

Ocean Abundance Projections and Prospective Harvest Levels for Klamath River Fall Chinook, 2017 Season

Klamath River Technical Team
3 March 2017

Summary

Predictor performance for 2016 and forecasts for 2017 are:

		2016			
	Age	Preseason	Postseason	Pre/Post	2017 Forecast
Ocean Abundance	3	93,400	42,400	2.20	42,000
	4	45,100	24,900	1.81	10,600
	5	3,700	1,200	3.17	1,700
Proportion Natural	3	0.66	0.66	1.00	0.59
	4	0.76	0.89	0.85	0.72
	5	0.80	0.76	1.06	0.80
Ocean Harvest Rate	4	0.08	0.09	0.92	-
Ocean Fall Harvest	3	-	82	-	-
	4	-	105	-	-
	5	-	0	-	-

The implications of the 2017 forecast ocean abundances, proportions natural, and the 2016 ocean fall harvest for fisheries management in 2017 were explored with the Klamath Ocean Harvest Model (KOHM) under two hypothetical management scenarios: (A) no additional ocean fisheries (commercial and recreational) from Jan–Aug 2017 between Cape Falcon, OR and Point Sur, CA (187 Klamath River fall Chinook were estimated to have been harvested in the ocean during the Sept-Dec 2016 period) and no Klamath River fisheries (tribal and recreational) in 2017, and (B) the 2016 ocean fishery seasons and quotas, the 2016 river recreational allocation of 15.0 percent (of non-tribal harvest), and a tribal allocation of 50% (of total harvest). The results are:

Sector	KOHM Forecasts	
	(A) No-fishing in 2017	(B) 2016 Regulations
Adult Spawners		
Natural Areas	12,300	9,400
Hatcheries	6,400	5,100
Adult Harvest		
Ocean Commercial	0	1,400
Ocean Recreational	200	600
River Recreational	0	400
Tribal	0	2,400
Age-4 Ocean Harvest Rate	0.010	0.090
Spawner Reduction Rate	0.006	0.241

With no further fishing in 2017 on the current stock, the expected number of natural area adult spawners would be 12,309, with an expected age-4 ocean harvest rate of 1.0% (105 age-4 KRFC were harvested in the Sept–Dec 2016 period). Applying 2016 fishery regulations resulted in 9,397 natural area adult spawners and an age-4 ocean harvest rate of 9.0%. These forecasts are provided for informational purposes only; the Pacific Fishery Management Council (PFMC) will adopt 2017 ocean salmon fishery management regulations in April 2017.

Introduction

The PFMC's fishery management plan for Klamath River fall Chinook (PFMC 2012; Amendment 16) defines a conservation objective of a natural spawner reduction rate via fisheries of no more than 0.68 and a maximum sustainable yield escapement of 40,700 natural area adult spawners. Annual management is guided by a harvest control rule that reflects this conservation objective but allows for *de minimis* fishing provisions at low abundance. Natural area adult spawners are defined as age-three or older fall Chinook that spawn outside of the hatchery environment, regardless of their origin. The KOHM is used by the PFMC to forecast the impacts of ocean and river fisheries on Klamath River fall Chinook, and to evaluate whether a given management alternative is expected to meet the fishery management plan's biological goals for Klamath River fall Chinook. The KOHM requires forecasts of Klamath River fall Chinook ocean abundance and proportion of natural spawners by age, along with the estimated harvest of these fish in the previous calendar year's September through December (fall) ocean fisheries. This report presents these forecasts and estimates for the 2017 management year. For informational purposes, KOHM forecasts of harvest and spawner escapement are also presented under two hypothetical management scenarios: (A) no ocean or river fisheries in 2017, and (B) the 2016 ocean fishery seasons and quotas, the 2016 river recreational allocation of 15.0 percent (of non-tribal harvest), and a tribal allocation of 50 percent (of total harvest). Historical records of ocean abundance, harvest, harvest rates, river escapement, and predictor performance are also compiled. These records differ from those presented in KRTAT reports issued prior to 2002 for reasons described in KRTAT (2002) and Goldwasser et al. (2001).

Data and Analytical Methods

The age-composition of the 2016 river run of Klamath River fall Chinook salmon used in this report is from KRTT (2017).

Ocean Abundance Forecast

The age-specific ocean abundance predictors are based on the use of a sibling regression. The age a September 1 ocean abundance estimates for brood years 1979-2012 were regressed against the age $a-1$ river run-size estimates of their respective cohorts (Table 1, Figure 1). By convention, September 1 is the date that immature Klamath River fall Chinook remaining in the ocean are incremented one year in age. The regressions were fit using least-squares with the y-intercept constrained to zero, which gives the biologically reasonable expectation that an age $a-1$ river run-size of zero predicts an age a ocean abundance of zero. This procedure is consistent with recommendations of the PFMC's Salmon Technical Team and Scientific and Statistical Committee.

Ocean abundance has been forecasted preseason since 1985 using methods similar to those described above (Tables 2 and 3). Postseason ocean abundance estimates were calculated using cohort reconstruction methods that accommodate spatial and/or temporal variations in maturity, straying, and fishery impact rates applied separately to the hatchery and natural components of the stock. The postseason estimates for 2015 (age-three) and 2016 (age-three, age-four) are preliminary, as their respective cohorts are incomplete (Table 1).

The 2016 age-three ocean abundance forecast was 2.20 times its postseason estimate (Table 2); the age-three predictor has overestimated abundance in 17 of the 32 previous years. The 2016 age-four ocean abundance forecast was 1.81 times its postseason estimate (Table 2); the age-four predictor has overestimated abundance in 21 of the 32 previous years. The 2016 age-five ocean abundance forecast was 3.17 times its postseason estimate (Table 2); the age-five predictor has over estimated abundance in 13 of the 30 previous years.

Proportion of Natural Spawners Forecast

The age-specific proportion of natural area spawners is also forecast using sibling regression. In this case, the age a observed proportion natural for calendar years 1997-2016 were regressed against the age $a-1$ observed proportion natural of their respective cohorts (Table 4, Figure 2). Data for calendar years prior to 1996 were not used because:

(1) at this time the hatcheries did not always have an open-door policy (some fish were denied entry into the hatcheries and presumably spawned in natural areas); and (2) the proportion natural time-series (Figure 2a) indicates a shift-point near 1995-1996. The regressions were fit using ordinary least-squares for age-three and age-four. For age-five, the slope of the relationship was insignificant, and the arithmetic mean was used as the predictor.

The 2016 proportion natural forecast for age-three, -four, and -five fish was 0.66, 0.76, and 0.80, respectively, and the corresponding post-season estimates are 0.66, 0.89, and 0.76, respectively (Table 4).

Historical Harvest Levels and Rates

Historical (1986-2016) ocean and river harvest levels and rates of age-three and age-four Klamath River fall Chinook are listed in Table 5. The 2016 age-four ocean harvest rate (preliminary) postseason estimate of 9.1 percent is greater than the preseason forecast of 8.4 percent (PFMC 2016).

2016 Ocean Fishery Fall Harvest

Klamath River fall Chinook ocean harvests during the 2016 fall period are estimated postseason through expansion of the coded-wire tags (all release types) recovered in those fisheries. Each coded-wire tag recovery is expanded for sampling and mark-rate, and then to account for the harvest of natural-origin fish, further expanded by the estimated basin-wide escapement (hatchery- plus natural-origin) per hatchery-origin fish observed in the river run, which is assumed to happen just prior to these fall fisheries (same brood and calendar year). In 2016, 187 Klamath River fall Chinook were estimated to have been harvested.

2017 Forecasts

The 2017 forecasts of ocean stock abundance and proportion natural area spawners are (Figures 1 and 2):

<i>Age</i>	<i>Abundance</i>	<i>Proportion Natural</i>
3	42,026	0.59
4	10,558	0.73
5	1,662	0.80

For the 2016 ocean fall fisheries, the natural production multipliers for the coded-wire tag recoveries are:

<i>Age (a)</i>	<i>Total Escapement (a-1)</i>	<i>Hatchery-origin Escapement (a-1)</i>	<i>Natural-production Multiplier (a)</i>
3	2,786	765	3.64
4	8,615	3,171	2.72
5	15,443	2,173	7.11

The fishery-area-month-age-specific estimated harvests are presented in Table 6. Estimated fall landings are accounted for in ocean fisheries harvest allocation in the following calendar year, and the associated harvest impacts are deducted from the September 1 ocean abundance forecasts.

KOHM principal forecast results under two management scenarios: (A) no additional ocean fisheries (commercial and recreational) from Jan–Aug 2017 between Cape Falcon, OR and Point Sur, CA (187 Klamath River fall Chinook were estimated to have been harvested in the ocean during the Sept–Dec 2016 period) and no Klamath River fisheries (tribal and recreational) in 2017, and (B) the 2016 ocean fishery seasons and quotas, the 2016 river recreational allocation of 15.0% (of non-tribal harvest), and a tribal allocation of 50% (of total harvest); are provided in Appendices A and B respectively.

2001	435,500	490,187	0.89
2002	362,500	619,464	0.59
2003	310,200	595,207	0.52
2004	216,300	281,876	0.77
2005	239,800	234,914	1.02
2006	110,000	159,225	0.69
2007	546,200	413,366	1.32
2008	190,700	152,269	1.25
2009	505,700	268,896	1.88
2010	331,500	255,369	1.30
2011	371,200	307,481	1.21
2012	1,651,800	878,375	1.88
2013	727,600	636,569	1.14
2014	299,300	404,873	0.74
2015	423,700	184,957	2.29
2016 ^{c/}	142,200	68,438	2.08
2017	54,200	--	--

a/ Original preseason forecasts for years 1985-2001 were for May 1(t); converted to Sept 1(t-1) forecasts by dividing the May 1(t) number by the Sept 1(t-1) through May 1(t) survival rate presumed by modelers in those years: 0.5 age-three, 0.8 age-four, 0.8 age-5.

b/ A scalar of 0.75 was applied to the jack count because 1) most jacks returned to the Trinity River and 2) the jack count was outside the database range.

c/ Preliminary.

d/ Age-5 preseason ocean abundance forecast unavailable.

Table 3. Summary of management objectives and predictor performance for Klamath River fall Chinook.

a/ Original preseason forecast for years 1986-2001 were for May 1(t); converted to Sept 1 (t-1) forecasts by dividing the May 1(t) number by the Sept 1(t-1) through May 1(t) survival rate presumed by modelers in those years: 0.5 age-three, 0.8 age-four, 0.8 age-five.

b/ Ocean harvest rate forecast is the fraction of the predicted ocean abundance expected to be harvested Sept 1 (t-1) through Aug 31 (t). River harvest rate forecast is the fraction of the predicted river run expected to be harvested in river fisheries. Original ocean harvest rate forecasts for year(t), 1986-2001, were based on a May 1(t) ocean abundance denominator; converted to Sept 1(t-1) abundance denominator by multiplying former values by 0.8 (the age-four survival rate between Sept 1 (t-1) and May (t) presumed by modelers in those years.

c/ Ocean harvest rate is the fraction of the postseason ocean abundance harvested Sept 1(t-1) through Aug 31(t). River harvest rate is the fraction of the river run harvested by river fisheries.

d/ Preliminary.

Table 4. Numbers of hatchery and natural-area adult fall Chinook spawners in the Klamath Basin by age.^{a/}

a/ Preliminary data (incomplete cohort).

b/ Ocean harvest rates are the fraction of Sept 1(t-1) ocean abundance harvested in these fisheries. River harvest rates are the fraction of the river run (t) harvested in these fisheries.

Table 6. Fall 2016 (September - November) ocean landings of Klamath River fall Chinook by fishery, age, and KOHM area.
