K.5.b could be restated in terms of a comparison of bycatch rates before and after regulatory measures were adopted. The period from 1997 to 2001 included the adoption of recommendations by the Pacific Offshore Cetacean Take Reduction Team to reduce marine mammal bycatch in the DGN, and the establishment in 2001 of the PLCA.

Table 2. Comparison of Bycatch Rates Pre-2001 and Post-2000 (Bycatch per 100 sets).

Period	All Cetaceans	Leatherbacks	Sperm Whales
Pre-2001	8.77	0.385	0.134
Post-2000	5.52	0.084	0.084
Pct Change	-37.1%	-78.3%	-37.5%

Table 2 summarizes bycatch rates per 100 drift gillnet sets before 2001 and after 2000 for all cetaceans, leatherback sea turtles and sperm whales. As seen in the table, the observed rate of DGN interactions with all cetaceans and with sperm whales alone was reduced by slightly over 37% after MMPA regulation, while the leatherback sea turtle interaction rate declined by over 78% after ESA regulation. Observer reports included 6 sperm whales reported dead, 2 released alive, and 2 released injured; 11 of 25 leatherback turtles observed as DGN bycatch were released uninjured.

CDFW Survey Results

At the request of the HMSMT, the California Department of Fish and Wildlife undertook a phone survey of all DGN permittees to gauge their interest in fishing should the PFMC's proposed Area Under Consideration (AUC) be reopened. The preliminary results of the survey are summarized in Appendix 2.

Of the 72 issued permits as of February 2014, 54 permit holders have responded to the survey thus far. The respondents held a permit for an average of 22 years up to the present. Twenty-six had not actively fished for swordfish within the last five years while 28 had actively fished within that time. When asked if the potential opening of the AUC would influence their decision to fish in the DGN in the future, 18 permittees replied that it would, 30 said it would not because the area was either too small or too far from their home port, and 6 were unclear on what influence the AUC opening would have. The respondents noted that a host of other factors would ultimately contribute to their final decision to fish or not, for instance swordfish availability and price. The respondents noted the average cost to get ready for DGN fishing in 2014-15 would be approximately $19,000, and 21 responded that it would cost them at least $10,000 to prepare to fish again. Thirty-eight stated they would be able to accommodate observers if so requested.

HMSMT RECOMMENDATION TO THE COUNCIL:

- If the Council choses to open the AUC, eliminate leatherback critical habitat from the AUC.

NATIONAL MARINE FISHERIES SERVICE REPORT
PACIFIC OFFSHORE TAKE REDUCTION TEAM RECOMMENDATIONS AND IMPLEMENTATION PLAN

Implementation Plan

NMFS has commenced rule writing and supporting processes under the Marine Mammal Protection Act (MMPA) to consider implementation of recommendations from the Pacific Offshore Cetacean Take Reduction Team (POCTRT), which met on February 4-6, 2014 in Long Beach California (Agenda item K.5.b). The Team was convened in 1996 to reduce the bycatch of strategic marine mammal stocks in the California drift gillnet fishery, as required under Section 118 of the MMPA. The recommendations to NMFS address permanent measures needed to reduce the risk of incidental mortality and serious injury to sperm whales during California drift gillnet (DGN) fishing operations. NMFS implemented temporary measures in 2013 under MSA emergency rulemaking authority to reduce the aforementioned risk. The temporary measures expired on January 31, 2014 (Agenda Item K.5.a, Attachment 1). NMFS will conduct all the relevant and mandatory impact analysis as stipulated under the applicable federal statutes to amend the Pacific Offshore Cetacean Take Reduction Plan (Plan) under the MMPA. NMFS will consider the below measures as recommended by the POCTRT (abbreviated from full list of recommendations) while developing the proposed amendments to the Plan:

i. A year-round closure of the DGN fishery in waters deeper than 1,100 fathoms unless a vessel is carrying an observer (the "Zone," as defined in the emergency rule)
ii. A fixed cap (maximum annual limit) of sperm whale serious injury/mortality
    1. If the cap is met/exceeded but the Potential Biological Removal (PBR) level is not exceeded, further DGN fishing in the Zone would be prohibited.
    2. If PBR is exceeded, all DGN fishing would be prohibited for the remainder of the season and the POCTRT would be reconvened. The DGN fishery would remain closed until NMFS promulgates additional regulations based on Team recommendations.
iii. Require VMS for all permitted DGN vessels
iv. Require DGN vessel owner/operators to notify the NMFS observer program at least 48 hours in advance of every fishing trip.

Action Plan/Timeline for amending the Pacific Offshore Cetacean Take Reduction Plan through Rulemaking:

1. Proposed Rule prepared, cleared, and published in Federal Register - target date late April/early May
    a. 30 day Public Comment period commences

2. NMFS prepares an Environmental Assessment under the National Environmental Policy Act
    a. Draft released for public review and comment concurrent with proposed rule.
3. NMFS evaluates the rule under Section 7 of the Endangered Species Act (ESA) and section 101(a)(5)(E) of the MMPA, including consideration of the existing Biological Opinions and Authorizations, to ensure full compliance with the ESA and MMPA.
4. Final rule published in Federal Register - target date mid/end July (to be effective mid/end August).

POCTRT Consensus Recommendations

Below is a near-final draft of consensus recommendations developed by the Pacific Offshore Cetacean Take Reduction Team at its February 3-5, 2014, meeting. The recommendations outline permanent amendments to the Take Reduction Plan to reduce sperm whale mortality and serious injuries, as well as a number of non-regulatory actions.

The POCTRT is still contemplating a handful of minor language changes to some of the non-regulatory recommended actions, but the substance and focus of the recommendations being provided to you today are not expected to change. NMFS looks forward to discussing these recommendations with you at your upcoming meeting.

Consensus Recommendations of the
Pacific Offshore Cetacean Take Reduction Team

(As negotiated and confirmed by the Team at its February 4-6, 2014, meeting)

Implement a year-round closure for CA thresher shark/swordfish drift gillnet ≥ 14 inches (DGN) vessels in an area (the Zone) unless the fishing vessel is carrying a federal observer. The Zone, as defined in the Emergency Rule, covers all areas of the U.S. EEZ seaward of California that are deeper than the 2,012 meters (1,100 fathoms) depth contour; however, the boundary line that defines the Zone closes some areas that are deeper or shallower than the 2,012 meter (1,100 fathoms) depth contour. The Zone's boundary line runs both north and south of Pt. Conception from the Oregon/California border to the Mexico/California border, generally along the 2,012 meter (1,100 fathoms) depth contour, with the exception of an area seaward of the Santa Lucia escarpment, and any canyons or basins shoreward of the main north-south 2,012 meter depth contour.

Implement a fixed, maximum annual limit of sperm whale mortality/serious injury (the cap) that is the largest whole number of mortality/serious injury that is less than PBR. If the cap is met or exceeded, but PBR is not exceeded, then DGN fishing in the Zone is prohibited for the remainder of the calendar year in which the mortality/serious injury occurs. Should mortality/serious injury occur at any time that exceeds PBR, all DGN fishing would be prohibited, and the POCTRT would be reconvened as soon as practicable to develop and recommend strategies for reducing serious injury and mortality to levels below PBR. The fishery would remain closed until NMFS promulgates implementing regulations to reduce mortality/serious injury of sperm whales in the fishery.

Target 100% observer coverage for observable vessels fishing in the Zone. Vessels deemed unobservable are prohibited from fishing in the Zone. The Team recommends that NMFS allow for the option of issuing a “no observer required waiver” to an otherwise observable vessel that wishes to fish in the Zone as long as the level of observer coverage in the Zone is sufficient to ensure that PBR will not be exceeded in the event the cap is reached and the observer coverage is less than 100%. All DGN fishermen are required to notify the NMFS observer program, at least 48 hours in advance of every fishing trip and specify if they intend to fish inside or shoreward of the Zone. Observer coverage at a minimum level of 20% is recommended shoreward of the Zone.

Require the use of VMS for all CA DGN vessels in order to facilitate monitoring and enforcement. Before fishing, DGN fishermen must activate the VMS unit on their vessel and declare to NMFS VMS their intent to fish using DGN gear. This is intended to be consistent with the 2013/2014 season requirements as described in the Emergency Rule.

POCTRT Consensus Recommendations Continued

(As negotiated and confirmed by the Team at its February 4-6, 2014, meeting)

Due to the VMS requirement, the DGN fleet is concerned about the possibility of being in a situation where they have unintentionally violated federal law by an unanticipated drift into the Zone. Therefore, discussions with enforcement regarding this issue should be incorporated into the Skipper Workshop. Additionally, investigate the application of existing technology that senses the operation of a DGN gear reel, which could be incorporated into the VMS feed or otherwise to give enforcement an additional ability to detect whether or not fishing operations are occurring.

To decrease the probability of future takes of sperm whales, NMFS should convene a mandatory Skipper Workshop as soon as practicable so that best practices can be reviewed and shared amongst the DGN fishermen. This and future workshops would allow fishermen to share ideas and strategies to reduce the take of sperm whales. We recommend that skipper workshops include:

1. A discussion and presentation regarding general sperm whale biology and information depicting previous locations of sperm whale takes in the fishery. Given the concentration of sperm whale takes near the continental slope, fishermen may want to avoid setting nets near the slope to reduce that risk.

2. Develop best practices for handling and disentangling sperm whales to reduce the probability that an interaction would result in a serious injury of sperm whales. Incorporate these best practices into training (e.g., skipper workshops) and provide specific disentanglement tools to increase the probability of successful disentanglement and safe release. Distribute these best practices (e.g., placards and associated tools) at skipper workshops.

3. Encourage the fleet to report sightings of large whales to other members of the fleet in as real-time as possible, especially for locations where large congregations might increase the risk of entanglement in those areas. Further encourage the real-time sharing of whale sightings with NOAA.

Observers, to the extent possible or permitted, take photographs and collect skin samples from entangled sperm whales that may allow future identification of that disentangled individual. These data may provide additional information as to the whale's fate, which could affect NMFS' serious injury determination. The POCTRT also recommends that NMFS pursue the possibility of observers satellite-tagging entangled sperm whales before release to help determine the movements and disposition of the animal.

The Team recommends that if a sperm whale is taken and released alive in the DGN fishery, that the injury determination be expedited and the team notified similar to the False Killer Whale Take Reduction Team's recommendation. Additionally, the Team should be notified of any sperm whale mortalities.

POCTRT Consensus Recommendations Continued

(As negotiated and confirmed by the Team at its February 4-6, 2014, meeting)

In addition to the immediate measures identified to address the current status of sperm whale estimated mortality in relation to PBR, the POCTRT believes there are a number of other longer term measures that could help address the broader goal of accurately assessing and reducing marine mammal mortality in the fishery.

The POCTRT recommends the following longer-term actions:

- Even if short-term increases in observer coverage related to sperm whales expire, observer coverage of at least 20% of the fishery should be maintained long term.
- NMFS should conduct a review of the status of sperm whales (whether or not an outside petition to down-list or delist is received) and that this should include the potential recognition of DPS units as appropriate.
- NMFS and the SRGs examine the efficacy of increasing the number of years used in the mortality estimates for a stock, beyond five years, in cases where mortality/serious injury events are very rare and a larger pool of years might improve the precision and accuracy of mortality/serious injury.
- Explore ways to improve abundance estimates and population structure for sperm whales which could include:
    - Continue surveys for abundance and incorporate new surveys as rapidly as possible.
    - Evaluate other approaches for estimating abundance including mark-recapture from photo or genetic identification should adequate sample size become available.
    - Use trend-based Nmin calculations in the SAR that make more complete use of the often-limited data available to assess populations, as has been already used in the fin whale SARs.
    - Examine this population using improved sample sizes for genetics, photo-ID and satellite tagging from CA-WA and surrounding areas as well as use of surveys outside the EEZ in combination with habitat models.
- Examine diving behavior and movements of large aggregations of sperm whales off CA-WA to determine if there are ways in terms of seasonality, daily diving behavior, and movements of sperm whale groups that could inform ways to reduce interaction with sperm whales.
- NMFS consult with CDFW and seek cooperation for the transfer of DGN limited entry permits and other state DGN fishery regulations to federal authority; furthermore, petition the PFMC to initiate an HMS FMP plan amendment incorporating the CA state permits into a federal limited entry fishery.
- Work with the PFMC's HMS Management Team (MT) and Advisory Subpanel (AS) in reviewing the existing suite of CA DGN fishery regulations, and making appropriate changes.

POCTRT Consensus Recommendations Continued

(As negotiated and confirmed by the Team at its February 4-6, 2014, meeting)

- Work with the HMS MT and AS to consider an HMS FMP plan amendment structure that includes a fishery monitoring program that targets 100% observer coverage, including the application of electronic monitoring technology, as an adjunct to human observers, and explores alternative and/or supportive sources of funding to support such a program.
- Evaluate ways in which others outside NOAA could contribute or help support the observer program should funding become a limiting factor.
- Continue to explore ways – and encourage implementation, as appropriate - to monitor the fishery using remote or electronic means (such as cameras or reel monitors), especially the vessels currently deemed unobservable.
- Explore and research options for making gear modifications (e.g., alternative pinger frequencies) to reduce serious injury and/or mortality.
- NMFS reconvene the Team within the next year to take advantage of the current progress and momentum, as well as to respond to new information or events, and to continue the development of long-term strategies for reducing marine mammal mortality. An in-person meeting would best be held from February through April to allow participation by the fishermen. Emergency meetings triggered by new developments or takes can be held remotely (conference calls and web connection) especially in the period June to January.
- NMFS should notify the POCTRT in the event of any change in PBR or ESA listing status for sperm whales so the team can evaluate the need for meeting and revising the Take Reduction Plan.

UNITED STATES DEPARTMENT OF COMMERCE
National Oceanic and Atmospheric Administration
NATIONAL MARINE FISHERIES SERVICE
West Coast Region
Sustainable Fisheries Division
501 West Ocean Boulevard, Suite 4200
Long Beach, California 90802

MAR - 5 2014

Assemblymember Mark Stone
California State Assembly
State Capitol
P.O. Box 942849
Sacramento, California 94249-0029

Dear Assemblymember Stone:

Thank you for your letter expressing your commitment to California's ocean health and the long-term sustainability of fisheries, both objectives that NOAA's National Marine Fisheries Service (NMFS) and the Pacific Fishery Management Council (Pacific Council) share. These objectives are embodied in the Pacific Council's Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species (HMS FMP), under which the drift gillnet fishery is managed, and are reflected in the Magnuson-Stevens Fishery Conservation and Management Act (MSA) that directs and guides all federal fisheries management.

I hope I correctly read the underlying theme in your letter, to be concerned about fisheries bycatch, the sea life returned to the ocean because of either its protected status or economic value. In addition to the MSA's provisions to minimize bycatch in U.S. federal fisheries, the Marine Mammal Protection Act (MMPA) and the Endangered Species Act (ESA) also govern bycatch minimization in U.S. federal fisheries. Collectively, these three statutes impose standards on our management to avoid and minimize impacts to protected species and unmarketable fish species. Fishing regulations are adopted to reflect these conservation standards while also carrying out the MSA's other objectives – utilize domestic fishery resources for contributing to the Nation's food supply and economy, and consider the participation of fishing communities that depend on these resources. The California swordfish drift gillnet fishery is managed to the same standards imposed on all fisheries regulated under these statutes.

The Pacific Council will consider management issues related to the drift gillnet fishery at its meeting this month. It will hear from advisory bodies, technical and scientific teams and the public. Should the Council make a recommendation to NMFS for any changes in current drift gillnet management, my office would then determine how their proposal comports with the three statutes mentioned above.

The Pacific Council will also hear about the ongoing results of research into two other fishing gears, deep-set pelagic longline and buoy gear. Both methods are designed to minimize protected species interactions and could provide additional local swordfish landings to the West Coast;

although more research is needed. We think that continued testing of these gears may provide California and the U.S. an opportunity to be a leader in innovative swordfish fishing techniques.

Prior to 2013, the drift gillnet fishery was classified under the MMPA as a Category III fishery, in large part because the use of "pingers" and other deterrent measures were sufficiently effective in reducing interactions with protected marine mammals. As you stated in your letter, in 2013 the drift gillnet fishery was classified as a Category 1 fishery due to the observed take of two sperm whales in 2010.[1] In response, NMFS re-convened the Pacific Offshore Cetacean Take Reduction Team (TRT) in July 2013, and again in February 2014. The TRT is finalizing consensus recommendations to NMFS that are designed to reduce serious injury and mortality of sperm whales in drift gillnet gear. NMFS will be sharing these recommendations with the Pacific Council at its March meeting and intends to pursue adoption of them after considering public comment, but before drift gillnet fishing commences on August 15, 2014.

Your letter also expresses concern about swordfish being landed in California by Hawaii-based vessels using pelagic shallow-set longline gear. These vessels and the gear used are authorized by NMFS under the Fishery Ecosystem Plan for Pacific Pelagic Fisheries of the Western Pacific Region (Pelagics FEP) to fish up to the seaward boundary of the U.S. West Coast exclusive economic zone (the "200-mile limit"). The fishing practices of these vessels are regulated by NMFS-imposed mandatory gear requirements under the previously mentioned statutes and 100 percent of the vessels are monitored by federally trained observers. These efforts have significantly reduced protected species interactions when compared to previous fishing practices. The success of the innovations in gear (developed by NMFS scientists in collaboration with industry) is evidenced by the U.S. Atlantic shallow-set longline fishery, which uses the same techniques and is now certified as a sustainable fishery by the Marine Stewardship Council.

With regard to the four informational requests, our responses are below:

Explain the state and federal regulatory mechanisms, requirements and authority that allow the Hawaii pelagic longline swordfish fleet to land fish in California and other U.S. West Coast ports despite the fact that the gear type is prohibited under the Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species and federal regulations covering the EEZ and adjacent High Seas.

From the federal perspective, the discrepancy between the two fisheries results from the 2004 adoption by the Pacific Council of the HMS FMP that, in the determination of NMFS under the ESA, did not adequately protect sea turtles. As a result, NMFS did not authorize shallow-set longline gear in the HMS FMP. At that time, however, Hawaii-based longline vessels operated out of both Hawaii and the West Coast under regulations implementing the Pelagics FEP that *did* protect sea turtles, and thus these vessels were allowed to land in California ports. The situation remains today and NMFS is anxious to work with the Pacific Council to address the issue.

---

[1] Based on these two sperm whale mortalities and the percent of DGN trips observed during the 2010-2011 fishing season, the estimated sperm whale take was extrapolated out to 16 animals. As specified by the MMPA, this take was then averaged over a 5-year period to result in an average annual estimate of 3.2 sperm whale mortalities or serious injuries. This value exceeded the allowable level of potential biological removal (PBR) for this stock under the MMPA. As a result, NMFS implemented temporary regulations, as recommended by the TRT, for the 2013-14 fishing season to reduce potential fishery impacts to below the PBR level.

Explain the state and federal regulatory mechanisms, requirements and authority that could prohibit the Hawaii pelagic longline swordfish fleet from landing fish in California and U.S. West Coast ports.

Under the federal laws mentioned above, regulation of federal fisheries is initiated within the regional fisheries management councils, in this case by either the Western Pacific Council or the Pacific Council. Each council has an expansive process for public, industry and scientific input prior to its decision-making. Council decisions are, in effect, recommendations for regulations made to NMFS as the regulating agency. If NMFS determined that such a prohibition on Hawaii vessels landing swordfish in West Coast ports was necessary and appropriate, and the Pacific Council (or Western Pacific Council) did not act, then NMFS could establish such a prohibition by secretarial amendment under the MSA to the HMS FMP or the Pelagics FEP. In adopting recommendations and regulations, both of the Councils and NMFS remain very mindful of the goals and requirements of the governing statutes, two of which are:

- *Ensure the productivity and sustainability of fisheries and fishing communities through science-based decision-making and compliance with regulations (MSA).*
- *Recover and conserve protected resources through the use of sound natural and social sciences (ESA).*

In that regard, we are mindful of the dynamics of swordfish consumption and supply. Based on the most recent figures from the U.S. Department of Commerce, 21,297 metric tons (mt) of swordfish was consumed in the U.S. in 2012, of which domestic swordfish fisheries operating in the Atlantic, Hawaii, and California supplied 19 percent. Since 1997, our domestic fisheries have supplied on average only 16 percent of swordfish to the U.S. market. The vast majority of U.S. demand for swordfish is met from imports harvested by foreign fleets that NMFS considers to be lacking the protections for marine mammals built into the operation and management of U.S. fisheries.

Describe the regulatory and policy efforts and timelines that the Council and NMFS are taking to require foreign fleets for swordfish and other seafood meet U.S. fishing standards under the MMPA and other applicable U.S. fishery and conservation laws.

The MMPA includes provisions allowing for the use of import sanctions both to advance global bycatch conservation measures and to create fair and competitive markets for U.S. fishermen, *i.e.*, provide a "level playing field."

In order to implement this MMPA provision, NMFS must specifically define "U.S. standards" for bycatch applicable to the U.S. domestic marine mammal bycatch management program under the MMPA. NMFS began to clarify "United States standards" by publishing an Advanced Notice of Proposed Rulemaking (ANPR) in April 2010 for public comment. The agency received numerous comments on the ANPR, including comments from more than 30 nations. NMFS has evaluated the public comments and continues to develop a proposed rule.

The rule, if adopted, is required to define U.S. standards to include the domestic regulatory program's core requirements and provide other nations the flexibility to develop and implement programs to produce comparable results. Comparability findings would be necessary to allow for the importation of fishery products. This rulemaking is a priority for NMFS in 2014.

Explain how the state of California might prevent imports of seafood that does not meet U.S. fishing standards until such time as the U.S. acts to meet its legal obligations under the MMPA and other applicable U.S. fishery and conservation laws.

While NMFS works on an ongoing basis to meet its obligations under federal law, it does not consider itself best able to comment on authorities of the State of California under state law for this purpose.

In closing, I thank the California Assembly members for the opportunity to respond to your inquiry and share some background on how U.S. fisheries are managed to avoid and minimize bycatch. We share your interest in ensuring the long-term sustainability of California's ocean health and ocean fisheries. I look forward to continuing this dialogue and providing additional information as necessary.

Sincerely,

Robert Turner

NOAA FISHERIES SERVICE

Builds on previous research using gear modifications to reduce bycatch

- 2001 SSLL SWO fisheries in NE Atlantic and Pacific shut down
- Research using circle hooks and finfish bait dramatically reduced bycatch

- Both fisheries reopened
- Atlantic SSLL, SWO fishery now MSC certified

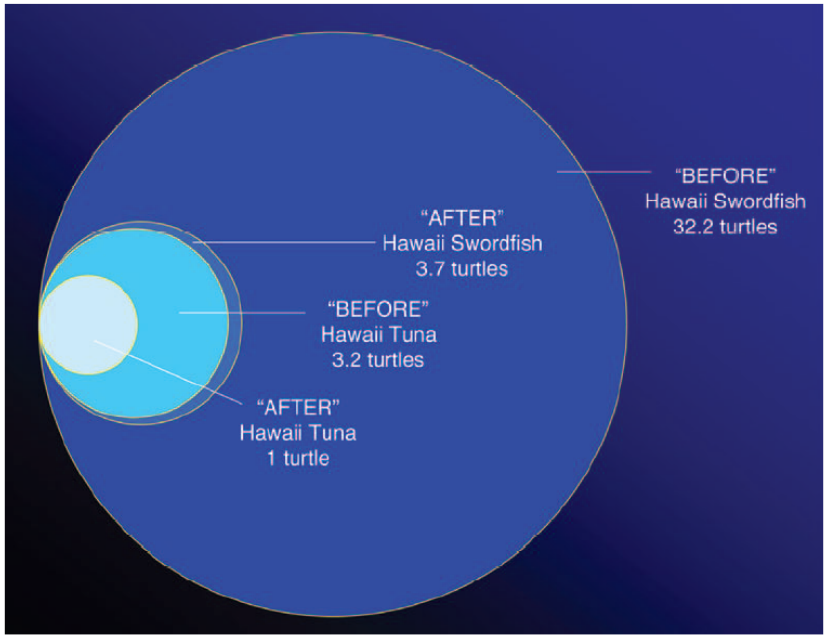

Figure 1. Computed Hawai'i longline tuna fisheries bycatch-to-catch (B/C) ratios were reduced after increased (to greater than 20 percent of the annual fishing trips) observer coverage documented a lower rate of sea-turtle interaction than had the lower previous observer coverage (of less than 5 percent of the annual fishing trips). Sea-turtle interactions were significantly reduced in the Hawai'i longline swordfish fishery as a result of revised hook-and-bait requirements required by federal regulations that took effect in mid-2004.

The area of the circles is proportional to the number of sea-turtle takes per 418,000 lb of target fish (tuna or swordfish) caught. The Hawai'i longline tuna fishery, with the lowest B/C ratio (for the 2003–2005 period studied) in this comparison, established the baseline of one sea-turtle take per 418,000 lb of tuna.

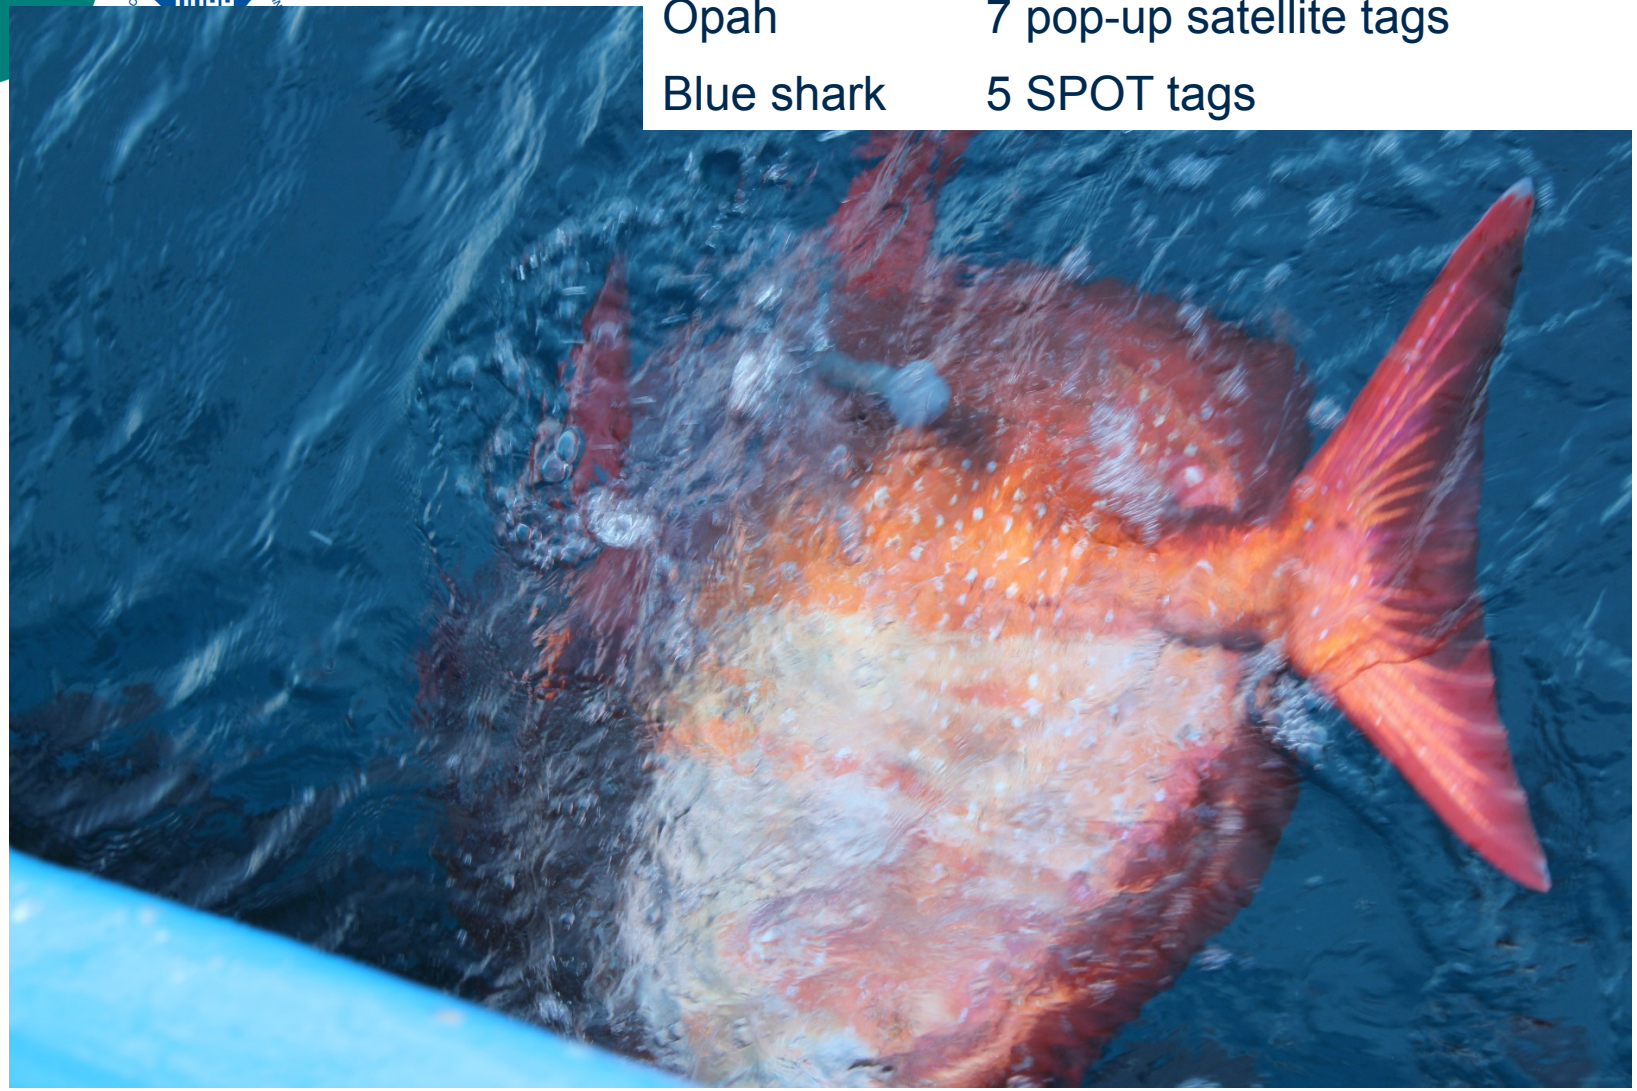
Albacore	4	
Bluefin	6	
Mako	2	
Dorado	1	
TOTAL	111	
Non-Marketable		**Mortalitiy**
Blue shark	328	31-62
Lancet fish	5	5
King of the Salmon	17	17
Mola	1	0
Oil fish	1	1
TOTAL	352	54-85

Mortality was estimated as 100% for fish that were landed or that died after release based on the tagging data, and for those species that were more delicate, deep water species that would not be expected to survive after release. Blue shark mortality was estimated as seen in next slide.

NOAA FISHERIES SERVICE



Blue Shark post-release mortality

- Post release mortality 5-15% (Musyl et al. 2011, Moyes et al. 2006)
- 15 moribund + 5-15% mortality = 31-62 blue sharks
- Small-scale research study; can't project bycatch rates to commercial fishery
- Fishermen work to reduce blue shark bycatch

  (They are not marketable and take time and gear, reducing overall efficiency and increasing costs.)

NOAA
FISHERIES

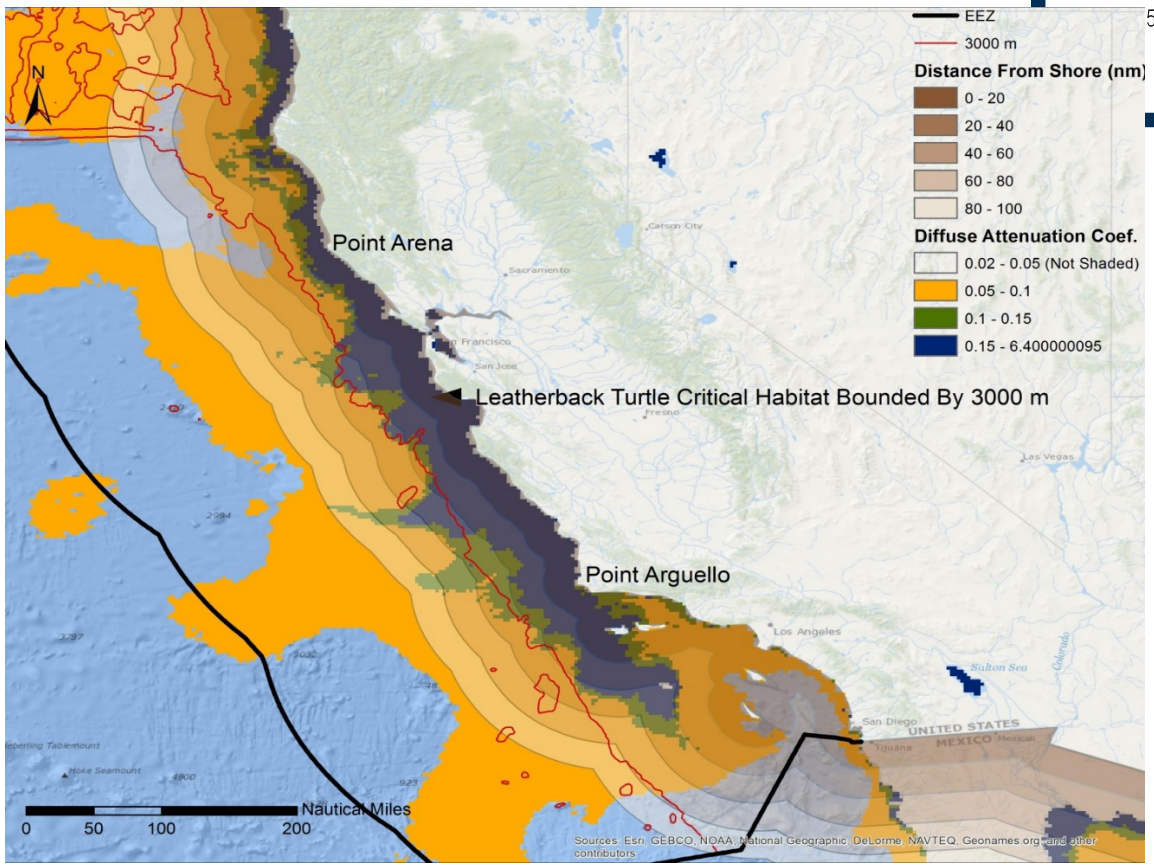
Conclusions



1. Gear trails successful
   A. Reached desired depths
   B. Caught swordfish and a range of marketable species

2. Timing of charters coincided with poor swordfish catch overall and number of sets limited

3. More data needed under conditions consistent with typical fishing operations i.e. fish when and where conditions optimal.

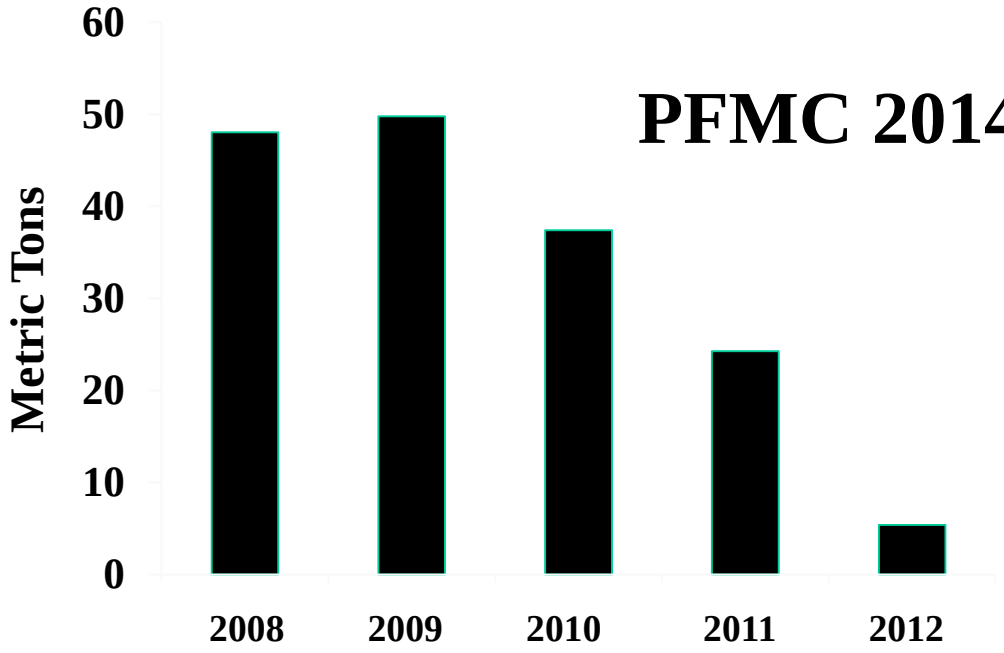
Blue Shark		**2**



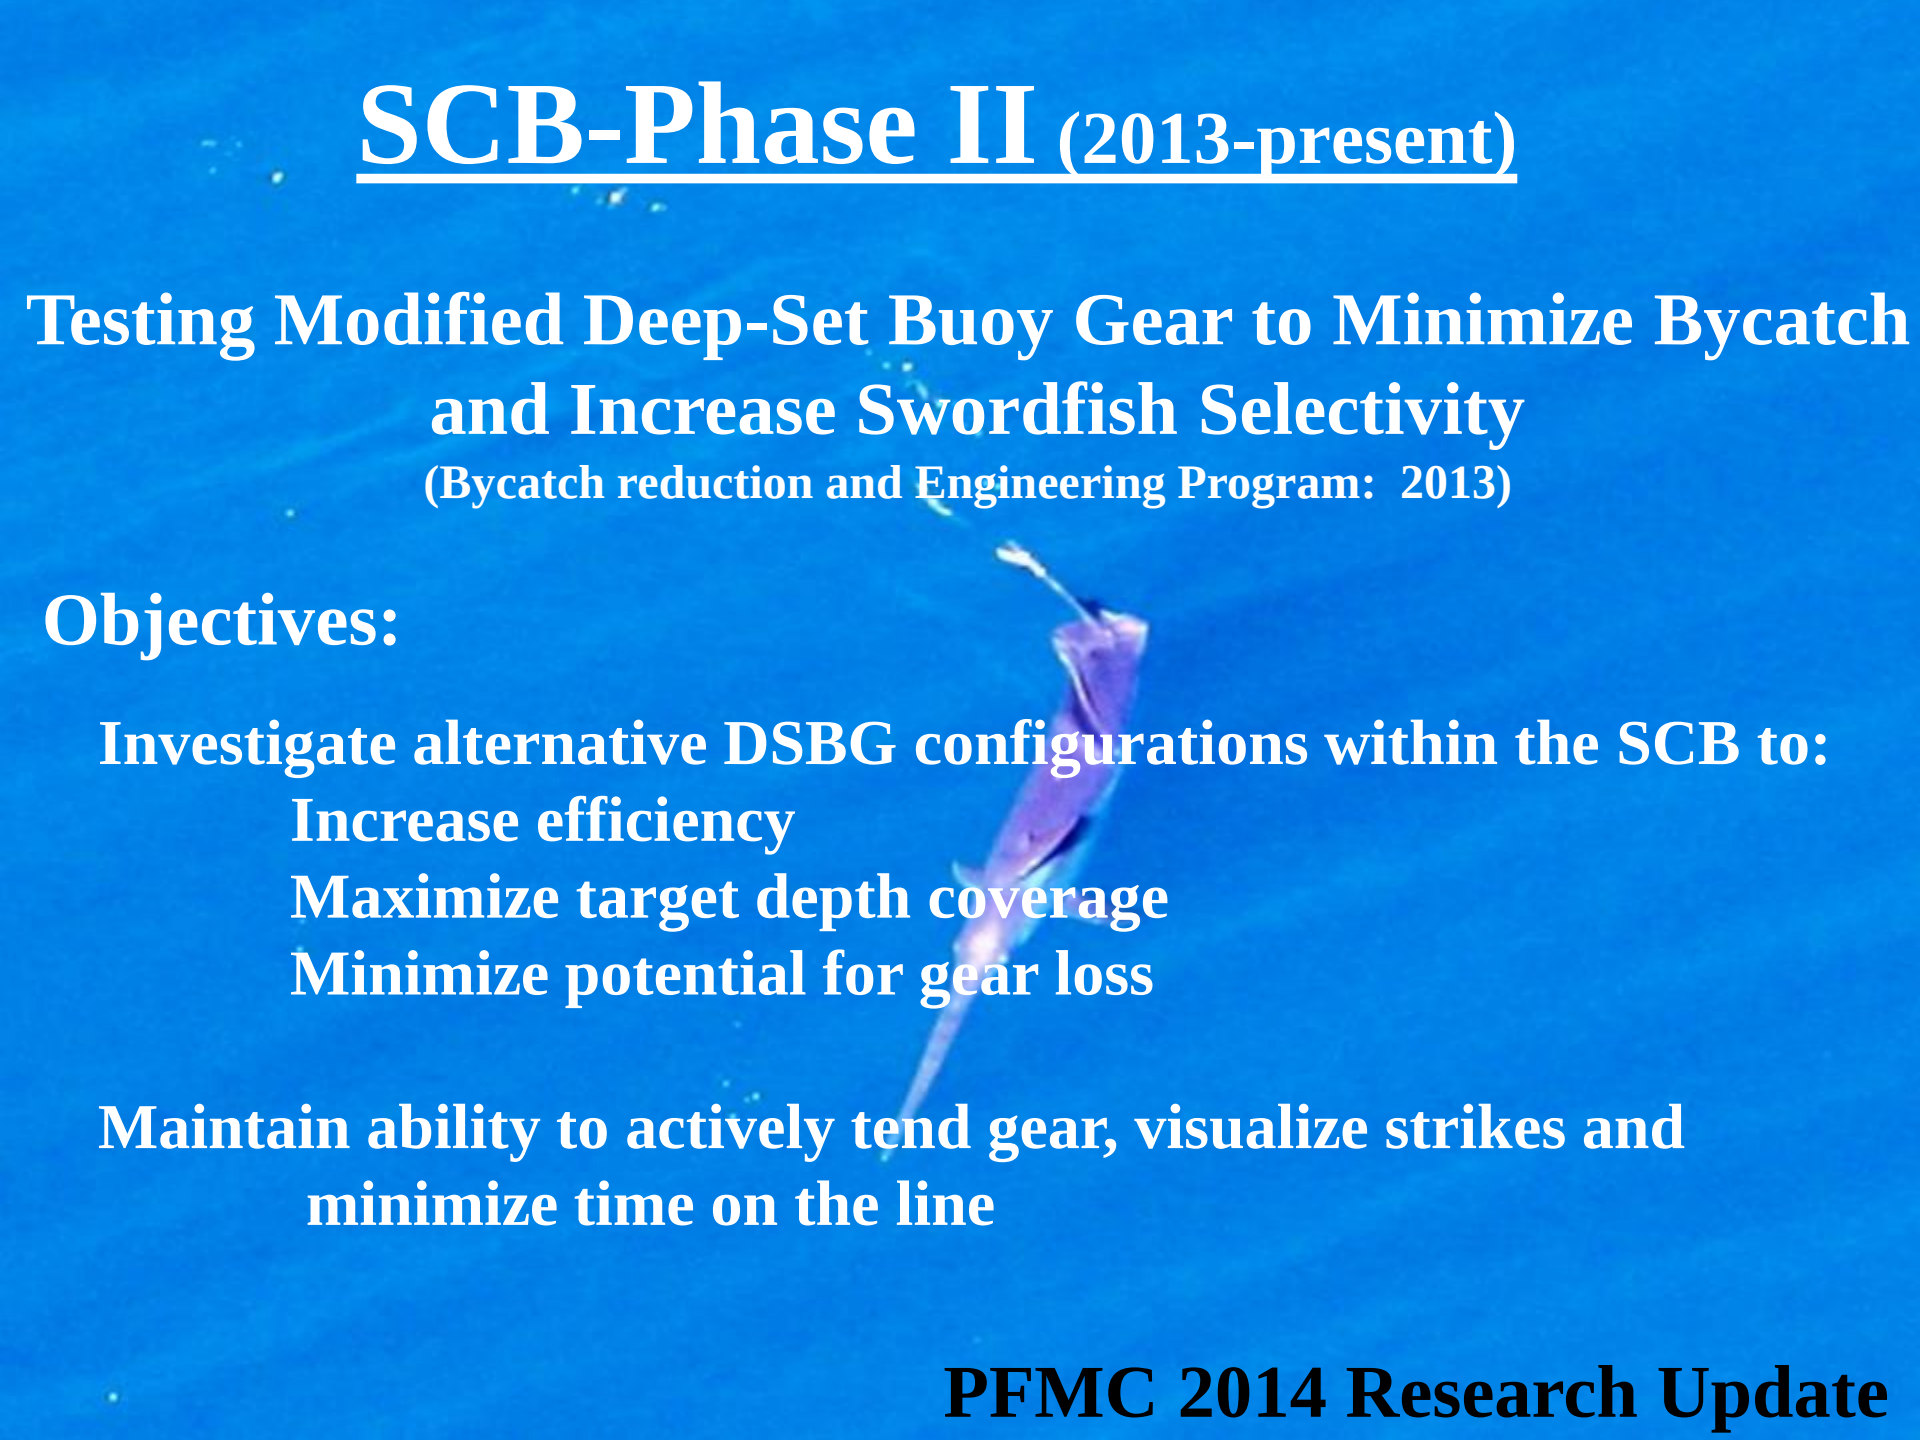
2012 CA Swordfish Landings

Harpoon was ~5 mt

DGN was ~72 mt

Experimental DSBG > than any CA harpoon vessel in 2012

PFMC 2014 Research Update



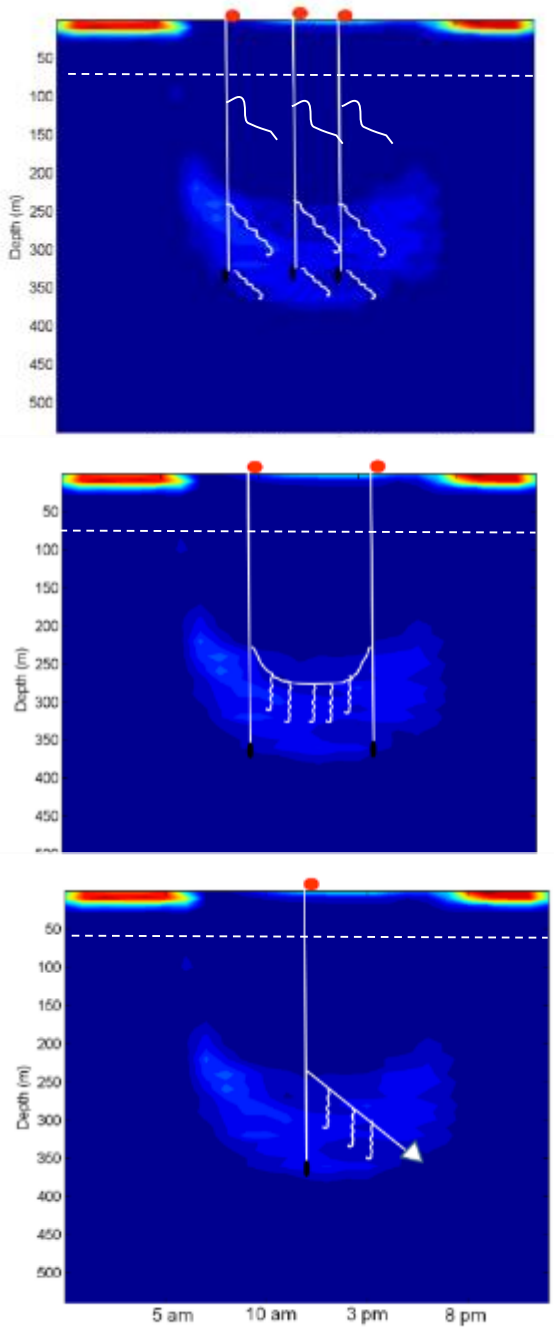
California Harpoon Landings

Data from PacFIN, 2/20/2013

SCB-Phase II (2013-present)

Testing Modified Deep-Set Buoy Gear to Minimize Bycatch and Increase Swordfish Selectivity

(Bycatch reduction and Engineering Program: 2013)



Objectives:

Investigate alternative DSBG configurations within the SCB to:

- **Increase efficiency**
- **Maximize target depth coverage**
- **Minimize potential for gear loss**

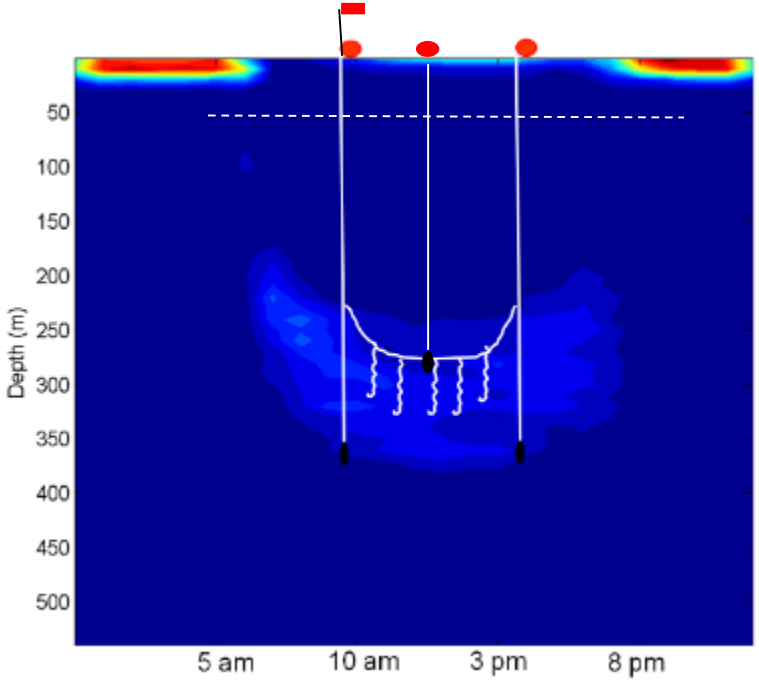
Maintain ability to actively tend gear, visualize strikes and minimize time on the line

SCB-Phase II (2013)

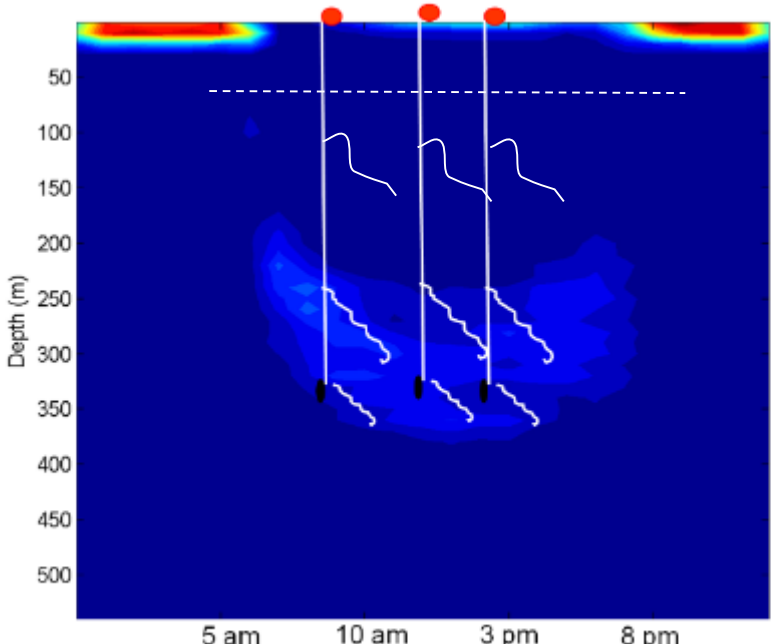
Investigate alternative DSBG configurations within the SCB.

1. **Reduce buoy count**
2. **Increase hook count**
3. **Maximize target depth coverage**
4. **Test different weighting regimes**
5. **Test the use of flashers and radar reflectors for nocturnal deployments**

Depth/temperature loggers used on all test sets



PFMC 2014 Research Update



SCB-Phase II (2013)

Two test configurations selected that:

- **Minimized tangling**
- **Maximized water column coverage**
- **Maintained ability to detect strikes**
- **Maintained consistent depths**
- **Maintained rapid sink rate**

PFMC 2014 Research Update

SCB-Phase II (2013-present)

Set information

Experimental trials (during periods of low swordfish harvest)
10 fishing days for 1,850 hook hours
- **3 Opah**
- **3 Bigeye thresher sharks**
- **1 Swordfish (lost at boat)**

Fishing trials: 12 fishing days for 2,590 hook hours
- **1 Mako shark**
- **1 Salmon shark**
- **6 Blue sharks**
- **11 Swordfish (3 lost at boat)**

SCB-Phase III

Phase III
Testing DSBG with cooperative fishers
(Bycatch reduction and Engineering Program: 2014)

Test modified DSBG configuration with 3 vessels in 2014

Collect adequate set data to better assess feasibility, fisher acceptance and catch composition

Continue outreach to fishers, community and markets

Collaborative Study: SWFSC, SWR & PIER

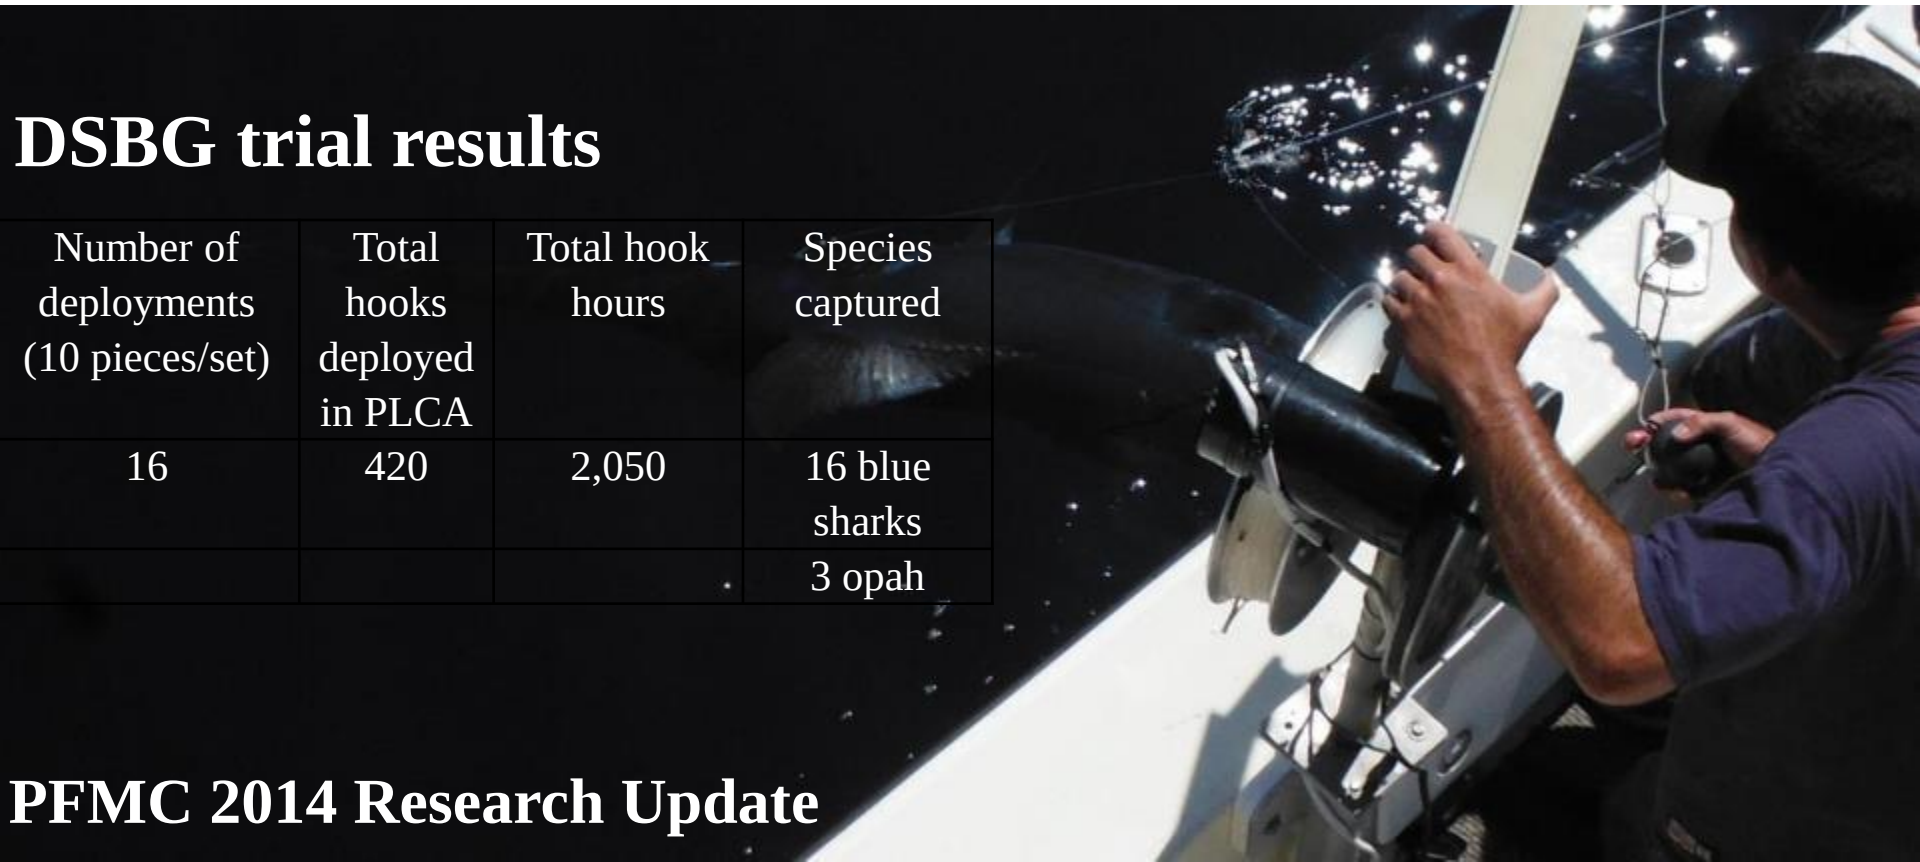
California Fisheries Research Program (CFR- West)
NOAA Cooperative Research Award
NOAA (Heidi Dewar, PhD, SWFSC) and PIER (Chugey Sepulveda, PhD).

PFMC 2014 Research Update

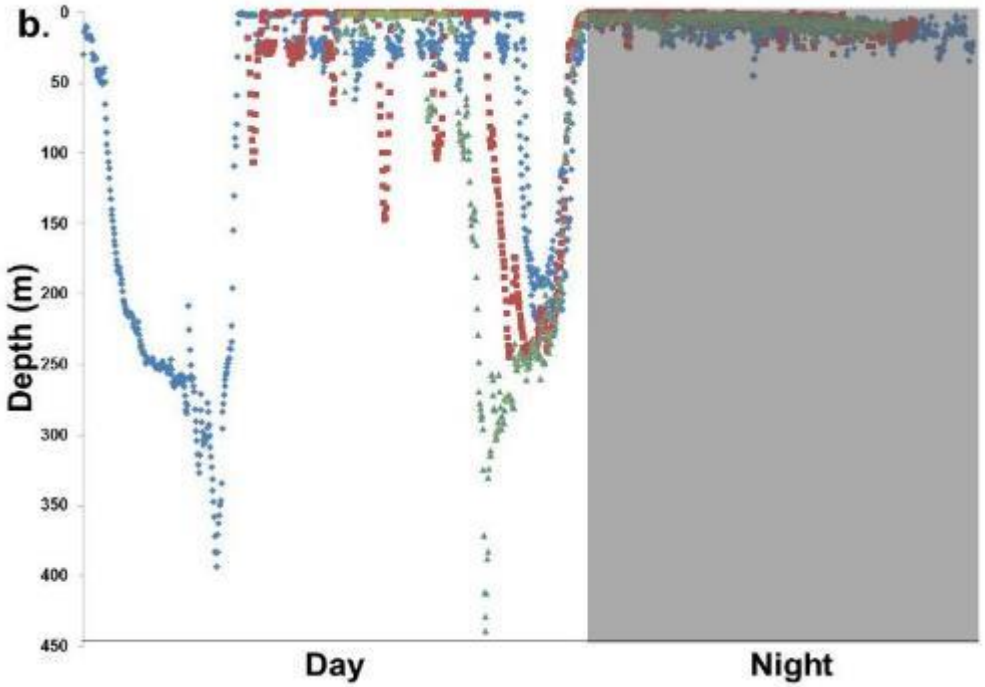
PLCA studies

- Tag swordfish within the PLCA
- Document depth distribution
- Trial alternative gear types:

Deep-set Buoy Gear (PIER)



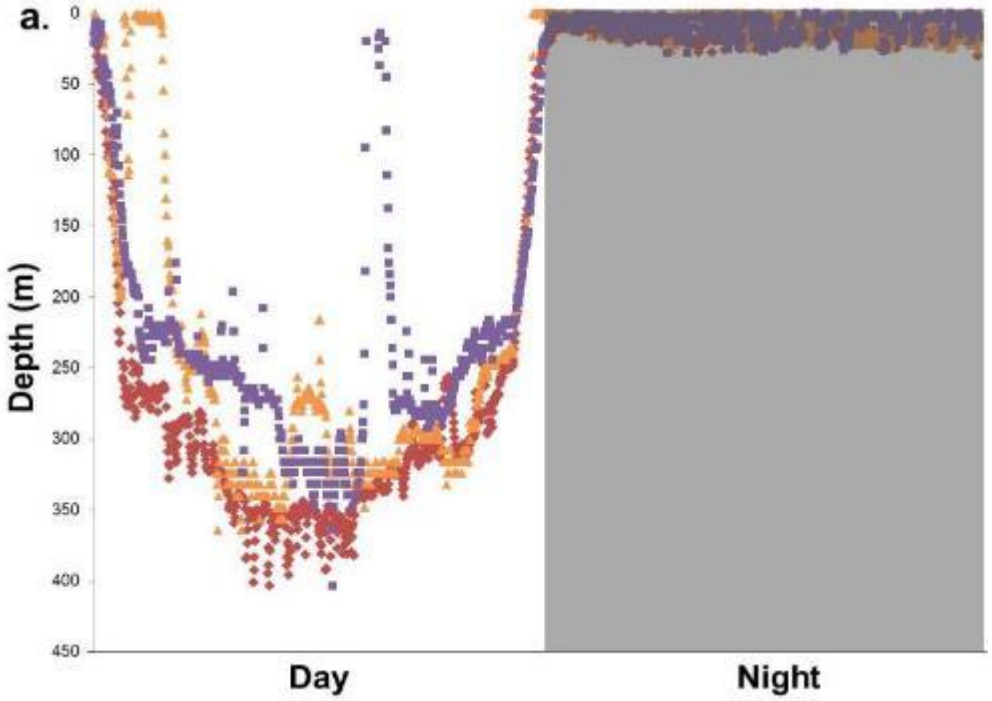
Deep-set Long Line (NOAA)



PIER swordfish research above Point Conception

- **Six cruises to the PLCA (2012 & 2013)**
- **Tagged 13 swordfish (all with harpoon)**
  - **11 with PSATs & 2 with SWFSC SPOT tags**

DSBG trial results



Number of deployments (10 pieces/set)	Total hooks deployed in PLCA	Total hook hours	Species captured
16	420	2,050	16 blue sharks
			3 opah

PLCA Tag Data

- Shallower daytime distribution
- Trends are consistent with 2013 data
- Inshore/bank oriented movements?

SCB Tag Data

- Consistent daytime distribution
- Trends are consistent across years and locations

Next Steps

Test DSBG in 2014 with cooperative fishers

Test Nocturnal fishing

- **Shallow set BG (Florida)**
- **Nocturnal Harpooning**

LETTER FROM ASSEMBLYMAN STONE AND STATE ASSEMBLY MEMBERS TO FEDERAL AGENCIES RELATED TO MARINE CONSERVATION AND CALIFORNIA DRIFT GILLNET FISHERY

Dear Chairwoman Lowman and Administrator Stelle,

As members of the California State Assembly who are invested in the long-term sustainability of California's ocean health and fisheries, we are writing to express our deep concerns about proposals being developed to open new areas to the California drift gillnet fleet for swordfish and thresher shark. Specifically, we are concerned with allowing such fishing in the Pacific Leatherback Conservation Area (PLCA) and the continued bycatch of more than 100 marine mammals in the fishery every year.

In particular, our reluctance over this proposal stems from the two endangered sperm whales that were killed in the fishery in 2010. The emergency regulations imposed on the fishery in 2013 were adequate, but moving forward it is necessary to implement long-lasting regulations to prevent further mortality for sperm whales. To that end, we also need to understand if and when permanent new regulations will be adopted to prevent excess take of endangered sperm whales and other marine mammals in the drift gillnet fishery, as required under the Marine Mammal Protection Act (MMPA). We understand that the fishery is designated a Category 1 Fishery under the MMPA, indicating frequent incidental mortality or serious injury of marine mammals.

We are also concerned that swordfish caught with pelagic longline gear is being landed in California by out-of-state vessels from Hawaii. Such gear is prohibited in state waters, the federal Exclusive Economic Zone (EEZ) and on the adjacent High Seas due to excess bycatch of endangered sea turtles under the Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species and federal regulations. We understand that

Printed on Recycled Paper

these vessels are permitted in Hawaii, but the landings in California appear to conflict with the intent, if not the letter, of current U.S. West Coast fishery regulations.

Even more worrisome is that most of the swordfish and other seafood consumed in the U.S. including California is sourced from non-U.S. fleets that have not provided proof of compliance with U.S. fishing standards as required by the MMPA Section 101(a)(2) (16 U.S.C.1371(a)(2)) and other federal laws. This conflicts with California's long commitment to sustainable fisheries and ocean health, and the practice creates an unfair playing field for California fishers.

In response to these concerns, we urge the Pacific Fishery Management Council (the Council) and National Marine Fisheries Service (NMFS) to halt further Council and NMFS efforts to expand the California drift gillnet swordfish fishery into the PLCA or elsewhere along the U.S. West Coast. We ask the Council and NMFS to make permanent the existing ban on pelagic longlining for swordfish along the U.S. West Coast and High Seas, and we request that they end research on the use of pelagic longline gear (deep set or shallow set) in California waters and the EEZ, specifically in the PLCA.

We also ask that the Council and the NMFS respond in writing to the following requests before the March 2014 Pacific Fishery Management Council meeting in Sacramento:

- Explain the state and federal regulatory mechanisms, requirements and authority that allow the Hawaii pelagic longline swordfish fleet to land fish in California and other U.S. West Coast ports despite the fact that the gear type is prohibited under the Fishery Management Plan for U.S. West Coast Fisheries for Highly Migratory Species and federal regulations covering the EEZ and adjacent High Seas.
- Explain the state and federal regulatory mechanisms, requirements and authority that could prohibit the Hawaii pelagic longline swordfish fleet from landing fish in California and U.S. West Coast ports.
- Describe the regulatory and policy efforts and timelines that the Council and NMFS are taking to require foreign fleets for swordfish and other seafood meet U.S. fishing standards under the MMPA and other applicable U.S. fishery and conservation laws.
- Explain how the state of California might prevent imports of seafood that does not meet U.S. fishing standards until such time as the U.S. acts to meet its legal obligations under the MMPA and other applicable U.S. fishery and conservation laws.

Thank you for your consideration and attention to these issues. Please contact Alfredo Arredondo at 916-319-2029 if you have questions.

Sincerely yours,

Mark Stone

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am grateful for the work the Council performs. Your progressive actions signal a positive milestone that begins a new era in fishery management, which takes into account the many links in the ocean food web. I am writing on behalf of Azul, an environmental project focused on empowering Latinos as marine and coastal stewards. In the past, I managed operations at an international aquaculture company and helped design a network of marine protected areas stretching from Santa Barbara to the Mexican border as part of California's Marine Life Protection Act Initiative. My extensive involvement in the seafood industry and the preservation of our coastal waters has given me special insight into the interconnectedness of everything in the marine ecosystem.

That is why, as you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

• Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.

• Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2014 to January 31, 2015 in nearly all areas deeper than the 1,100 fathom depth contour.

• Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you for considering these comments, for your continued leadership, and for the Council's commitment to a productive and healthy marine environment.

Respectfully yours,

Marce Gutiérrez

February 12, 2014

Chair Ms. Dorothy Lowman and Council Members,

RE: HMS DGN

The drift gill net (DGN) fishery is the only efficient gear to commercially harvest swordfish within the west coast EEZ. This statement is intended to explain why the DGN fishery needs to be authorized and addresses the misperceptions about the fishery.

The DGN fishery has gone through many positive changes since the 1980s. Prior to implementation of the HMS FMP, the State of California passed legislation to issue experimental permits to what was then a fleet of over 170 fishermen. They were required to fish outside 12 miles. Fishing leaders formed a group called the Federation of Independent Seafood Harvesters (FISH). Although this group folded long ago, while active they faithfully paid into the California Seafood Council, and for their permits every year until attrition reduced the fishery in size. Fewer fishermen decided to go fishing and many allowed their permit to lapse because fishing areas were closed. Only 71 remained. Over the years a biological opinion to observe 20% of the fishery has led to extrapolated high numbers of incidental take of marine mammals and even fewer fishermen decided to go fishing.

Meanwhile, NMFS formed a Pacific Offshore Cetacean Take Reduction Team to oversee any fishery coming in contact with marine mammals (MMPA). The Team included Conservation groups, NMFS' Office of Protected Resource, State of California, Marine Mammal Commission, fishermen and others, all of whom sit on the Team to resolve issues of concern. Fishermen reduced the length of their nets, lowered buoy lines to 36 feet, have a gillnet mesh > 14 inches, use acoustic pingers on float and bottom lines, and a closed area from Point Conception to Newport Oregon during the start of the season August 15 to November 15, (turtle protection Zone) was implemented. This caused many northern boats not to go fishing. Commercial fishermen voluntarily agreed to another closed area at the Channel Islands to protect Marlin. The fishery has adopted a best practices plan for skippers. When the Council passed the HMS FMP these rules were incorporated into the HMS FMP. FISH's Executive Director Chuck Janisse wrote an Exempted Fishery Permit for a few boats to gather data in the closed Turtle Zone and the Council supported it. However it was never signed. Fishermen dissolved FISH as an organization and are without leadership.

Recently, NMFS received a petition from groups regarding a take of two sperm whales in one set in 2010. Because of uncertainty on sperm whale population data and extrapolation of takes based on the number of latent permits in the fishery, it led to promulgation of an emergency rule and further restrictive changes. The TRT recently met to discuss those changes and the results were to add Vessel Monitoring Systems, a depth management zone seaward of California deeper than 2,012 meters (about 1,100 fathoms), and require 100% observers in the zone. The fishery also adopted a best practices plan for skippers to follow and attend workshops.

In spite of the efforts being made by fishermen to avoid marine mammals and sea turtles, we are now faced with proposed legislation in the State of California to ban drift gillnets. How this would work in a fishery that is conducted entirely in federal waters is unclear but we believe the threat is real. If such legislation passes and is upheld through any legal challenge, then a fishery which provides a premium product to west coast markets will be destroyed and consumers will be eating imported swordfish rather than fish harvested by local boats.

We believe there are two things that can be done to help resolve this problem. First, the DGN fishery should be removed from state control and exist only as a federally permitted fishery. This will keep all of the best practices and other rules in place, will allow continued monitoring by the Council through the HMS FMP, and keep our local fishermen – who have already suffered economic setbacks from the various shark finning rules – alive.

Second, we ask that the Council propose a de-listing, or at least a down-listing, of sperm whales. We believe that an updated stock assessment will show that the sperm whale population is healthy, if not recovered.

Please consider any fishing opportunity to allow fishing with DGN in the proposed triangle, opening the closed area earlier than November 15, hard caps on species of concern, and a minimum of 20% observer coverage. Thank you for your attention on this matter.

Kind regards,

Kathy Fosmark

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am writing on behalf of Hayes Street Grill, a fish restaurant in San Francisco's Civic Center district that drew inspiration from old San Francisco grills and took the grill concept a step further by seeking out local ingredients and cooking them in a modern style. First thing in the morning, the grill chef calls our fish purveyor, the pioneering Monterey Fish Company, to find out what looks good that day, and we base our daily menu on that. The whole menu benefits from the stunning array of seasonal produce we get directly from the Ferry Plaza Farmers Market two times a week. Above every other consideration, we want the freshness and pristine quality of the fish, produce, and naturally raised meats to speak for themselves. This is why, after 34 years in business, we understand the importance of sustainable fishing advocacy. We know that maintaining a healthy, balanced, and productive Pacific Ocean is everyone's responsibility.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial

fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you for your consideration of my comments and for your stewardship of our marine resources.

Respectfully yours,

Patricia Unterman
Hayes Street Grill, Founder & Co-Owner
Ferry Plaza Farmers' Market, Founding Board Member

RE: Agenda Item K.5 – Highly Migratory Species Management, Drift Gillnets

Dear Chair Lowman and Council Members:

Oceana, Center for Biological Diversity and Turtle Island Restoration Network are writing to formally request the Pacific Fishery Management Council (PFMC) amend the Highly Migratory Species Fishery Management Plan to prohibit large mesh drift gillnets off the U.S. West Coast. In addition we request the PFMC immediately stop all efforts to expand the California drift gillnet fishery into the Pacific Leatherback Conservation Area (PLCA). In no uncertain terms, this fishery has proven to be a failed experiment, and it is time to end the use of this unsustainable gear and transition to sustainable, low-bycatch alternatives for catching swordfish.

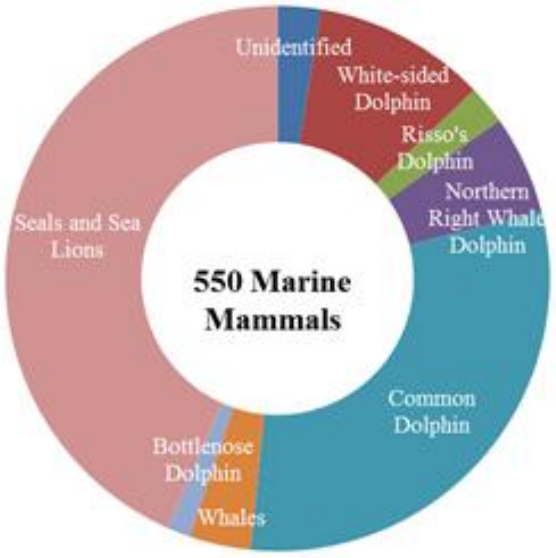
In March 2013 the PFMC requested analysis of potentially allowing drift nets into an approximately 6,000 square mile area of the PLCA. This area overlaps with the Monterey Bay National Marine Sanctuary, including Davidson Seamount, as well as recently designated critical habitat for endangered Pacific leatherback sea turtles. It is an area consistently used by leatherback sea turtles for migrating and feeding. Prior to the establishment of the PLCA in 2001, there were two observed leatherback sea turtle takes in the area now under consideration for reopening (attachment, figure 1).

With respect to leatherback sea turtles that nest in Indonesia and forage off the U.S. West Coast, we remind the PFMC of the scientific paper submitted in the March 2013 supplemental briefing book highlighting the ongoing long-term decline of the western leatherback sea turtle population. In a peer-reviewed scientific publication the authors

> *"found a 29% decline in nesting at Jamursba Medi and a 52% decline at Wermon from 2005 through 2011. We found that the estimated annual number of nests at Jamursba Medi has declined 78.3% over the past 27 years (5.5% annual rate of decline) from 14,522 in 1984 to 1,596 in 2011."*[1]

[1] Tapilatu, R. F., P. H. Dutton, M. Tiwari, T. Wibbels, H. V. Ferdinandus, W. G. Iwanggin, and B. H. Nugroho. 2013. Long-term decline of the western Pacific leatherback, *Dermochelys coriacea*: a globally important sea turtle population. Ecosphere 4(2):25. http://dx.doi.org/10.1890/ES12-00348.1.

A new IUCN Red List assessment of leatherback sea turtles estimates that as few as 2,071 mature adult leatherback sea turtles (males and females) remain in the entire Pacific, and the IUCN predicts a 96 to 99 percent total population decline by 2040.[2] The Red List Assessment, published in November 2013, names fisheries bycatch as one of the biggest threats to leatherbacks globally, offering further support for reducing the threat of interactions in the California driftnet fishery. As you know, California recently designated Pacific leatherback sea turtles as the state marine reptile. Last year the State of California and others hosted the Pacific Leatherback Sea Turtle Conservation Summit resulting in an international commitment to protect and restore this shared sea turtle population, along with government partners from leatherback nesting beaches in Tambrauw, Indonesia.



In addition to leatherback sea turtles, a wide suite of iconic marine animals frequently inhabit the proposed expansion area, including endangered sperm whales, Dall's porpoise, short beaked common dolphin, northern right whale dolphin, northern elephant seals and California sea lions; all of which have been taken and killed by drift gillnets inside the proposed expansion area since 1990 (see attachment, figure 2). In fact, six of the ten total observed drift gillnet sperm whale takes since 1992 occurred in the general Davidson Seamount/ Monterey region, three of which were inside the specific area under consideration for reopening.

In addition to taking and killing over 100 marine mammals per year[3], more marine animals are thrown back to sea than kept in the drift gillnet fishery. From May 2007 to January 2012, one marine mammal was caught for every 18 swordfish landed, four molas were caught for every swordfish, and two sharks were discarded for every three swordfish landed. In 2011 for every five swordfish landed, one marine mammal was killed and six fish including sharks and tunas were tossed overboard, clearly dead or dying.[4] Further, we learned at the recent February 4-6, 2014 Take Reduction Team meeting in Long Beach that one gray whale and two short-finned pilot whales were observed caught in the drift gillnet fishery in the May 2013 to January 2014 season. While some may attempt to rationalize that the injury and killing of endangered whales, dolphins, and sharks is part of "the cost of doing business," we believe it is an outrage in this day and age of sustainability that this gear continues to be authorized. This drift gillnet gear should entirely eliminated as soon as possible.

[3] National Oceanic Atmospheric Administration (NOAA). West Coast Observer Program Data Summaries and Reports, 2002-2011

[4] NOAA, West Coast Observer Program Data Summaries and Reports, 2011.

Over five years (May 2007 to January 2012), the fishery discarded:

- 63% of all animals caught, including more than 39,000 common molas (ocean sunfish) and hundreds of billfish
- More than 6,000 sharks, amounting to 45% of those caught
- 290 dolphins
- 237 seals and sea lions
- 21 whales
- 8 leatherback sea turtles

Oceana, CBD and TIRN encourage the PFMC and NMFS to continue to explore alternatives to drift gillnets. We are not opposed to catching swordfish. We are opposed, however, to using gear types that have demonstrated high levels of bycatch and gear types that kill endangered and protected marine life. We are opposed to the continued use of drift gillnets, as well as pelagic longline gear which is currently prohibited off the U.S. West Coast. We are encouraged by the ongoing experimental trials with deep-set buoy gear. We request the PFMC and NMFS specifically focus on incentives for increasing participation and reducing costs in the existing harpoon fishery for swordfish.

In 1978, prior to the authorization of drift gillnets off California, the harpoon fishery landed 1,171 metric tons of swordfish.[5] This is comparable to annual swordfish catches by drift gillnets in the 1980s and far greater than any annual swordfish catches with driftnets in the past 18 years. The biggest disincentive to participating in the harpoon fishery after 1980 was the authorization of the more efficient, yet indiscriminate, drift gillnets. A ban on drift gillnets with a transfer to harpoon gear or other authorized experimental gear could spur participation in the existing harpoon fishery and possibly alternative gears as well.

With respect to alternative gears, our organizations support the existing prohibition on pelagic longline gear off the U.S. West Coast and we would oppose proposals to conduct further experiments or authorize this gear type. Because of the frequent take and serious injury of marine mammals, NMFS lists the California drift gillnet fishery as a "Category I" fishery as required by the Marine Mammal Protection Act. The only other Category I fishery in the Pacific is the Hawaii-based deep-set longline fishery,[6] and based on current experimental trials with deep set gear off the West Coast and the litany of bycatch associated with this gear, no data has been presented to date that this gear type can be used to selectively target swordfish. Rather than waste valuable time and resources and kill more protected species by trying to improve

[5] Coan, A.L., M. Vojkovich, D. Prescott. 1998. The California Harpoon Fishery for Swordfish, *Xiphias gladius*. NOAA Technical Report NMFS 142.
[6] 78 Fed Reg. 53,336, 53,350 (August 29, 2013), 2013 List of Fisheries.

inherently unsustainable fishing practices like drift gillnets or pelagic longlines, swordfish fishery revitalization efforts must focus on proven clean gears and experiments with new methods.

Proponents of the drift gillnet fishery will continue to look for technical fixes to make a better drift gillnet and they will promote the "market transfer effect" theory to rationalize the killing of iconic marine life in the California Current ecosystem. While it may be possible or even desirable to make improvements to reduce the take of individual species in a case-by-case situation, over thirty years of experimentation has clearly demonstrated there is no comprehensive technical fix or innovative solution to the great array of bycatch problems inherent to this gear. Despite various time and area closures and gear modifications (e.g. acoustic pingers and extender lines), this fishery continues to take and kill unacceptably high numbers of whales, dolphins, turtles, seals and sea lions, and it has unacceptably high levels of fish bycatch.

The transfer effect argument - which suggests that regional regulations to protect sea turtles result in increasing foreign swordfish catch, with overall higher impacts to turtle populations – has several flaws. First, no studies or data have provided sufficient evidence to support a transfer effect argument in the context of the West Coast swordfish fishery. Second, the concept fails to account for the fact that other countries will continue to catch swordfish and find markets despite what the U.S. does. This is a key point. In understanding whether a reduction in California drift gillnet swordfish landings could lead to increased turtle, whale, or other bycatch in other countries, it must be shown that decreases in California swordfish catch lead to increased catches in other areas THAT WOULD NOT HAVE OCCURRED OTHERWISE. Third, the theory fails to recognize that allowing more sea turtles to be killed in the U.S. will only add to global impacts.

What is more, there is a mechanism in the Marine Mammal Protection Act's section 101(a)(2) that mandates NMFS to "ban the importation of commercial fish or fish products that have been caught with commercial fishing technology which results in the incidental kill or incidental serious injury of marine mammals in excess of United States standards." 16 U.S.C. § 1371(a)(2). In addition, the Moratorium Protection Act provisions as adopted in the 2006 Magnuson – Stevens Reauthorization Act (16 U.S.C. § 1826k) call on the Secretary to identify nations taking protected living marine resources (e.g. turtles) as bycatch when fishing activities are not being managed consistent with U.S. standards, and if a nation fails to take appropriate action to address the bycatch activities, the U.S. can ban fish imports or port entry from those nations.[7] In other words, the appropriate course of action to control for any transfer effects is to restrict trade with nations not meeting U.S. standards to protect sea turtles and marine mammals.

Further, the irony is that in 2014 while some continue to promote the use of driftnets in our "Blue Serengeti" - the California Current ecosystem - NMFS is currently working with Morocco to transition swordfish drift gillnet fishermen to buoy gear, gillnets are banned on the Mediterranean Sea, and the international community has banned high seas driftnets for over 20

[7] E.g. In January 2013 NMFS formally "identified" Mexico for the bycatch of North Pacific loggerheads in its report to Congress on IUU fishing and bycatch of protected living marine resources. See: http://www.nmfs.noaa.gov/ia/slider_stories/2013/01/msra_2013_report.html

years.[8] In 1999 NMFS prohibited the use of driftnet gear in the North Atlantic swordfish fishery with the purpose to specifically "reduce bycatch of protected resources in a manner that maximizes the benefit to the Nation."[9] Closer to home, the State of Washington prohibits this gear type for targeting swordfish and thresher sharks, and in 2009, citing bycatch concerns and changes in the Developmental Fisheries Program, the Oregon Fish and Wildlife Commission revoked all state drift gillnet permits.

In conclusion, we request that the PFMC amend the HMS FMP to prohibit the use of large mesh drift gillnets[10] and end the ongoing and persistent effort to expand the California-based drift gillnet fishery once and for all. If, however, the PFMC chooses to move forward with an analysis of alternatives to expand the fishery, we expect alternatives to also 1) phase out and prohibit the use of drift gillnet gear; 2) consider experimental gear, like buoy gear, so long as it is significantly different from the pelagic longline gear; and 3) consider approaches to restrict the importation of swordfish by nations not meeting U.S. standards under the Magnuson Stevens Act and Marine Mammal Protection Act. We also expect that there will be a full NEPA analysis, including an Environmental Impact Statement if any further actions are taken to modify the drift gillnet fishery.

Thank you for your time and consideration of these comments.

Sincerely,

RE: Agenda Item K.5: Highly Migratory Species Management, Drift Gillnets

Dear Chair Lowman, Administrator Stelle, and Director Bonham:

We the undersigned 39,252 residents of the United States (including 7,491 California residents, 1,038 Oregon residents, 1,576 Washington residents, and 182 Idaho residents) urge the Pacific Fishery Management Council, NOAA Fisheries, and the State of California to halt the current effort to expand the California-based drift gillnet fishery, and initiate a permanent prohibition on the use of drift gillnet gear throughout the U.S. West Coast Exclusive Economic Zone. This drift gillnet fishery targeting swordfish and thresher sharks entangles and kills over a hundred protected marine mammals per year, continues to take endangered sea turtles and sperm whales, and kills unacceptably high numbers of non-target species such as blue sharks, bigeye thresher sharks, striped marlin, ocean sunfish, and others. Despite the current regulations in place and over 30 years of efforts to address this waste, the continued bycatch from drift gillnets is unacceptable. The proposed expansion of the fishery will also encroach on recently designated critical habitat of endangered leatherback sea turtles, whose population continues to decline, as well as encroach on the ecologically important Davidson Seamount which is a major congregation area for marine mammals and fish.

As state and federal fishery managers, you have a crucial responsibility to California and U.S. citizens to protect endangered species and the health of our marine ecosystems to maximize the benefit to California and the Nation. Continuing to authorize the drift gillnet fishery, much less considering expanding it, fundamentally contradicts this responsibility.

When these curtains of death are left to soak in ocean waters overnight they entangle some of the California Current's top ocean predators and migratory species. In order to maintain ocean health and biodiversity of the California Current marine ecosystem, drift gillnets should be eliminated and replaced with fishing methods that are proven to be clean. Ultimately, management resources should be focused on promoting and developing gear types that demonstrably minimize bycatch; and our fishery management agencies have an important responsibility to identify and promote such methods. They should not be expanding the use of drift gillnets, an inherently unselective fishing method which we know will kill high levels of non-target fish, marine mammals, and threatened and endangered species. Any efforts to maintain drift gillnets or bring back harmful gears such as longlines to the U.S. West Coast will run contrary to this responsibility and will only move us backwards.

Sincerely,

The list of names of those who signed this letter are on pages 20 through 390 of this document. Public comment letters from additional entities and individuals may be found beginning with page 391.

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am grateful for the work the Council performs. Your progressive actions signal a positive milestone that begins a new era in fishery management, which takes into account the many links in the ocean food web and how everything is connected.

I am writing on behalf of Shark Stewards, a nonprofit organization working for sound stewardship of the oceans and all ocean life. At Shark Stewards, we focus on organizing individuals to advocate the importance of a healthy ocean from the top to the bottom of the food web. Our work with predatory species such as sharks, swordfish and Bluefin tuna has shown the vital importance of sustainable fishing practices for all marine life. In particular, we are concerned about the 10,000+ blue sharks that have been caught in drift gillnets and discarded over the last 10 years. This is why we understand the importance of sustainable fishing advocacy and the need to maintain a healthy and productive Pacific Ocean.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you for your consideration of my comments and for your continued work and commitment to ensuring a healthy and productive Pacific Ocean.

Respectfully yours,

David McGuire, MPH

Dear Chair Lowman, Administrator Stelle, and Director Bonham,
Pacific Fishery Management Council, NOAA Fisheries, and the California Department of Fish and Wildlife

I urge the Pacific Fishery Management Council, NOAA Fisheries, and the State of California to halt the current effort to expand the California-based drift gillnet fishery, and initiate a permanent prohibition on the use of drift gillnet gear throughout the U.S. West Coast Exclusive Economic Zone. This drift gillnet fishery targeting swordfish and thresher sharks entangles and kills over a hundred protected marine mammals per year, continues to take endangered sea turtles and sperm whales, and kills unacceptably high numbers of non-target species such as blue sharks, bigeye thresher sharks, striped marlin, ocean sunfish, and others. Despite the current regulations in place and over 30 years of efforts to address this waste, the continued bycatch from drift gillnets is unacceptable. The proposed expansion of the fishery will also encroach on recently designated critical habitat of endangered leatherback sea turtles, whose population continues to decline, as well as encroach on the ecologically important Davidson Seamount which is a major congregation area for marine mammals and fish.

As state and federal fishery managers, you have a crucial responsibility to California and U.S. citizens to protect endangered species and the health of our marine ecosystems to maximize the benefit to California and the Nation. Continuing to authorize the drift gillnet fishery, much less considering expanding it, fundamentally contradicts this responsibility.

When these curtains of death are left to soak in ocean waters overnight they entangle some of the California Current's top ocean predators and migratory species. In order to maintain ocean health and biodiversity of the California Current marine ecosystem, drift gillnets should be eliminated and replaced with fishing methods that are proven to be clean. Ultimately, management resources should be focused on promoting and developing gear types that demonstrably minimize bycatch; and our fishery management agencies have an important responsibility to identify and promote such methods. They should not be expanding the use of drift gillnets, an inherently unselective fishing method which we know will kill high levels of non-target fish, marine mammals, and threatened and endangered species. Any efforts to maintain drift gillnets or bring back harmful gears such as longlines to the U.S. West Coast will run contrary to this responsibility and will only move us backwards.

Letter Attached.

Sincerely,

David McGuire, MPH

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am grateful for the work the Council performs. Your progressive actions signal a positive milestone that begins a new era in fishery management, which takes into account the many links in the ocean food web and how everything is connected. As chef and partner at award-winning One Market Restaurant, a northern California establishment based out of the San Francisco Embarcadero, I make it a point each day to serve food that is created by blending the freshest, seasonal ingredients from California and off of our coast. My approach to cooking ensures that the menu is a true reflection of the finest raw materials used- featuring inventive farm-fresh dishes- all stemming from the restaurant's commitment to sustainability. This would not be possible without a healthy Pacific Ocean. I know that maintaining a productive and balanced marine ecosystem is a responsibility that we all must share.

As you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.
- Required 100% observer coverage on all drift gillnet fishing vessels from August 15, 2013 to January 31, 2014 in nearly all areas deeper than the 1,100 fathom depth contour.
- Required installation and operation of a vessel monitoring system (VMS) prior to embarking on a drift gillnet fishing trip.

Nothing has substantively changed regarding this fishery since these temporary regulations expired that would change the outcome of probable sperm whale bycatch. As long as drift gillnets operate off the West Coast, there will be a likelihood of interaction with whales, as well as other marine mammals and fish. In order to minimize interactions and properly account for all incidental catch of other species, these temporary regulations should be made permanent before the start of the 2014-2015 drift gillnet fishing season.

In addition to making these protections for sperm whales permanent, I ask that you continue supporting research of new commercial fishing methods that will minimize the indiscriminate death of other marine mammals and sea turtles that make the Pacific Ocean such a vibrant ecosystem. Preliminary studies suggest that fishing techniques like

deep-set buoy gear can be effective at catching prized swordfish while avoiding species like protected leatherback turtles and sperm whales.

I am encouraged that the Council recognizes the need to protect these ecologically and economically critical species. I look forward to the Council taking positive action that gives everyone the security of knowing we can rely on a healthy ocean to provide an economic engine for years to come.

Thank you for your consideration of my comments and for your continued work and commitment to ensuring a healthy and productive Pacific Ocean.

RE: Agenda Item K.5, Drift Gillnet Monitoring, Management, and Alternative Gear Report

Dear Chair Lowman and Council Members:

I am writing on behalf of Harbor Breeze Cruises, a southern California cruise company based out of Long Beach that has been offering seasonal whale watching cruises for nearly twenty years. At Harbor Breeze Cruises, our livelihoods depend on a thriving marine ecosystem that supports robust populations of marine mammals, and we are lucky enough to bring the experience of seeing these animals in action to thousands of people every year.

Throughout the year, our guests are treated to sightings of Gray and Blue Whales, Fin Whales, Humpback Whales, Minke Whales and Killer Whales. Other wildlife frequently spotted are a variety of dolphins including Common, Bottlenose, Risso's and Pacific White Sided, as well as sea lions and harbor seals. These charismatic marine mammals are drawn to the California Current along our coast, and we hope to continue our work for many years to come. We know that this would not be possible without a healthy Pacific Ocean. I understand that maintaining a productive and balanced marine ecosystem is a responsibility that we must all share.

That is why, as you look toward future regulations of the drift gill net fishery for swordfish and thresher shark off the west coast, I encourage you to make the 2013 NMFS emergency rule to protect sperm whales permanent. These permanent protections should include:

- Immediate closure, for the remainder of the season, of the drift gillnet fishery if one sperm whale is observed killed or injured in drift gillnet gear.

Monday, February 12, 2014

Pacific Fishery Management Council
7700 NE Ambassador Place, Suite 101
Portland, Oregon 97220-1384

Subject: Vote 'no' on gillnet fishing in sea turtle habitat

Dear Chair Lowman:

I strongly urge the Pacific Fisheries Management Council to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. I urge the Pacific Fisheries Management Council to vote 'No' on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

> *"Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method."*
> *-- Theodore Roosevelt*

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna, and other non-target fish. Emergency regulations were recently imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks, of which less than 1,500 adults survive in the entire Pacific. And every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

> *"Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish—indeed, all the living creatures of prairie and woodland and seashore—from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."*
> *-- Theodore Roosevelt*

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances, and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries, and our oceans.

> *"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."*
> *-- Aldo Leopold*

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish

Dear Chair Lowman and Council Members,

Please find attached this new public comment petition containing the names of more than 6,000 people from the U.S. and Canada that oppose the expansion of the CA Drift Gillnet Fishery into the Pacific Leatherback Conservation Area and urging an end to the use of drift gillnet gear along the U.S. West Coast.

This petition is submitted for the March 2014 Council meeting, HMS Item K-5 – CA Drift Gillnet Fishery.

This is a separate public comment piece from the individual letters from 4,300 people that was submitted previously.

Together, more than 10,000 people are counting on you to protect endangered marine species and end the high bycatch driftnet fishery.

Submitted by,

Teri Shore

Dear Chair Lowman and Council Members,

Please find attached 4,400 individual comment letters from members of the public from the U.S. West Coast, across the U.S. and around the world who oppose expansion of the CA Drift Gillnet fishery into the Pacific Leatherback Conservation Area under any circumstance.

The 4,400 people also want the PFMC to halt the use of drift gillnet gear along the U.S. West Coast due to high bycatch of marine mammals and non-target finfish in the swordfish and thresher shark fishery.

Please seriously consider these views when voting and making decisions about the drift gillnet fishery at the March 2014 meeting in Sacramento.

Thank you.

Submitted on behalf of 4,400 individual members of the public.

SAMPLE

Dorothy Lowman
Pacific Fisheries Management Council

Dear Chair Lowman:

I am writing to urge the Pacific Fisheries Management Council (the Council) to halt any further action to expand the drift gillnet fishery for swordfish off the West Coast. In particular, I oppose weakening the Pacific Leatherback Conservation Area that has reduced observed entanglements of endangered leatherback sea turtles to two over the past decade. The Council must vote 'No' on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned in the open ocean and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish.

Recently emergency regulations were imposed after two endangered sperm whales were entangled and killed in the California drift gillnet fishery. Any actions to increase gillnet fishing will risk the capture and death of critically endangered leatherbacks of which less than 1,500 adults survive in the entire Pacific. Any every sperm whale lost is a problem because as few as 700 are left in the West Coast population.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along our coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Thank you for considering my comments.

Mary Hebold
Luebecker St. 15
Koeln, IA 50858

February 11, 2014

Dear Pacific Fisheries Management Council and National Marine Fisheries Service,

The 6,386 individuals listed below are writing to urge the Pacific Fisheries Management Council (the Council) and National Marine Fisheries Service (NMFS) to halt any further action to expand the drift gillnet fishery for swordfish off the U.S. West Coast. In particular, we oppose weakening the Pacific Leatherback Conservation Area that has reduced entanglements of endangered leatherback sea turtles to two observed interactions over the past decade. The Council must vote no on any proposals that would allow more gillnet fishing in leatherback habitat or increase the high bycatch in this unpopular, unsustainable swordfish fishery.

Drift gillnets have been banned on the High Seas and along most of the U.S. West Coast because of high bycatch of marine life including endangered whales, dolphins, sea turtles, shark, tuna and other non-target fish. In 2010, two endangered sperm whales were entangled and killed in the California drift gillnet fishery.

Any actions to increase gillnet fishing conflict with new protections given to sea turtles, including designation of critical habitat for Pacific leatherbacks along the West Coast and the uplisting of the Pacific loggerheads from threatened to endangered under the U.S. Endangered Species Act. To date, NMFS has failed to protect critical habitat for loggerheads as required by the Endangered Species Act.

For these reasons, I urge you to stop any and all efforts to expand the swordfish gillnet fishery before it goes any farther. Instead, I urge you to begin to phase out the drift gillnet fishery along the U.S. West coast, permanently ban longlining under any circumstances and to support sustainable fishing practices that don't compromise the health of endangered species, fisheries and our oceans.

Sincerely yours,
