West Coast Region
Management Strategy Evaluation
Listening Session

April 18, 2018
12:30-4:30pm

Background
A Management Strategy Evaluation (MSE) is a tool that scientists and managers can use to simulate the workings of a fisheries system and allow them to test whether potential harvest strategies—or management procedures—can achieve management objectives. MSEs are becoming an integral component of the fishery management process, helping to determine the harvest strategy likely to perform best, regardless of uncertainty, and balance trade-offs amongst competing management objectives.

The International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean (ISC) has been engaged in the development of an MSE for North Pacific albacore tuna since 2015 and plans to engage in the development of an MSE for Pacific bluefin tuna. Because the U.S. fishing industry targets both of these species, it is important that managers, scientists, industry, and other stakeholders understand the MSE process. The National Marine Fisheries Service West Coast Region and Southwest Fisheries Science Center are hosting a joint listening session to discuss the MSE process, provide updates on the ISC North Pacific albacore tuna MSE and plans for developing a Pacific bluefin tuna MSE.

Agenda

| 3:35 – 4:30  | Open Discussion                                             | DiNardo, Taylor    |
Summary of Listening Session

The following is a summary of the listening session compiled from notes taken by National Marine Fisheries Service (NMFS) West Coast Region (WCR):

The NMFS WCR and Southwest Fisheries Science Center (SWFSC) hosted a listening session regarding management strategy evaluation (MSE) on April 18, 2018. Stakeholders were invited to participate in person in either Long Beach or La Jolla, California, or remotely via webinar. The purpose of this listening session was to provide stakeholders with information about the MSE process and discuss ongoing MSE activities by the International Scientific Committee for Tuna and Tuna-like Species in the North Pacific Ocean (ISC). Participants represented fishing industry, state and federal fisheries managers, fishery management council staff, scientists, and non-governmental organizations. The presentations are included in this summary report as Appendices.

North Pacific albacore MSE
Dr. Desiree Tomassi of the SWFSC gave an introduction to the MSE process and then provided an overview of the North Pacific albacore MSE (See Appendices I and II). The example results of the North Pacific albacore MSE were shown with spider plots, which provide a visual representation of trade-offs between management objectives. However, spider plots do not depict uncertainty.

A participant highlighted that there is uncertainty in percentage of the stock that migrates into the eastern Pacific Ocean (EPO). Dr. Tommasi pointed out that there are many unknowns, but that the operating model will try to address this uncertainty. When discussing the management objectives identified for North Pacific albacore, which is not overfished or subject to overfishing, it was noted that these objectives may be different than those identified for a depleted stock. A participant expressed concern about fleets switching fishing pressure from South Pacific albacore to North Pacific albacore. This is an uncertainty that will be included in the MSE, but it is a scenario that does not seem likely to occur.

Lastly, participants raised questions about how catch may be allocated in the scenarios. Dr. Tomassi clarified that in scenarios with a total allowable catch, catch was allocated by country. Participants followed up by suggesting the MSE could examine economic objectives with different ways of allocating catch. Dr. DiNardo noted that it is very difficult to get countries to agree to allocations, which may stall the MSE process.

1 When compared to the biomass limit reference point adopted by the Western and Central Pacific Fisheries Commission and fishing mortality that corresponds to maximum sustainable yield.
**Pacific bluefin tuna**

Dr. Gerard DiNardo briefly discussed the 2018 Pacific bluefin tuna stock assessment. The Pacific bluefin tuna stock biomass continues to be at very low levels, although there has been a 0.6% increase in spawning stock biomass (SSB) since the 2016 stock assessment. Recruitment in 2016 that is higher than in the previous few years, which were at historic lows, and there are indications that recruitment may remain high in 2017 as well. As agreed to by the WCPFC, the ISC performed projections to determine if under a given set of assumptions (e.g., low recruitment until the initial rebuilding target is met, and then average recruitment) the initial and second rebuilding targets adopted by the WCPFC will be met². Dr. DiNardo explained that the current recruitment index is derived from the stock assessment model and that efforts are underway to validate using small fish (age 0) caught in Japan’s coastal troll fishery as a recruitment index in the future. Dr. DiNardo further explained that to assess the effectiveness of the recruitment increase in a single year, it is necessary to determine if that increase is observed in other fisheries in the subsequent years. The next stock assessment will be completed in 2020.

On the subject of survivability, Dr. DiNardo noted that most mortality is associated with larval stages, and once the fish migrate across the Pacific Ocean, survivability is good because fishing pressure in the EPO is relatively little. He added that recent diet studies have found more anchovy in the stomachs, which improves growth and survival---as compared to pelagic red crab, which has been observed in stomach contents from 2013-2016 and represented more than 50% of the diet in 2015 and 2016.

Dr. DiNardo provided an overview of the agenda for a Pacific bluefin tuna MSE workshop to be hosted by the ISC in Japan in May 2018 and potential candidate management objectives that stakeholders and managers may want to consider (see Appendix III). This workshop is organized as a result of a request from the WCPFC Northern Committee and Dr. DiNardo noted that ISC will begin work on the MSE in 2019 after the Northern Committee provides candidate reference points (target and limit) and harvest control rule, as well as funding to support hiring of staff to work on the MSE.

Dr. DiNardo presented a slide with potential candidate management objectives for the MSE (see Appendix III). In addition to those presented, below is a list of candidate objectives, concepts for objectives, or considerations for that resulted from the discussion at the listening session.

**Concepts and Considerations for Management Objectives**

- All fishing sectors should have access to catch. For example, different fishing sectors rely on Pacific bluefin tuna in different areas of the ocean and at different ages.

---

² The Inter-American Tropical Tuna Commission adopted the initial rebuilding target in 2016 and is expected to adopt the second rebuilding target at its 2018 annual meeting.
- As fisheries improve, there may be new entrants or emerging fisheries to consider.
- Stability and continuity of market supply.
- Harvest Pacific bluefin tuna of certain sizes that would allow the greatest possibility of rebuilding.
- Maximize the economic value of the product.
- An objective that examines canning versus selling fish whole.
- An objective that supports historic participation in the Pacific bluefin tuna fishery.
- Maintain biomass.
- Utilize traceability to ensure catch from various fisheries are accounted, which could be incorporated into the model by testing whether there is uncertainty in the catch.
- Once the second rebuilding target is met:
  - maintain the stock above spawning stock biomass (SSB) expected to achieve maximum sustainable yield (MSY) and to maintain fishing mortality below the level that would achieve MSY (FMSY) with at least 75% probability;
  - if SSB has been assessed by the ISC as below SSB_{msy}, to rebuild SSB to or above SSB_{msy}, with at least a 75% probability, and within as short time as possible, but not longer than 1.5 generations;
  - limit changes in catch limits between management periods to no more than 10% upwards or downwards, unless the ISC has assessed that there is greater than a 50% chance the stock is below the SSB\_limit, in which case more significant decreases in catch limits shall be approved;
  - maintain an equitable balance between the fisheries in the western and central Pacific Ocean and those in the EPO;
  - maximize the long-term yield and average annual catch from the fishery; and
  - maximize the productivity of the stock by managing the catch of the smallest fish.

April 18, 2018
Outline

1. MSE Definition
2. Key ingredients
3. Examples
Management Strategy Evaluation (MSE)

“Use of simulation to evaluate the trade-offs achieved by alternative management strategies and to assess the consequences of uncertainty in achieving management goals”

Punt et al. 2016, Fish and Fisheries
MSE = a harvest control rule (HCR) slot machine

Slide courtesy of Carsten Hvingel and Jacqueline Perry, Greenland Halibut MSE, NAFO RBMS Working Group
Key Ingredients of MSE

1. A set of Harvest Control Rules (HCRs)
   • Pre-agreed upon set of rules to specify a management action (e.g. setting the total allowable catch or location/timing of closures)
Key Ingredients of MSE

2. A set of Operating Models (OMs)
   • Plausible versions of true dynamics of the system
   • Conditioned on historical data
   • Represent the range of uncertainty in different factors

- OPERATING MODEL 1
  Natural Mortality = 0.45

- OPERATING MODEL 2
  Natural Mortality = 0.4

- OPERATING MODEL 3
  Natural Mortality = 0.35
2. A set of Operating Models (OMs)
   • Range in complexity depending on management objectives and management strategies of interest
1. Candidate HCRs

2. Operating Models

Modified from slide courtesy of Carsten Hvingel and Jacqueline Perry, Greenland Halibut MSE, NAFO RBMS Working Group
3. An Estimation Model
• Takes data generated with error by the OM (e.g. catch, abundance index) and produces an estimate of stock status
Key Ingredients of MSE

Modified from slide courtesy of Carsten Hvingel and Jacqueline Perry, Greenland Halibut MSE, NAFO RBMS Working Group
Key Ingredients of MSE

1. Candidate HCRs

2. OMs

3. Estimation Model

4. Performance meter

Biomass

Catch

Risk

Modified from slide courtesy of Carsten Hvingel and Jacqueline Perry, Greenland Halibut MSE, NAFO RBMS Working Group
Key Ingredients of MSE

4. A set of performance metrics
   • Quantitative indicators that are used to evaluate each HCR

Performance meter

Biomass

Catch

Risk
Key Ingredients of MSE

5. A set of management objectives
   • High level goals of a management plan
   • E.g. Prevent overfishing, Promote profitability of the fishery
   • There are often trade-offs among management objectives
   • Represented in MSE using performance metrics
Key Ingredients of MSE

1. OMs
2. Candidate HCRs
3. Estimation Model
4. Performance Metrics
5. Management Objectives

Modified from slide courtesy of Carsten Hvingel and Jacqueline Perry, Greenland Halibut MSE, NAFO RBMS Working Group
Why do an MSE

- How well can a management strategy achieve pre-agreed upon management objectives given uncertainty?
- How does a particular management strategy perform compared to alternative ones?
- Quantitatively and explicitly highlight trade-offs between different management objectives
How to do an MSE Computer simulation, Feedback Loop

- **OPERATING MODEL**
  - “True” Population dynamics

- **DATA GENERATION**
  - Estimation of stock status

- **IMPLEMENTATION ERROR**
  - Harvest control rule

- **ESTIMATION MODEL**
  - Stock Assessment Model
For each management strategy

1. Project (true) state given the catch

2. Generate data from true population

3. Estimate stock status given the catch

4. Use control rule to calculate TAC for the next three years

Current Stock Biomass
Current Fishing Intensity
For each management strategy

1. Project (true) state given the catch

2. Generate data from true population

3. Estimate stock status given the catch

4. Use control rule to calculate TAC for the next three years

PERFORMANCE METRICS
Stakeholders involvement is important for:

1. Clearly specifying pre-agreed upon management objectives and performance metrics
2. Identifying candidate management strategies to be tested in MSE framework
3. Review results
MSE Example – North Pacific Albacore

Background: see Steve Teo’s talk

Goal: Examine performance of candidate alternative management strategies and target reference points for North Pacific albacore given uncertainty
North Pacific Albacore

Highly migratory species whose habitat spans the entire North Pacific Ocean

Trans-Pacific Movements

Spawning Area
North Pacific Albacore

Majority of the catch occurs in the Western Pacific

ISC ALBWG,
http://isc.fra.go.jp/working_groups/albacore.html

Ichinokawa et al. 2008, Canadian Journal of Fisheries and Aquatic Sciences
MSE Example – North Pacific Albacore

Management Objectives

1. Maintain spawning biomass above the limit reference point
2. Maintain depletion (fished biomass/unfished biomass) around historical average depletion
3. Maintain fishing impact by fishery at historical average
4. Maintain catches by fishery above average historical catch
5. Change in total allowable catch between years should be relatively gradual
6. Maintain fishing mortality (F) at the target value
MSE Example - North Pacific Albacore

Performance Metrics

1. Spawning stock biomass (SSB)/SSB-based limit reference point (LRP)
2. Depletion/minimum historical depletion
3. Fishing impact by fishery/minimum historical fishing impact by fishery
4. Catch/average historical catch
5. % change in total allowable catch between years
6. F-based target reference point/F
MSE Example – North Pacific Albacore

Harvest Control Rule (HCR)

F_{target} = F_{50%}

Spawning Stock Biomass relative to unfished level
MSE Example – North Pacific Albacore

Strategies/HCRs

- Fishing intensity
- Spawning Stock Biomass relative to unfished level

F_{\text{target}} = 50\%

\[ B_{\text{threshold}} = 8\% \]

\[ B_{\text{limit}} = 14\% \]

\[ F = \text{HCR } 1 \]

\[ = \text{HCR } 2 \]
MSE Example – North Pacific Albacore

**Strategies/HCRs**

- Ensure current management strategy is well defined

**Fishing intensity**

- $F_{target} = 30\%$

- $SSB_{limit} = 8\%$
- $SSB_{threshold} = 14\%$

- $SSB_{in 2015} = 47\%$ of the unfished level

- $F_{in 2015} = 47\%$

### Graph

- Green line = HCR 1
- Purple line = HCR 2
- Orange line = HCR 3

**Notes**

- Spawning Stock Biomass relative to unfished level
MSE Example - North Pacific Albacore

Performance Metrics Comparison

- **Biomass** - % SSB above limit reference point
- **Target F** - % F below target
- **Catch variability** - (100-average catch variability between years)
- **Catch** - % above historical catch
- **Fishing intensity** - % US fishing intensity above historical minimum fishing intensity
- **Depletion** - % above historical depletion
MSE Example - North Pacific Albacore

Performance Metrics Comparison

HCR 1
MSE Example - North Pacific Albacore

Performance Metrics Comparison

HCR 1

HCR 2

HCR 3
MSE Example - North Pacific Albacore

Performance Metrics Comparison – Scenario 2
MSE Example – Southern Bluefin tuna

Background: high uncertainty in stock assessment results, for almost a decade managers struggled to reach agreement on TAC

Goal: To evaluate the performance of pre-agreed upon management procedures
MSE Example – Southern Bluefin tuna

Management Objectives

1. Maximize catches
2. Avoid stock collapse
3. Minimize interannual catch variation

Kurota et al. 2010
MSE Example – Southern Bluefin tuna

Performance Metrics

1. Short and Long term mean catch
2. Catch variability
4. Maximum TAC decrease between years
5. Mean biomass
6. Risk of falling below low biomass level

Kurota et al. 2010
MSE Example – Southern Bluefin tuna

Development of MSE framework took longer than 10 years!

Figure from http://isc.fra.go.jp/pdf/2015_MSE/4-1c_Sakai_ISC_MSE_2015-0417.pdf
Stakeholders involvement is important for:

1. Clearly specifying pre-agreed upon management objectives and performance metrics
2. Identifying candidate management strategies to be tested in MSE framework
3. Review results

### How does an MSE fit in or why do an MSE?

From the NC13 reports…

71. NC13 recommends that the Commission adopt the attached revision to the title of previously adopted precautionary management framework for North Pacific albacore (Attachment H), so that it may be recognized as a harvest strategy. In addition, NC13 recommends that the Commission direct the Secretariat to make this harvest strategy available, as a stand-alone harvest strategy document, on a web page dedicated to this and other harvest strategies, including interim harvest strategies, agreed to by the Commission.

#### Attachment H (Interim Harvest Strategy for NPALB Fishery)

4. Future work

This framework may be periodically reviewed and revised. To support such revisions, NC endorses the ongoing development and implementation of an MSE for the stock and fishery, which would yield new information that would enhance the robustness of this framework.

#### Attachment I (Work Programme for the NC)

NPALB:

(B) Implement the Interim Harvest Strategy, including: (1) monitor if LRP is breached; (2) continue to work to establish TRP and other elements of harvest strategies, if appropriate based on MSE; (3) recommend any changes to CMM 2005-03.

---

Because the managers wanted to…

- Evaluate candidate target reference points
- Associated harvest control rules
Timeline for NP albacore

1st ISC MSE WS (16-17 April 2015 at Yokohama, JAPAN)
- 71 participants: fishery managers, stakeholders, NGOs, and scientists
- Purpose: to learn about and understand the MSE process; review the objectives, benefits, and requirements to implement an MSE; as well as recent progress made by tuna RFMOs towards adopting and implementing the MSE process

2nd ISC MSE WS (24-25 May 2016 at Yokohama, JAPAN)
- 24 participants: fishery managers, stakeholders, NGOs, and scientists
- Purpose: to develop management objectives and performance indicators, based on input from managers, stakeholders and scientists

3rd ISC MSE WS (17-19 October 2017 at Vancouver, CANADA)
- 23 participants: fishery managers, stakeholders, NGOs, and scientists
- Purpose: to identify acceptable level of risk for each management objective; and develop candidate reference points and harvest control rules for testing

| Late 2018 – early 2019 | 4th ISC MSE workshop (managers, stakeholder, NGOs & scientists) to:  
1) Discuss MSE results in detail  
2) Based on MSE results, propose RPs and HCRs to WCPFC NC and IATTC  
3) Propose refinements to MSE |
### Objective\(^A\) | Quantity | Proposed Performance Indicators\(^8\), C, D | Example Output\(^8\)
--- | --- | --- | ---
1. **Maintain spawning biomass above the limit reference point**
   - \(20\%\)SSB\(_{\text{CURRENT}, F=0}\)
   - \(14\%\)SSB\(_{\text{CURRENT}, F=0}\) (calculated as \((1-M)\times\text{SSB}20\%\))
   - \(\text{SSB}_0.5\text{R}_0\), where \(h = 0.75\) (IATTC SAC)
   
   • SSB for each projected year / SSB-based LRP

   • % of runs in which ratio \(\geq 1\) for 29/30, 27/30, 24/30;

   • Each run = 30 years

2. **Maintain total biomass, with reasonable variability, around the historical average depletion of total biomass**
   - Historical depletion is estimated as the depletion level of total biomass for 2006-2015

   • Depletion of projected total biomass over 30 yrs /minimum historical depletion of total biomass (minimum of 2006 - 2015)

   • % of runs in which ratio \(\geq 1\) for 29/30, 27/30, 24/30;

   • Each run = 30 years

3. **Maintain harvest ratios by fishery (fraction of fishing impact with respect to SSB) at historical average**
   - Historical harvest ratio by fishery estimated as the average of 2006 – 2015
   - Historical variability in harvest ratio estimated from 2006 – 2015

   • Harvest ratio (H) by fishery (i) for each year is calculated as \((1-\text{SPR}_i)/1-\text{SPR}_\text{total}\)

   • Projected harvest ratio by fishery over 30 yrs \(\geq\) minimum historical harvest ratio by fishery (minimum of 2006 - 2015) and \(\leq\) maximum historical harvest ratio by fishery (maximum of 2006 - 2015)

   • % of runs within minimum and maximum for 29/30, 27/30, 24/30;

   • Each run = 30 years
### Management objectives for NP albacore MSE

<table>
<thead>
<tr>
<th>Objective</th>
<th>Quantity</th>
<th>Proposed Performance Indicators</th>
<th>Example Output</th>
</tr>
</thead>
</table>
| 4. Maintain catches by fishery above average historical catch | • Average catch by fishery over the 30 year period, 1981-2010. | • Total catch of each projected year / average total historical catch (1981 – 2010)  
• Catch by fishery of each projected year / average historical catch of the fishery (1981 – 2010)  
• Projected catch by fisheries over 30 yrs /lower 25% of historical catch (1981 - 2010)  
• Projected catch by fisheries over 30 yrs /upper 25% of historical catch (1981 - 2010) | • % of runs in which ratio ≥1 for 29/30, 27/30, 22/30, 15/30;  
• Each run = 30 years; |
| 5. If a change in total allowable effort and/or total allowable catch occurs, the rate of change should be relatively gradual | • % change in TAE and/or TAC between years (separate increases vs decreases) | • Median ± 5 and 95% percentiles of maximum % change in TAE and/or TAC for all years over all runs  
• Median ± 5 and 95% percentiles of % of projected years where change (0-15%, 15-30%, >30%) in TAE and/or TAC for all years over all runs |

NOTES
A - Objectives 1-6 for the first round of MSE were reviewed and agreed upon by the 3rd MSE Workshop participants, October 17-19, 2017.
B - Performance indicators and example output proposed by the Albacore Working Group
C - Performance indicators are configured so that higher estimated values mean better performance and lower estimated values mean poorer performance, i.e., they have consistent directionality to reduce confusion in interpreting results. The exception to this practice is the first indicator (% change due to HCR between years) for objective 5 for which there is no directionality.
D - Definition of each fishery for fishery-specific performance indicators should be based on flag and gear.
Common language and values for acceptable risk categories in an MSE proposed by the ISC NPALB WG

Three candidate harvest strategies proposed

Harvest Strategy 2 (based on IATTC-Resolution C-16-02)
Harvest strategy 2 is based on the IATTC HCR for tropical tunas.

Changes in management actions occur when there is a risk that SSB drops below a biomass-based LRP or fishing intensity is higher than an F-based LRP.
Candidate Harvest Strategy 1

- For stocks at or above $SSB_{THRESHOLD}$ an annual Total Allowable Catch (TAC) or Total Allowable Effort (TAE) is set to allow the stock biomass to fluctuate around $SSB_{TARGET}$ and the fishery to have a fishing impact around $F_{TARGET}$.

- For stocks below $SSB_{THRESHOLD}$ with a given probability (see Table 4 for the range of probabilities to be tested) but above $SSB_{LIMIT}$, an annual TAC or TAE is set based on a proportional reduction from $F_{TARGET}$ using the fraction $SSB_{LATEST} / SSB_{THRESHOLD}$.

- For stocks below $SSB_{LIMIT}$, a stock rebuilding plan is implemented such that SSB will be rebuilt to $SSB_{TARGET}$ within 2 generations. More specifically, if the spawning biomass is below the limit reference point ($SSB_{LIMIT}$) with a given probability, management measures are established to ensure a probability of at least 50% of restoring SSB to the target level ($SSB_{TARGET}$).
Candidate Harvest Strategy 3

• For stocks at or above \( \text{SSB}_{\text{THRESHOLD}} \), the HCRs are the same as Harvest Strategy 1.

• For stocks below \( \text{SSB}_{\text{THRESHOLD}} \), the annual TAC or TAE decreases linearly until the \( \text{TAC}_{\text{LIM}} \) or \( \text{TAE}_{\text{LIM}} \) is reached. The \( \text{TAC}_{\text{LIM}} \) or \( \text{TAE}_{\text{LIM}} \) are the TAC and TAE when \( \text{SSB} < \text{SSB}_{\text{LIMIT}} \) and a stock rebuilding plan is not implemented.

• For stocks below \( \text{SSB}_{\text{LIMIT}} \), the stock rebuilding plan is the same as harvest strategy 1 but alternative actions only include constant TAE or TACs.

![Diagram of harvest strategy conditions](image.png)
Candidate Harvest Strategy 2

Harvest strategy 2 is based on the IATTC HCR for tropical tunas. In summary, changes in management actions occur when SSB drops below a biomass-based LRP or fishing intensity is higher than an F-based LRP.

- If the probability that F will exceed $F_{\text{LIMIT}}$ is greater than 10%, management measures shall be established that have a probability of at least 50% of reducing F to $F_{\text{TARGET}}$ or less, and a probability of less than 10% that F will exceed $F_{\text{LIMIT}}$.
- If the probability that SSB is below $SSB_{\text{LIMIT}}$ is greater than 10%, management measures shall be established that have a probability of at least 50% of restoring SSB to $SSB_{\text{TARGET}}$ or greater, and a probability of less than 10% that SSB will descend to below $SSB_{\text{LIMIT}}$ in a period of two generations of the stock or five years, whichever is greater.

Reference points

- $SSB_{\text{LIMIT}}$ is $SSB_{0.5r0}$ and $F_{\text{LIMIT}}$ is $F_{0.5r0}$. This is the spawning biomass or fishing intensity corresponding to a spawning biomass that leads to a 50% reduction in the virgin recruitment level given a steepness value of 0.75.
- $SSB_{\text{TARGET}}$ is $SSB_{\text{MSY}}$ and $F_{\text{TARGET}}$ is $F_{\text{MSY}}$. These refer to the spawning biomass or fishing mortality corresponding to the maximum sustainable yield (MSY). For North Pacific albacore, $SSB_{\text{MSY}}$ corresponds to approximately 14% of the virgin spawning biomass in the latest stock assessment but is considered difficult to estimate reliably for this stock.

### Additional Assumptions

| Assessment periodicity | Once every 3 years | Once every 3 years | Once every 3 years |
| Comments | Both targeting and non-targeting | Both targeting and non-targeting | Both targeting and non-targeting |
| HCRs controls on albacore targeting and/or non-targeting | Both targeting and non-targeting | Both targeting and non-targeting | Both targeting and non-targeting |
| Targeting only | Targeting only | Targeting only | Targeting only |

### Harvest Control Rules 3
Lessons learnt

• Takes longer than expected to find and hire an MSE analyst

• Progress is slow because WG has to squeeze this into the assessment schedule

• Important to have stakeholders at the MSE workshops

• Having clear management objectives from the start will help

• Technical terms and acronyms can be overwhelming to non-scientists but taking the time to explain things in different ways (e.g., graphical) is worth the effort
