A report of the Pacific Fishery Management Council pursuant to National Oceanic and Atmospheric Administration Award Number FNA20NMF4410011.

TABLE OF CONTENTS

	<u>Page</u>
INTRODUCTION	1
CHAPTER I – Coastwide Summary	3
1.1 Council-Area Regulations and Landings	3
1.2 Regulatory Objectives by Management Area	3
1.2.1 Latitude 40°10' N. to U.S./Mexico Border	4
Chinook Fisheries	4
Coho Fisheries	5
1.2.2 Humbug Mountain to Latitude 40°10' N.	5
Chinook Fisheries	5
Coho Fisheries	6
1.2.3 Cape Falcon to Humbug Mountain	6
Chinook Fisheries	6
Coho Fisheries	6
1.2.4 U.S./Canada Border to Cape Falcon	7
Chinook Fisheries	7
Coho Fisheries	8
1.3 Selective Fisheries and Salmon Bycatch	8
1.3.1 Selective Chinook Fisheries	9
1.3.2 Selective Coho Fisheries	9
1.4 Pacific Salmon Commission	9
1.4.1 Chinook Fisheries	10
1.4.2 Coho Fisheries	12
CHAPTER II – Chinook Salmon Management	33
2.1 Central Valley Chinook Stocks	33
2.1.1 Sacramento River Fall Chinook	34
2.1.2 Sacramento River Winter and Spring Chinook	35
2.1.3 Sacramento River Late-Fall Chinook	36
2.1.4 San Joaquin River Fall Chinook	36
2.2 Northern California Chinook Stocks	36
2.2.1 Threatened California Coastal Chinook	37
2.2.2 Klamath River Fall Chinook	38
2.3 Oregon Coast Chinook Stocks	38
2.3.1 North Migrating Chinook	40
2.3.2 South/Local Migrating Chinook	40
2.4 Columbia River Basin Chinook Stocks	41
2.4.1 Upper Columbia Summer Chinook	43
2.4.2 Upriver Bright Fall Chinook	44
2.4.3 Snake River Wild Fall Chinook	44
2.4.4 Lower Columbia River Natural Tule Fall Chinook	44
2.5 Washington Coastal Chinook Stocks	44
2.5.1 Willapa Bay Chinook	45
2.5.2 Grays Harbor Chinook	47
2.5.3 Quinalt River Chinook	49
2.5.4 Queets River Chinook	49

2.5.5	Hoh River Chinook	51
2.5.6	Quillayute River Chinook	52
2.5.7	Hoko River Chinook	55
2.6	Puget Sound Chinook Stocks	55
2.7	Coastwide Goal Assessment Summary	56
2.8	Stock Status Determinations	57
	CHAPTER III – Coho Salmon Management	71
3.1	Oregon Production Index Area Coho Stocks	71
3.1.1	Central California Coast and Northern California Coho	74
3.1.2	Oregon Coast Natural Coho	74
3.1.3	Oregon Coastal Hatchery Coho	75
3.1.4	Columbia River Coho	75
3.2	Washington Coastal Coho Stocks	75
3.2.1	Willapa Bay Coho	76

LIST OF ACRONYMS AND ABBREVIATIONS

AABM	aggregate abundance-based management
ADFG	Alaska Department of Fish and Game
AEQ	adult equivalents
CCC	central California coast (coho)
CDFW	California Department of Fish and Wildlife
Council	Pacific Fishery Management Council
CVI	Central Valley Index
CWT	coded-wire tag
CYER	calendar year exploitation rate
EEZ	exclusive economic zone (from 3-200 miles from shore)
EMAP	Environmental Monitoring and Assessment Program
ESA	Endangered Species Act
ESU	evolutionarily significant unit
FEAM	Fishery Economic Assessment Model
FMP	fishery management plan
F _{MSY}	maximum sustainable yield exploitation rate
FRAM	Fishery Regulation Assessment Model
IGN	Indian gill net
ISBM	individual stock-based management
KMZ	Klamath management zone (ocean zone between Humbug Mountain and latitude 40°10'N, near Cape Mendocino, California, where management emphasis is on KRFC)
KRFC	Klamath River Fall Chinook
LCN	Lower Columbia Natural (coho)
LCR	Lower Columbia River (natural tule Chinook)
LRH	Lower Columbia River hatchery (tule fall Chinook returning to hatcheries below Bonneville Dam)
LRW	Lower Columbia River wild (bright fall Chinook spawning naturally in tributaries below Bonneville Dam)
MCB	mid-Columbia River brights (bright hatchery fall Chinook released below McNary Dam)
MFMT	maximum fishery mortality threshold
MOC	mid-Oregon coast
MSST	minimum stock size threshold
MSY	maximum sustainable yield
NA	not available
NMFS	National Marine Fisheries Service
NOC	north Oregon coast

LIST OF ACRONYMS AND ABBREVIATIONS *(continued)*

ODFW	Oregon Department of Fish and Wildlife
OCN	Oregon coastal natural (coho)
OPI	Oregon Production Index (coho salmon stock index south of Leadbetter Point)
PacFIN	Pacific Coast Fisheries Information Network
PSC	Pacific Salmon Commission
PST	Pacific Salmon Treaty
RER	rebuilding exploitation rate
RK	Rogue/Klamath (coho)
S _{ACL}	annual catch limit spawner abundance
SAFE	stock assessment and fishery evaluation (document)
SCH	Spring Creek Hatchery (tule fall Chinook returning to SCH)
SDC	status determination criteria
SEAK	Southeast Alaska
S _{MSY}	MSY spawning escapement
SONCC	southern Oregon/northern California coastal (coho)
SRFC	Sacramento River fall Chinook
SRFI	Snake River Fall Index
SRS	Stratified Random Sampling
SRW	Snake River Wild (Chinook)
SRWC	Sacramento River winter Chinook
STEP	Salmon Trout Enhancement Program
STT	Salmon Technical Team (formerly the Salmon Plan Development Team)
SUS	Southern United States
TAC	total allowable catch
URB	Upriver Bright (naturally spawning fall Chinook primarily migrating past McNary Dam)
USFWS	U.S. Fish and Wildlife Service
WCVI	West Coast Vancouver Island
WDFW	Washington Department of Fish and Wildlife

COMMON TABLE CONVENTIONS

All 2023 data provided in this report are preliminary. The following conventions apply to all tables in this report:

1. Due to rounding, the total values may not equal the sum of individual values.
2. A single dash (-) indicates there are no data appropriate for a particular table cell, or in the case of fishing effort or landings, that the season was closed.
3. A double dash (--) indicates no records are available, for example, a fishery may not have been sampled due to low and sporadic effort.
4. "NA" indicates data are not available at the time of publication but are likely to be available at a future date.

INTRODUCTION

The Salmon Technical Team (STT) and staff of the Pacific Fishery Management Council (Council) have prepared this stock assessment and fishery evaluation (SAFE) document as a postseason review of the 2023 ocean salmon fisheries off the coasts of Washington, Oregon, and California to help assess Council salmon fishery management performance, the status of Council-area salmon stocks, and the socioeconomic impacts of salmon fisheries. The STT and Council staff will provide three additional reports prior to the beginning of the ocean salmon season to help guide the Council's selection of annual fishery management measures: Preseason Report I, Preseason Report II, and Preseason Report III. These reports will provide forecasts of stock abundance, determine annual catch limits, and will analyze the biological and economic impacts of the Council's proposed alternatives and adopted fishery management recommendations.

This postseason report will also provide a detailed description of the salmon fishery portions of the affected environment to be incorporated by reference into an Environmental Assessment (EA) to comply with National Environmental Policy Act (NEPA) requirements for the 2024 ocean salmon management measures. Preseason Report I will constitute the first part of the EA for 2024 ocean salmon fishery management measures, and include a statement of the purpose and need, a description of the affected environment, and a description and analysis of the status quo (no action) alternative. Preseason Report II will constitute the second and final part of the EA and will include a description and analysis of the alternative management measures considered for 2024 ocean salmon fisheries. The alternatives analyzed in Preseason Report II will provide a reasonable range of environmental effects, which will bound those of the final fishery management measures included in Preseason Report III. Together, these two parts of the EA will provide the necessary components to determine if a finding of no significant impact (FONSI) is warranted.

West Coast fisheries in Council-managed waters (ocean fisheries between the U.S./Canada border and the U.S./Mexico border from 3 to 200 nautical miles offshore) are directed toward and harvest primarily Chinook or king salmon, *Oncorhynchus tshawytscha*, and coho or silver salmon, *Oncorhynchus kisutch*. Small numbers of pink salmon, *Oncorhynchus gorbuscha*, also are harvested, especially in odd numbered years. There are no directed fisheries for other Pacific salmon species, which are rarely caught in Council-managed fisheries.

The Council's annual review of ocean salmon fisheries provides a summary of important biological and socioeconomic data from which to assess the status of managed stocks, impacts of past management actions, to determine how well management objectives are being met, and to improve regulations for the future. The Council will formally review this SAFE document at its March meeting prior to the development of management alternatives for the approaching fishing season.

Chapter I summarizes ocean salmon fishery regulations and landings within the Council management area, and management actions and landings under the jurisdiction of the Pacific Salmon Commission (PSC). Appendix A provides historical effort and harvest data by state and by management area. Appendix C summarizes historical ocean fishery regulations.

For Chinook and coho salmon, respectively, Chapters II and III assess, where possible, the achievement of pertinent management objectives by salmon stock (including those listed under the Endangered Species Act [ESA]), outline regulations used to achieve the objectives, and summarize

inside fisheries catch and spawner escapement data. Appendix B provides detailed historical spawning escapement and inside fisheries catch information. Detailed information for other salmon species is not included since Council fisheries have minor impacts on pink salmon escapements and no measurable impacts on sockeye or chum salmon or steelhead trout; however, catch and escapement data and objectives for Puget Sound pink salmon are summarized in Appendix B, Table B-43.

Status determination criteria (SDC) for overfishing, approaching an overfished condition, overfished, not overfished/rebuilding, and rebuilt were included in the Salmon Fishery Management Plan (FMP) under Amendment 16 (December 2011).

All SDC rely on the most recent estimates available, which in some cases may be a year or more in the past due to incomplete broods or data availability. The criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. Pertinent stocks are evaluated relative to these SDC as required by the FMP. Stock specific reference points, and recent year estimates for relevant stocks, are presented in Table II-6 and Table III-7.

Status determinations are reported in this SAFE document; however, because approaching an overfished condition relies on a preseason forecast, that status determination is reported in Preseason Report III. In addition, some status determinations may be updated in Preseason Report I or in Preseason III if more recent spawning escapement or exploitation rate estimates become available between the time this SAFE document and Preseason Reports are published.

Socioeconomic impacts of the fisheries are discussed in Chapter IV. Appendix D provides historical fishery-related socioeconomic data.

The annual review of ocean salmon fisheries is drafted as early as analyses of landings and escapement data are available. The most recent entries are noted as preliminary and later updated when the data become final. If updated information or error corrections that could substantially affect the development of management measures for the upcoming season are available, an errata sheet will be included as an appendix in one of the subsequent STT preseason planning documents.

CHAPTER I – COASTWIDE SUMMARY

Chapter I contains or references tables summarizing the current and historical ocean salmon fishing regulations and harvest data. In addition, this chapter provides a summary of the Council's regulatory objectives, by management area, for the most recent fishing year, reports on the results of the Council's selective fisheries for marked hatchery Chinook and coho, and bycatch mortality of Chinook and coho salmon. The final section in the chapter summarizes management information and harvests under the authority of the PSC.

1.1 Council-Area Regulations and Landings

Summaries of the 2023 regulations for non-Indian commercial troll, treaty Indian commercial troll, and recreational ocean salmon fishing in both the exclusive economic zone (EEZ) (3 to 200 nautical miles from shore) and state territorial waters (0 to 3 nautical miles from shore) are provided in Tables I-1, I-2, and I-3, respectively. Historical summaries of regulations for each of the three West Coast states and for treaty Indian troll fisheries are provided in Appendix C, Tables C-1 through C-7. Table C-9 provides a summary of inseason regulatory actions and events during the 2023 season.

Catch, quota, and fishing effort statistics are presented in the following series of tables:

Table I-4: Council-area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by state of landing.

Table I-5: Council-area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by management area.

Table I-6: The coho and Chinook quotas for each fishery compared with actual harvests.

Appendix A, Tables A-1 through A-19: Historical monthly ocean salmon harvest data by state and port area.

Tables A-20 through A-28: Historical monthly ocean salmon harvest data by management area.

Appendix B, Tables B-1 through B-46: Historical inside harvest and escapement data.

Appendix C, Table C-8: Historical record of annual preseason catch quotas for the area north of Cape Falcon, as well as the stocks that were critical for ocean salmon management actions.

1.2 Regulatory Objectives by Management Area

The following sections provide a brief outline of the regulatory objectives that shaped the 2023 ocean salmon fisheries by management area and species. Further details of the conservation and allocation objectives by salmon stock and an assessment of performance are provided in Chapters II and III for Chinook and coho, respectively.

1.2.1 Latitude 40°10' N. to U.S./Mexico Border

Chinook Fisheries

Chinook fisheries management in this area is guided by the Fishery Management Plan (FMP) - defined control rules for Sacramento River fall Chinook (SRFC), Klamath River fall Chinook (KRFC), and by National Marine Fisheries Service (NMFS) Endangered Species Act (ESA) consultation standards for Sacramento River winter Chinook (SRWC), California Coastal Chinook, Oregon Coast Natural (OCN) coho, and Southern Oregon/Northern California Coast (SONCC) coho. The Council structured 2023 Chinook salmon fisheries south of latitude 40°10'N. (near Cape Mendocino, California) to meet the following objectives (in order of most to least constraining):

1. A Klamath Basin natural area spawning escapement of no less than 23,614 fall Chinook adults which is produced, in expectation, by a spawner reduction rate of 10.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
2. A SRFC spawner escapement of no less than 122,000 hatchery and natural area adults.
3. A KRFC age-4 ocean harvest rate of no greater than 10.0 percent, consistent with 2023 NMFS guidance for California Coastal Chinook salmon.
4. The SRWC ESA consultation standard requiring:
 - a. A maximum forecast age-3 impact rate for the area south of Point Arena of 20.0 percent.
 - b. Commercial seasons between Point Arena and the U.S./Mexico border shall open no earlier than May 1 and close no later than September 30, except for a permissible October season conducted Monday through Friday between Point Reyes and Point San Pedro, which shall end no later than October 15; the minimum size limit shall be at least 26 inches total length.
 - c. The recreational season between Point Arena and Pigeon Point shall open no earlier than the first Saturday in April and close no later than the second Sunday in November; the recreational season between Pigeon Point and the U.S./Mexico Border shall open no earlier than the first Saturday in April and close no later than the first Sunday in October; the minimum size limit shall be at least 20 inches total length.
5. A total exploitation rate not to exceed 16.0 percent for the Trinity River component of the SONCC coho ESU and a total exploitation rate not to exceed 15.0 percent for all other components of the SONCC coho ESU.
6. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 20.0 percent for the north-central sub-aggregate and 30.0 percent for the northern and south-central sub-aggregates as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.

Conservation concerns for SRFC and KRFC were the primary constraining factors for 2023 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted

in the following projections: a KRFC spawning escapement of 23,614 natural area adults, a KRFC age-4 ocean harvest rate of 0.3 percent, a SRWC age-3 impact rate of 0.0 percent for the area south of Point Arena, and a SRFC spawner escapement of 164,964 hatchery and natural area adults.

Coho Fisheries

Coho fishery management for 2023 in this area was guided by the ESA consultation standard for Central California Coast (CCC) coho, which prohibits retention of coho in this area. No projection of non-retention fishery impacts on CCC coho was available; projected non-retention exploitation rates on OCN and SONCC coho were 0.0 and 0.0 percent, respectively, in this area. Retention of coho has been prohibited south of the Oregon/California border since 1996. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2023 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

1.2.2 Humbug Mountain to Latitude 40°10' N.

Chinook Fisheries

The area between Humbug Mountain (near Port Orford, Oregon) and latitude 40°10' N. is referred to as the Klamath Management Zone (KMZ). In 2021 the southern border of the KMZ was shifted from Horse Mountain five nautical miles north to latitude 40°10' N. Chinook fisheries management in this area is guided by FMP-defined control rules for KRFC, SRFC, and by NMFS ESA consultation standards for California Coastal Chinook, Lower Columbia Natural (LCN) coho, OCN coho, and SONCC coho. The Council structured 2023 Chinook salmon fisheries in the KMZ to meet the following objectives (in order of most to least constraining):

1. A SRFC spawner escapement of no less than 122,000 hatchery and natural area adults.
2. A Klamath Basin natural area spawning escapement of no less than 23,614 fall Chinook adults which is produced, in expectation, by a spawner reduction rate of 10.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
3. A KRFC age-4 ocean harvest rate of no greater than 10.0 percent, consistent with 2023 NMFS guidance for California Coastal Chinook salmon.
4. A total exploitation rate not to exceed 16.0 percent for the Trinity River component of the SONCC coho ESU and a total exploitation rate not to exceed 15.0 percent for all other components of the SONCC coho ESU.
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 20.0 percent for the north-central sub-aggregate and 30.0 percent for the northern and south-central sub-aggregates as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.

Conservation concerns for SRFC and KRFC were the primary constraining factors for 2023 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a KRFC age-4 ocean harvest rate of 0.3 percent, a KRFC spawning escapement of 23,614 natural area adults, and a SRFC spawner escapement of 164,964 hatchery and natural area adults.

Coho Fisheries

Coho fisheries management in this area is guided by the ESA consultation standards for LCN, OCN, SONCC, and CCC coho, which prohibits retention of coho south of the Oregon/California border. No projection of non-retention fishery impacts on CCC coho was available. Projected exploitation rates on LCN, OCN, and SONCC coho were 0.1, 0.4, and 0.7 percent, respectively, in this area. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2023 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

1.2.3 Cape Falcon to Humbug Mountain

Chinook Fisheries

Chinook fisheries management in this area is guided by FMP-defined control rules for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, Lower Columbia River (LCR) natural tule Chinook, and Snake River wild (SRW) Chinook. The Council structured 2023 Chinook salmon fisheries in this area to meet the following objectives (in order of most to least constraining):

1. A Klamath Basin natural area spawning escapement of no less than 23,614 fall Chinook adults which is produced, in expectation, by a spawner reduction rate of 10.0 percent, along with the allocation objective of 50 percent of the allowable adult harvest for federally-recognized tribal subsistence and commercial fisheries.
2. A KRFC age-4 ocean harvest rate of no greater than 10.0 percent, consistent with 2023 NMFS guidance for California Coastal Chinook salmon.
3. A SRFC spawner escapement of no less than 122,000 hatchery and natural area adults.
4. NMFS consultation standards and annual guidance for ESA-listed LCR natural tule Chinook, which required a total exploitation rate not to exceed 38.0 percent in marine and freshwater fisheries combined.

Conservation concerns for SRFC and KRFC were a constraining factor for 2023 Chinook fisheries management in this area. The adopted regulations (Table I-1 and I-3) resulted in the following projections: a LCR natural tule Chinook total exploitation rate of 38.0 percent, a coastwide ocean fishery harvest rate of 0.3 percent on age-4 KRFC, a KRFC spawning escapement of 23,614 natural area adults, and a SRFC spawner escapement of 164,964 hatchery and natural area adults.

Coho Fisheries

Coho fisheries management in this area is guided by NMFS ESA consultation standards for LCN coho, OCN coho, and SONCC coho. The Council structured 2023 coho salmon fisheries in this area to meet the following objectives:

1. The LCN coho ESA consultation standard requirement of no greater than a 23.0 percent exploitation rate (marine and mainstem Columbia River combined).
2. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 20.0 percent for the north-central sub-aggregate and 30.0 percent for the northern and

south-central sub-aggregates as required by the exploitation rate matrix recommended by the OCN coho work group which was accepted by the Council as expert biological advice in November 2000.

3. A total exploitation rate not to exceed 16.0 percent for the Trinity River component of the SONCC coho ESU and a total exploitation rate not to exceed 15.0 percent for all other components of the SONCC coho ESU.

Objective 2 was the most constraining factor in 2023 coho fisheries management in this area. The Council adopted seasons in this area with projected exploitation rates of 5.7, 11.7, and 0.9 percent on LCN coho, OCN coho, and SONCC coho, respectively. In all relevant fisheries, projected exploitation rates were 18.9 and 19.8 percent for LCN and OCN, respectively. For the Trinity, Klamath, Rogue, and all other components of the SONCC ESU, projected total exploitation rates were 15.0, 7.7, 6.7, and 1.8 percent, respectively.

1.2.4 U.S./Canada Border to Cape Falcon

Chinook Fisheries

Management objectives for Chinook fisheries in this area were to comply with NMFS ESA consultation standards for Lower Columbia River (LCR) natural tule fall Chinook, Lower Columbia River Wild (LRW) fall Chinook, Snake River Wild (SRW) fall Chinook and Puget Sound Chinook; meet treaty Indian sharing obligations, the allocation provisions in the Salmon FMP, and provisions of the Pacific Salmon Treaty (PST); and to the extent possible, provide for viable ocean and in-river fisheries while meeting natural stock escapement objectives and hatchery fall Chinook broodstock needs. Columbia lower river hatchery (LRH) and Spring Creek Hatchery (SCH) fall Chinook have historically been the major contributors to ocean fishery catches in the Council-area north of Cape Falcon.

The Council structured Chinook salmon fisheries between Cape Falcon, Oregon, and the U.S./Canada border to meet the following objectives:

1. The LCR natural tule Chinook ESA consultation standard requirement for a combined marine and freshwater exploitation rate of no greater than 38.0 percent.
2. The Snake River fall Chinook ESA consultation standard of at least a 30.0 percent reduction in the total ocean age-3 and age-4 adult-equivalent (AEQ) exploitation rate from the 1988-1993 average.
3. For relevant Chinook stocks, adhere to the Individual Stock Based Management (ISBM) limits set forth in Attachment I of Chapter 3 of the 2019 PST.

Objective 1 was the primary constraint for 2023 ocean fisheries in this area. Under the adopted regulations (Tables I-1, I-2, and I-3), fisheries were projected to have a 38.0 percent total AEQ exploitation rate on LCR natural tules (12.0 percent in Council-area fisheries) and be 49.0 percent of the 1988 to 1993 base period AEQ exploitation rate for SRW (a 51 percent reduction). Additionally, the 2023 ocean fisheries were shaped to limit impacts on ESA-listed Puget Sound natural Chinook stocks.

Coho Fisheries

The Council structured coho salmon fisheries to meet the following objectives:

1. The LCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 23.0 percent.
2. An exploitation rate on Interior Fraser coho of no more than 10.0 percent in southern U.S. (SUS) fisheries in accordance with the provisions of the Southern Coho Management Plan adopted by the PSC in February 2002.
3. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 20.0 percent for the north-central sub-aggregate and 30.0 percent for the northern and south-central sub-aggregates as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
4. Meet FMP conservation objectives and obligations under the PST Southern Coho Management Plan for stocks originating on the Washington coast, Puget Sound, and British Columbia, and inside/outside and treaty Indian/non-Indian allocation objectives with special attention to meeting objectives for Washington coastal natural coho.
5. Meet FMP objectives for allocation of impacts between commercial and recreational ocean fisheries, and among port areas for the recreational fishery.

Objective 4 was the primary constraint for 2023 ocean fisheries in this area. The adopted regulations (Tables I-1, I-2, and I-3) were projected to have a total exploitation rate on LCN coho of 18.9 percent (13.9 percent in Council-area fisheries), an exploitation rate in SUS fisheries of 9.7 percent on Interior Fraser (Thompson River) coho (5.0 percent in Council-area fisheries), and a total exploitation rate of 19.8 percent on OCN coho (13.7 percent in Council-area fisheries). The adopted regulations were projected to meet all FMP objectives or objectives agreed to by Tribal and WDFW comanagers per the PST Southern Coho Management Plan for Grays Harbor, Queets, Hoh, and Quillayute natural coho when combined with scheduled in-river fisheries.

1.3 Selective Fisheries and Salmon Bycatch

Estimated incidental Chinook and coho mortalities are reported in Tables I-7, I-8, and I-9. Unless otherwise noted, Chinook mortality estimates south of Humbug Mountain, Oregon were based on expansion of dockside sampling data.

The Council assumed hook-and-release mortality rates of 26 percent in commercial troll fisheries coastwide, and 14 percent in recreational fisheries north of Point Arena. Recreational fisheries south of Point Arena were closed in 2023. The Council assumed a hook-and-release mortality rate of 15 percent based on the proportion of fish caught using mooching versus trolling gear, and the estimated rates of 42.2 and 14 percent for these gear types, respectively. In addition, the Council assumes drop-off mortality for both Chinook and coho to be equal to 5 percent of total encounters.

1.3.1 *Selective Chinook Fisheries*

No recreational fisheries selective for marked Chinook were planned for the four ocean subareas between Cape Falcon, Oregon, and the U.S./Canada border in 2023. Recreational fisheries in the Strait of Juan de Fuca operated under mark-selective retention restrictions for Chinook in Area 5 and the portion of Area 6 west of Port Angeles. Area 5 was open to mark-selective retention from July 1 through August 15, Area 6 was open from July 1 through August 15 (Figure I-1). Both Area 5 and Area 6 mark-selective fisheries were managed to a threshold of total legal-sized encounters for the fishery. The threshold for Area 5 was 7,254 and the threshold for Area 6 was 11,516.

Mark-selective Chinook fisheries were also held in Puget Sound Area 7 July 13 through July 15, July 21, and July 28 through July 29 in Area 9 Thursday through Saturday only from July 13 through July 22, and July 27 and 28, in Area 10 from July 13 through August 3, August 11 through August 13, and August 18 through August 20, in Area 11 from June 1 through June 4, June 8 through June 11, July 1 and 2, July 13 and 14, in Area 12 from July 10 through September 30, and in Area 13 May 1 through September 30 (Figure I-1).

The 2024 winter mark-selective fisheries are scheduled in Area 5 from April 1-30, in Area 10 from March 1 - April 15, and in Area 11 from March 1-April 15. The preseason prediction of total Chinook salmon encounters in Area 10 is 4,953 and will also be managed to 953 total unmarked encounters and 4,181 total sublegal encounters. The Area 11 mark-selective fishery will be managed to a threshold of 1,191 total Chinook encounters, 259 total unmarked encounters and 816 total sublegal encounters. Area 13 is open for mark-selective Chinook from October 1, 2023, through April 30, 2024. Marine Areas 6, 7, 8-1, 8-2, 9, and 12 are not scheduled for winter Chinook mark-selective fisheries in 2023-2024.

1.3.2 *Selective Coho Fisheries*

Commercial troll fisheries selective for marked coho were planned for the area between the U.S./Canada border and Cape Falcon, Oregon. Recreational fisheries selective for marked coho were planned for the area between the U.S./Canada border and the Oregon/California border, and the inside fishery at Buoy 10 (Figure I-1). Other inside and freshwater recreational fisheries in Washington and Oregon had mark-selective restrictions for coho. Preseason and postseason assessments of mark rates, catch, number of coho released, and incidental (bycatch) mortality for Council-area and some mixed stock inside fisheries are summarized in Table I-9. Fisheries in Washington ocean fisheries were sampled by dockside interviews, with some fisheries monitored using additional voluntary trip reporting and/or onboard observers. Oregon ocean fisheries were sampled exclusively by dockside interviews. The observed mark rates in ocean fisheries were lower than what was predicted preseason. Observed total non-retention mortality was lower than expected in north of Cape Falcon Council-area mark-selective coho recreational fisheries and lower than expected in north of Cape Falcon Council-area mark-selective coho commercial troll fisheries. Estimated non-retention mortality was lower than expected in all south of Cape Falcon Council-area mark-selective coho fisheries.

1.4 *Pacific Salmon Commission*

The PSC was established to implement the 1985 Pacific Salmon Treaty (PST) between the U.S. and Canada. Because many of the stocks under the jurisdiction of the Council are significantly

affected by management actions taken in Canadian and Alaskan waters, considerable interaction between the Council and the PSC occurs at both the policy and technical levels. Actual catches for PSC fisheries of most relevance to the Council are summarized in Tables I-10 and I-11. Note that these catches result from inseason management of fisheries for compliance with aggregate abundance-based management (AABM; see below) under the PST. They do not include incidental mortality associated with regulation of these fisheries, except as noted.

1.4.1 Chinook Fisheries

Northern British Columbia (B.C.) and Southeast Alaska (SEAK) fisheries impact far-north migrating Chinook stocks from Washington, Oregon, and Idaho. These include Washington coastal stocks, Columbia and Snake River bright fall and summer stocks, and far-north migrating Oregon coastal Chinook stocks. The West Coast Vancouver Island (WCVI) troll and recreational fisheries, in addition to recreational fisheries in the Strait of Georgia and the Strait of Juan de Fuca, impact far-north migrating stocks (including LRW) to a lesser degree but can have a major impact on more southerly-distributed Columbia River tule and Puget Sound stocks.

In June 1999, the U.S. and Canada reached agreement on a framework for Chinook fishing regimes for 1999 through 2008. Under this agreement, SEAK (all gear), Northern B.C. (troll and recreational), and WCVI (troll and outside recreational) fisheries were regulated under AABM regimes. These fishery regimes had catch ceilings derived from indices for total aggregate abundance of stocks contributing to specific components of the fisheries and target fishery harvest rates. For example, the allowable catches for WCVI troll and outside recreational fisheries were determined by the Abundance Index (AI) estimated for the WCVI troll fishery. The allowable catch for the WCVI AABM fisheries was designed to reduce harvest rates for the combined troll and outside recreational fisheries by approximately 35 percent from levels observed during 1985 through 1996.

With the expiration of the 1999 Agreement in 2008, another 10-year agreement was negotiated and implemented from 2009 through 2018 that included reductions to catch ceilings in SEAK and WCVI AABM fisheries of 15 percent and 30 percent, respectively, from those in the 1999 Agreement. As this 2009 Agreement expired at the end of 2018, a new 10-year agreement has been negotiated and went into effect beginning with the 2019 season. This new agreement includes further reductions to SEAK and WCVI AABM fisheries relative to the 2009 Agreement. For SEAK, the reductions range from 1.5 percent in years of high abundance to 7.5 percent in years of low abundance. For WCVI, the reductions range from 2.4 percent in years of high abundance to 12.5 percent in years of low abundance. Additionally, with the implementation of the 2019 Agreement, beginning in 2019 the allowable catches for SEAK fisheries were no longer determined using the AI produced by the PSC Chinook Model, rather, they were set using a catch-per-unit-effort (CPUE) estimate from the early winter power troll fishery (see Tables 1 and 2 in Chapter 3 of the 2019 PST Agreement for specifics). Use of this approach continued through 2022, however, in 2023 the PSC agreed to suspend the use of the CPUE approach and adopted a new multivariate model for setting the 2023 SEAK AABM catch limit, which incorporates PSC Chinook Model AIs and the early winter power troll CPUE.

For fisheries not driven by AABM regimes, including Council-area fisheries, the 1999 Agreement established conservation obligations to reduce harvest rates on depressed Chinook stocks (those

not meeting escapement goals) by 36.5 percent for Canadian fisheries and 40 percent for U.S. fisheries, relative to levels observed during 1979 through 1982. This individual stock-based management (ISBM) obligation was taken into account during Council and inside fisheries preseason management planning processes. However, relative to meeting the provisions of the PST, the ISBM indices are evaluated on a postseason basis only. Under the terms of the 2019 PST Agreement, these fisheries are subject to a new set of ISBM fishery limits. These provisions require the calendar year exploitation rate (CYER) by all U.S. fisheries south of the U.S./Canada border on specific indicator stocks to be below some level of the average 2009 – 2015 CYER if they do not achieve their management objectives (see Attachment I in Chapter 3 of the 2019 PST Agreement for specifics). Similar to the previous ISBM obligations, these limits are taken into account during preseason planning processes, however, relative to meeting the provisions of the PST, the CYER limits are evaluated on a postseason basis only.

Beginning in 2019, AABM fisheries were conducted in accordance with the obligations set forth in the 2019 PST Agreement. The PSC reached agreement in 2023 on a calibration of the PSC Chinook Model that produces AIs for the three AABM fisheries. The AI corresponds to an annual catch limit of “Treaty” Chinook per provisions in the PST. Treaty Chinook are those fish that are counted against the AABM catch ceiling; they represent total landed catch minus terminal exclusions (fish taken in terminal net fisheries where escapement goals are achieved) and hatchery add-ons (fish attributed to production from Alaskan hatchery facilities in excess of levels observed prior to the 1985 PST). The AIs produced by the 2023 calibration of the PSC Chinook Model were used to set the treaty catch limits for the Northern B.C. and WCVI AABM fisheries, while the new multivariate model was used to determine the treaty catch limit for the SEAK AABM fishery.

The 2023 AI produced by the multivariate model for SEAK was 1.42, which corresponds to an annual catch limit of 206,027 Treaty Chinook. The preliminary estimate of total Chinook catch by SEAK fisheries in 2023 is 235,200, of which 202,700 were Treaty Chinook (Table I-10). These catches were less than the total catch of 275,800 Chinook in 2022, of which 238,600 were Treaty fish.

The 2023 AI for Northern B.C. was 1.16, corresponding to an annual catch limit of 141,700 Chinook. The preliminary estimated catch in the Northern B.C. AABM fisheries (Northern B.C. troll plus Haida Gwaii [Queen Charlotte Islands] recreational) in 2023 is 81,000 Chinook (51,800 troll; 29,200 recreational; Table I-11). This was well below the preseason catch ceiling and similar to the previous year’s total catch of 83,200. The Northern B.C. troll fishery in 2023 was conducted under a system of individual transferable quotas that was fully implemented beginning in 2008.

The 2023 AI for WCVI was 1.02, corresponding to an annual catch limit of 115,500 Chinook. In addition to the overall catch ceiling determined by the PST, Canada’s principal management objectives for the 2023 WCVI Chinook fisheries were to meet domestic allocation objectives as well as address concerns for Lower Strait of Georgia Chinook, WCVI Chinook stocks, and Fraser River Chinook, in addition to Interior Fraser (Upper Fraser and Thompson) coho and steelhead populations. The preliminary estimated 2023 catch in WCVI AABM fisheries was 75,900 Chinook (23,000 First Nations, 22,100 troll, and 30,600 recreational; Table I-11). This was below the preseason catch ceiling and lower than the previous year’s total catch of 95,300.

Since 1999, the WCVI Area G troll fishery has been managed to distribute the catch throughout the year with fisheries in the summer shaped to reduce impacts on coho and WCVI, Lower Strait of Georgia, and early-run Fraser River Chinook stocks. Beginning with the 2019 fishing year (October 2018 through September 2019), additional conservation measures were put in place to protect Fraser River Chinook by implementing troll fishery closures in periods prior to July 31. Troll catch in the 2023 fishing year occurred during three openings, one from January 2 through March 15, a second in inshore areas only from April 5 through May 31, and a third from August 16 through September 15. Preliminary estimates indicate that the fishery harvested 22,100 fish, which is similar to the 24,700 caught in 2022 (Table I-12).

For the WCVI outside recreational fishery (the area where non-local stocks predominate), in addition to existing domestic management measures to protect local WCVI Chinook, new actions have been in place since 2019 to further protect Fraser River Chinook populations. These included Chinook non-retention from April 1 through July 14 in waters beyond 1 mile of shore, and for July 15 through July 31 a maximum size limit of 80 cm (31.5 inches) and a reduction in the daily limit to one per day. Preliminary estimates indicate that the fishery harvested 30,600 Chinook in 2023, down from 37,200 caught in 2022.

The reported Canadian ISBM Chinook catch for Northern B.C. in 2023 was approximately 12,700 (6,500 First Nations FSC & Treaty, 600 commercial, 5,600 recreational). Southern B.C. ISBM fisheries in 2023 harvested approximately 269,900 Chinook (98,800 First Nations, 27,300 commercial, 143,800 recreational). Note, however, that these ISBM catch estimates for both Northern and Southern B.C. are preliminary and incomplete, as catch estimates in some areas are not yet available.

No direct management measures for Chinook salmon within the Council management area were specified under the 2019 PST agreement, except for the ISBM commitment. The Council's 2023 ocean fisheries and inside fisheries conducted by the state and tribal managers were designed to minimize impacts on spawning escapements of depressed stocks, and preseason estimates of impacts complied with the terms of the PST agreement. Information necessary to evaluate the postseason impacts of 2023 Council-area fisheries was not available.

1.4.2 Coho Fisheries

In 2002, the PSC adopted a management plan for coho salmon originating in Washington and Southern B.C. river systems. The plan is directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, and Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the U.S. and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status (low, moderate, and abundant) and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan. A new 10-year agreement has been negotiated and went into effect beginning in 2019. Under the new plan the Strait of Georgia Mainland and Strait of Georgia Vancouver Island management units were combined into a single Strait of Georgia management unit. The status of the Interior Fraser

management unit shall be managed at a low status until Canada establishes status determination methods that would provide the basis for a change.

The status of Interior Fraser River coho remained “low” in 2023 preseason. The smolt-to-adult survival index in 2022 was less than 3 percent, indicating that Interior Fraser River Coho will remain in “low” status for at least another 3 years. In 2023, Canadian fisheries were managed for an exploitation rate of 3-5 percent on interior Fraser River coho, less than the 10 percent ceiling allowed under the PSC coho management plan. Categorical forecasts for the Lower Fraser, Georgia Basin, and the Johnstone Strait coho management units were not performed. The PSC coho status categories of low, moderate, and abundant are analogous to the FMP categories of critical, low, and normal.

In 2023, approximately 117,600 coho were retained in troll fisheries in Northern and Central B.C. In Southern B.C. commercial fisheries were very minor, limited by the status of Interior Fraser coho. Coho kept and released by marine commercial fisheries are summarized in Table I-13.

For recreational fisheries, mark-selective coho retention was permitted in mixed stock areas, and barbless hooks were required. Mark-selective fisheries were implemented in most of Southern B.C. (Johnstone Strait, Strait of Georgia, Juan de Fuca Strait, and WCVI). The estimated total retained catch of coho in Southern B.C. marine recreational fisheries in 2022 was 76,100. Coho kept and released by marine recreational fisheries in Southern B.C. are summarized in Table I-14. A preliminary harvest estimate for the 2023 Southern B.C. First Nations coho fisheries was not yet available.

TABLE I-1. Summary of actual ocean non-Indian commercial troll salmon fishing regulations for 2023. (Page 1 of 2)

Area and Season	Salmon Species	Actual Quota		Special Restrictions ^{a/}
		Chinook	Coho	
U.S./Canada Border to Cape Falcon, OR (U.S./Canada Border to the Queets River)	All except coho	26,000 with ^{b/} sub- allocation by area	-	Chinook minimum size limit of 27 inches total length. Weekly landing and possession limits in place and modified inseason. Salmon Troll Yelloweye Rockfish Conservation Area, Cape Flattery and Columbia Control Zones closed. Vessels must land and deliver their fish within 24 hours of any closure of this fishery and landings were generally restricted to area of catch. Refer to complete 2023 ocean salmon regulations for detailed landing and notification requirements.
May 1-10; May 17-June 21; June 24-29 (The Queets River to Cape Falcon, OR)				
May 1-June 21; June 24-29				
July 1-Aug. 2; Aug. 17-Sept. 30	All salmon	13,000	30,400 ^{c/}	Chinook minimum size limit of 27 inches total length. Coho minimum size limit of 16 inches total length. All coho must be marked with a healed adipose fin clip through August 25. No chum retention north of Cape Alava beginning August 1. Weekly landing and possession limits for Chinook and coho in place and modified inseason. Coho quota was modified inseason to allow for non-mark selective retention. Salmon Troll Yelloweye Rockfish Conservation Area, Cape Flattery and Columbia Control Zones closed. Grays Harbor Control Zone open. Vessels must land and deliver their fish within 24 hours of any closure of this fishery and landings were generally restricted to area of catch. Refer to complete 2023 ocean salmon regulations for detailed landing and notification requirements.
Cape Falcon to Humbug Mt., OR Sept. 1-30 Oct. 1-31	All Salmon All except coho	None	10,000	Open seven days per week. All salmon, through the earlier of September 30 or reaching the 10,000 non-mark selective coho quota; all salmon except coho thereafter. Coho minimum size limit of 16 inches total length, and Chinook minimum size limit of 28 inches total length. All vessels fishing in the area must land their salmon in the State of Oregon. Beginning October 1, open shoreward of the 40-fathom regulatory line. No more than 75 Chinook allowed per vessel per landing week (Thurs.-Wed.) Coho quota of 10,000 non-mark selective. No more than 75 coho allowed per vessel per landing week (Thurs.-Wed.).
Elk River State Waters Terminal Area Inside a line from Cape Blanco to Black Rock to Best Rock to 42°40'30" N. Lat. 124°29'00" W. Long. to Humbug Mt. Nov. 1-30	Chinook only	None	-	Open seven days per week. Chinook minimum size limit of 26 inches in total length. Daily landing and possession limit of 10 Chinook per vessel. Landings restricted to Port Orford. Redfish Rocks Marine Reserve closed to all fishing.

TABLE I-1. Summary of actual ocean non-Indian commercial troll salmon fishing regulations for 2023. (Page 2 of 2)

Area and Season	Salmon Species	Actual Quota		Special Restrictions ^{a/}
		Chinook	Coho	
Humboldt Mt. to OR/CA Border (Oregon KMZ) Closed	-	-	-	
OR/CA Border to Humboldt South Jetty (California KMZ) Closed	-	-	-	
Humboldt South Jetty to 40°10' line Closed	-	-	-	
40°10' line to Pt. Arena (Ft. Bragg Area) Closed	-	-	-	
Pt. Arena to Pigeon Pt. (San Francisco Area) Closed	-	-	-	
Fall Area Target Zone Pt. Reyes to Pt. San Pedro Closed	-	-	-	
Pigeon Pt. to U.S./Mexico Border (Monterey Area) Closed	-	-	-	

a/ Single-point, single-shank barbless hooks required in all open areas coastwide. Limited to no more than 4 spreads per wire for all seasons between Cape Falcon and the OR/CA border and no more than 6 spreads per wire from the OR/CA border south to the U.S./Mexico border. Beginning Apr. 1, 2023 unless modified: license holders may land or possess no more than one Pacific halibut per each two Chinook, except one Pacific halibut may be possessed or landed without meeting the ratio, and no more than 35 halibut may be possessed or landed per trip, unless modified by inseason action (see Appendix table C-9 for inseason action on halibut retention limits). See Appendix Tables C.1, C.3, C.5, and C.9 for additional details and inseason adjustments.

b/ No more than 6,890 from U.S./Canada border to Queets R. and 6,040 between Leadbetter Pt. and Cape Falcon.

c/ Beginning August 26, the remaining coho quota was adjusted on an impact-neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho quota is 9,070.

d/ Quotas do not match preseason quota/guidelines because inseason actions (i.e., trades, transferring quotas on an impact neutral basis, and converting to non-mark-selective fishery equivalence) resulted in increases or decreases to the overall quota. See Tables I-1, I-2, I-3, or Appendix Table C-9 for specifics of inseason adjustments.

		June 18-June 30	61	24	-	
	All ^{b/}	July 1- Sept. 15	77	24	16	
S'Klallam						
Area 4B	All ^{b/}	Jan. 1-Apr. 15	105	22	16	Troll gear must not be operated closer than 1,000 feet away from any stream or river mouth in area 4B, or within a 1,000 yard radius from the mouth of the Elwha River.
	All except coho	May 1-June 30	61	24	-	
	All ^{b/}	July 1- Sept. 15	77	24	16	
	All ^{b/}	Nov. 1-Dec. 31	61	22	16	

a/ The overall quotas for these fisheries during the May 1-Sept. 15 ocean salmon management period were 45,000 Chinook and 57,000 coho. These quotas include troll catches by the S'Klallam and Makah tribes in Washington State Statistical Area 4B from May 1-Sept. 15. The overall Chinook quota was divided pre-season to provide 22,500 Chinook for the May 1-June 30 Chinook-directed season and 22,500 Chinook for the July 1-Sept. 15 all-salmon season. The balance of the Chinook quota from the spring period was added to the summer period in-season. Single point, single shank barbless hooks were required in all ocean fisheries.

b/ Retention of steelhead prohibited; retention of chum prohibited beginning August 1.

TABLE I-3. Summary of actual ocean recreational salmon fishing regulations for 2023. (Page 1 of 2)

Area and Season	Salmon Species	Actual Quota		Daily Limit and Special Restrictions ^{b/}
		Chinook	Coho ^{a/}	
U.S./Canada Border to Cape Falcon, OR				
U.S./Canada Border to Cape Alava, WA (Neah Bay subarea) June 17 - Sept. 30	All salmon	8,710 ^{c/}	16,600 ^{e/}	Two salmon daily, only one Chinook through July 7. Beginning July 8-two salmon daily. No chum beginning August 1. Chinook non-retention east of the Bonilla-Tatoosh line during Council managed ocean fishery beginning August 1. Coho quota was modified inseason to allow for non-mark selective retention.
Cape Alava to Queets R., WA (La Push subarea) June 17 - Sept. 30 Oct. 3-7	All salmon	1,440 ^{c/}	4,150 ^{e/}	Two salmon daily, only one Chinook through July 7. Beginning July 8 two salmon daily. No chum beginning August 1. Coho quota was modified inseason to allow for non-mark selective retention.
	Chinook only	150	-	One salmon daily. La Push Late Season Area (area north of 47°50'00" N. Lat. and south of 48°00'00" N. Lat.)
Queets R. to Leadbetter Pt., WA (Westport subarea) June 24-July 27, July 30-Aug. 3, Aug. 6-10, Aug. 13-Sept. 30	All salmon	17,210 ^{c/}	59,050 ^{e/}	Two salmon daily, only one Chinook through July 27. Beginning July 28, Chinook retention prohibited on Fridays and Saturdays. Beginning Aug. 18, two salmon daily, only one Chinook. Grays Harbor Control Zone open. Chinook min. size limit of 22 inches total length. Coho quota was modified inseason to allow for non-mark selective retention.
July 28-29, Aug. 4-5, 11-12	All except Chinook	-	-	Two salmon daily.
Leadbetter Pt., WA to Cape Falcon, OR (Columbia River subarea) June 24-Sept. 30	All salmon	11,490 ^{c/}	79,800 ^{e/}	Two salmon daily, only one Chinook. Columbia River Control Zone closed. Chinook min. size limit of 22 inches total length. Coho quota was modified inseason to allow for non-mark selective retention.
Cape Falcon to to OR/CA Border June 17-Aug. 31 Mark-selective coho fishery:	All except Chinook	-	110,000	Two salmon daily. All retained coho must be marked with a healed adipose fin clip.
Cape Falcon to Humbug Mt. Sept. 1-Oct. 1	All except coho	-	-	One salmon per day. Chinook minimum size limit of 24 inches total length. Beginning October 1, open only shoreward of the 40-fathom regulatory line.
Sept. 1-30 Non-mark-selective coho fishery	All salmon		25,000 ^{d/}	Two salmon per day only one of which may be a Chinook.
Elk River State Waters Terminal Area				
Inside a line from Cape Blanco to Black Rock to Best Rock to 42°40'30" N. Lat. 124°29'00" W. Long. to Humbug Mt. Nov. 1-30	Chinook only	None	-	One salmon per day per angler. Chinook minimum size limit of 24 inches in total length. Redfish Rocks Marine Reserve closed to all fishing.

Closed	-	-	-	-

a/ All coho fisheries and quotas are mark-selective for coho with a healed adipose fin clip unless otherwise noted. Total coho quota for the North of Falcon area is 159,600 marked fish.

b/ Unless otherwise noted, minimum size limits are 24 inches for Chinook and 16 inches for coho. Seasons open 7 days per week. For a complete description of gear restrictions, see the annual ocean salmon regulations or the annual Preseason Report III, Table 2.

c/ Total preseason recreational Chinook quota for the North of Falcon area is 39,000 fish. Numbers presented for recreational Chinook are subarea guidelines (not quotas).

d/ Preseason coho quota for South of Cape Falcon for the non-mark selective fishery was 25,000. Beginning September 19, the remaining coho quota was adjusted on an impact neutral basis, from mark-selective to non-mark selective. The adjusted non-mark selective coho quota was 42,500 coho.

e/ Beginning August 26, the remaining coho quota was adjusted on an impact-neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho quotas are: Neah Bay subarea - 4,800; La Push subarea - 1,210; Westport subarea - 16,010; Columbia River subarea - 21,740

TABLE I-4. Council area commercial and recreational ocean salmon fishing effort and landings by state. Data are provisional, pending further review of data compilation methods. A double dash (“- -”) indicates no records are available. Fewer than 500 pounds may be shown as zero. (Page 5 of 5)

a/ For Washington, commercial effort and landings include: (1) treaty Indian fisheries (ocean and Area 4B only from May 1-Sept. 30) beginning in 1972; (2) prior to 1978, catch off British Columbia landed in Washington; (3) catch off Alaska landed in Washington; and (4) catch off Oregon and California beginning in 1976. Treaty Indian effort is in deliveries. Beginning in 1989, recreational angler trips and catch include state-managed, late-season Area 4B fishery when open (see Table IV-15).

b/ Recreational effort and catch includes WA-based effort and catch from OR state waters (July 26-Aug. 1) and Strait of Juan de Fuca after WDFW and NMFS ocean closures in 1982.

c/ Preliminary.

d/ OR commercial troll landings include small numbers of salmon caught in Alaska (prior to 1990), WA, and CA. Oregon recreational effort data are total angler trips prior to 1979 and salmon trips beginning in 1979. Significantly reduced salmon per angler trip in 1994-1998 reflects regulations requiring nonretention of coho in the recreational fishery south of Cape Falcon.

e/ California commercial effort and landings include salmon caught off Oregon and landed in California prior to 2005, which were relatively minor in all years except 2004 when 25,655 Chinook were landed and 227 days fished in Oregon waters.

f/ Recreational estimates for California do not include May and June due to restrictions on sampling caused by the COVID-19 pandemic.

a/ Guidelines for Chinook fisheries are marked with an asterisk (*).

b/ Quotas do not match preseason quota/guidelines because inseason actions (i.e., trades, transferring quotas on an impact neutral basis, and converting to non-mark-selective fishery equivalence) resulted in increases or decreases to the overall quota. See Tables I-1, I-2, I-3, or Appendix Table C-9 for specifics of inseason adjustments.

c/ Chinook catch does not include landed-catch-equivalent of Chinook non-retention mortality that was projected inseason and assessed toward fishery guidelines.

TABLE I-7. Estimated incidental mortality of Chinook and coho in 2023 ocean salmon fisheries. Observed incidental mortality was calculated by scaling preseason projections of incidental mortality by the ratio of observed to projected catch.

a/ The bycatch mortality reported in this table consists of drop-off mortality (includes predation on hooked fish) plus hook-and-release mortality of Chinook and coho salmon in Council-area fisheries. Drop-off mortality for both Chinook and coho is assumed to be equal to 5% of total encounters. The hook-and-release mortality (HRM) rates used for both Chinook and coho are: Commercial: 26%, recreational north of Pt. Arena: 14%

b/ Bycatch calculated as drop-off mortality plus fish released.

c/ Includes Oregon territorial water, late season Chinook fisheries.

TABLE I-8. Summary of 2023 recreational fisheries selective for marked hatchery Chinook (preliminary data).

CHAPTER II – CHINOOK SALMON MANAGEMENT

2.1 Central Valley Chinook Stocks

Central Valley Chinook stocks include fall, late-fall, winter, and spring stocks of the Sacramento and San Joaquin rivers and their tributaries. Two of these stocks are listed under the ESA: (1) Sacramento River winter Chinook, listed as threatened in August 1989 and endangered in January 1994; and (2) Central Valley spring Chinook, listed as threatened in September 1999.

Management Objectives

The following objectives guided Council management of Central Valley Chinook salmon stocks in the 2023 fisheries: (1) for SRFC, a spawner escapement of no less than 122,000 hatchery and natural area adults, and (2) for SRWC, the harvest control rule-specified a maximum allowable age-3 ocean impact rate of 20.0 percent in fisheries south of Point Arena and the ESA consultation standard restrictions concerning the duration, timing, and minimum size limits in the same ocean area.

Regulations to Achieve Objectives

In 2023, fishing opportunity south of Cape Falcon was primarily constrained by conservation concerns for SRFC and KRFC. Season and size limit details are presented in Tables I-1 and I-3.

Commercial

In 2023, commercial salmon fishing was closed in California and the Oregon portion of the KMZ due to conservation concerns. The area south of Pigeon Point (the Monterey management area), from Point Arena to Pigeon Point (the San Francisco management area), the fall area target zone fishery between Point Reyes and Point San Pedro, and the area between latitude 40°10'N and Point Arena (the Fort Bragg management area) did not have any ocean salmon seasons.

The California portion of the KMZ (Oregon/California border to Latitude 40°10' N) and the Oregon portion of the KMZ (Humbug Mountain, OR to the Oregon/California border) were also closed in 2023.

The Oregon coast between Cape Falcon and Humbug Mountain was open September and October for Chinook, with coho retention non-mark selective in September and closed in October. In October the fishery was only open shoreward of the 40-fathom management line. Throughout the open season, weekly landing and possession limits and a 28-inch minimum size limit for Chinook and 16-inch minimum for coho were in place.

Recreational

The recreational fishery from the Oregon/California border to the U.S./Mexico border was closed. Therefore, the Monterey management area, San Francisco management area, Fort Bragg management area, and the California KMZ did not have any ocean salmon seasons.

The area from Cape Falcon to the OR/CA border was open for mark-selective coho fishing with no Chinook retention from June 17 through August 31 with a quota of 110,000 marked coho.

The recreational Chinook fishery between Cape Falcon and Humbug Mountain was open September through October with daily a limit of two salmon and no more than one Chinook. Coho retention was non-mark-selective in September with a quota of 25,000 coho. In October, coho retention was prohibited and the fishery was only open shoreward of the 40-fathom management line.

Recreational Chinook fisheries in Oregon had a 24-inch minimum size limit.

Inside Harvest

In 2023, recreational angling for salmon in the Sacramento River and its tributaries was closed. A summary of past regulations are listed below for historical context.

Since 1990, regulations have closed the mainstem Sacramento River to retention of salmon from January 15 through July 15, a period when SRWC adults are thought to be most abundant. Beginning in 2004, the retention closure was enacted earlier, on January 1, from the Carquinez Bridge to Red Bluff, in response to the recovery of SRWC coded-wire tags (CWTs) in the sport fishery. To further protect SRWC spawners, an additional closure was implemented beginning in 2017 from April 1 through July 31. This closure prohibits all fishing in the uppermost six miles of the Sacramento River that is accessible to salmon, from the Highway 44 Bridge to Keswick Dam.

In March 2018, a section of the lower American River, extending from Nimbus Dam to about one-half mile downriver, was closed permanently to all fishing as part of a project to reconstruct the Nimbus Fish Hatchery fish ladder. This section of river, known as Nimbus Basin, has typically comprised a sizable portion of SRFC river harvest. Foregone harvest in Nimbus Basin now contributes to American River natural area escapement.

Owing to low Chinook escapement to the Stanislaus, Tuolumne, and Merced rivers, the majority of the San Joaquin River Basin has been closed to recreational salmon fishing. However, beginning in 2012, recreational angling opportunity was reintroduced on the Mokelumne River, the first such opportunity since 2007.

Escapement and Management Performance

Commercial harvest in areas from Cape Falcon to Humbug Mountain were above preseason expectations (Table I-7). The September commercial coho quota for the area between Cape Falcon and Humbug Mountain was not attained (Table I-6). In Oregon, recreational harvest between Cape Falcon and the Oregon/California border was above preseason expectations (Table I-7).

2.1.1 Sacramento River Fall Chinook

Under the 2023 regulations, the projected spawning escapement in the Sacramento River Basin was 164,964 hatchery and natural area fall Chinook adults. A total of 133,638 hatchery and natural area adult spawners were estimated to have returned to the Sacramento River Basin in 2023 (Table II-1, Figure II-1).

Fall Chinook returns to Sacramento River hatcheries in 2023 totaled 28,026 adults and 4,920 jacks, and escapement to natural areas was 105,612 adults and 7,013 jacks. Table II-1 and Figure II-1

display historical natural area and hatchery adult fall spawner escapement estimates. For a more detailed breakdown of the historical escapement see Appendix B, Table B-1. It is important to note that available data indicate that hatchery-origin fish generally constitute a large portion of the Sacramento River naturally spawning fall Chinook population.

In 2018, SRFC met the criteria for overfished status. Under the terms the salmon FMP, SRFC are considered rebuilt when the 3-year geometric mean spawning escapement exceeds the level associated with MSY (S_{MSY}) of 122,000 hatchery and natural area adults. SRFC met this criterion and were determined to be rebuilt in 2021. The geometric mean of adult spawning escapement for years 2021-2023 is 95,569, which is greater than the minimum stock size threshold (MSST) of 91,500 and therefore SRFC should not be considered overfished.

SRFC are considered to have been subject to overfishing if the estimated exploitation rate exceeds their maximum fishing mortality threshold (MFMT) of 0.78. An estimate of the 2023 SRFC exploitation rate is not yet available. However, fisheries in 2022 resulted in a preliminary exploitation rate of 0.52, which is below the MFMT. Therefore, overfishing did not occur in 2022 (Table II-6).

2.1.2 Sacramento River Winter and Spring Chinook

Spawner escapement of endangered SRWC in 2023 was estimated to be 2,447 adults and 54 jacks. This estimate was derived from three sources: a carcass survey conducted on the upper Sacramento River, SRWC captured in the Keswick trap which provides broodstock to Livingston Stone National Fish Hatchery, and SRWC returns to Battle Creek into and upstream of Coleman National Fish Hatchery as part of the Battle Creek “jumpstart” reintroduction effort.

SRWC spawner escapement estimates derived from Red Bluff Diversion Dam counts began in 1967, and from 1987 to 2008 the estimates were derived by expanding counts made during the period of dam operation (which overlaps with approximately 15 percent of the SRWC migration period). Escapement estimates from the carcass survey are considered a better representation of SRWC spawner escapement due to the small proportion of the SRWC migration sampled during the Red Bluff Diversion Dam operation period. Red Bluff Diversion Dam gates were permanently removed in 2012, and escapement estimates based on dam passage are no longer available.

Escapement of spring Chinook to the Sacramento River system in 2023 totaled 1,479 fish (jacks and adults), with an estimated return of 106 to upper Sacramento River tributaries and the remaining 1,391 fish returning to the Feather River Hatchery. Estimates of spring Chinook escapement to the upper mainstem Sacramento River are no longer made due to the permanent removal of the Red Bluff Diversion Dam gates in 2012. The method used to estimate the spring Chinook return to the Feather River Hatchery was modified in 2005. In previous years, the estimate was equal to the number of Chinook that entered the hatchery during the early period of Chinook spawning. Since 2005, prior to the spring run spawning period, fish that entered the hatchery are tagged and returned to the river; the number of tagged fish that re-entered the hatchery during the spring run spawning period are used as the estimate of spring Chinook escapement in the Feather River. The fish that are tagged at the hatchery and returned to the river but did not re-enter the hatchery during the spawning period are counted in the natural fall run survey and

reported as Feather River fall Chinook. The natural area spawner surveys in the Feather River are not currently capable of separating the spring and fall runs.

Historical spawner escapements for SRWC and spring Chinook salmon are presented in Appendix B, Table B-3.

2.1.3 Sacramento River Late-Fall Chinook

Late-fall Chinook spawning escapement in 2023 was estimated to be 2,972 adults and 284 jacks. These Chinook returned primarily to the Coleman National Fish Hatchery and the upper Sacramento River. These numbers also include late-fall Chinook that returned to upper Sacramento River tributaries and those captured in the Keswick trap for use as broodstock at Coleman National Fish Hatchery (Appendix B, Table B-3 provides historical spawner escapement).

2.1.4 San Joaquin River Fall Chinook

San Joaquin River spawning areas are used primarily by fall Chinook. The estimated San Joaquin River fall Chinook spawning escapement in 2023 totaled 25,072 fish (jacks and adults) in natural areas, and 10,760 fish (jacks and adults) to hatcheries (Appendix B, Table B-2 provides historical spawner escapements). Salmon production in the San Joaquin River is determined largely by spring outflows three years earlier. In most years between 1986 and 2014, spawner returns to the San Joaquin River constituted less than 10 percent of the total Central Valley escapement for fall run Chinook. Since 2015, the San Joaquin contribution has exceeded 10 percent in several years with an average contribution of 14 percent. In 2023, San Joaquin fall Chinook spawners constituted 19.8 percent of the total fall run escapement to the Central Valley

2.2 Northern California Chinook Stocks

Northern California stocks include fall and spring stocks north of the entrance to San Francisco Bay. Primary river systems in this area are (from north to south) the Smith, Klamath, Mad, Eel, Mattole, and Russian rivers. Coastal Chinook stocks south of the Klamath River were listed as threatened under the ESA in September 1999.

Management Objectives

KRFC were managed in accordance with their control rule, which in 2023 specified a maximum exploitation rate of 10.0 percent, resulting in an expected spawner escapement of 23,614 adults in natural areas. The available harvest of KRFC was shared equally between non-tribal and Klamath River tribal fisheries (tribes with federally-recognized fishing rights). The NMFS ESA consultation standard for California Coastal Chinook limits the ocean harvest rate on age-4 KRFC to a maximum of 16 percent. However, NMFS guidance for 2023 fisheries was to limit the forecast KRFC age-4 ocean harvest rate to a maximum of 10.0 percent.

Regulations to Achieve Objectives

To achieve the management objectives for KRFC and California Coastal Chinook, the adopted regulations were designed to result in: (1) a Klamath River run of 39,858 fall Chinook adults, resulting in a spawner escapement of 23,614 adults to natural areas, taking into account projected river fishery impacts of 3,876 adults and returns to basin hatcheries; (2) 50 percent (1,872) of the allowable adult harvest for tribal subsistence and commercial fisheries; (3) 96.3 percent (1,804) of

the non-tribal harvest to the Klamath River recreational fishery; and (4) 37.7 percent (26) of the ocean harvest to the KMZ recreational fishery. The age-4 ocean harvest rate resulting from the above configuration was forecast to be 0.3 percent. Season and size limit details are presented in Tables I-1 and I-3.

The primary constraints to commercial and recreational fisheries south of Cape Falcon in 2023 were conservation concerns for SRFC and KRFC.

Commercial

The Oregon coast between Cape Falcon and Humbug Mountain was open during September and October. The Oregon portion of the KMZ was closed for the year. September included the retention of non-marked coho and a non-mark-selective coho quota of 10,000. Chinook fisheries between Cape Falcon and Humbug Mountain were open for all of September and all of October with weekly landing and possession limits. The fishery was only open shoreward of the 40-fathom management line for October.

The California portion of the KMZ and the Fort Bragg management area were closed to commercial fishing in 2023 (Table I-3).

Recreational

The recreational Chinook fishery between Cape Falcon and Humbug Mountain was open in September and October. In October, the fishery was only open shoreward of the 40-fathom management line. The Oregon KMZ was closed for Chinook retention for the year.

The California portion of the KMZ and the Fort Bragg management area were closed to recreational fishing in 2023 (Table I-3).

Inside Harvest

The Yurok and Hoopa Valley tribes shared a federally-reserved right of 50 percent (1,872) of the available harvest surplus of adult Klamath fall Chinook. Tribal adult harvest was 2,091 (Yurok: 423 adults; Hoopa Valley: 1,668 adults), which was 112 percent of the tribal allocation (Appendix B, Tables B-4, and B-5). An estimated 53 fall Chinook adults were harvested in the Klamath River basin recreational fishery in 2023. Harvest estimates for streams outside the Klamath River Basin were not available.

Escapement and Management Performance

Fort Bragg, San Francisco, and Monterey management areas in California were closed for commercial harvest (Table I-7). Commercial harvest from Cape Falcon to Humbug Mountain were above preseason expectations (Table I-7). Recreational harvest along the coast of California was closed. In Oregon, recreational harvest between Cape Falcon and the OR/CA border were above preseason expectations (Table I-7).

2.2.1 Threatened California Coastal Chinook

Historical indices of spawner abundance, or actual spawning escapement estimates, for Chinook salmon in California coastal streams outside of the Klamath River Basin have been limited. cursory, nonsystematic surveys had been conducted on Tomki Creek (Eel River Basin), Sprowl

Creek (Eel River Basin), and Cañon Creek (Mad River Basin), but the surveys on Sprowl and Cañon creeks were discontinued in 2016. However, there have been recent increases in survey effort. Video counts of Chinook passage at Mirabel Dam on the Russian River began in 2000. Additional Chinook escapement estimates or redd counts for Redwood Creek, the Mad River, the mainstem Eel River, the South Fork Eel River, and the Mattole River are now available and will be reported on an annual basis. These streams are considered important spawning habitat for California Coastal Chinook. Historical spawning stock surveys for these northern California coastal rivers are presented in Appendix B, Table B-7.

2.2.2 Klamath River Fall Chinook

The 2023 preliminary postseason river run size estimate for KRFC was 65,904 adults compared to the preseason-predicted ocean escapement (river run size) of 39,858 adults. The escapement to natural spawning areas was 41,623 adults, which was 176 percent of the preseason prediction of 23,614 adults. The estimated hatchery return was 21,964 adults. Jack returns to the Klamath Basin totaled 11,673 including 9,470 that escaped to natural spawning areas. Table II-2, Figure II-2, and Appendix B, Table B-4 present historical harvest and escapement estimates for KRFC.

Spawning escapement to the upper Klamath River tributaries (Salmon, Scott, and Shasta rivers), where spawning was only minimally affected by hatchery strays, totaled 7,765 adults. The Shasta River has historically been the most important Chinook salmon spawning stream in the upper Klamath River, supporting a spawning escapement of 27,600 adults as recently as 2012 and 63,700 in 1935. The escapement in 2023 to the Shasta River was 4,747 adults. Escapement to the Salmon and Scott rivers was 1,355 and 1,663 adults, respectively (Appendix B, Table B-6).

In 2018, KRFC met the criteria for overfished status. Under the terms of the salmon FMP, KRFC are considered rebuilt when the 3-year geometric mean spawning escapement exceeds the level associated with MSY (S_{MSY}) of 40,700 natural area adult spawners. The geometric mean of adult spawning escapement in natural areas for years 2021-2023 is 30,134, therefore KRFC continue to meet the criteria for overfished status (Table II-6).

KRFC are considered to have been subject to overfishing if the estimated exploitation rate exceeds their maximum fishing mortality threshold (MFMT) of 0.71. An estimate of the 2023 KRFC exploitation rate is not yet available. However, fisheries in 2022 resulted in a preliminary exploitation rate of 0.45, which is lower than the MFMT. Therefore, overfishing did not occur in 2022 (Table II-6)

2.3 Oregon Coast Chinook Stocks

Oregon Coast Chinook stocks include all fall and spring stocks from Oregon streams south of the Columbia River. These stocks are categorized into two major subgroups based on ocean migration patterns. Although ocean harvest distributions overlap somewhat, they are categorized as either north or south/local migrating. North migrating Chinook stocks include stocks from the Elk River north, except for Umpqua River spring Chinook. South/local migrating Chinook stocks include Rogue River spring and fall Chinook, Umpqua River spring Chinook, and fall Chinook from smaller rivers south of the Elk River.

Based on CWT analysis, the populations from 10 major north Oregon Coast (NOC) river systems from the Nehalem through the Siuslaw Rivers are harvested primarily in PSC ocean fisheries off B.C., SEAK and Oregon terminal area fisheries. NOC stocks are harvested to a much lesser degree in Council-area fisheries off Washington and Oregon. Analysis of CWTs indicates the populations from five major mid-Oregon Coast (MOC) systems between the Coos and the Elk rivers are harvested primarily in ocean fisheries off B.C., Washington, Oregon, and in terminal area fisheries. Minor catches occur in California fisheries and variable catches in SEAK troll fisheries. South/local stocks are important contributors to ocean fisheries off Oregon and northern California. Another central Oregon stock, Umpqua River spring Chinook, contributes primarily to ocean fisheries off Oregon and California, and to a lesser degree, off Washington, B.C., and SEAK.

Management Objectives

The conservation objective for the northern and central Oregon Coast Chinook stock complexes was an aggregate of 150,000 to 200,000 natural adult spawners, as indicated by peak spawner counts of 60 to 90 fish per mile in standard index surveys. These stocks have been abundant historically; therefore, preseason abundance estimates were not developed, and it has not been a critical management concern. Council-area Chinook fisheries have minor impacts on most of the stocks originating from these areas, which have a northerly marine distribution pattern. For the South/Local Oregon Coast Chinook stock complex, the conservation objective is assessed using the escapement estimate at Huntley Park on the Rogue River with the goal of 34,992 natural adult passage. ESA consultation standards for OCN coho, LCN coho, and California Coastal Chinook, and KRFC management objectives generally result in reduced Council-area ocean fishery impacts on Oregon south/local migrating Chinook stocks.

Regulations to Achieve Objectives

The areas of primary management concern for ocean fisheries impacting Oregon Coast Chinook vary between the north and south/local migrating stocks, although there is some overlap. Preseason abundance estimates were not available for Oregon Coast Chinook; however, based on postseason abundance indicators, impacts on these stocks from Council-area fisheries have not significantly affected achievement of management objectives in recent years.

In some years, Oregon State waters terminal area fisheries are adopted to provide additional harvest on robust hatchery or naturally produced fall Chinook. When in place, special regulations for each of these seasons are implemented to maintain fishery impacts within conservation objectives. These regulations would include season quotas, daily and weekly landing limits in commercial fisheries, and reduced daily and season bag limits and partial mark-selective restrictions in some recreational fisheries. A state waters terminal area fishery was adopted in 2023 and the season and size limit details are presented in Tables I-1 and I-3.

Inside Harvest

Inside recreational harvest of fall and spring Chinook occurred in most Oregon coastal estuaries and rivers. In 2023, fishery regulations were adopted with the intention of reducing impacts on some of these stocks.

Estimates of recreational harvest of spring and fall Chinook are reported in Table II-3. Estimates prior to 2019 were derived from Oregon Department of Fish and Wildlife (ODFW) salmon and steelhead angler catch record cards. Since 2019, estimates are derived from the self-reported catch from anglers using ODFW's electronic licensing system,

Escapement and Management Performance

Under the 2023 regulations, the STT expected the aggregate conservation objectives for these stocks would be met with the constraints required for California Coastal Chinook and KRFC. Actual escapement was not estimated for the northern and central Oregon Coast Chinook stock aggregate; achievement of the aggregate 150,000 to 200,000 naturally spawning adults was assessed through peak spawner index counts of 60 to 90 adults per mile in nine index streams and included both spring and fall Chinook. Peak spawner index counts were based on traditional non-random surveys (e.g., stream surveys, dam counts, etc.). ODFW is developing alternative methodologies for establishing escapement goals for these Oregon coastal Chinook stocks, including fall Chinook PSC indicator stocks. The aggregate South/Local Oregon Coast Chinook conservation objective is the achievement of at least 34,992 naturally produced Chinook adults passing Huntley Park in the lower Rogue River, which was not met in 2023 (Appendix B, Table B-10).

2.3.1 North Migrating Chinook

In 2023, index counts of adult spawners (peak count per index mile) were conducted for six of the nine standard streams and used to measure natural spawner escapement trends for north-migrating fall Chinook. Data have been collected since about 1950 for most systems. Overall peak Chinook adult index spawner counts in 2023 were estimated at 118 adults per mile, higher than the maximum sustainable yield (MSY) spawner escapement level of 60 adults per mile (Appendix B, Table 11).

The geometric mean of north-migrating Oregon Coast Chinook adult escapement in 2021, 2022, and 2023 was 102 fish per mile, which exceeded both the MSST (30) and the MSY spawner escapement level. Estimates of exploitation rates were not available for 2022 and 2023, but earlier fisheries resulted in exploitation rates that were lower than the MFMT (0.78). Therefore, north-migrating Oregon Coast Chinook should not be considered overfished or subject to overfishing (Table II-6).

2.3.2 South/Local Migrating Chinook

Standard fall Chinook spawning index escapement data for the smaller southern Oregon coastal rivers (south of the Elk River) were available for the Winchuck, Chetco, and Pistol rivers (Appendix B, Table B-8). The 2023 preliminary estimate was reported at 29 adults per mile. The escapement goal prior to 2015 was assessed using this methodology.

Two trend indicators of escapement for naturally produced spring Chinook are utilized: (1) Rogue River counts at Gold Ray Dam, and (2) Umpqua River counts at Winchester Dam (Table II-4). Gold Ray Dam was removed in October 2010. For recent years, an estimate of natural spring Chinook escapement above the Gold Ray Dam site was made using the relationship of 2004-10 spawning ground surveys to the Gold Ray Dam passage (Figures II-3 and II-4).

Rogue River carcass counts were used as an indicator of trends in escapement for naturally produced fall Chinook, but these surveys have not been conducted since 2004 (Table II-4). Passage estimates of naturally produced fall Chinook at Huntley Park in the lower Rogue River are presented in Appendix B, Table B-10.

The geometric mean of south/local migrating Oregon Coast Chinook adult escapement in 2021, 2022, and 2023 was 29,428, which exceeded the MSST (20,500); therefore, south/local-migrating Oregon Coast Chinook should not be considered overfished. Estimates of exploitation rates were not available, so an assessment of overfishing status was not possible, but based on exploitation rates for KRFC, it is unlikely that south/local-migrating Oregon Coast Chinook were subject to overfishing (Table II-6).

2.4 Columbia River Basin Chinook Stocks

Columbia River Basin Chinook salmon stocks include fall, summer, and spring stocks. NMFS has listed five Chinook evolutionarily significant units (ESUs) within the Columbia Basin under the ESA: (1) SRW fall Chinook listed as threatened in April 1992; (2) Snake River spring/summer listed as threatened in April 1992; (3) upper Columbia River spring listed as endangered in March 1999; (4) LCR Chinook listed as threatened in March 1999; and (5) upper Willamette River spring listed as threatened in March 1999.

The assessment below focuses on the five major stock groups of Columbia Basin fall Chinook: lower river hatchery (LRH) tule stock and lower river wild (LRW) bright stock, both of which are part of the ESA-listed LCR Chinook ESU; Spring Creek Hatchery (SCH) tule stock; upriver bright (URB) stock, which includes the ESA-listed SRW Chinook ESU; and mid-Columbia bright (MCB) hatchery stock. A brief assessment of upper Columbia summer Chinook is also included. Management details for Columbia River spring Chinook stocks are not discussed. Council-managed ocean salmon fisheries have very limited impacts on these stocks (less than a 2 percent exploitation rate in base-period fisheries); as a result, mid-Columbia spring stocks were removed from the FMP under Amendment 16 in December 2011. Appendix B, Tables B-12 through B-19, contain historical harvest and escapement data for fall, summer, and spring stocks. Appendix B, Table B-20 summarizes catch information for all three Chinook runs in the Columbia Basin. Additional information on these stocks and inriver fisheries can be found in the *Joint Staff Report: stock status and fisheries for spring Chinook, summer Chinook, sockeye, steelhead, and other species* and the *Joint Staff Report: stock status and fisheries for fall Chinook salmon, coho salmon, chum salmon, summer steelhead, and white sturgeon* published annually by the joint staffs of ODFW and WDFW.

Management Objectives

In 2023, Council-area fisheries north of Cape Falcon were managed to access URB, SCH and LRH stocks while meeting the NMFS ESA consultation standards for the ESA-listed LCR Chinook ESU (both LCR natural tules and LRW) and SRW fall Chinook ESU. The standard for ESA-listed LCR natural tules was a total (ocean plus inriver) AEQ exploitation rate of no more than 38.0 percent. For preseason modeling, the estimated total exploitation rate on a composite of Washougal, Kalama, Cowlitz, and Big Creek hatchery tules was used as a surrogate for LCR natural tules. The NMFS ESA consultation standard for LRW was a North Lewis River fall Chinook spawning escapement of 5,700 (equivalent to 6,900 ocean escapement); the preseason forecast was for an

ocean escapement of 10,800. The standard for the SRW ESU was no less than a 30.0 percent reduction in the Snake River Fall Index (SRFI) from the 1988 through 1993 base period AEQ exploitation rate for all ocean fisheries combined.

The NMFS ESA consultation standard for the threatened LCR natural tule Chinook was a key consideration for management of Council-area Chinook fisheries north of Cape Falcon. However, the impacts on LCR natural tule Chinook did not limit, by itself, the fisheries north of Cape Falcon in 2023.

Regulations to Achieve Objectives

Fisheries north of Cape Falcon are managed with quotas to help ensure impacts to stocks do not exceed allowable limits and to ensure allocation objectives are met. The 2023 forecast for the combined abundance of Chinook stocks contributing to northern AABM fisheries (SEAK and Northern B.C.) was similar to that in 2022, but lower than the most recent ten-year average. For the WCVI AABM fishery, however, the 2023 forecast of Chinook contributing to the fisheries was higher than both the 2022 forecast and the most recent ten-year average. The impacts of northern fisheries on Columbia River stocks are included in the modeling of Council-area fisheries.

The 2023 overall non-Indian Chinook total allowable catch (TAC) for North of Cape Falcon was 78,000. This compares to a 2022 non-Indian TAC of 54,000. The 2023 overall TAC was divided into 39,000 commercial and 39,000 recreational. The 2023 treaty Indian ocean troll TAC was 45,000 Chinook and was applicable to the May-September period. This compares to a 2022 treaty Indian TAC of 40,000. Season and size limit details are presented in Tables I-1, I-2, and I-3.

Commercial

Non-Indian commercial fisheries north of Cape Falcon included a Chinook-directed fishery Spring season (May 1-June 29) with landing and possession limits in place for all management areas. This fishery had a preseason quota of 26,000 Chinook, no more than 6,890 of which may be caught in the area between the U.S./Canada border and the Queets River, and no more than 6,040 of which may be caught in the area between Leadbetter Pt. and Cape Falcon.

The Summer season (July 1-September 30) non-Indian commercial all-salmon fishery had a preseason quota of 13,000 Chinook with landing and possession limits in place for all management areas.

The Chinook minimum size limit was 27 inches.

Recreational

In the area between the U.S./Canada Border and Cape Falcon, the coastwide quota was 39,000 Chinook. The Neah Bay and La Push subareas opened June 17, whereas the Columbia River and Westport subareas opened June 24. All subareas were scheduled to close September 30 and had a two-salmon daily bag limit, of which only one could be a Chinook. The Neah Bay and La Push management areas had a minimum size of 24 inches, whereas the minimum size limit was 22 inches in the Westport and Columbia River management areas.

Treaty Indian Ocean Harvest

The Tribal troll ocean fishery (also known as the Treaty troll fishery) quotas were limited by the conservation concerns for ESA-listed Chinook and select coho stocks that have been declared overfished. The 2023 Chinook Tribal troll quota of 45,000 was split 50/50 between the May-June and July-September 15 sub-quotas. The 2023 coho Tribal troll quota of 57,000 was an increase when compared to the 2022 quota of 52,000. The Tribal troll fishery takes place in Washington ocean areas 2, 3, 4 and 4B. The Chinook only fishery was open May 1 through June 30 with a 22,500 sub-quota. The all-salmon fishery was open July 1 through September 15 with a sub-quota of 22,500 Chinook and a coho quota of 57,000.

Inside Harvest

Since the Columbia River Fishery Management Plan expired on December 31, 1998, fall Chinook in Columbia River fisheries were managed through 2007 under the guidance of annual management agreements among the *U.S. v. Oregon* parties. In 2008, a 10-year management agreement was negotiated through the *U.S. v. Oregon* process, which included revisions to some inriver objectives. In particular, the "*2008-2017 U.S. v Oregon Management Agreement*" (2008-2017 MA) specified that with run sizes of greater than 200,000 URB, including at least 8,000 SRW fall Chinook, the allowable URB impact rate would be 45.0 percent. NMFS used the URB impact rate as a proxy in the SRW consultation standard. A new 10-year *U.S. v Oregon* management agreement for 2018-2027 was finalized, and NMFS issued a new Biological Opinion in February 2018.

In 2023, the fall fisheries were managed to achieve the NMFS ESA consultation standards for threatened LCR natural tule and SRW Chinook, and the 2023 URB and SRW preseason forecast run sizes (278,500 and 13,300, respectively) were both large enough to allow a 45.0 percent harvest rate in in-river fisheries.

Within the ESA limitations there were harvestable numbers of salmon available for most major stocks in 2023. While preliminary postseason run reconstructions were complete for spring and summer Chinook salmon, the postseason fall Chinook run reconstruction was not completed in time for this report. The preliminary catch estimates (adults) for the non-Indian commercial net fisheries were 1,177 spring and 51 summer Chinook. The preliminary catch estimate (adults) for the recreational fisheries totaled 6,019 spring Chinook and 2,298 summer Chinook in mainstem sport fisheries below and above Bonneville Dam (Appendix B, Table B-20).

Escapement and Management Performance

2.4.1 Upper Columbia Summer Chinook

Upper Columbia summer Chinook met the escapement objective, and Columbia River fall Chinook are expected to also meet the escapement objectives (Table II-5). The number of URB fall Chinook counted at McNary Dam was 192,296, and the natural area spawner escapement is expected to exceed the MSY level of 39,625 adults established under FMP Amendment 16. The upper Columbia summer Chinook escapement (Rock Island Dam count) in 2023 was 49,410, exceeding the MSY spawner escapement objective of 12,143 adults established under FMP Amendment 16.

The geometric mean of upper Columbia summer Chinook adult escapement in 2021, 2022, and 2023 was 54,954, which exceeded the MSST (6,072); therefore, upper Columbia summer Chinook should not be considered overfished (Table II-6). Estimates of combined ocean and in-river exploitation rates were not available for 2022 or 2023, but the 2021 exploitation rate of 0.40 was below the MFMT (0.75); therefore, upper Columbia summer Chinook did not experience overfishing in 2021 (Table II-6).

2.4.2 Upriver Bright Fall Chinook

The preliminary 2023 URB in-river harvest rate estimate was not available in time for this report. The total count of adult fall Chinook (SRW, hatchery, and supplementation) at Lower Granite Dam in 2023 was 47,001, which was greater than the count of 46,173 in 2022. The preliminary estimate of URB spawning escapement in 2023 was 109,133 adult Chinook.

The preliminary geometric mean of Columbia URB fall Chinook adult escapement in 2021, 2022, and 2023 was 79,908, which exceeded the MSST (19,182); therefore, Columbia URB fall Chinook should not be considered overfished (Table II-6). Estimates of combined ocean and in-river exploitation rates were not available for 2022 or 2023, but the 2021 exploitation rate of 0.40 was below the MFMT (0.86); therefore, Columbia URB fall Chinook did not experience overfishing in 2021 (Table II-6).

2.4.3 Snake River Wild Fall Chinook

The estimate of SRW adult fall Chinook at Lower Granite Dam in 2023 was 7,491. Postseason estimates of the exploitation rate on SRW fall Chinook in ocean fisheries were unavailable.

2.4.4 Lower Columbia River Natural Tule Fall Chinook

Table II-7 provides conservation objective and fishery impacts for LCR natural tule fall Chinook. Recent year estimates are preliminary.

2.5 Washington Coastal Chinook Stocks

Washington coastal Chinook stocks include all fall, summer, and spring stocks from coastal streams north of the Columbia River through the western Strait of Juan de Fuca (west of the Elwha River, inclusive). This complex consists of several natural stocks, generally of small to medium-sized populations, and some hatchery production (primarily Willapa Bay and Quinault River). Coastal stocks are not impacted significantly by Council-area ocean fisheries.

Management Objectives

Willapa Bay natural fall Chinook did not have a defined conservation objective in the Salmon FMP during the preseason process, although WDFW has a spawning escapement objective of 4,350 natural Chinook, which is based on peak density estimates and watershed area. Amendment 16 to the Salmon FMP, adopted in December 2011, included a MSY spawning escapement objective of 3,393, which was based on the WDFW objective.

Spawning escapement goals for natural stocks managed within this complex north of Willapa Bay, established in U.S. District Court by WDFW and the treaty Indian tribes, were recognized in the Council's FMP conservation objectives. Objectives for Grays Harbor and the north coast river systems were established pursuant to the U.S. District Court order in *Hoh v. Baldrige*. However,

annual natural spawning escapement targets may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of *Hoh v. Baldrige* and subsequent U.S. District Court orders. After agreement is reached on the annual targets, ocean fishery escapement objectives are established for each river, or region of origin, which include provisions for treaty Indian allocation and inside non-Indian fishery needs. As provided for in Amendment 14, and pursuant to rules and procedures established under *U.S. v. Washington*, WDFW and the Quinault Indian Nation (QIN) presented new management objectives for Grays Harbor fall Chinook salmon. These objectives were reviewed by the Chinook Technical Committee of the Pacific Salmon Commission in February 2014 and adopted in November 2014. The new objectives are based on spawner-recruit relationships using estimates of production resulting from naturally spawning fish in the Chehalis and Humptulips river basins from brood years 1986 through 2005. It is the intent of WDFW and QIN to use for management purposes an aggregate natural spawning escapement goal of 13,326 for Grays Harbor fall Chinook salmon. No alternate agreements on annual spawning targets for Washington coastal Chinook, other than those in the FMP, were made in 2023.

Regulations to Achieve Objectives

Preseason abundance forecasts for some Washington coastal Chinook stocks were available for the first time in 2008 for the Council preseason management process. Because Council area fishery impacts to Washington coastal Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. Season and size limit details are shown in Tables I-1, I-2, and I-3.

2.5.1 Willapa Bay Chinook

Inside Harvest

Historical terminal run size, harvest, and escapement data for Willapa Bay fall Chinook are presented in Appendix B, Table B-23.

The 2023 preseason forecast of Chinook returning to Willapa Bay was 30,320 fish (2,833 natural and 27,487 hatchery). A Chinook directed non-tribal gillnet fishery was not conducted until late August 2023. Beginning in 2015, the Willapa Bay Salmon Management Policy (C-3622) prohibits Chinook directed non-tribal gillnet fisheries until after Labor Day. There were 34 12-hour and one 8-hour Chinook and coho directed openings from August 20 through November 27. Retention of unmarked Chinook was prohibited. Total Chinook harvest in the non-tribal gillnet fishery was 1,699 fish, based on preliminary data. There were three emergency regulations issued in-season for this commercial salmon fishery for the 2023 season.

- Commercial emergency regulation opened areas 2M and 2R on August 20, 2023, with tangle net gear and closed 2M and 2R on August 25, 2023.
- Commercial emergency regulation opened area 2N on August 31, 2023, with tangle net gear.
- Commercial emergency regulation opened areas 2N, 2M, and 2R for 8 hours on September 7, 2023, with tangle net gear.

The recreational salmon fishery in the marine waters of Willapa Bay (Area 2-1) was open from June 24 through July 31, 2023, concurrent with Marine Area 2 (ocean rules applied). From August 1, 2023, through January 31, 2024, Willapa Bay marine waters 2-1 were scheduled to be open to

recreational salmon fishing with a daily bag limit of 6 salmon, only 2 may be adults. The Willapa Bay Control Zone was open to salmon fishing beginning August 1. Anglers were required to release unmarked Chinook. Anglers could fish with two poles if they had a Two-Pole Endorsement.

Recreational salmon fisheries in tributaries to Willapa Bay watersheds varied in duration but were generally open as early as August 1, 2023, and remained open through January 31, 2024. All freshwater systems in Willapa Bay were open to recreational salmon fishing with a daily bag limit of 6 salmon, only 2 may be adults. Anglers were required to release unmarked Chinook. Single-point, barbless hooks were required in all areas except Naselle, South Fork Willapa, and Bear rivers, where only barbless hooks were required. Anglers could fish with two poles in sections of the Naselle and Willapa rivers with the Two-Pole Endorsement.

There was one emergency regulation issued in-season for the freshwater recreational fishery that included two changes effective December 8, 2023.

- Recreational emergency regulation required the release of unmarked coho in the Willapa and Naselle rivers. This emergency regulation also modified the gear and hook restrictions.

Expected Chinook harvest in all recreational fisheries based on preseason forecast abundances was 3,970 hatchery Chinook for the 2023 season. Retention of unmarked Chinook was prohibited. Marine and freshwater recreational harvest estimates were unavailable for 2023, but the 2022 Marine Area 2-1 and freshwater recreational estimates totaled 4,841 Chinook.

Escapement and Management Performance

The 2023 escapement estimates are unavailable. In 2022, hatchery-origin Chinook returning to the Willapa Bay watershed was estimated at 14,280 fish. Based on current hatchery production, this return was sufficient to achieve the goal of 9,800 total Chinook escapement to Willapa Bay hatchery facilities. The most recent but still preliminary 2022 natural-origin spawner escapement estimate was 2,351 Chinook, below the FMP objective of 3,393.

The geometric mean of Willapa fall Chinook adult escapement in 2020, 2021, and 2022 was 2,924 which exceeded the MSST (1,696); therefore, Willapa Bay fall Chinook should not be considered overfished (Table II-6).

Exploitation rate estimates for Willapa Bay fall Chinook were available through 2021 and calculated using Queets River fall Chinook CWTs as a surrogate for ocean fishery exploitation rates. For terminal fisheries, adjustments were made to the Queets River CWT-based exploitation rates to account for harvest rates that occurred in the Willapa Bay terminal area. In 2019, 2020, and 2021 the Willapa Bay fall Chinook exploitation rates were 0.65, 0.55, and 0.71 respectively; all of which were below the MFMT (0.78); therefore, Willapa Bay fall Chinook were not subject to overfishing during the most recent three years of available data (Table II-6). The MFMT for Willapa Bay fall Chinook is also based on a proxy derived from an average value of other Chinook stocks; therefore, overfishing status based on total exploitation rates for Willapa Bay fall Chinook are less certain than for some other Washington Coast Chinook stocks.

2.5.2 Grays Harbor Chinook

Inside Harvest

Historical terminal run size, harvest, and escapement data for Grays Harbor Chinook are presented in Appendix B, Table B-25.

The Quinault Indian Nation has not conducted any spring/summer fishery on the Chehalis River or in Grays Harbor commercial fishing Areas 2A, 2A-1, and D since 2018 because of forecasts of low spring/summer Chinook stock abundances. No spring/summer fisheries were directed at salmon or white sturgeon in 2023.

There were no non-Indian recreational fisheries allowing the retention of spring Chinook in the Chehalis River during the spring Chinook management period. The Chehalis Tribe did not conduct a spring Chinook commercial fishery in 2023.

In 2023, The Quinault Indian Nation conducted a fall gillnet fishery harvesting a total of 348 fall Chinook in two separately scheduled areas: the first in the lower Chehalis River and adjacent areas of Grays Harbor, Areas 2D, 2A, and 2A-1, and the second in the lower Humptulips River and adjacent Area 2C of Grays Harbor. Fishing was restricted to east of Stearns Bluff and excluded the area known as the “South Channel” in the Chehalis River, and Areas 2D, 2A, and 2A-1 to limit catch of Chinook, which tend to concentrate in deep areas off the mouths of the Johns and Elk Rivers. The 2023 fishery was scheduled on the Chehalis side to run from week 40 to week 48. All weeks of Chehalis fishing were conducted with a 6½-inch maximum mesh size restriction. During weeks 40 through 43, beginning October 1, the number of days open per week were 2,4,4, and 3, respectively. The fishery was closed during week 44 consistent with the preseason plan. The fishery was closed by emergency regulation for the remainder of the Fall season after in-season evaluation of commercial harvest data indicated lower than expected coho returns. This resulted in a schedule reduction of 20 fishing days. The Chehalis area treaty Indian fishery catch of 289 Chinook was lower than the expected catch of 2,225 (~14 percent of the expected catch).

The Humptulips area treaty Indian fishery schedule was also set with a 6½-inch maximum mesh restriction through the fall period from weeks 40 through 48. The number of days open per week during weeks 40 through 43 were 4,4,4, and 3, respectively. The remaining schedule was closed by emergency regulation after in-season evaluation of commercial harvest data indicated lower than expected coho returns. The closure reduced the commercial schedule by 20 fishing days. The Humptulips reported catch of 59 Chinook was lower than the expected catch of 1,081 (~5.5 percent of the expected catch). The combined Grays Harbor Chinook catch of 348 was lower than the expected catch of 3,306 (10.5 percent of the expected catch).

In 2023, the non-Indian gillnet fishery harvested a total of 9 fall Chinook with an estimate of 7 non-harvest mortalities in two separately scheduled areas: The Humptulips 2C and the Chehalis River 2A and 2D areas. Although non-Indian gillnet fisheries were scheduled in Humptulips commercial Area 2C to fish a 36-hour fishery during week 43 and a 12-hour fishery in week 44, no participation occurred in 2023. The non-Indian gillnet mark-selective fishery in the Chehalis River commercial Areas 2A and 2D harvested 9 hatchery-origin Chinook. Chehalis River fisheries consisted of one 7-hour day and one 12-hour day during week 40, one 7-hour day in Week 42, one

12-hour day during week 43, and three 12-hour days in Week 44. It is estimated that 7 unmarked Chinook mortalities occurred during this fishery based on data collected during on-board monitoring, catch accounting, and when applying 31 percent mortality rate with tangle nets and 56 percent mortality rate using 6½-inch maximum mesh gill nets of encountered unmarked Chinook. During Weeks 40 and 42, the “South Channel” was closed; during the rest of the fishery all areas of 2D were open, however, live boxes were required, and wild Chinook retention was prohibited.

A recreational fishery in the northern portion of Marine Area 2-2, Commercial Area 2C, occurred August 1 through September 15. The daily bag limit was 1 adult salmon requiring the release of wild Chinook. The portion of Marine Area 2-2 east of a line from the mouth of Johns River to Brackenridge Bluff Tripod occurred September 16 through November 30. The daily bag limit was 2 adult salmon, and all Chinook were required to be released.

A recreational Chinook fishery occurred on the mainstem Humptulips River from the mouth to the confluence of the East and West forks was originally scheduled from September 1 through December 31. In September, the daily limit was 2 adult salmon requiring the release of wild Chinook. In October, the daily limit remained at 2 adults, but only 1 could be a Chinook and required the release of wild Chinook. In November and December, the daily limit was reduced to 1 adult salmon and all Chinook were required to be released. In-season adjustments to these fisheries occurred due to concerns of potential lower than expected coho returns and impacts to wild steelhead. The recreational Chinook fishery in the Humptulips River closed December 1.

No recreational fisheries targeting Chinook were scheduled in 2023 in the Chehalis River or any of the tributaries, including the Hoquiam and Wishkah basins.

Escapement and Management Performance

Chehalis River spring Chinook, also referred to as Grays Harbor spring Chinook, are of natural origin and managed for an escapement goal of 1,400 adults. The 2023 terminal run forecast was 1,232 adult fish; a preliminary natural spawning escapement estimate is not yet available at this time. The geometric mean of natural spawning escapement estimates in 2020, 2021, and 2022 is 2,141 fish, which exceeded the MSST (546); therefore, Grays Harbor spring Chinook should not be considered overfished (Table II-6).

The 2023 Grays Harbor fall Chinook run size forecast of 20,928 included 15,006 natural and 5,922 hatchery adults. The return of hatchery-origin fall Chinook to Grays Harbor hatchery programs to date are 1,325 fish, sufficient to provide for 2024 fall Chinook production goals. The 2022 Grays Harbor fall Chinook actual run size of 17,430 included 14,991 natural and 2,439 hatchery adults. The combined components of the 2022 return were 97 percent of the 2022 forecast of 17,909.

Grays Harbor fall Chinook are managed for a natural spawning escapement goal of 13,326 adults. The preliminary natural spawning escapement estimate for 2023 was not available. The final 2023 spawning ground escapement estimate for the Grays Harbor fall Chinook is in development by QIN and WDFW. The 2022 natural-origin spawning escapement estimate was 13,174 out of a total natural escapement of 14,259. The geometric mean of natural spawning escapement

estimates in 2020, 2021, and 2022 was 15,783, which exceeded the MSST (5,694); therefore, Grays Harbor fall Chinook should not be considered overfished (Table II-6).

Exploitation rate estimates for Grays Harbor fall Chinook were available through 2021 and calculated using Queets River fall Chinook CWTs as a surrogate for ocean fishery exploitation rates. For terminal fisheries, adjustments were made to the Queets River CWT-based exploitation rates to account for harvest rates that occurred in the Grays Harbor terminal area. Exploitation rate estimates in the most recent years available were below the MFMT (0.78); therefore, Grays Harbor fall Chinook should not be considered subject to overfishing (Table II-6).

2.5.3 Quinault River Chinook

Inside Harvest

Historical terminal gillnet harvest data for Quinault River Chinook stocks are presented in Appendix B, Table B-27.

A run of natural spawning spring/summer Chinook enters the Quinault River from April through July. The spring/summer Chinook run is typically small, and any harvest is taken incidentally during fisheries directed at sockeye and steelhead.

In 2023, the tribal fishery had a reported harvest of 12 spring/summer Chinook during the spring/summer fishery running from May 8 through June 29 during a fishery directed on sockeye. Subsequent commercial salmon fisheries were closed until the fall fishing period.

The 2023 recreational fishery within the Quinault Indian Reservation was conducted from August 25 through November 30 with a daily bag limit of 1 adult Chinook.

The 2023 non-treaty recreational fishery upstream of Lake Quinault was open from July 1 through September 30 for jack salmon only. From October 1 through November 30 anglers are allowed a daily limit of 2 adult salmon but required to release sockeye and chum salmon.

The 2023 treaty Indian gillnet fishery harvested 7,481 fall Chinook. The Quinault River Fall gillnet fishery is designed to maximize harvest opportunity during hatchery Chinook and coho entry while reduced effort occurs during the scheduled fishing days later in the season during primarily wild Chinook and wild coho entry.

Escapement and Management Performance

Quinault fall Chinook are managed for hatchery production. The 2023 fall Chinook natural spawning escapement is expected to be available for 2024 management planning. Hatchery fall Chinook egg-take goals for the Quinault River were attained at the Lake Quinault tribal hatchery.

2.5.4 Queets River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Queets River Chinook stocks are presented in Appendix B, Tables B-29, and B-30.

The 2023 treaty Indian gillnet harvest of spring/summer Chinook remained closed through the spring/summer management period.

There were no non-Indian recreational fisheries allowing the retention of spring Chinook in the Queets River basin during the spring/summer Chinook management period.

The 2023 recreational fishery within the Quinault Indian Reservation was opened September 1 and closed by emergency regulation on October 30. The fishery allowed the retention of 1 adult Chinook per day.

The 2023 non-Indian in-river recreational fishery opened September 1 and closed November 30. Anglers were allowed to retain one Chinook per day. In the Queets River, within the Olympic National Park (ONP), the fishery opened September 1 and closed by emergency regulation on November 27, and anglers were required to release all wild fish encountered. Catch during these fisheries are not available for 2023. No adult fall Chinook were reported harvested during the 2022 season.

The 2023 treaty commercial gillnet fishery began Sunday, September 3 and included the following weekly openers: 5 days per week from September 3-29, 4 days the week of October 1, and 2 days the week of October 8. The fishery was closed by emergency regulation after the October 8 opener due to lower than expected returns of natural coho. The fishery remained closed for the remainder of the fall management period. A 2-day opener was canceled the week of October 15. The treaty commercial gillnet fishery harvested 1,212 fall Chinook compared to a preseason expected commercial catch of 1,392.

The 2023 Queets mainstem recreational fishery was regulated with a bag limit of 1 Chinook September 1 through October 21. The Salmon River recreational salmon fishery was open from September 1 through October 21 in order to target hatchery coho along with requiring non-retention of fall Chinook. Catch estimates for 2023 recreational salmon fisheries are unavailable. The catch estimate for the 2022 recreational salmon fisheries occurring within the Quinault reservation boundaries was 415 adult fall Chinook.

Escapement and Management Performance

The 2023 Queets River spring/summer Chinook spawning escapement estimate is currently under development and review. The 2022 Queets River spring/summer Chinook spawning escapement estimate is 434.

No terminal fisheries occurred in Queets River basin for spring/summer Chinook in 2023.

Queets River spring/summer Chinook were categorized as overfished in 2023 based on 2019, 2020, and 2021 data. The geometric mean of the spring/summer Chinook adult spawning escapement in 2020, 2021, and 2022 is 346, which is below the MSST (350), therefore the stock continues to meet the criteria for overfished status (Table II-6). The STT is working with tribal and state managers to develop a rebuilding plan that will be ready for Council consideration in the fall of 2024.

The 2023 Queets River fall Chinook spawner survey estimate is not available. The indicator Chinook originate from wild broodstock taken each year in the river. The 2022 spawning escapement estimate for Queets River fall Chinook was 1,469 natural-origin, 174 indicator returns with an additional 141 Chinook (including 2 indicator Chinook) taken for broodstock, the total natural spawning escapement was 1,784. In Appendix Table B-30, fish removed from the river for hatchery (indicator) brood stock included in the escapement columns (footnote b/) and only natural broodstock are included in the terminal natural run size columns.

The geometric mean of Queets River fall Chinook adult spawning escapement in 2020, 2021 and 2022 is 2,791, which exceeded the MSST (1,250); therefore, Queets River fall Chinook should not be considered overfished (Table II-6). Exploitation rates were not available for Queets River fall Chinook for 2022 and 2023, but between 2018 and 2021 the exploitation rates ranged from 0.66 to 0.79 percent, all of which were below the MFMT (0.87); therefore, Queets River fall Chinook should not be considered subject to overfishing (Table II-6).

2.5.5 Hoh River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River spring/summer and fall Chinook are presented in Appendix B, Tables B-32, and B-33, respectively.

The 2023 Hoh River spring/summer Chinook terminal abundance forecast was 1,045 fish. The tribal fishery targeted 5.9 percent of the terminal run with commercial and ceremonial and subsistence fisheries. The tribal commercial fishery harvested 79 natural spring/summer Chinook and 83 hatchery spring/summer Chinook for a total of 162 spring/summer Chinook. The non-tribal recreational salmon fishery was closed June 1 through September 15.

Hoh River fisheries for fall Chinook were based on an expected terminal run size of 2,599 adults, allowing for a terminal harvest rate of 31 percent. The spawning escapement was expected to be 1,805 adults.

The treaty Indian fishery targeted 23 percent of the terminal run. The treaty Indian gillnet fishery was closed during weeks 36-37, and open one day per week during weeks 38-49. The Hoh treaty commercial fishery caught 700 Chinook.

The non-tribal recreational salmon fishery was open September 16 through December 15, from the Olympic National Park boundary upstream to the Oxbow Campground boat launch, and open October 16 through December 15 from the Oxbow Campground upstream to Morgans Crossing Boat Launch. Starting December 1, all fishing from a floating device in the Hoh River was restricted. Fishing from a floating device was allowed Sunday through Tuesday from the Morgan's Crossing boat launch downstream to the Washington Department of Natural Resources Hoh Oxbow Campground boat launch, and Wednesday through Saturday from the Hoh Oxbow boat launch downstream to the Olympic National Park boundary near the mouth. The daily bag limit through October 31 was 4 salmon of which 2 adults could be retained, of which no more than 1 Chinook could be retained. On November 1, the daily limit was reduced to 1 salmon. The daily

bag limit December 1 through December 15 was 1 salmon, release all Chinook. Only 1 single-point barbless hook was allowed. Sport catch is not yet available for 2023.

Escapement and Management Performance

The preliminary 2023 spawning escapement estimate for Hoh River spring/summer Chinook is not available. The geometric mean of Hoh River spring/summer Chinook spawner escapement in 2020, 2021, and 2022 was 1,025, which exceeded the MSST (450); therefore, Hoh River spring/summer Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Washington coastal spring/summer Chinook stocks. Based on the limited in-river harvest rate and lack of ocean harvest data, it is difficult to assess the extent to which Hoh River spring/summer Chinook were subject to overfishing in recent years (Table II-6).

The preliminary 2023 spawning escapement estimate for Hoh River fall Chinook is not available. The geometric mean of Hoh River fall Chinook adult spawning escapement in 2020, 2021, and 2022 was 2,232, which exceeded the MSST (600); therefore, Hoh River fall Chinook should not be considered overfished (Table II-6).

Exploitation rate estimates for Hoh River fall Chinook were available through 2021 and calculated using Queets River fall Chinook CWTs as a surrogate for ocean fishery exploitation rates. For terminal fisheries, adjustments were made to the Queets River CWT-based exploitation rates to account for harvest rates that occurred in the Hoh River terminal area. Exploitation rate estimates were not available for 2022 or 2023 from 0.56 to 0.74 between 2018 and 2021, all of which were below the MFMT (0.90); therefore, Hoh River fall Chinook should not be considered subject to overfishing (Table II-6).

2.5.6 Quillayute River Chinook

Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River spring/summer and fall Chinook are presented in Appendix B, Tables B-35, and B-36, respectively.

The recreational and tribal fisheries for spring/summer Chinook were established by a preseason management agreement between WDFW and the Quileute Tribe. The total IGN catches for 2023 were 656 hatchery and 176 natural spring/summer Chinook. Chinook taken in the ceremonial and subsistence fishery are included in the IGN catch. The Quillayute system was closed to all recreational fishing from April 1 through April 30 by the preseason management plan. Both the treaty and non-treaty fisheries were also closed week 29 through week 39 in-season by emergency regulation due to extreme low flows and low adult hatchery rack numbers. WDFW required the release of unmarked Chinook in fisheries through August to reduce impacts of the recreational fishery on the natural spring/summer Chinook stock. The catch record card (CRC) estimate for the 2023 recreational spring/summer Chinook fishery is not yet available; the 2021 CRC sport harvest was used as a placeholder (due to having similar regulations) for 2023 in Appendix B, Table 35, until those estimates are available.

The recreational and tribal fisheries for fall Chinook were established by a preseason management agreement between WDFW and the Quileute Tribe. The 2023 Quileute IGN harvest of fall (natural) Chinook was 2,289 and catch of stray fall hatchery Chinook was two fish, for a total harvest of 2,291. Catch for ceremonial and subsistence use is included in the IGN harvest numbers. The CRC estimate for the 2023 fall Chinook recreational fishery is not yet available, instead 2023 creel survey harvest data was used from the Quillayute Basin in Appendix B, Table 36.

Both the treaty and non-treaty fall fisheries were reduced from previous years for conservation reasons. In-river recreational fisheries were closed to all fishing April 1 through April 30 by preseason management plan and were also closed by emergency regulation July 15 through September 30 (due to low hatchery returns of spring/summer Chinook). Daily limits were reduced by emergency regulation to one salmon starting November 1 until the season closed on December 15 (due to concerns over low returns).

The 2023 recreational Chinook fishery in the Quillayute (park boundary to confluence of Bogachiel and Sol Duc) and Sol Duc (mouth to Sol Duc hatchery) consisted of:

- Preseason rules included a season of February 1 through March 31 and May 1 through August 31, daily limit 4 salmon, up to 2 adults retained, release wild Chinook, wild coho, and sockeye.
- Preseason rules included a season of September 1 through December 15, daily limit 6, up to 4 adult salmon retained, release wild coho through September 15, retention of 1 wild Chinook allowed as part of the 4 fish limit. September 16 through December 15, daily limit 6, 1 wild Chinook and 1 wild coho allowed as part of 4 fish limit, release sockeye.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.
- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.
- The Quillayute River was closed Mondays and Tuesdays September 4 through October 17 to avoid gear conflicts with tribal fisheries during low flows.

The 2023 recreational Chinook fishery in the Bogachiel (mouth to highway 101 bridge) and Calawah (mouth to highway 101 bridge) consisted of:

- Preseason rules included a season of July 1 through August 31 with a daily limit of 4 salmon, up to 2 adult salmon retained, release wild coho and wild Chinook.
- Preseason rules included a season of September 1 through December 15 with a limit of 3 adult salmon, 2 adults retained of which 1 may be a wild Chinook, release wild adult coho through September 15.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.
- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.

The 2023 recreational Chinook fishery in Dickey (ONP boundary to confluence with East and West Forks) consisted of:

- Preseason rules included a season of July 1 through August 31 with a daily limit of 4 salmon, up to 2 adult salmon retained, release wild coho and wild Chinook.

- Preseason rules included a season of September 1 through December 15 with a limit of 3 adult salmon, 1 adult retained, release wild adult coho through September 15.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.
- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.

The Quileute Tribe greatly reduced the total number of days fished in their 2023 fall IGN fishery by being closed to fishing weeks 36 through 38 due to extreme low flows and fish compression in the lower Quillayute River. The IGN fishery opened in week 39 for 2 consecutive days (6am-6pm). Week 40 was restricted to one half day only (6am-6pm), 6-inch maximum mesh, set net only and Week 41 was restricted to one half day only (6am-6pm), 6-inch maximum mesh, set net only 25 fathom maximum length. Additionally, Weeks 42-44 were restricted to two days a week (6am-6pm), and the fishery was closed Week 45-46 for conservation measures.

Escapement and Management Performance

The 2023 management agreement called for an escapement goal of 900 hatchery spring Chinook. The actual hatchery rack return was 749 plus 64 jacks, which was below hatchery requirements. A total of 707,000 eggs were taken.

The natural summer Chinook run is managed to achieve an MSY spawner escapement of 1,200 adults, jacks, and brood stock collection combined. The 2023 preliminary natural spawning summer Chinook escapement estimate was 1,791, which includes 95 wild broodstock fish.

The geometric mean of Quillayute River natural summer Chinook spawner escapement in 2021, 2022, and 2023 is 1,397, which exceeded the MSST (600); therefore, Quillayute River summer Chinook should not be considered overfished (Table II-6). Estimates of exploitation rates were not available for Washington coastal spring/summer Chinook stocks. But based on the limited in-river harvest rate and ocean harvest rates of Queets fall Chinook, it is unlikely that Quillayute River summer Chinook were subject to overfishing in recent years (Table II-6).

Terminal area fisheries on fall Chinook are managed for a target 40 percent in-river harvest rate, equating to an escapement of 60 percent of the terminal return or 3,000 adults, whichever is greater. The preliminary 2023 escapement estimate of 5,607 fall Chinook was above the escapement floor and above the targeted escapement of 60 percent of the return (60 percent of the estimated preliminary return of fall Chinook is 5,182).

The geometric mean of the Quillayute River fall Chinook adult spawning escapement in 2021, 2022, and 2023 was 5,954, which exceeded the MSST (1,500); therefore, Quillayute River fall Chinook should not be considered overfished (Table II-6).

Exploitation rate estimates for Quillayute River fall Chinook were available through 2021 and calculated using Queets River fall Chinook CWTs as a surrogate for ocean fishery exploitation rates. For terminal fisheries, adjustments were made to the Queets River CWT-based exploitation rates to account for harvest rates that occurred in the Quillayute River terminal area. Estimates of exploitation rates were not available for 2022 and 2023 but ranged from 0.60 to 0.72 between 2018

and 2021, all of which were below the MFMT (0.87); therefore, Quillayute River fall Chinook should not be considered subject to overfishing (Table II-6).

2.5.7 Hoko River Chinook

Inside Harvest

Historical terminal run size, harvest, and escapement data for Hoko River summer/fall Chinook are presented in Appendix B, Table B-38.

Hoko River Chinook are harvested primarily in fisheries in southeast Alaska and northern British Columbia with minimal harvest in Council area and inside waters. There have been no tribal or recreational fisheries in the Hoko River for Chinook salmon since the early 1980s, although some terminal catch is occasionally reported by anglers on WDFW Catch Record Cards. Historical terminal run size, catch, and escapement data for Hoko River summer/fall Chinook are presented in Appendix B, Table B-38.

Escapement and Management Performance

The 2023 escapement and terminal run size estimates for Hoko Chinook are not available.

The 2022 escapement estimate for Hoko Chinook was 1,386 (including broodstock used for the hatchery supplementation program), which was comprised of 578 natural-origin Chinook and 808 hatchery-origin Chinook.

The geometric mean of Hoko River summer/fall Chinook escapement in 2020, 2021, and 2022 is 1,285 which exceeds the MSST (425); therefore, Hoko River summer/fall Chinook should not be considered overfished (Table II-6). Exploitation rate estimates were not available for 2021, 2022 or 2023, but ranged from 0.22 to 0.56 in earlier years, where available, below the MFMT (0.78); therefore, Hoko River summer/fall Chinook should not be considered subject to overfishing (Table II-6).

2.6 Puget Sound Chinook Stocks

Puget Sound Chinook stocks include all fall, summer, and spring stocks originating from U.S. tributaries in Puget Sound and the eastern Strait of Juan de Fuca (east of Salt Creek, inclusive). This stock complex consists of numerous natural Chinook stocks of small to medium-sized populations and significant hatchery production. The Puget Sound ESU was listed under the ESA as threatened in March 1999.

Management Objectives

Puget Sound Chinook stocks are listed under the ESA and were managed pursuant to the provisions of a WDFW/Tribal management plan approved under an ESA Section 4(d) rule promulgated by NMFS. This plan contains exploitation rate ceilings for ESA-listed Puget Sound stocks expressed in terms of constraints on total fishery rebuilding exploitation rates (RER) or of exploitation rates on fisheries south of the Canadian border for those stocks without RERs. The Council's annual management objectives for ESA-listed stocks are to meet the ESA consultation standards set forth by NMFS.

Regulations to Achieve Objectives

Puget Sound stocks contribute to fisheries off B.C., are present to a lesser degree off SEAK, and are impacted to a minor degree by Council-area ocean fisheries. Because Council-area fishery impacts to Puget Sound Chinook stocks are negligible, ocean regulations are not generally used to manage these stocks. The only Council-area regulations affecting any of these stocks were closing the Cape Flattery Control Zone for the non-Indian commercial troll fishery and holding the non-Indian commercial troll fishery to impacts in Area 3 and Area 4 not to exceed those modeled pre-season. Season and size limit details are presented in Tables I-1, I-2, and I-3.

Inside Harvest

Commercial inside fishery harvest of Puget Sound Chinook was managed for six regional stock management units or, in some cases, component stocks within management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest was regulated according to the natural spawning escapement goal or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) is presented in Appendix B, Table B-39. These catches included some fish of non-Puget Sound origin. The total commercial harvest in Puget Sound in 2023 was 104,209 Chinook, compared to 107,567 Chinook caught in 2022. The 2023 non-Indian net catch was 15,811 Chinook, compared to 17,757 Chinook caught in 2022. The 2023 treaty Indian net and troll harvest was 88,398 Chinook, compared to 89,810 Chinook caught in 2022.

Chinook catches in the Puget Sound recreational fishery for years beginning in 1971 are presented in Appendix B, Table B-40. Catch estimates for the 2023 Puget Sound recreational fishery were unavailable.

Escapement and Management Performance

Puget Sound Chinook management goals for fishery planning processes in 2023 were compared to predicted escapements and exploitation rates to assess compliance with ESA consultation standards (Table II-5). Information to evaluate performance against these constraints was unavailable.

Historical hatchery and natural run component escapements and net catches for summer/fall Chinook for each Puget Sound region of origin are presented in Appendix B, Table B-41. Recreational salmon catch estimates are summarized in Appendix B, Table B-40. Historical spring Chinook escapement data are presented in Appendix B, Table B-44.

Escapement and hatchery estimates for 2023 were not available for most runs. In many natural spawning areas, hatchery-origin Chinook comprise a large component of the natural spawning population.

2.7 Coastwide Goal Assessment Summary

In 2023, the SRFC and KRFC adult spawner escapements both met their FMP objectives. Information to assess compliance with FMP conservation objectives and ESA consultation standards was unavailable for LCR natural tule Chinook, several Washington coast Chinook stocks, and all Puget Sound natural Chinook stocks.

2.8 Stock Status Determinations

In 2011, the Council adopted SDC for overfishing, overfished, not overfished/rebuilding, and rebuilt under FMP Amendment 16. These criteria, approved and implemented since December 2011, are:

- Overfishing occurs when a single year exploitation rate exceeds the MFMT (F_{MSY}).
- Overfished status occurs when a 3-year geometric mean spawning escapement is less than the MSST.
- Not overfished/rebuilding status occurs when the most recent 3-year geometric mean spawning escapement is greater than the MSST but less than S_{MSY} .
- A stock is rebuilt when the most recent 3-year geometric mean spawning escapement exceeds S_{MSY} .

All criteria rely on the most recent estimates available, which in some cases may be a year or more in the past because of incomplete broods or data availability. The above criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. Stock specific reference points and recent year estimates for relevant stocks are presented in Table II-6.

In June 2018, NMFS published an overfished designation for SRFC and KRFC based on the geometric mean of escapement in 2015 – 2017. Rebuilding plans for both of these Chinook stocks were completed in July 2019 and SRFC were declared rebuilt in 2021. KRFC continue to meet the criteria for overfished status based on spawner escapement estimates from 2021 – 2023. The Queets River spring/summer Chinook stock also continues to meet the criteria for overfished status based on spawner escapement estimates from 2020 – 2022. Based on the most recent year exploitation rate estimates available, no stocks were subject to overfishing

TABLE II-1. Sacramento River natural area and hatchery adult fall Chinook escapement in numbers of fish.

Goal	≥40,700 ^{d/e/}										

a/ Inriver run size includes a USFWS estimate of 30,550 fish (19% of the run) that died prior to spawning in September 2002.

b/ Total inriver run includes fish collected from the Klamath and Trinity rivers by the Yurok and Hoopa Valley tribes, respectively, to test for the presence of the parasite *Ichthyophthirius multifiliis* during the following years: 2014 - 272 adults; 2015 - 123 adults; 2016 - 111 adults, 2019 - 8 adults, 2021 - 113 adults and 6 jacks.

c/ Preliminary.

d/ In December 2011, Amendment 16 to the Salmon Fishery Management Plan was approved, which replaced the 35,000 spawning escapement floor with an SMSY management objective of 40,700 natural area adult spawners. The 35,000 spawner floor was in effect from 1989-2007 and in 2011. In 2008-2010, fisheries were managed for a natural area spawning escapement of 40,700 adults under requirements of a rebuilding plan.

e/ Annual escapement goals may be more or less than SMSY in some years due to meeting SACL requirements and de minimis fishing provisions.

a/ Adults only.

b/ Freshwater harvests prior to 2019 are derived from ODFW salmon/steelhead angler catch record card information and harvest estimates since 2019 are derived from the ODFW's electronic licensing system. Harvest estimates represent fish larger than 24 inches (i.e., adults). Includes both hatchery and natural fish.

c/ Preliminary.

Goal	60-90			

a/ North migrating peak counts are taken on nine miles of standard index surveys over nine river systems (see Appendix B, Table B-11 for individual system counts). Complete carcass counts are listed in Appendix B, Table B-10. Complete counts for Gold Ray and Winchester dams are listed in Appendix B, Table B-9.

b/ Gold Ray Dam removed October, 2010. Natural estimates after 2010 derived using relationship of 2004-2010 spawning ground surveys to Gold Ray Dam passage. Estimate includes an unknown number of jacks.

c/ In 2004 one of the standard survey sections was not sampled. In the previous two years this section accounted for 33% of the total adult carcass counts.

d/ Surveys were not conducted.

e/ Preliminary.

TABLE II-5. Performance of Chinook salmon stocks in relation to 2023 preseason conservation objectives (preliminary data).
(Page 1 of 2)

System and Stock	2023 Conservation/Management Objective(s)	2023 Achievement
Sacramento River Chinook		
Fall	Minimum escapement of 122,000 natural area and hatchery adults.	Preliminary estimate of 133,638 hatchery and natural area adult fall Chinook is above the 2023 management objective.
Winter (Endangered)	Age-3 impact rate for the area south of Point Arena, CA no greater than 20.0% (NMFS ESA consultation standard).	Preseason projection of 0.0%; no postseason estimate was available at time of printing.
Spring (Threatened)	No management objective	No management objective
California North Coast Chinook		
Klamath River Fall	Minimum escapement of 23,614 natural area adult spaw ners.	Preliminary estimate of 41,623 is above the 2023 management objective.
California Coastal (Threatened)	No greater than a 10.0% ocean harvest rate on age-4 Klamath River fall Chinook (NMFS guidance).	Preseason projection of 0.3%; no postseason estimate was available at time of printing.
Oregon Coast Chinook		
North Migrating Stocks	150,000-200,000 natural adult spaw ners (equivalent to peak spaw ner index counts of 60-90 adults per mile).	118 natural adult spaw ners per mile, above the aggregate stock index range.
South/Local Migrating Stocks	34,992 natural adult passage estimate at Huntley Park in the low er Rogue River.	29,550 natural adult passage estimate at Huntley Park, below the conservation objective.
Columbia River Basin Fall Chinook		
LRW (Component of threatened low er Columbia River Chinook ESU)	MSY objective of 5,700 natural North Lew is River adult spaw ners.	Preseason LRW forecast was 8,790. Postseason estimate not available.
LCR natural tules (Component of threatened low er Columbia River)	Total (ocean plus inriver) AEQ exploitation rate on ESA-listed natural tules of no more than 38.0%.	Preseason projection of 38.0%. Postseason estimate not available.
LRH	14,800 adult hatchery spaw ners.	Preseason LRH forecast was 77,000. Postseason estimate not available.
SCH	6,000 adult hatchery spaw ners.	60,113 adult hatchery spaw ners, above the goal.
MCB	No FMP objective; target of 7,900 hatchery adults.	10,963 adult hatchery spaw ners, above the target.
URB	Minimum 40,000 natural and hatchery adults above McNary Dam, plus meet treaty Indian obligations. <i>U.S. v. Oregon</i> parties agreed to 60,000 in 2011.	192,296 natural and hatchery adults over McNary Dam, well over the MSY target in FMP.

TABLE II-5. Performance of Chinook salmon stocks in relation to 2023 preseason conservation objectives (preliminary data).
(Page 2 of 2)

System and Stock	2023 Conservation/Management Objective(s)	2023 Achievement
Columbia River Basin Fall Chinook (continued)		
Snake River Fall Chinook (Threatened; component of URB)	SRFI ≤0.700 for all ocean fisheries combined (i.e., no less than a 30.0% reduction from the 1988-1993 base period exploitation rate).	Preseason SRFI projection of 0.490. Postseason estimate was not available.
Washington Coastal Chinook		
Fall	Natural spaw ner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations.	Preliminary estimates: Quillayute was above the goal. Estimates for other fall stocks were not available.
Spring/Summer	Natural spaw ner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations.	Preliminary estimates: Quillayute was above the goal. Estimates for other spring/summer stocks were not available.
Puget Sound Chinook		
(Threatened)	Minor part of Washington ocean harvest; Council ocean management not directed at these stocks. Adult equivalent exploitation rate standard developed for some stocks:	Postseason estimates were not available. Preseason predictions of adult equivalent exploitation rates and spaw ner objectives were:
	Exploitation Rate Spaw ner Esc. ISBM	Exploitation Rate Spaw ner Esc. ISBM

CHAPTER III – COHO SALMON MANAGEMENT

3.1 *Oregon Production Index Area Coho Stocks*

Oregon Production Index (OPI) area coho stocks include all Washington, Oregon, and California natural and hatchery stocks from streams south of Leadbetter Point, Washington, although stocks produced north of Leadbetter Point are also intercepted in the OPI area. The largest naturally produced coho stock is OCN coho, which includes coho produced from Oregon river and lake systems south of the Columbia River. OCN coho are managed as a stock aggregate with four identified components. Prior to 2000, NMFS listed three coho ESUs within the OPI area as threatened: CCC coho listed October 1996, SONCC coho listed May 1997, and OCN coho listed August 1998. In 2002, NMFS began an update of all its listing determinations and in January 2006 concluded that the OCN ESU did not warrant listing under the ESA. That determination was overruled by a U.S. Court decision in 2007, and subsequently relisted by NMFS as threatened in February 2008. Lower Columbia River natural (LCN) coho were listed as endangered under the Oregon State ESA in 2002, and as threatened under the Federal ESA on June 28, 2005. The primary OPI hatchery stocks include a south migrating Columbia River (early) stock, a north migrating Columbia River (late) stock, public hatchery coho from the Oregon and northern California Coast, and formerly a small cooperative program along the southern Oregon Coast known as the Salmon Trout Enhancement Program (STEP), which was discontinued after the 2004 brood releases.

Management Objectives

In establishing ocean salmon fisheries that impact OPI area coho stocks, the Council was guided by the reasonable and prudent alternatives of NMFS 1999 Supplemental Biological Opinion and Incidental Take Statement for CCC and SONCC coho, and the March 2023 NMFS ESA guidance letter for LCN and OCN coho, which required:

1. No directed coho fisheries or retention of coho in all commercial and recreational fisheries off California to protect endangered CCC coho.
2. A total exploitation rate not to exceed 16.0 percent for the Trinity River component of the SONCC coho ESU and a total exploitation rate not to exceed 15.0 percent for all other components of the SONCC coho ESU.
3. The LCN coho ESA consultation standard requirement of no greater than a 23.0 percent exploitation rate (marine and mainstem Columbia River combined).
4. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 20.0 percent for the north-central sub-aggregate and 30.0 percent for the northern and south-central sub-aggregates as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.

The harvest management matrix specified by the Salmon FMP (Amendment 13) is based on the parental escapement levels and the marine survival for the three sub-aggregates of OCN stock. The total allowable OCN coho exploitation rate for marine and freshwater for those three sub-aggregates (listed above in item 4) are recommended by Amendment 13 and the matrix developed

by the OCN Coho Workgroup during their review of Amendment 13. The Workgroup recommendation was accepted by the Council as expert biological advice in November 2000. A modification to the marine survival index in the matrix was adopted by the Council in 2013.

The Council was also guided by a treaty Indian/non-Indian sharing agreement for Columbia upriver coho stocks, which required passage of 50 percent of the run destined for areas above Bonneville Dam.

Regulations to Achieve Objectives

Historically, OPI area coho stocks contributed primarily to ocean fisheries off Oregon and northern California and, to a lesser degree, Washington and B.C. The Council has prohibited retention of coho in all fisheries south of the Oregon/California border since 1996. For the adopted seasons, the STT projected exploitation rates of 15.0, 7.7, 6.7, and 1.8 percent for Trinity, Klamath, Rouge, and other natural stocks that comprise of SONCC coho aggregate in marine and freshwater fisheries combined, 19.8 percent for OCN coho in marine and freshwater fisheries combined and 18.9 percent for LCN coho in marine and freshwater fisheries combined.

Total coastwide allowable harvest set preseason for treaty Indian troll fisheries, non-Indian commercial troll fisheries, and recreational fisheries were 57,000, 40,400, and 294,600 coho, respectively. Season and size limit details are presented in Tables I-1, I-2, and I-3.

Commercial Troll

Commercial troll fisheries have been closed to coho retention south of Cape Falcon since 1993 except for limited fisheries in 2007, 2009, 2014, 2021, 2022, and 2023. In 2023, a September fishery from Cape Falcon to Humbug Mountain had a quota of 10,000 non-mark selective coho.

All species treaty Indian fisheries north of Cape Falcon were not restricted to mark-selective retention of coho and operated on an overall quota of 57,000 coho (Table I-2).

Non-Indian commercial troll fisheries from Cape Falcon to the U.S./Canada border in 2023 had an overall quota of 30,400 marked coho (Table I-1). The remaining coho quota was modified inseason to allow for non-mark selective retention. The adjusted non-mark-selective coho quota was 9,070.

Recreational

From 1994 through 1998, coho retention was prohibited in Oregon recreational fisheries south of Cape Falcon. Retention of coho has been prohibited off the coast of California since 1996 to protect ESA-listed CCC coho. Mark-selective coho directed ocean recreational fisheries have been implemented in the OPI area since 1998. Limited non-mark-selective recreational ocean coho fisheries have occurred in recent years; since 2011 between Cape Falcon and Humbug Mountain, in 2004 and 2022 between Leadbetter Point and the Queets River, 2012 and 2013 between the Queets River and Cape Falcon, in 2014, in all areas from the U.S.-Canada border to Humbug Mountain, and in 2015 and 2023 in all areas from the U.S.-Canada border to Cape Falcon. Adequate abundance of marked coho in the OPI area has resulted in allowable harvests of marked coho in Oregon and Washington within constraints for OCN and LCN coho.

In 2023, the recreational coho fisheries north of Cape Falcon operated with a mark-selective quota of 159,600 (Table I-3). The remaining coho quota was modified inseason to allow for non-mark selective retention. The adjusted non-mark-selective coho quota was 43,760. The recreational fishery between Cape Falcon and the Oregon/California border operated with a mark-selective quota of 110,000. After inseason adjustments, a non-mark-selective fishery with a quota of 42,500 occurred in September between Cape Falcon and Humbug Mountain (Table I-3).

Inside Harvest

Coho retention in all California fisheries was prohibited.

The 2023 inside recreational harvest of coho in Oregon coastal basins were generally limited to areas where abundant naturally-produced or hatchery coho returns were expected. Historical estimates of the recreational harvest of adult coho in Oregon coastal estuaries and rivers, derived from ODFW salmon and steelhead angler catch record cards and electronic licensing system, are reported in Table III-1.

Limited recreational fisheries for naturally produced coho (non-mark-selective) were approved in three lake systems and eleven rivers in 2023. The preliminary total catch estimate for these fisheries was 8,699 coho.

The 2023 Columbia River non-Indian commercial net fishery harvested 56,525 adult coho. Select Area fisheries in both Oregon and Washington accounted for 48,143 of the total 2023 Columbia River commercial coho catch. The Columbia River treaty Indian mainstem commercial gillnet catch was preliminarily 17,778 coho. Columbia River commercial coho fishery harvest was mostly mark-selective in 2023. Coho harvest information for Columbia River commercial and recreational fisheries are reported in Appendix B, Table B-21.

In 2023, all lower Columbia River recreational fisheries were mark-selective for coho, and barbless hooks were required in mainstem fisheries. The upriver boundary for the Buoy 10 fishery was at the Tongue Point, Oregon to Rocky Point, Washington line. The Buoy 10 fishery opened August 1 for Chinook and marked coho with a daily bag limit of two fish. Chinook were restricted to marked only through September 4 and Chinook retention was closed from September 5-8. All angling was closed August 21-23 and August 28-29. The daily bag limit increased to three fish on September 5 through the end of the year but only one Chinook when retention allowed. The 2023 Buoy 10 effort totaled 78,179 angler trips (Table III-2) and resulted in a harvest of 9,832 adult coho. Historical Buoy 10 catch and effort data are provided in Appendix B, Table B-22. Recreational coho harvest estimates for Columbia River mainstem from Bonneville Dam downstream to the Tongue Point/Rocky Point line are reported in Appendix B, Table B-21.

Escapement and Management Performance

The overall postseason abundance estimate for OPI area stocks in 2023 was 707,700 compared to 905,100 in 2022, and to the recent ten-year average of 652,400 (Table III-3; Figure III-1). All Council-area coho fisheries and quota limits are included in Table I-6.

3.1.1 Central California Coast and Northern California Coho

Table B-7 displays natural area coho spawning stock estimates for nine watersheds that have only recently been reported in this document, although estimates are mostly unavailable for the 2022/23 escapements.

For SONCC coho, redd counts are conducted in Redwood Creek, four tributaries to Humboldt Bay, and the South Fork Eel River. During the 2020/21 season there were 1,132 redds counted in the Humboldt Bay tributaries and 617 redds counted in the South Fork Eel River (redd counts were not available for Redwood Creek). In Freshwater Creek, one of the tributaries to Humboldt Bay that is included in the redd count, there are also escapement estimates derived from mark-recapture surveys. In 2022/23, 643 coho were estimated to have entered Freshwater Creek. In the Klamath Basin, estimates are available for escapement to hatcheries. In 2023/24, a preliminary total of 2,432 adult coho returned to Trinity River Hatchery and 534 adult coho returned to Iron Gate Hatchery (hatchery spawners are not reported in Table B-7).

For CCC coho, Table B-7 displays escapement estimates for Ten Mile River, Pudding Creek, Noyo River, Big River and Little River. During the 2022/23 season, an estimated 1,075, 107, 1,299, 490, and 51 coho returned to these watersheds, respectively. Further south in the CCC coho ESU, redd counts are conducted in the Lagunitas Creek basin. In 2022/23 and 2023/24, 210 and 334 redds were counted, respectively. The 2023/24 spawning season for this watershed was not complete at the time of this report's publication, and the final redd count will likely change.

3.1.2 Oregon Coast Natural Coho

The 2023 preliminary estimate of natural spawner escapement to Oregon coastal river and lake systems from the Sixes River north (Oregon Coast ESU) was 151,500 adult coho. This compares to 170,000 adults in 2022. Historical spawner escapement estimates of naturally produced coho are reported in Table III-1.

Preliminary information indicates the total natural spawning population on the Oregon Coast was the third highest since 2014. The total estimate of the natural spawning population in 2023 was 155,100, including estimates from the Rogue River, which is part of the SONCC ESU (Table III-4, Figure III-2).

Preliminary postseason estimates of combined marine and freshwater exploitation for the North-Central stock component of OCN coho is 20.8 percent which is greater than the 20.0 percent maximum allowed under the OCN work group matrix. The maximum exploitation rate for the North and South-Central stock components of OCN coho was 30.0 percent and the preliminary postseason estimates were lower than the limit at 17.2 and 17.6 percent, respectively.

The preliminary postseason estimate of marine exploitation on SONCC coho is 0.7 percent, which is lower than the preseason projection of 1.8 percent. Postseason estimates of total exploitation rate for each of the SONCC coho populations in 2023 are unavailable for comparison against the 16.0 percent exploitation rate limit for the Trinity River population and 15.0 percent limit for all other populations.

3.1.3 Oregon Coastal Hatchery Coho

The preliminary estimate of total coho returns to Oregon coastal public hatcheries in 2023 is 2,100 adults (Table III-1).

3.1.4 Columbia River Coho

The 2023 ocean escapement of adult early and late Columbia River coho stocks was 419,500 fish, compared to 539,700 adults in 2022 (Appendix B, Table B-21).

The preliminary postseason estimate of marine exploitation on LCN coho was 11.9 percent, which is lower than the preseason projected 14.4 percent. The 2023 postseason total exploitation rate (marine and freshwater) was estimated at 13.5 percent, less than the 23.0 percent allowed (Table III-5).

3.2 Washington Coastal Coho Stocks

Washington coastal coho stocks include all natural and hatchery stocks originating in Washington coastal streams north of the Columbia River to the western Strait of Juan de Fuca (west of the Sekiu River). The stocks in this group most pertinent to ocean salmon fishery management were Willapa Bay, Grays Harbor, Quinalt (hatchery), Queets, Hoh, and Quillayute coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

Management Objectives

Preseason management goals for Grays Harbor and Olympic Peninsula coho stocks include achieving natural spawning escapement objectives and treaty Indian allocation requirements. The Council's preseason conservation objectives for stocks managed for natural production were based on maximum sustainable yield (MSY) spawner escapements established pursuant to the U.S. District Court order in *Hoh v. Baldrige*. The conservation objectives for the Queets, Hoh, and Quillayute rivers were developed as ranges intended to bracket estimates of MSY escapement. The range reflected the inherent uncertainty by using the high estimate of recruits-per-spawner and the low estimate of carrying capacity for the lower bound, and the low estimate of recruits-per-spawner and the high estimate of smolt carrying capacity for the upper end of the range. The ranges were further adjusted upward by 26 to 184 percent for risk aversion and habitat considerations. Annual targets for natural spawning escapement and total escapement were established by WDFW and treaty Indian tribes under the provisions of *U.S. v. Washington* and subsequent U.S. District Court orders. After an annual agreement was reached, ocean fishery escapement objectives were established for each river or region of origin. Agreements included provisions for treaty Indian allocation requirements and inside non-Indian fishery needs.

In December 2011, Amendment 16 to the FMP was approved, which established new conservation objectives and SDC for Washington coastal coho based on either S_{MSY} estimates derived from FRAM run reconstruction programs or existing conservation objectives.

Regulations to Achieve Objectives

Washington coastal coho stocks played a primary role in 2023 Council-area ocean fishery management, particularly north of Cape Falcon. All ocean non-tribal coho fisheries both north and south of Cape Falcon were planned mark-selective except for a September recreational coho fishery south of Cape Falcon. Consistent with 2023 preseason planning for potential inseason

action, WDFW proposed and NMFS approved inseason action to convert the NOF recreational and commercial troll ocean fisheries to non-mark selective for coho, in response to lower-than-expected mark rates, effective August 26. Revised quota values for the non-selective portion of the season were calculated so that projected exploitation rates on limiting stocks stay within pre-season planned limits for non-treaty North of Falcon ocean fisheries. Quota adjustments were based on actual catches and remaining unused impacts through the date of the conversion, and reduced an additional 10 percent, as a precautionary policy measure. Season and size limit details are presented in Tables I-1, I-2, and I-3.

3.2.1 Willapa Bay Coho

Inside Harvest

Historical terminal run size, harvest, and escapement data for Willapa Bay coho are presented in Appendix B, Table B-24.

In 2023, the Willapa Bay non-tribal commercial gillnet fishery harvested 16,638 coho. Based on the preseason forecast for a terminal run of 116,672 (79,237 hatchery and 37,435 natural) fish, the scheduled fisheries were expected to harvest approximately 54,815 total coho. The season consisted of 34 12-hour and one 8-hour Chinook and coho directed openings from August 20 through November 27. Retention of both marked and unmarked coho was allowed. Unmarked Chinook retention was prohibited. There were three emergency regulations issued in-season for this commercial salmon fishery for the 2023 season.

- Commercial emergency regulation opened areas 2M and 2R on August 20, 2023, with tangle net gear and closed 2M and 2R on August 25, 2023.
- Commercial emergency regulation opened area 2N on August 31, 2023, with tangle net gear.
- Commercial emergency regulation opened areas 2N, 2M, and 2R for 8 hours on September 7, 2023, with tangle net gear.

The recreational salmon fishery in the marine waters of Willapa Bay (Marine Area 2-1) was open from June 24 through July 31, 2023, concurrent with Marine Area 2 (ocean rules applied). From August 1, 2023, through January 31, 2024, Willapa Bay Marine Area 2-1 was scheduled to be open to recreational salmon fishing with a daily bag limit of 6 salmon, only 2 may be adults. The Willapa Bay Control Zone was open to salmon fishing beginning August 1. Anglers were required to release unmarked Chinook. Anglers could fish with two poles if they had a Two-Pole Endorsement.

Recreational salmon fisheries in tributaries to Willapa Bay watersheds varied in duration but were generally open for salmon fishing as early as August 1, 2023, and remained open through January 31, 2024. All freshwater systems in Willapa Bay were open to recreational salmon fishing with a daily bag limit of 6 salmon, only 2 may be adults. Anglers were required to release unmarked Chinook. Barbless hooks were required when fishing for salmon. Anglers could fish with two poles if they had a Two-Pole Endorsement.

There was one emergency regulation issued in-season for the freshwater recreational fishery that included two changes effective December 8, 2023.

- Recreational emergency regulation required the release of unmarked coho in the Willapa and Naselle rivers. This emergency regulation also modified the gear and hook restrictions.

Expected coho harvest in all recreational fisheries was 7,361 hatchery and wild coho combined for the 2023 season based on preseason forecast abundances. Marine and freshwater recreational harvest estimates were unavailable for 2023, but the 2022 Marine Area 2-1 and freshwater recreational catch estimates totaled 3,262 coho, compared to the preseason catch projection of 4,912 coho.

Escapement and Management Performance

Willapa Bay coho were managed primarily for natural production. Estimates of natural spawning escapement for 2023 were unavailable. The most recent but still preliminary 2022 natural spawning escapement estimate was 24,197, which was above the FMP escapement objective of 17,200 natural area spawners. Escapement to Willapa Bay hatcheries in 2022 was estimated at 67,557 coho, which met the WDFW escapement objective of 6,100 spawners.

The geometric mean of Willapa Bay coho natural spawning escapements in 2020, 2021, and 2022 is 23,212, which was above the MSST of 8,600; therefore, Willapa Bay coho should not be considered overfished. Estimates of Willapa Bay coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.74); therefore, Willapa Bay coho should not be considered subject to overfishing (Table III-7).

3.2.2 Grays Harbor Coho

Inside Harvest

Historical terminal run size, harvest, and escapement data for Grays Harbor coho are presented in Appendix B, Table B-26.

The 2022 terminal run size estimates for Grays Harbor coho, after execution of the ocean fishery were 78,656 natural origin and 99,991 hatchery origin coho. The 2023 terminal run size data is currently not available.

In 2022, treaty Indian gillnet fisheries harvested 22,100 coho and non-Treaty gillnet fisheries harvested 3,770 coho (natural, hatchery, and net-pen origin). The Chehalis Tribe did not conduct a commercial fishery for coho in 2022. The 2022 recreational fishery coho catch is estimated at 16,141, which due to concerns for wild steelhead, closed on December 1 rather than the scheduled end date of December 31.

In 2023, the Quinault Indian Nation operated two separately scheduled gillnet fisheries for Chinook, coho, and chum in the Lower Humptulips and the Lower Chehalis, as described in Chapter II under the section labeled Grays Harbor Chinook. The preseason expected coho fishery impacts were limited by the expected abundance and harvest of Chinook in the Lower Chehalis side of the fishery. The combined Grays Harbor treaty fishery catch of 3,562 coho was lower than the preseason expected total coho catch of 43,350 (~8.2 percent of the expected catch). The treaty commercial fishery was closed by emergency regulation on October 26, 2023, due to concerns of

lower than expected coho returns. The early closure reduced the Chehalis and Humptulips treaty commercial fishery schedule by a total of 40 fishing days.

In 2023, the non-tribal gillnet fishery operated in two separately scheduled areas: Humptulips 2C and the Chehalis River 2A and 2D area. Although the non-Indian gillnet fishery in Humptulips Area 2C was scheduled for a 36-hour period in week 43 (7:00 a.m. October 23 to 7:00 p.m. October 24) and a 12-hour period in week 44 (week of November 2), no participation occurred in 2023. The Chehalis River 2A and 2D area was scheduled for one 7-hour and one 12-hour period in week 40, one 7-hour period in week 42, one 12-hour period during week 43, and three 12-hour periods in week 44. During weeks 40 and 42 the south channel was closed to provide additional protection to Chinook. During weeks 43 through 44 all areas of 2D were open with live boxes required and wild Chinook retention prohibited. The non-tribal gillnet fishery catch for areas 2A and 2D is 1,474 coho, which is lower than the preseason expected coho catch of 7,002.

The Chehalis Tribe conducted limited commercial fisheries for coho in 2023. They harvested 1,348 coho, of which 638 were hatchery-origin and 710 were natural origin. Opportunities were limited by flows and concern for Chehalis River steelhead.

The 2023 recreational fisheries were conducted in three general areas: Marine Area 2-2, the Chehalis River including its tributaries, and the Humptulips River. Catch estimates are not currently available.

In 2023, a recreational fishery in the northern portion of Marine Area 2-2, Commercial Area 2C, was open from August 1 through September 15 with a daily bag limit of one adult salmon, wild coho must be released. From September 16 through November 30, the portion of Marine Area 2-2 east of a line from the mouth of Johns River to Brackenridge Bluff Tripod was open with a daily bag limit of two adult salmon; all Chinook must be released.

In 2023, the Chehalis River and its tributaries were scheduled to open for coho fishing on the following dates and areas:

- Chehalis River mainstem downstream of the Fuller Bridge: August 1 through September 15 the daily bag limit was 6 salmon; all adults must be released. September 16 through November 30 the daily bag limit was 2 adult salmon, and in December, the daily bag limit was reduced to 1 adult salmon.
- Fuller Bridge to the South Elma Bridge (Wakefield Road): August 1 through September 15 the daily bag limit was 6 salmon, all adults must be released. In October and November, the daily bag limit was 2 adult salmon and in December, the daily bag limit was reduced to 1 adult.
- Upstream of the South Elma Bridge (Wakefield Road) to the high bridge on Weyerhaeuser 1000 line approximately 400 yards downstream from Roger Creek and tributaries. From October through November, the adult daily bag limit was 2 adult salmon and reduced to 1 adult salmon in December.

In 2023, the Humptulips River recreational fishery was scheduled to open for coho fishing on the following dates from the mouth to the confluence of the East and West forks:

- September 1 through October 31: a daily limit of 6 salmon, 2 of which may be adults, wild coho must be released.
- November 1 through December 31: a daily limit of 6 salmon, 1 of which may be an adult, wild coho must be released.

In-season adjustments to these fisheries occurred in 2023 due to preliminary concerns for the runsize of coho returns along the coast and impact concerns to wild steelhead. Salmon bag limits in the Humptulips and Chehalis rivers (including all tributaries) were reduced to one fish beginning November 3. These fisheries closed December 1 and did not reopen.

Escapement and Management Performance

Grays Harbor coho are managed by the co-managers for natural production with a spawning escapement goal of 35,400, which exceeds the FMP S_{MSY} of 24,426.

The 2022 preliminary escapement estimate for natural spawning coho is 65,977. The 2022 terminal run sizes are estimated at 78,656 natural-origin coho and 99,991 hatchery-origin coho. The returns of hatchery-origin coho to Grays Harbor hatchery programs were sufficient to provide for 2023 coho production goals.

The 2023 spawning escapement and terminal run size estimates for Grays Harbor coho are currently unavailable. Coho from this return are still spawning and are being enumerated at this time. The 2023 escapement has not been determined, but 282 natural origin fish were taken for hatchery broodstock.

The geometric mean of Grays Harbor coho natural spawning escapements in 2020, 2021, and 2022 is 46,200, which exceeded the MSST of 18,320; therefore, Grays Harbor coho should not be considered overfished. Estimates of Grays Harbor coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Grays Harbor coho should not be considered subject to overfishing (Table III-7).

3.2.3 Quinault River Coho

Inside Harvest

Historical terminal run size, harvest, and escapement for Quinault River coho are presented in Appendix B, Table B-28.

The IGN fishery targeted hatchery Chinook and coho from early September through November. A total of 7,979 coho were harvested by the gillnet fishery during the 2023 season.

Freshwater sport fisheries are regulated by the Quinault Indian Nation (QIN) within the boundaries of the Quinault Indian Reservation and the Washington Department of Fish and Wildlife (WDFW) and Olympic National Park (ONP) regulate freshwater fisheries within their respective jurisdictions. Salmon-directed sport fisheries regulated under QIN authority occur within the Lower Quinault River and its tributaries, while WDFW and ONP regulate sport fisheries upstream of Lake Quinault. Coho harvest during these fisheries is not available for 2023. 2022 sport harvest

estimates in the lower Quinault and its tributaries are not yet available. In 2022, sport fisheries regulated under WDFW regulations harvested 28 coho.

Escapement and Management Performance

Quinault River coho were managed for hatchery production. Escapement estimates for Quinault River coho in 2023 were unavailable. The Quinault National Fish Hatchery egg take objectives for 2023 were achieved.

3.2.4 Queets River Coho

Inside Harvest

Historical terminal run size, harvest, and escapement for Queets River coho are presented in Appendix B, Table B-31.

The treaty commercial schedules fished in 2023 are depicted in the discussion of the Chinook directed fishery in Chapter II of this report. The total harvest of coho in the Treaty Indian gillnet fishery was 4,573.

The 2023 Queets sport fishery within the Quinault Indian Reservation was open from September 1 through October 30 when it was closed by emergency regulation due to lower than expected natural coho returns. The 2023 sport catch estimates are not available. The 2022 sport catch estimate within the Quinault Indian Reservation is 976 adult coho.

State regulated recreational fisheries, outside of the Quinault Indian Reservation on Clearwater and Salmon rivers occurred from September 1 until November 30. Two adult salmon per day was allowed during these fisheries. In the Queets River within the ONP, the fisheries were opened September 1 and closed by emergency regulations on November 27, anglers were required to release all wild fish encountered. An in-season adjustment to the adult salmon bag limit to one fish per day was implemented November 3. Catch during 2023 State and ONP regulated recreational fishery is currently not available. In the 2022 State and ONP regulated recreational fisheries 29 coho were harvested in the Queets River basin.

Escapement and Management Performance

The spawning escapement objective in the FMP for Queets River coho is a range of 5,800-14,500 natural adult spawners.

In 2023, comanagers agreed to a spawning escapement objective of 7,503 natural origin adult coho. The 2023 spawning escapement estimate is not available.

In 2022, the comanagers had agreed to a spawning escapement objective of 11,819. The 2022 final natural coho escapement estimate was 12,083 adult fish.

The geometric mean of Queets River coho escapement in 2020, 2021, and 2022 was 6,624, which was above MSST (4,350) and above the lower bound of the escapement objective (5,800). In June 2018, NMFS published an overfished designation for Queets River coho based on the geometric mean of escapement in 2014-16 of 4,291. A rebuilding plan was adopted by the Council in

September 2019. Based on the most recent data (2020-22), the stock now meets the criteria for ‘rebuilt’ status (Table III-7). Estimates of Queets River coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Queets River coho should not be considered subject to overfishing (Table III-7).

3.2.5 Hoh River Coho

Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River coho are presented in Appendix B, Table B-34.

The 2023 forecast for the terminal runsize of Hoh River natural coho was 5,870.

In 2023, the tribal fishery targeted 22.4 percent of the terminal run with commercial and ceremonial and subsistence fisheries. The treaty IGN fishery occurred from the week of September 11 to the week of December 3 as described in Chapter II under the section labeled Hoh River Chinook. The tribal commercial fishery harvested 766 natural coho and 49 hatchery coho for a total of 815 coho.

In 2023, the non-tribal recreational fishery was open September 16 through December 15, from the Olympic National Park boundary upstream to the Oxbow Campground boat launch, and open October 16 through December 15 from the Oxbow Campground upstream to Morgans Crossing Boat Launch. Starting December 1, all fishing from a floating device in the Hoh River was restricted. Fishing from a floating device was allowed Sunday through Tuesday from the Morgan’s Crossing boat launch downstream to the Washington Department of Natural Resources Hoh Oxbow Campground boat launch, and Wednesday through Saturday from the Hoh Oxbow boat launch downstream to the ONP boundary near the mouth. The daily bag limit through October 31 was 4 salmon of which 2 adults could be retained, of which no more than 1 Chinook could be retained. On November 1, the daily limit was reduced to 1 salmon. The daily bag limit December 1 through December 15 was 1 salmon, release all Chinook. Only 1 single-point barbless hook was allowed. The 2023 catch estimate for the coho recreational fishery was not yet available.

Escapement and Management Performance

The 2023 spawning escapement estimate for coho in the Hoh River is not available. The escapement goal range established for this stock is 2,000 to 5,000.

The geometric mean of Hoh River coho escapement in 2020, 2021, and 2022 was 5,306, which exceeds the MSST of 1,890, therefore Hoh River coho should not be considered overfished. Estimates of Hoh River coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Hoh River coho should not be considered subject to overfishing (Table III-7).

3.2.6 Quillayute River Coho

Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River summer and fall coho are presented in Appendix B, Table B-37.

The recreational and tribal fisheries for coho were established by preseason agreement between WDFW and the Quileute Tribe. The 2023 Quileute Tribe's commercial, ceremonial, and subsistence fisheries harvested one summer coho (one hatchery and zero natural). The catch record card (CRC) estimates for the 2023 recreational summer coho fishery is not yet available; the 2021 CRC sport harvest was used as a placeholder (due to having similar regulations) for 2023 in Appendix B, Table B-37 until those estimates are available.

Both the treaty and non-treaty fisheries were closed week 29 through week 38 in-season by emergency regulation due to extreme low flows and low adult hatchery rack numbers. The Quileute Tribe greatly reduced the total number of days fished in their 2023 fall IGN fishery by being closed to fishing weeks 36 through 38 due to extreme low flows and fish compression in the lower Quillayute River. The IGN fishery opened in week 39 for 2 consecutive days (6am-6pm). Week 40 was restricted to one half day (6am-6pm), 6-inch maximum mesh and set net only. Week 41 was restricted to one half day (6am-6pm), 6-inch maximum mesh and set net only with a 25-fathom maximum length. Additionally, weeks 42 through 44 were restricted to two days per week (6am-6pm). The IGN fall fishery closed weeks 45 and 46 for conservation measures in response to low flows.

The total IGN catch for 2023 of fall coho was 2,873 (824 hatchery and 2,049 natural). Fall coho taken in the ceremonial and subsistence fishery are included in the IGN catch. The CRC estimate for the 2023 fall coho recreational fishery is not yet available, instead the 2023 creel survey harvest data was used from the Quillayute Basin in the Appendix B tables.

Consistent with the preseason management plan, in-river recreational fisheries were closed to all fishing April 1 through April 30. These fisheries were also closed by emergency regulation from July 15 through September 30 due to low hatchery returns of spring/summer Chinook. Daily limits were reduced by emergency regulation to one salmon starting November 1 until the season closed on December 15 for concerns over low returns.

The 2023 recreational coho fishery in the Quillayute (park boundary to confluence of Bogachiel and Sol Duc) and Sol Duc (mouth to Sol Duc hatchery) consisted of:

- Preseason rules included a season of February 1 through March 31 and May 1 through August 31, daily limit 4 salmon, up to 2 adults retained, release wild Chinook, wild coho, and sockeye.
- Preseason rules included a season of September 1 through December 15, daily limit 6, up to 4 adult salmon retained, release wild coho through September 15, retention of 1 wild Chinook allowed as part of the 4 fish limit. September 16 through December 15, daily limit 6, 1 wild Chinook and 1 wild coho allowed as part of 4 fish limit, release sockeye.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.

- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.
- The Quillayute River was closed Mondays and Tuesdays September 4 through October 17 to avoid gear conflicts with tribal fisheries during low flows.

The 2023 recreational coho fishery in the Bogachiel (mouth to highway 101 bridge) and Calawah (mouth to highway 101 bridge) consisted of:

- Preseason rules included a season of July 1 through August 31 with a daily limit of 4 salmon, up to 2 adult salmon retained, release wild coho and wild Chinook.
- Preseason rules included a season of September 1 through December 15 with a limit of 3 adult salmon, 2 adults retained of which 1 may be a wild Chinook, release wild adult coho through September 15.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.
- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.

The 2023 recreational coho fishery in Dickey (ONP boundary to confluence with East and West Forks) consisted of:

- Preseason rules included a season of July 1 through August 31 with a daily limit of 4 salmon, up to 2 adult salmon retained, release wild coho and wild Chinook.
- Preseason rules included a season of September 1 through December 15 with a limit of 3 adult salmon, 1 adult retained, release wild adult coho through September 15.
- Emergency rules closed the Quillayute system to all sport fishing July 15 through September 30.
- The daily limit was reduced via emergency regulation to 1 salmon from November 1 through December 15.

Escapement and Management Performance

The 2023 summer coho hatchery rack return was 420, which exceeds the goal of 300 hatchery summer coho. The 2023 wild summer coho escapement estimate was 324 fish.

In 2023, the preliminary escapement estimate for Quillayute natural fall coho was 7,245, which includes 10 broodstock fish. The Sol Duc Hatchery rack return for fall coho had 2,416 adults and 552 jacks. Based on the WDFW In-Season Hatchery Escapement Report the fall coho egg take goal for Sol Duc Hatchery was met with a total of 787,500 eggs.

The geometric mean of natural Quillayute fall coho escapement in 2021, 2022, and 2023 was 9,782, which exceeds the MSST of 4,725; therefore, Quillayute fall coho should not be considered overfished. Estimates of Quillayute fall coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates below the MFMT (0.59); therefore, Quillayute Fall coho should not be considered subject to overfishing (Table III-7).

3.3 Puget Sound Coho Stocks

Puget Sound coho salmon stocks include natural and hatchery stocks originating from U.S. tributaries in Puget Sound and the Strait of Juan de Fuca. The primary stocks in this group that are most pertinent to ocean salmon fishery management were Strait of Juan de Fuca, Hood Canal, Skagit, Stillaguamish, Snohomish, and South Puget Sound (hatchery) coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

Management Objectives

The Council's previous conservation objectives were based on the Puget Sound Salmon Management Plan, which defined management objectives and long-term goals for these stocks as developed by representatives from tribal, federal, and state agencies. Conservation objectives for specific stocks were based on either maximum sustainable production for stocks managed primarily for natural production or on hatchery escapement needs for stocks managed for artificial production. The original conservation objectives were developed by a State/Tribal Management Plan Development Team following the Boldt Decision with the goal for natural spawning stocks defined as "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The methodology used to develop the objectives was based on assessment of the quantity and quality of rearing habitat and the number of adult spawners required to fully seed the habitat. Some objectives were subsequently modified by the U.S. District Court Fisheries Advisory Board and later determinations of the Tribal/WDFW Technical Committee. However, annual natural management objectives may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of *U.S. v. Washington* and subsequent U.S. District Court orders (see "Memorandum Adopting Salmon Management Plan"; *U.S. v. Washington*, 626 F. Supp. 1405 [1985]).

In 2002, the PSC adopted a management plan for coho salmon originating in Washington and southern B.C. river systems. The plan was directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the U.S. and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan. Categorical status was employed by the PST under the 2002 coho Agreement to indicate general ranges of allowable total exploitation rates for U.S. and Canadian coho management units in 2023. Three categories were employed: low (total exploitation rate <20 percent), moderate (total exploitation rate 20-40 percent), and abundant (total exploitation rate >40 percent).

In 2014, the Council adopted management objectives for Puget Sound coho as recommended by WDFW and tribal co-managers under provisions of *U.S. v. Washington*. The annual objectives were based on the Comprehensive Coho Agreement categorical status and associated maximum exploitation rate limits. The Council formally adopted exploitation rate management objectives for Puget Sound coho in November 2009, which were generally consistent with PSC objectives,

and replaced the longstanding FMP spawning escapement objectives in 2010. For 2023, the objectives and categorical status under the PST Southern Coho Management Plan were as follows:

- Strait of Juan de Fuca (East and West): Moderate status 40 percent maximum exploitation rate
- Hood Canal: Moderate status 45 percent maximum exploitation rate
- Skagit: Moderate status 35 percent maximum exploitation rate
- Stillaguamish: Abundant status 50 percent maximum exploitation rate
- Snohomish: Moderate status 40 percent maximum exploitation rate

Regulations to Achieve Objectives

Puget Sound coho stocks did not play a primary role in 2023 ocean fishery management considerations, since management of impacts to Interior Fraser coho, Washington coastal natural coho, and LCN coho were more constraining. Inside fisheries, primarily in Puget Sound, were constrained to meet objectives for Puget Sound coho. The mark-selective regulations in ocean commercial and recreational fisheries and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Washington Coast coho, Puget Sound coho, LCN coho, OCN coho, and Interior Fraser coho. Season and size limit details are presented in Tables I-1, I-2, and I-3.

Inside Harvest

Inside harvest of Puget Sound coho was managed for the six regional management units. Harvest of coho for each management unit is regulated according to the natural spawning escapement or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) for all coho stocks combined is presented in Appendix B, Table B-39. The 2023 total Puget Sound commercial catch of coho was 190,251 fish, compared to a catch of 238,754 coho in 2022. Non-Indian harvest was 9,845 coho, compared to 17,192 coho in 2022. Treaty Indian net and troll fisheries harvested 180,406 coho, compared to 221,562 coho in 2022.

Historical coho catches in the Puget Sound recreational fishery beginning in 1971 are listed in Appendix B, Table B-40. Catch estimates for the 2023 Puget Sound recreational fishery were unavailable.

Escapement and Management Performance

Puget Sound FMP conservation objectives were updated to reflect exploitation rate management objectives adopted by the Council in 2009. 2023 postseason estimates were not available for SUS harvest impacts on Puget Sound coho stocks; therefore, the 2023 preseason exploitation rate objectives could not be evaluated. Preliminary 2023 escapement information was not available for natural Puget Sound coho.

3.3.1 Strait of Juan de Fuca Coho

The geometric mean of Strait of Juan de Fuca natural coho escapement (combined Western and Eastern; the current stock designation) in 2020, 2021, and 2022 was 14,461, which was above the MSST of 7,000 and S_{MSY} estimate of 11,000. In June 2018, NMFSs published an overfished designation for Strait of Juan de Fuca coho based on the geometric mean of escapement in 2014-16 of 6,842, and a rebuilding plan was adopted by the Council in September 2019. Based on the most recent information (2020-2022), the stock now meets the criteria for 'rebuilt' status. Estimates of Strait of Juan de Fuca coho exploitation rates were not available for 2022 and 2023;

however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.60); therefore, Strait of Juan de Fuca coho should not be considered subject to overfishing (Table III-7).

3.3.2 Hood Canal Coho

The geometric mean of Hood Canal natural coho primary management unit escapements in 2020, 2021, and 2022 are preliminary, though the geometric mean of the current estimates is 17,458. This is above the MSST of 10,750; therefore, Hood Canal coho should not be considered overfished. Estimates of Hood Canal coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates well below the MFMT (0.65); therefore, Hood Canal coho should not be considered subject to overfishing (Table III-7).

3.3.3 Skagit River Natural Coho

The geometric mean of Skagit natural coho escapement in 2020, 2021, and 2022 was 54,958, which was above the MSST of 14,875; therefore, Skagit coho should not be considered overfished. Estimates of Skagit coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years have resulted in exploitation rates below the MFMT (0.60) therefore, Skagit coho should not be considered subject to overfishing (Table III-7).

3.3.4 Stillaguamish River Natural Coho

The geometric mean of Stillaguamish natural coho escapement in 2020, 2021, and 2022 was 35,382, which was above the MSST of 6,100; therefore, Stillaguamish coho should not be considered overfished. Estimates of Stillaguamish coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates below the MFMT (0.50); therefore, Stillaguamish coho should not be considered subject to overfishing (Table III-7).

3.3.5 Snohomish River Natural Coho

The geometric mean of Snohomish natural coho escapement in 2020, 2021, and 2022 was 70,915, which was above the MSST of 31,000, therefore Snohomish coho should not be considered overfished. Estimates of Snohomish coho exploitation rates were not available for 2022 and 2023; however, fisheries in earlier years resulted in exploitation rates below the MFMT (0.60); therefore, Snohomish coho should not be considered subject to overfishing (Table III-7).

3.4 British Columbia Coho Stocks

Management Objectives

B.C. coho stocks were managed under the PSC management plan as described in the previous section on Puget Sound coho.

Regulations to Achieve Objectives

In the 2023 management process, Interior Fraser coho were designated to be in the “low” status category, which required the total exploitation rate in SUS fisheries not to exceed 10.0 percent. The preseason projected SUS fishery exploitation rate on Interior Fraser coho was 9.7 percent (5.0 percent in Council-area fisheries). The mark-selective regulations in ocean and Puget Sound

recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Interior Fraser coho.

Inside Harvest

Harvest of coho in inside waters affecting B.C. coho stocks occurred in Puget Sound fisheries, which were described in the previous section of this chapter.

Escapement and Management Performance

Postseason estimates of SUS inside harvest impacts on coho stocks subject to the PSC coho management plan were unavailable.

3.5 Coastwide Goal Assessment Summary

Preliminary assessment indicates that ESA consultation standards and FMP conservation objectives for Council managed coho stocks in effect during the preseason planning process of 2023 were met for OCN and LCN coho stocks (Table III-6). The 2023 data needed to assess compliance with ESA consultation standards and FMP conservation objectives for SONCC coho populations and most Washington coastal and Puget Sound coho stocks were unavailable.

3.6 Stock Status Determinations

The Council adopted SDC for overfishing, overfished, not overfished/rebuilding, and rebuilt under FMP Amendment 16. These criteria, approved and implemented in December 2011, were:

- Overfishing occurs when a single year exploitation rate exceeds the MFMT (F_{MSY}).
- Overfished status occurs when a 3-year geometric mean spawning escapement is less than the MSST.
- Not overfished/rebuilding status occurs when the most recent 3-year geometric mean spawning escapement is greater than the MSST but less than S_{MSY} .
- A stock is rebuilt when the most recent 3-year geometric mean spawning escapement exceeds S_{MSY} .

All criteria rely on the most recent estimates available, which in some cases may be a year or more in the past because of incomplete broods or data availability. The above criteria for rebuilt status are the default criteria provided in the FMP; however, alternative criteria may be developed through a rebuilding plan if warranted by stock specific circumstances. All relevant stocks were evaluated relative to these SDC as required by the FMP. Stock specific reference points and recent year estimates for relevant stocks are presented in Table III-7.

In June 2018, NMFS published an overfished designation for Queets, Strait of Juan de Fuca, and Snohomish natural coho based on the geometric mean of escapement in 2014 – 2016. A rebuilding plan was adopted by the Council in September 2019 for each of these stocks. In 2022, the Strait of Juan de Fuca natural coho met the criteria for ‘not overfished/rebuilding,’ and Snohomish natural coho met the criteria for rebuilt. Based on spawner escapement estimates for 2020 – 2022, Queets natural coho and Strait of Juan de Fuca natural coho now meet the criteria for rebuilt status.

Exploitation rate estimates for these stocks are not available for 2022 and 2023. The most recent year where exploitation rates are available is 2021, and no stocks were subject to overfishing.

a/ Does not include estimates for the Rogue River (SONCC ESU). Spawner escapements to rivers prior to 1990 were estimated by a nonrandom standard index of streams north of the Rogue River. A total coastwide spawner escapement methodology based on stratified random sampling (SRS) was initiated in 1990 and used through 1997 and was implemented concurrently with the standard index methodology. The SRS methodology indicated that actual escapements were less than estimated by the standard rivers index. The spawner index data for years prior to 1990 have been recalibrated in this table to be comparable with the SRS estimates. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used.

b/ Oregon coastal Salmon Trout Enhancement Program (STEP) production from hatchery smolt rearing sites only.

c/ Natural and hatchery fish prior to 1990, marked fish only thereafter.

d/ Freshwater sport catch from ODFW salmon/steelhead angler catch record card information and represents only those coho greater than 24 inches total length through 1993, and those coho with a total length greater than 20 inches from 1994 on. Includes estimated mortality from hook-and-release.

e/ Preliminary.

a/ Includes boat-based and shore-based fisheries from the upstream boundary at the Tongue Point/Rocky Point line (2000), downstream to the Buoy 10 line including Clatsop Spit and the South Jetty of the Columbia River. Youngs Bay bubble closure in effect August 1 through September 15. Fishery opened August 1 for Chinook and marked coho with a two fish daily-bag-limit. Chinook were restricted to marked only through September 4 and Chinook retention was closed from September 5-7. All angling was closed August 21-23 and August 28-29. The daily-bag-limit increased to three fish on September 5 through the end of the year but only one Chinook when retention allowed.

b/ Includes adults and jacks as determined by CWT analysis.

a/ A spawner escapement methodology study based on SRS had been in effect from 1990 to 1997 in which coho salmon population estimates have been made for Oregon coastal river systems from the Sixes River and north. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used. Spawner population estimates include an adjustment for observation error.

b/ Estimate based on 899 miles of spawner habitat within Nehalem, Tillamook, and Nestucca Rivers and other direct ocean tributaries from Necanicum River through Neskowin Creek.

c/ Estimate based on 1,163 miles of spawner habitat within Siletz, Yaquina, Alsea, and Siuslaw Rivers and other direct ocean tributaries from the Salmon through Siuslaw Rivers.

d/ Estimate based on 1,622 miles of spawner habitat within Umpqua, Coos, and Coquille Rivers. Also includes spawners using tributaries to Siltcoos, Tahkenitch, and Tenmile Lakes.

e/ Estimate based on a mark-recapture methodology and 410 miles of spawner habitat within the Rogue River.

f/ Preliminary.

CHAPTER IV – SOCIOECONOMIC ASSESSMENT

4.1 *Socioeconomic Assessment Summary of 2022 Ocean Salmon Fisheries*

Total 2023 exvessel value of the Council-managed non-Indian troll commercial salmon fishery was \$3.8 million. Due to closure of the commercial fishery in California, this was 84 percent below the prior year's total of \$22.9 million, 85 percent below the 2021 level of \$25.3 million, 83 percent below the 2018-2022 average of \$21.7 million, and the lowest since the \$2.1 million harvested in 2009 (including pink salmon, all dollar values adjusted for inflation). The coastwide average exvessel price for Chinook was \$8.89 per pound, 12 percent above the prior year's average of \$7.92, three percent below the 2021 average of \$9.17 and slightly above the 2018-2022 average of \$8.82 (all dollar values adjusted for inflation). Chinook contributed 94 percent of total coastwide exvessel value of non-Indian commercial troll salmon landed in 2023. Approximately \$219,700 exvessel value of coho were landed in the ocean commercial troll fishery in 2023, 14 percent below \$256,000 landed the prior year but nearly double the 2018-2022 average value of \$110,800 in inflation-adjusted terms. The coastwide average exvessel price for coho in 2023 was \$2.97, three percent below the prior year's value of \$3.06, and 32 percent below the 2021 value of \$4.38 which was the highest since \$5.06 in 1988 (all dollar values adjusted for inflation).

The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2023 was 143,300. Due to closure of the recreational fishery in California, this represents a reduction of 46 percent from 264,600 taken the prior year, 42 percent below the 248,100 trips in 2021, 37 percent below the 2018-2022 average of 227,100, and the lowest since 67,200 trips taken in 2008.

Total West Coast income impacts associated with commercial and recreational ocean salmon fisheries in 2023 for Washington, Oregon, and California combined were an estimated \$23.5 million, 71 percent below the prior year's total of \$81.5 million, 72 percent below the 2021 total of \$82.9 million, 68 percent below the 2018-2022 average of \$73.8 million, and the lowest since \$22.9 million in 2009 (all dollar values adjusted for inflation).¹

In 2023, the treaty Indian ocean troll fishery harvested approximately 31,400 Chinook (273,600 pounds) and 30,000 coho (145,200 pounds) compared with 36,600 Chinook (279,300 pounds) and 36,200 coho (169,900 pounds) last year, 8,300 Chinook (67,700 pounds) and 26,400 coho (134,400 pounds) in 2021, and the 2018-2022 average of 18,400 Chinook (151,500 pounds) and 28,800 coho (148,800 pounds). In addition to the commercial Indian fisheries, fish are taken in Indian fisheries each year for ceremonial and subsistence purposes.

¹A change in methodology from Fisheries Economic Assessment Model (FEAM)-based to IO-PAC-based income impact multipliers means that comparisons of annual income impacts for years prior to 2010 with later years are not meaningful. Consequently, any comparisons of income impacts in this document are generally confined to describing trends appearing since 2009, during which period the IO-PAC-based models and multipliers were applied. See Appendix E of the [Review of 2014 Ocean Salmon Fisheries](#) for a more detailed explanation of the change in income impact modeling methodology.

4.2 Allocation of the Salmon Resource

Salmon management by the Council involves numerous allocation issues including:

- Determining the number of salmon available for ocean harvest after considering expected abundances, harvests by inside fisheries, and spawning escapement goals.
- Allocating harvest among broad management areas and among port areas within the management areas.
- Allocating harvest between Indian and non-Indian harvesters.
- Allocating the non-Indian portion between commercial and recreational harvesters.

The number of salmon available for harvest in Council management areas depends, in part, on harvest in Canada and Alaska. Allocation of harvest between the West Coast, Canada, and Alaska is determined within the constraints of the PST.

In general, the recreational fishery has tended to have a somewhat less volatile harvest level than the commercial fishery (in both absolute and relative terms) (Figures IV-1 and IV-2). Most of the annual variation in available ocean harvest is usually taken up in the commercial fishery. However, both commercial and recreational fisheries have suffered substantial declines relative to harvest levels of the 1980s, the effects of which are amplified within specific geographic areas.

Decisions on allowable harvests for a particular stock often have implicit allocation effects on the geographic distribution of salmon harvest. Seasons may be more restrictive along a particular area of the coast to protect a depressed stock that is encountered at a relatively higher rate in that area. The geographic distribution of harvest opportunity along the coast involves balancing the often-conflicting objectives of maximizing ocean harvest and distributing the responsibility for resource conservation. A brief outline of the regulatory objectives that shaped the 2023 season is provided in Chapter I, and an assessment of success in meeting the objectives is provided in Chapters II and III for Chinook and coho, respectively.

4.3 Commercial Salmon Fisheries

4.3.1 West Coast Non-Indian Commercial Ocean Fishery

In-season Price Trends

Monthly average exvessel price data provide information on price trends over the season (Table IV-1). The coastwide weighted-average exvessel prices per dressed pound for salmon caught in the 2023 ocean commercial troll fishery were \$8.89 for Chinook and \$2.97 for coho. Weighted-average Chinook prices in Oregon were \$9.12 for the season and highest in May, August and November at \$11.27, \$9.95, and \$9.59 per pound, respectively. Weighted-average Chinook prices in Washington were \$8.87 for the season, and highest in May and June at \$11.01 and \$9.25 per pound, respectively. The lowest weighted-average Chinook exvessel prices in Oregon were recorded in July (\$8.07) and in Washington in September (\$7.29). The commercial salmon fishery was closed in California. (Tables IV-3 and IV-4).

Annual Trends (Seasons, Value, Prices, and Pounds)

Average Chinook and coho troll exvessel prices and value by state and species, compiled from fish receiving tickets and expressed both in nominal and inflation-adjusted terms, are presented in

Tables IV-2, IV-3, and IV-4. Data on pink salmon are shown in Table IV-5. The gross domestic product implicit price deflator, developed by the Bureau of Economic Analysis, was used to adjust nominal dollar values for inflation (Appendix D, Table D-22). Landing weights by state and port for Chinook and coho are presented in Tables IV-6, IV-7, and IV-8. These tables and the following discussion focus on the non-Indian commercial troll fishery in Council management areas and associated state territorial ocean-area waters.

Total 2023 exvessel value of the Council-managed non-Indian troll commercial salmon fishery was \$3.8 million. Due to closure of the commercial fishery in California, this was 84 percent below the prior year's total of \$22.9 million, 85 percent below the 2021 level of \$25.3 million, 83 percent below the 2018-2022 average of \$21.7 million, and the lowest since the \$2.1 million harvested in 2009 (including pink salmon, all dollar values adjusted for inflation). Chinook contributed 94 percent of total coastwide exvessel value of non-Indian commercial troll salmon landed in 2023. Approximately \$219,700 exvessel value of coho were landed in the ocean commercial troll fishery in 2023, 14 percent below \$256,000 landed the prior year, but 49 percent above the \$147,600 landed in 2021 and nearly double the 2018-2022 average value of \$110,800 in inflation-adjusted terms. (all values adjusted for inflation).

For the first time since 2009, no commercial salmon were landed in California in 2023.

The 2023 exvessel value of the Oregon non-Indian commercial troll harvest (\$0.4 million) was 88 percent below the prior year's level of \$3.3 million, 83 percent below the \$2.5 million recorded in 2021, 84 percent below the 2018-2022 average of \$2.6 million, and the lowest total harvest value on record for the data series, which begins in 1971. All values are adjusted for inflation.

The \$3.4 million exvessel value of Washington's 2023 non-Indian troll harvest was 76 percent above the prior year's value of \$1.9 million, 48 percent above the 2021 value of \$2.3 million, 57 percent above the 2018-2022 average of \$2.1 million, but 70 percent below the 1979-1990 average of \$11.3 million. All values are adjusted for inflation.

The 2023 average West Coast ocean harvest Chinook price of \$8.89 per pound was 12 percent above the prior year's value of \$7.92 per pound, three percent below the 2021 value of \$9.17 per pound, and slightly above the 2018-2022 average of \$8.82 per pound. During 2023, Chinook exvessel prices in Oregon and Washington averaged \$9.12 and \$8.87 per pound, respectively, slightly above the prior year's inflation-adjusted state-level average for Oregon, and 15 percent above the prior year's inflation-adjusted state-level average for Washington. Season-average coho exvessel prices were \$3.43 per pound in Oregon and \$2.70 per pound in Washington, nine percent above the prior year's inflation-adjusted state-level average for Oregon but 11 percent below the prior year's inflation-adjusted state-level average for Washington. In both states, average exvessel prices for coho were highest in September. The commercial salmon fishery was closed in California. All values are adjusted for inflation.

In terms of numbers of fish, the 2023 coastwide non-Indian commercial troll harvest of 39,200 Chinook was 85 percent below the prior year's level of 267,700, 84 percent below the 2021 harvest of 239,100, 83 percent below the 2018-2022 five-year average of 231,900 fish, and the lowest since 13,500 Chinook were harvested in 2009 (Figure IV-1). The 2023 coastwide average weight

per non-Indian commercial troll harvested Chinook of 10.4 pounds per fish was two percent below the prior year's average of 10.7 pounds, nine percent below the 2021 average weight of 11.5 pounds, and five percent below the previous five-year (2018-2022) average of 11.0 pounds per fish (Appendix D Tables D-1, D-2, and D-3).

The coastwide non-Indian commercial troll fishery landed 12,600 coho in 2023, 16 percent fewer than the number landed the prior year, but more than double the 5,600 coho landed in 2021 and the recent 2018-2022 average of 5,700 coho. The 2023 coastwide average weight per non-Indian commercial troll harvested coho of 6.0 pounds per fish was seven percent above the prior year's average of 5.6 pounds, and approximately equal to the 2021 and the previous five-year (2018-2022) average weight of 6 pounds per fish (Appendix D Tables D-1, D-2, and D-3).

On average over the prior four years (2019-2022), from 47 to 64 percent of annual coastwide non-Indian commercial troll Chinook landings (by weight) were landed in ports in the San Francisco management area, and 79 to 85 percent of coastwide landings were made in the three, combined southern-most port areas—Fort Bragg, San Francisco, and Monterey. Most of the between-port fluctuation during that 2019-2022 period was among those three port areas. Prior to 2019, the average annual share landed in San Francisco during 2011 to 2018 was approximately 25 percent, with an average of approximately 51 percent of coastwide landings made in the three, combined southern-most port areas. However, since the commercial salmon fishery was closed in California in 2023, the West Coast port area with the highest landings share was Westport with 71 percent of coastwide Chinook landings by weight. Port areas with the next highest landings shares were also all in Washington: Ilwaco (eight percent), Neah Bay (seven percent) and La Push (six percent). Oregon port areas registering the highest coastwide landings shares by weight were well down the list: Astoria and Brookings (approximately four percent each).

In 2023, ports north of Cape Falcon (from the Astoria port area north to Neah Bay) accounted for approximately 96 percent of aggregate annual coastwide Chinook harvest by weight, the highest share on record going back to 2000. By way of historical comparison, ports north of Cape Falcon accounted for between approximately seven percent and nine percent of aggregate coastwide Chinook harvest from 2019-2022, and between approximately nine percent and 32 percent during 2011-2018. In 2008 and 2009, the last period during which there was no commercial ocean salmon harvest in California, ports north of Cape Falcon accounted for 84 percent and 95 percent, respectively, of annual coastwide Chinook landings by weight.

Compared with the prior year, non-Indian commercial troll Chinook harvest by weight in 2023 was down 86 percent coastwide to 408,800 pounds, including being down 100 percent in California due to closure, down by 90 percent in Oregon to 35,100 pounds, but up in Washington by 67 percent to 373,700 pounds. Total non-Indian commercial troll coho harvest in 2023 was approximately 76,000 pounds, 11 percent below coastwide coho landings by weight the prior year (85,000 pounds), but more than double 2021 coho landings of 33,800 pounds. Compared with the prior year, 2023 coho harvests by weight were 47 percent higher in Oregon to 27,400 pounds, but 27 percent below last year's harvest in Washington of 48,700 pounds. In 2023 approximately 64 percent of the non-Indian commercial troll coho harvest by weight was landed in Washington,

compared with approximately 78 percent the prior year and 62 percent in 2021. The remainder of coho landings were in Oregon.²

4.3.1.1 *Ocean Commercial Salmon Harvesters*

Based on preliminary Pacific Coast Fisheries Information Network (PacFIN) data extracted January 22, 2024, a total of 173 harvesting vessels participated in the West Coast non-Indian commercial troll salmon fishery in 2023. This is 69 percent fewer than participated in the prior year (560), and the fewest participating vessels on record going back to 2000. Note that these coastwide vessel counts are lower than totals derived by summing values in the three state-level tables (Appendix D, Tables D-4, D-5, and D-6) due to a degree of incompleteness at the time PacFIN data were extracted for this report, and because vessels landing in more than one state are counted more than once when summing the three state-level tables.

In 2023, no commercial vessels made salmon landings in California due to closure of the commercial fishery, compared with 464 vessels participating in the California fishery the prior year. In Oregon, the active fleet decreased by half from 180 vessels the prior year. The 90 vessels participating in 2023 was lowest number on record going back to 1974. The preliminary number of vessels active in Washington in 2023 was 93, 14 more than participated the prior year, 17 more than in 2021, and 33 more than participated in 2020 (Note: The 60 vessels active in the Washington fishery in 2020 was the lowest number of vessels landing salmon in Washington since 2001).

Coastwide, the number of limited entry salmon permits issued by the three states in 2023 (1,955) decreased by 56 from the prior year (2,011). This is the lowest number of coastwide salmon permits on record. Declines over the prior year (which had previously been the lowest number) occurred in California (-55) and Washington (-1), while the number of salmon permits in Oregon remained the same as the prior year.

Landings were made on only nine percent of all permits coastwide in 2023, lower than the shares last year and in 2021 (36 percent), and the lowest share since nine percent 2008. Note that the prior years when the salmon fishery was closed in California (2008 and 2009) along with 2023 are the three years with lowest recorded rates of participation by permitted vessels on records going back to 1982, i.e., 2008 (nine percent), 2009 (13 percent) and 2023 (nine percent). From 1982 to 1993, an average of 5,193 of 7,942 total permits (65 percent) harvested on an annual basis. Harvest opportunity began declining substantially after that time, and some permits were subsequently removed in a buyback program. See Appendix D, tables D-4, D-5, and D-6 for details.

In 2023, coastwide average inflation-adjusted exvessel value of salmon landings per active vessel decreased by 35 percent compared with the prior year to \$20,600 per vessel. Compared to the prior year, average state-level exvessel revenue per vessel in 2023 was lower by 100 percent in California due to closure of the commercial fishery, and by 75 percent (to \$4,600) in Oregon, but higher than the prior year by 49 percent (to \$36,100) in Washington. Note that some caution needs to be exercised in interpreting average exvessel revenue per vessel. The averages may be influenced as much by disproportionate changes in the number of relatively small or large

² Commercial harvest of coho has been prohibited in California since 1992.

harvesters participating from one year to the next as by any real change in the average revenues of vessels that have consistently participated in the fishery.

Additional detailed historical information on landings by vessel size, percentages of the fleet responsible for most of the harvest, and harvest by residence of participants in each state's fishery is included in Appendix D.

4.3.2 West Coast Treaty Indian Commercial Ocean Fishery

Treaty Indian commercial fisheries in ocean areas off Washington operate under regulations established by the Council. While some of the treaty Indian harvest is for ceremonial and subsistence purposes, the vast majority of the catch is sold commercially. Commercial treaty Indian fisheries provide food to consumers and generate income in local and state economies through expenditures related to harvesting, processing and marketing of the catch plus indirect spending effects. In 2023, the treaty Indian ocean troll fishery harvested approximately 31,400 Chinook (273,600 pounds) and 30,000 coho (145,200 pounds) compared with 36,600 Chinook (279,300 pounds) and 36,200 coho (169,900 pounds) last year, 8,300 Chinook (67,700 pounds) and 26,400 coho (134,400 pounds) in 2021, and 3,100 Chinook (35,600 pounds) and 14,400 coho (89,200 pounds) in 2020. Chinook landings by weight in 2023 were two percent less than the prior year's harvest but four times the landed weight in 2021. In terms of weight, coho landings in 2023 were 15 percent below the prior year and two percent below the recent five-year (2018-2022) average treaty Indian coho harvest of 148,800 pounds. Recent inflation-adjusted total exvessel values in treaty Indian ocean troll fishery were approximately \$1.7 million in 2023, \$1.6 million in 2022 and \$0.8 million in 2021. (Note that values for 2023 may be incomplete.)³

4.3.3 Columbia River Commercial Fishery

Harvest in the ocean salmon fisheries affects the number of fish available for harvest in inside and in-river treaty Indian and non-Indian fisheries. Table IV-9 shows the exvessel value of treaty Indian and non-Indian commercial harvest of Chinook, coho, and chum salmon in the Columbia River. All prices and dollar values in the table and the following discussion are reported in inflation-adjusted dollars. Exvessel prices for in-river commercial salmon landings vary considerably with species (Chinook, coho or chum), race (e.g., spring versus fall Chinook), and stock (e.g., tules versus brights). Spring Chinook generally bring the highest prices, and tule fall Chinook and chum the lowest prices.

Total exvessel value of combined treaty Indian and non-Indian commercial salmon harvested in the Columbia River in 2023 was approximately \$7.0 million. This was nine percent below the prior year's level of \$7.7 million, 12 percent below the 2021 level of \$8.0 million, but five percent above the recent five-year (2018-2022) average of \$6.7 million (all values adjusted for inflation). Of these amounts, the total exvessel value of salmon harvested in the non-Indian portion of the Columbia River commercial fishery in 2023 was \$3.7 million, six percent above the prior year's level of \$3.5 million, six percent below the \$3.9 million harvested in 2021, and 30 percent above the recent five-year (2018-2022) average of \$2.8 million (all values adjusted for inflation) (Table IV-9).

³ Numbers of fish are from Table A-15, average weights are from Table D-3, and revenue values are from PacFIN data extracted January 22, 2024.

4.3.4 Puget Sound and Washington Coastal Inside Fisheries

Information on 2023 Puget Sound and Washington coastal inside fisheries below is preliminary. All dollar values reported below are adjusted for inflation. In previous years, substantial revisions to these numbers have occurred following publication of this review. Based on PacFIN data (as of January 22, 2024) the preliminary exvessel value of all salmon species taken in the commercial non-Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) in 2023 was approximately \$1.2 million. This was 85 percent below the prior year's value of \$7.7 million, 57 percent below the \$2.7 million harvested in 2021, and 77 percent below the 2018-2022 average of \$5.0 million (all values adjusted for inflation). Of total Puget Sound and Washington coastal inside fisheries non-Indian commercial landings in 2023, \$0.8 million were Chinook and coho, compared with \$1.4 million in 2022 and \$1 million in 2021. The 1981-2022 inflation-adjusted average annual exvessel value from Puget Sound and Washington coastal inside non-Indian commercial salmon landings is \$18.6 million, of which approximately \$4.4 million on average were landings of Chinook and coho. It is interesting to note that all years with recorded values higher than those averages occurred prior to 1995.

Although not yet complete, the preliminary exvessel value reported by PacFIN (as of January 22, 2024) of all salmon species taken in Puget Sound and Washington coastal inside commercial treaty Indian fisheries (excluding the Columbia River) during 2023 was approximately \$4.0 million of which \$3.6 million were Chinook and coho. The revised inflation-adjusted total exvessel value for the 2022 commercial treaty Indian harvest in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) is \$12.6 million for all salmon species, of which \$4.4 million were Chinook and coho⁴. The 1981-2022 inflation-adjusted average annual exvessel value of commercial treaty Indian salmon fisheries in Puget Sound and Washington coastal inside areas is approximately \$25 million, of which on average \$9.9 million were Chinook and coho.

4.3.5 Klamath River Tribal Fisheries

Commercial sales from the Yurok and Hoopa Valley tribal spring and fall gillnet fisheries on the Klamath and Trinity rivers occur periodically. The 1,900 fall Chinook harvested commercially in 2019 were the first since 2015 when 17,100 fall Chinook were harvested commercially (Appendix B, Table B-5). Sales from the spring Chinook fishery occurred in 1989, 1996, 2000-2004, and 2007-2013. The average annual commercial catch of spring Chinook during years that the fishery was open was 1,100 fish. Sales from the fall Chinook fishery occurred in 1987-1989, 1996, 1999-2004, 2007-2015, and 2019. The average annual commercial catch of fall Chinook during years that the fishery was open was 21,200 fish, the vast majority of which were taken in the estuary.

Records are not available for the weight and value of harvests for years since 1997, after which each Indian fisher began marketing their fish independently. Estimated exvessel values associated with the 1989 and 1996 Klamath River commercial fisheries were last provided in the *Review of 2021 Ocean Salmon Fisheries*.

4.3.5.1 Ceremonial and Subsistence Salmon Fisheries

In addition to the commercial Indian fisheries discussed above, fish are taken in Indian fisheries each year for ceremonial and subsistence purposes. Estimates of the number of salmon used for

⁴ Based on PacFIN data extracted January 22, 2024.

ceremonial and subsistence purposes are documented in Appendix B, Table B-5. Discussion of the importance of ceremonial and subsistence fish to Indian communities is presented in Appendix B to Amendment 14 of the salmon FMP.

4.4 Recreational Salmon Fisheries

4.4.1 West Coast Recreational Ocean Fishery

The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2023 was 143,300, a 46 percent decrease from the prior year's 264,600 trips, a 42 percent decrease from the 248,100 trips taken in 2021, 37 percent below the 2018-2022 average of 227,100 trips, and the lowest total since 67,200 angler trips were recorded in 2008. Compared with the prior year, preliminary estimates of the number of trips taken in 2023 decreased by three percent in Washington, by 21 percent in Oregon and by 100 percent in California. There were no angler trips in California due to the closure of the recreational fishery. Note that Washington effort estimates shown in Tables IV-10 and IV-13 may differ from those in Table I-4 and Appendix A Table A-17 because the former exclude bank fishers on the Columbia River north jetty.

Recreational ocean area salmon fishing takes place primarily in two modes: (1) anglers fishing from privately owned pleasure craft, and (2) anglers employing the services of charter vessels. In general, success rates on charter vessels tend to be higher than success rates on private vessels. Small amounts of shore-based effort directed toward ocean area salmon also occur from jetties and piers. The coastwide proportion of angler trips taken on charter vessels in 2023 (13 percent) was approximately half the prior year's and 2021 ratios (25 percent and 24 percent, respectively), and also just less than half the 2018-2022 average of 27 percent. Underlying the change in the proportion of coastwide charter trips in 2023 relative to the prior year were a decrease of two percent in the proportion of charter trips in Oregon, a decrease of 21 percent in Washington, and especially the closure of the California recreational fishery which typically has the highest proportion of charter trips among the three states. Figure IV-5 and Tables IV-10, IV-11, IV-12, and IV-13 display recreational effort and catch statistics by port area and mode for each state.

4.4.1.1 California

The number of ocean recreational salmon trips in California in 2023 was zero due to closure of the recreational fishery. This compares with the 98,900 trips last year, 88,600 in 2021, and the recent 2018-2022 average of 89,500 angler trips per year. (Table IV-10, Table IV-11, and Figure IV-5).

4.4.1.2 Oregon

The 76,400 ocean recreational salmon trips in Oregon in 2023 were 21 percent below the 96,400 trips in 2022, 23 percent below the 98,700 trips in 2021, and seven percent below the recent five-year (2018-2022) average of 82,000 angler trips per year (Tables IV-10 and IV-12). Compared with the prior year, regional effort was down in all areas: by five percent in Astoria, 25 percent in Tillamook, six percent in Newport, 41 percent in Coos Bay and 89 percent in Brookings.

From 1979 to 1993, on average coho accounted for 87 percent of the Oregon annual recreational ocean salmon catch. From 1994 through 1998, the lack of opportunity to retain coho south of Cape Falcon generally resulted in much lower angler success rates (0.37 fish per angler day compared to an average of 0.99 for 1979 through 1993). Salmon retention rates increased with the

opportunity to retain coho in mark-selective fisheries south of Cape Falcon beginning in 1999. From 1999 through 2022, retention rates have averaged 0.68 salmon per angler-day. The 2023 Oregon salmon retention rate of 0.91 was approximately equal to the prior year's rate, 12 percent below the 2021 value of 1.03, and 22 percent above the recent five-year (2018-2022) average retention rate of 0.74 salmon per angler-day. In 2023, coho contributed 91 percent of total Oregon recreational ocean salmon catch, slightly above the prior year's 90 percent share, slightly below the 2021 share of 92 percent, and five percent above the recent five-year (2018-2022) average 86 percent share.

The charter industry's share of Oregon recreational salmon trips in 2023 was five percent, slightly below the prior year's share, 39 percent below the share in 2021, and 28 percent below the recent five-year (2018-2022) annual average of seven percent (Table IV-10, Table IV-12, and Figure IV-5).

4.4.1.3 Washington

In 2023, 66,900 ocean angler salmon trips were taken on vessels on the Washington coast, a decrease of three percent from the 69,300 trips the prior year, 10 percent above the 60,900 trips taken in 2021, and 21 percent above the recent five-year (2018-2022) average of 55,500 angler trips per year. Effort was 51 percent higher than the prior year in Neah Bay, but lower by one percent in La Push and Westport, and by 26 percent in Ilwaco. The angler success rate in Washington (in terms of retained fish per angler-trip) was 1.06 in 2023, 11 percent below the prior year, slightly below the rate in 2021, and three percent above the recent five-year (2018-2022) average success rate of 1.03 salmon per angler-trip. Approximately 22 percent of Washington angler trips in 2023 were taken on charter vessels, a decrease of 21 percent from proportion the prior year, 19 percent below the proportion in 2021, and 22 percent below the recent five-year (2018-2022) average charter trip share of 28 percent (Table IV-10, Table IV-13, and Figure IV-5). Note that these figures do not include angler effort that occurs from the ocean side of the Columbia River jetty, or in the state managed Area 4B add-on fishery (if open).

4.4.2 North of Cape Falcon Non-Salmon Recreational Fisheries

To offset the impact of reduced ocean recreational salmon trips on coastal communities, beginning in 1985 partial-week closures were instituted in the ocean recreational salmon fishery over the entire north of Cape Falcon area in hopes of increasing angler participation in non-salmon recreational fishing (e.g., bottomfish) and extending the overall length of the salmon season. Beginning in 1996, Sunday through Thursday salmon openings were generally used in the two southern areas (Westport and Columbia River), and seven-day per week seasons were common in the two northern areas (Neah Bay and La Push). Starting in 1999, seven-day per week openings began to be used in the later part of the summer in the Columbia River area and, initially to a lesser extent, in Westport. In the same year, partial week openings were instituted for much of the season in both northern areas. Since then, seven-day per week openings have been increasingly used in the Westport and Columbia River areas.

In 2023, there were approximately 55,400 total recreational bottomfish trips north of Cape Falcon (including trips taken inside Buoy-10 and from Columbia River jetties), slightly more than the 55,300 trips taken the prior year, 40 percent more than the 39,600 trips taken in 2021, and 11 percent above the recent five-year (2018-2022) annual average of 50,100 angler trips. Compared

with the prior year, total bottomfish effort decreased in Westport and in the Columbia River–Buoy 10 area, but increased in La Push and in Neah Bay–Area 4B (Table IV-14).

4.4.3 Buoy 10 and Area 4B Add-On Fisheries

Salmon anglers fishing from private and charter boats originating from Oregon and Washington ports made a total of approximately 76,200 trips in the Buoy 10 fishery in 2023. This effort level is two percent less than the 77,900 trips taken the prior year, 23 percent less than the 98,900 trips recorded in 2021, and slightly below the 2018-2022 average of 76,300 angler-trips. The success/retention rate for anglers fishing from boats in the Buoy 10 fishery in 2023 was 0.36 salmon per angler trip, 22 percent below the 0.46 success rate the prior year, 35 percent below the 0.56 average success rate in 2021, and 12 percent below the average annual success rate of 0.41 salmon per angler trip in the Buoy 10 fishery during 2018-2022 (Table IV-15).

There were numerous other inside recreational salmon fishing opportunities in coastal streams and estuaries and Puget Sound that are not enumerated in this chapter of the Review. See Appendix B for estimates of harvest in some of those other fisheries.

4.5 Salmon Fishery Income Impacts and Community Dependence

Coastal community income impacts provide information on the effects of fluctuations in annual salmon harvest on local economies and small businesses. Income impacts are based on commercial landings and recreational fishing days (angler-trips) and were estimated using the IO-PAC fisheries economic impact model. Prior to the *Review of 2014 Ocean Salmon Fisheries*, income impacts were estimated using the Fisheries Economic Assessment Model (FEAM). When IO-PAC was adopted, it was applied retrospectively back to 2010. The change in methodology means that income impacts estimated using IO-PAC for years beginning with 2010 are not completely comparable with historical values for years prior to 2010, which were estimated using FEAM. Consequently, comparisons of income impacts in this document are generally confined to describing trends occurring beginning with the 2010 salmon fishery, during which period the IO-PAC-based models and multipliers have been exclusively and consistently applied. Appendix E to the *Review of 2014 Ocean Salmon Fisheries* contains a more detailed explanation of the change in income modeling methodology, including comparisons of IO-PAC with FEAM-based estimates for overlapping years.

Estimated state and local community income impacts of commercial and recreational ocean salmon fisheries and selected state-managed fisheries are shown in Tables IV-16 through IV-20. Income impacts measures are most relevant to those dependent on an income stream from the fishery, including individuals, businesses, and state and local governments. These impacts represent estimates of total personal income associated with harvesting and processing activities in commercial salmon fisheries and trip-related expenditures made by recreational salmon anglers, expressed at the local community (county) and state levels.⁵ The income impacts reported in this chapter consist of the sum of personal income earned by those directly participating in the fishery (e.g. vessel owners, crew members, processing workers, recreational charter operators), income

⁵ Because income impact refers to income “associated with” a given level of economic activity, the term impact in this context should not be confused with the term impact as frequently employed in policy analyses such as those required by the National Environmental Policy Act. Such policy analyses refer to impact as the effect (the difference) which results from taking an action (as compared to not taking the action). Income impacts are one of a number of different but related measures of total economic activity (e.g., income impacts, gross receipts, total jobs, etc.).

indirectly associated with the fishery that is earned by those providing inputs to harvesting, processing and recreational sectors (e.g., fuel, gear, packaging, bait, and ice suppliers; and hotel, restaurant, and campground operators), and income earned by those whose goods and services are purchased when direct and indirect income is re-spent in the community (e.g., grocery store owners and employees, local manufacturers, auto mechanics, restaurants, health care, and legal professionals). This latter category of impacts is sometimes called ‘induced income.’

When the commercial or recreational fishery is reduced or absent, the net impact on local communities will depend on the economic base of the community and on how people respond to the reduced fishery. For example, if a recreational angler is unable to make a coastal salmon trip and instead travels inland to fish in a river or at a mountain lake, then the impact associated with the lost salmon trip represents a net loss to the members of the coastal community. On the other hand, if the recreational fisher instead took part in another form of recreational activity in the same coastal community, then there may be little or no net loss to the community as a whole. However, at least some of those whose livelihood involves the salmon fishery would experience an income reduction, as if the angler’s money had been spent elsewhere (or not at all). Similarly, for those involved in the commercial fishery, whether or not reduced income impacts associated with a reduction in salmon harvest represents a net loss to the community depends on the degree to which opportunities exist in the community to engage in some other economic activity to compensate for the loss of income from commercial salmon harvesting and processing.

Income impacts are presented at the local and state levels. Estimates of changes in income impacts may represent a disruption due to redistribution of activity within the local economy or a net loss from activity leaving the local economy. At higher levels, such as for the state, it is more likely that an estimate of change represents a disruption due to redistribution of activity within the economy rather than a net loss to the greater state economy.

Income impacts are estimated based on several data components, including reported commercial fishery landings and exvessel prices by port or area, an inventory of local harvesters and processors, estimates of operational expenditures by harvesters and processors, estimates of the number of angler trips and expenditure patterns of recreational anglers, and local and state-level total income impact coefficients generated using IMPLAN[®] models constructed for each port or area. Commercial ocean harvests that are landed outside of coastal areas (e.g., ocean troll caught salmon landed in Puget Sound ports) are not included in estimates of coastal community impacts but may be included in the overall state-level impacts.

The income impacts presented below are estimates of annual trends and are intended to indicate the possible redirection of economic activity between fishing-dependent and non-fishing sectors. As such, they represent likely upper bounds on the local community and state-level income impacts generated by West Coast salmon fisheries. All income impact estimates reported in this document are in terms of inflation-adjusted 2023 dollars.

4.5.1 West Coast Ocean Fishery Commercial and Recreational Income Impacts

Total state-level income impacts associated with all combined West Coast non-Indian commercial ocean troll and recreational salmon fisheries in 2023 (note that there were no commercial or recreational salmon fisheries in California) were \$23.5 million, 71 percent below the prior year’s

level of \$81.5 million, 72 percent below the 2021 level of \$82.9 million, and 68 percent below the 2018-2022 annual average of \$73.8 million (all values adjusted for inflation) (Tables IV-16, IV-17, and IV-18). Total West Coast income impacts associated with the 2023 West Coast non-Indian commercial ocean troll fishery were \$5.5 million, 86 percent below the prior year's estimate of \$40.6 million), 88 percent below the 2021 level of \$45.2 million, and 85 percent below the 2018-2022 annual average of \$37.9 million (all values adjusted for inflation).⁶ Income impacts generated by combined 2023 West Coast ocean recreational salmon fisheries totaled \$18.0 million, 56 percent below the prior year's level of \$40.9 million, 52 percent below the 2021 level of \$37.7 million, and 50 percent below the 2018-2022 average of \$35.9 million (all values adjusted for inflation). Note that these aggregated coastwide values may mask the underlying effects in individual states and communities. Tables IV-16, IV-17, and IV-18 provide greater detail on the income impacts estimated for individual port areas in each of the three West Coast states.

4.5.2 Selected Inside Fisheries

Columbia River Commercial Fisheries

Historically the non-Indian and treaty Indian Columbia River commercial salmon fisheries have generated a substantial amount of income for Oregon and Washington communities on the Columbia River. In 2023, income impacts associated with the Columbia River commercial catch (combined non-Indian and treaty Indian) were estimated at \$10.2 million, 15 percent below the prior year's value of \$11.9 million, 25 percent below the estimated \$13.6 million in 2021, and five percent below the recent five-year annual average for the 2018-2022 period of \$10.7 million (all values adjusted for inflation) (Table IV-19).

Buoy 10

Estimated local community income impacts associated with the 2023 Columbia River Buoy 10 recreational salmon fishery were \$6.1 million, eight percent below the prior year's value of \$6.7 million, 26 percent below the 2021 value of \$8.3 million, and five percent below the 2018-2022 annual average value of approximately \$6.4 million (all values adjusted for inflation) (Table IV-20).

⁶ Income impact estimates for the commercial fishery do not include postseason settlement payments fishers may have received from buyers. In certain years postseason settlements have been particularly significant in the California fishery.

a/ These exvessel values do not include the postseason settlement payments some fishers may have received from buyers, and therefore may underestimate the true payments received by fishers for their landings. Beginning circa 1999, these postseason settlements are believed to have grown for the California fishery. For 2002, the exvessel value reported here is believed to be under-reported by roughly 5 percent to 10 percent.

b/ Does not include pink salmon landings, if any.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.

b/ Does not include pink salmon landings.

c/ There was no legal coho fishery in 1988. The value used in this average for 1988 is for landings of fish caught south of Cape Falcon and seizures of illegal fish.

d/ In 1994-1996 Chinook were caught off Oregon and landed in Washington. Value information was not provided to preserve confidentiality.

e/ The port of Neah Bay was closed to public access and the port of La Push was restricted to local access only in 2020 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (36,000 pounds of Chinook, 800 pounds of coho) in Puget Sound ports authorized by the emergency rule.

f/ The port of Neah Bay was partially closed and restricted to limited local access only in 2021 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (9,100 pounds of Chinook, 1,300 pounds of coho) in Puget Sound ports authorized by the emergency rule.

a/ The major port areas listed may include smaller ports as follows: Crescent City includes only Crescent City; Eureka includes Trinidad and Humboldt Bay; Fort Bragg includes Shelter Cove, Noyo Harbor, Mendocino, and Albion; San Francisco includes Point Arena, Bodega Bay, Richmond, Bolinas, Sausalito, Berkeley, Alameda, and Half Moon Bay; Monterey includes Santa Cruz, Moss Landing, Morro Bay, Avila, and all ports south of Pt. Conception.

b/ Prior to 2005 landings were based on catch area, not port of landing.

c/ Less than 500 pounds.

d/ Landings in 2021 and 2022 in Crescent City and Eureka port area are fish caught in the Fort Bragg and San Francisco areas and landed in Crescent City and Eureka ports.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.

b/ The major port areas listed may include smaller ports as follows: Neah Bay includes only Neah Bay; La Push also includes Kalaloch; Westport also includes Aberdeen, Bay City, Copalis Beach, Hoquiam, Moclips, Taholah, Bay Center, Grayland Beach, Raymond, South Bend, and Tokeland; Ilwaco also includes Long Beach, Nahcotta, Naselle, and all Columbia River Ports; Puget Sound includes all Puget Sound ports east of Neah Bay.

c/ State total includes landings where port of landing is not specified.

d/ There was no ocean commercial fishery for Chinook north of Cape Falcon in 1994-1996; however, Chinook were caught off Oregon and landed in Washington.

e/ Less than 500 pounds.

f/ The port of Neah Bay was closed to public access and the port of La Push was restricted to local access only in 2020 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (36,000 pounds of Chinook, 800 pounds of coho) in Puget Sound ports authorized by the emergency rule.

g/ The port of Neah Bay was partially closed and restricted to limited local access only in 2021 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (9,100 pounds of Chinook, 1,300 pounds of coho) in Puget Sound ports authorized by the emergency rule.

TABLE IV-9. Landings, exvessel values and average prices (inflation adjusted, 2023 dollars) of inriver commercial harvest of Columbia River salmon.^{a/} (Page 3 of 3)

a/ Excluding pink, sockeye, and steelhead.

b/ Mainstem below Bonneville and Select Areas (Youngs Bay, Tongue Point, Blind Slough, and Deep River). Gear type may also include purse seine, beach seine and tanglenet gear after 2013.

c/ Treaty Indian landings and values do not include direct sales to consumers ('Over-the-bank' sales).

d/ For Washington, this column includes fall brights, tules, and jacks. Price changes may reflect a change in the mix of brights, tules, and jacks rather than annual price changes.

e/ Sale and possession of chum salmon prohibited beginning October 2013 in Columbia R. commercial fisheries. Reported sales are likely mis-identified fish at time of landing.

f/ Gillnet exvessel salmon prices are recorded in round weight and therefore are not strictly comparable to exvessel troll prices.

g/ Less than \$500 or 500 pounds.

h/ Preliminary. (All Washington values in this table are based on preliminary information available when each year's Salmon Review is drafted.)

i/ Washington prices for years prior to 2000 are based on a combination of Washington and Oregon value information.

j/ Treaty Indian values are primarily mainstem Columbia gillnet, but also include Klickitat dipnet, Drano Lake (Little White Salmon River mouth), and Priest Rapids Pool fisheries.

a/ Catch numbers may include some illegal harvest.

b/ Fewer than 50 fish.

c/ Preliminary.

d/ Estimates for California private trips do not include May and June due to restrictions on sampling caused by the COVID-19 pandemic.

e/ Salmon data from surveyed ports only. These generally include Astoria, Garibaldi, Depoe Bay, Newport, Winchester Bay, Coos Bay, and Brookings. Since 1981, Pacific City and Florence have also been included. Gold Beach data are included from 1981-1987. Astoria was not included in 1994.

f/ Numbers do not include angling from the Columbia River jetty.

g/ Numbers do not include angling from the Columbia River jetty or from the late-season state waters Area 4B fishery.

h/ Values for 1982-1985 include some inriver Columbia River fishing after closure of the ocean fishery.

i/ Neah Bay and La Push were closed to public access in 2020 and Neah Bay again in 2021 due to the COVID-19 pandemic.

2020 Values for Washington include catch and effort from 7,016 ocean salmon angler trips (276 charter and 6,740 private) from Sekiu. 2021 Values for Washington include catch and effort from 10,899 ocean salmon angler trips (345 charter and 10,554 private) from Sekiu.

a/ Does not include effort from the late-season state water Area 4B fishery, when open.

b/ Does not include effort from the Columbia River Jetty.

c/ Neah Bay and La Push were closed to public access in 2020 due to the COVID-19 pandemic. State totals include 7,016 ocean salmon angler trips (276 charter and 6,740 private) from Sekiu.

d/ Neah Bay remained closed to public access in 2021 due to the COVID-19 pandemic. 2021 Values for Washington include catch and effort from 10,899 ocean salmon angler trips (345 charter and 10,554 private) from Sekiu.

e/ Preliminary.

TABLE IV-14. Oregon and Washington recreational salmon, bottomfish, and sturgeon angler trips (thousands) by ocean port area and boat type for the area north of Cape Falcon.

a/ Fewer than 50 angler trips.

b/ Columbia River north jetty was not sampled in 2005, 2007, 2018 and 2019 due to construction limiting access; the outer jetty was not sampled in 2015 due to construction limiting access to near-beach areas.

c/ Preliminary.

d/ Oregon data is a minimum estimate, as the jetty is not sampled, and bottomfish sampling of vessels only occurs when the ocean is open for salmon.

e/ For 1996, no Oregon bottomfish trips are included.

f/ For 1996, includes tuna trips: Ilwaco - 9 charter, 14 private; Westport - 784 charter, 0 private.

g/ Annual sturgeon angler trips for the lower Columbia River from the western tip of Puget Island to mouth.

h/ Neah Bay and La Push were closed to public access in late March for the remainder of 2020 due to the COVID-19 pandemic. An additional 7,016 ocean salmon angler trips (276 charter, 6,740 private) and 9,940 ocean bottomfish angler trips (458 charter, 9,482 private) occurred from the port of Sekiu and are not included in this table.

i/ Neah Bay remained closed to public access in 2021 due to the COVID-19 pandemic. An additional 10,899 ocean salmon angler trips (345 charter and 10,554 private) and 17,367 ocean bottomfish angler trips (1,005 charter, and 16,362 private) occurred from the port of Sekiu and are not included in this table.

a/ From 2000, catch downstream of boundary line from Tongue Pt., OR to Rocky Pt., WA. Prior to 2000, only catch downstream of Astoria-Megler Br.

b/ Prior to 1987, data on charter and private anglers were combined. Total Buoy 10 catch and effort data prior to 1987 are provided in Table B-21.

c/ Preliminary.

d/ There was no Area 4B add-on fishery prior to 1989.

e/ There was no Area 4B add-on fishery opening in 1999 and 2006 as the Area 4 ocean quota was not attained.

f/ There has been no Area 4B add-on fishery planned since 2008.

a/ Estimates of income impacts are provided from output of the Fishery Economic Assessment Model (FEAM) and IOPAC. These are the income impacts associated with expenditures in the troll and/or recreational sectors. There is no differentiation between money that may be new to the area versus money that may otherwise have been expended in other sectors. Values through 1995 are based on a 1992 run of the FEAM using 1989 IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 IMPLAN data. Values from 2001 through 2009 are based on a run of the FEAM using 2000 PacFIN landings and 1998 IMPLAN data. Beginning with the 2010 data year, income impact estimates are based on the NWFSC's IOPAC model, which uses updated IMPLAN and landings data, and survey-based industry cost data. A description of the transition from FEAM-based to IOPAC-based impact multipliers and comparisons of results from the two models are found in Appendix E of the Review of 2014 Ocean Salmon Fisheries:

<http://www.pcouncil.org/salmon/stock-assessment-and-fishery-evaluation-safe-documents/review-of-2014-ocean-salmon-fisheries/>

b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.

c/ Excluding pink salmon.

d/ Less than 500 dollars.

e/ Eureka impacts are from fish caught in the Fort Bragg area fishery and landed in Eureka.

f/ Preliminary.

g/ California 2020 recreational estimates do not include private trips during May and June due to restrictions on sampling caused by the COVID-19 pandemic.

h/ Commercial landings in 2021 and 2022 in Crescent City and Eureka port areas are fish caught in the Fort Bragg and San Francisco areas but landed in Crescent City and Eureka ports.

A description of the transition from FEAM-based to IOPAC-based impact multipliers and comparisons of results from the two models are found in Appendix E of the Review of 2014 Ocean Salmon Fisheries:

<http://www.pcouncil.org/salmon/stock-assessment-and-fishery-evaluation-safe-documents/review-of-2014-ocean-salmon-fisheries/>

b/ Recreational values exclude recreational shorebased effort from the Columbia River north jetty.

c/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.

d/ Through 1993, commercial values include a very small amount of fish landed in Washington coastal areas not included in the major port groups.

e/ Excluding pink salmon.

f/ All commercial values in this table are based on preliminary information available at the start of each year's Salmon Review.

g/ The non-Indian commercial and recreational fisheries were closed north of Cape Falcon in 1994. Some commercial catch taken south of Cape Falcon was landed in the Puget Sound area.

h/ The port of Neah Bay was closed to public access and the port of La Push was restricted to local access only in 2020 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (36,000 pounds of Chinook, 800 pounds of coho) in Puget Sound ports authorized by emergency rule.

i/ The port of Neah Bay was partially closed and restricted to limited local access only in 2021 due to the COVID-19 pandemic. Vessels were allowed to land in the Puget Sound ports of Sekiu and Port Angeles by emergency rule. Totals include revenue from ocean troll-caught landings (9,100 pounds of Chinook, 1,300 pounds of coho) in Puget Sound ports authorized by emergency rule.

j/ Neah Bay and La Push were closed to public access in 2020 and Neah Bay again in 2021 due to the COVID-19 pandemic. 2020 Values for Washington include catch and effort from 7,016 ocean salmon angler trips (276 charter and 6,740 private) from Sekiu. 2021 Values for Washington include catch and effort from 10,899 ocean salmon angler trips (345 charter and 10,554 private) from Sekiu.

a/ Estimates of income impacts are provided from output of the Fishery Economic Assessment Model (FEAM) and IOPAC. These are the income impacts associated with expenditures in the troll and/or recreational sectors. There is no differentiation between money that may be new to the area versus money that may otherwise have been expended in other sectors. Values through 1995 are based on a 1992 run of the FEAM using 1989 IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 IMPLAN data. Values from 2001 through 2009 are based on a run of the FEAM using 2000 PacFIN landings and 1998 IMPLAN data. Beginning with the 2010 data year, income impact estimates are based on the NWFSC's IOPAC model, which uses updated IMPLAN and landings data, and survey-based industry cost data. A description of the transition from FEAM-based to IOPAC-based impact multipliers and comparisons of results from the two models are found in Appendix E of the Review of 2014 Ocean Salmon Fisheries:

<http://www.pcouncil.org/salmon/stock-assessment-and-fishery-evaluation-safe-documents/review-of-2014-ocean-salmon-fisheries/>

b/ Mainstem below Bonneville and Select Areas (Youngs Bay, Tongue Point, Blind Slough, and Deep River).

c/ Treaty Indian values do not include direct sales to consumers.

d/ For Washington and the Columbia River this column includes fall brights, tules, and jacks.

e/ Less than \$500.

f/ Preliminary. (All Washington values in this table are based on preliminary information available when each year's Salmon Review is drafted.)

g/ Washington income impacts for years prior to 2000 are based on a combination of Washington and Oregon value information.

h/ Treaty Indian values are primarily mainstem Columbia set gillnet but also include Klickitat dipnet, Drano Lake (Little White Salmon River mouth), and Priest Rapids Pool fisheries.

b/ Preliminary

c/ There were no Area 4B add-on fisheries prior to 1989.

d/ There was no Area 4B add-on fishery opening in 1999 and 2006 as the Area 4 ocean quota was not attained.

e/ There has been no Area 4B add-on fishery planned since 2008.

a/ Includes minor effort off Oregon for fish landed in California.

b/ Commercial fishery closed in all months except August 2002 (27 days fished) and September 2001-2005 (quota fisheries); all other harvest occurred in Oregon waters but was landed in Crescent City.

a/ Includes minor catches made off Oregon and landed in California prior to 2005.

b/ Commercial fishery closed all months except Aug. 2002 (681 Chinook) and Sept. 2001-2005; all other harvest occurred in Oregon waters but was landed in Crescent City.

a/ Days fished and landings are reported by port of landing through 1978 and by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; New port area includes Depoe Bay through Waldport; Coos Bay area prior to 1986 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1986 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

b/ Preliminary.

a/ Summary of ODFW fish receiving ticket information. Beginning in 1979, monthly totals are the sum of statistical weeks with closest fit to the calendar month. Excludes effort occurring off Alaska, Washington, and California. Days fished data are reported by port of landing through 1978 and by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; New port area includes Depoe Bay through Waldport; Coos Bay area prior to 1986 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1986 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

b/ Preliminary.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month. Excludes harvests off Alaska, Washington (north of Leadbetter Point), and California that were landed in Oregon. Landings are reported by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1988 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1988 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

b/ Preliminary.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month. Since 1981, data from sampled ports only. Effort consists of salmon angler trips only.

Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; New port area includes Depoe Bay and New port; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only terminal area fisheries.

b/ Preliminary.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month and may include illegal catch. Data is from sampled ports only. Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; New port area includes Depoe Bay and New port; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only, terminal area fisheries.

b/ Preliminary.

a/ Includes effort from the Washington State waters Area 4B fishery (none in 1994 or 1999).

b/ Preliminary.

c/ Includes effort from the North Jetty when the ocean fishery was open; does not include effort reported as occurring inside the Columbia River mouth (North Jetty effort when the ocean fishery was closed and Buoy 10 was open).

d/ The ports of Neah Bay and La Push were closed to public access in 2020 due to the COVID-19 pandemic. In 2021, Neah Bay remained closed to public access and La Push opened to public access July 12. Effort shown in this table includes effort that occurred in the adjacent catch areas and originated from Sekiu during periods Neah Bay and La Push remained closed to public access.

TABLE A-18. Washington ocean recreational Chinook and coho salmon landings in numbers of fish by port of landing and statistical month. (Page 1 of 3)

a/ Neah Bay and La Push statistics do not include estimates of 707 Chinook killed during Chinook nonretention fishery (July 19-August 20, 1987).

b/ Includes catch from the Washington State waters Area 4B fishery in 1991, 1992, 1993, 1996, 1997, 1998, 2000, and 2008.

c/ The ports of Neah Bay and La Push were closed to public access in 2020 due to the COVID-19 pandemic. In 2021, Neah Bay remained closed to public access and La Push opened to public access July 12. Catch shown in this table includes catch that occurred in the adjacent catch areas and was landed into Sekiu during periods Neah Bay and La Push remained closed to public access.

d/ Preliminary.

e/ Includes catch from the North Jetty when the ocean fishery was open; does not include catch reported as occurring inside the Columbia River mouth (North Jetty catch when the ocean fishery was closed, and Buoy 10 was open).

a/ Odd year averages only, includes five years of data.

b/ Includes catch from the Washington State waters Area 4B fishery.

c/ In 2021, the port of Neah Bay was closed to public access and the port of La Push opened to public access July 12 due to the COVID-19 pandemic. Catch shown in this table includes catch that occurred in the adjacent catch areas and was landed into Sekiu during periods Neah Bay and La Push remained closed to public access.

d/ Includes catch from the North Jetty when the ocean fishery was open; does not include catch reported as occurring inside the Columbia River mouth (North Jetty catch when the ocean fishery was closed and Buoy 10 was open).

e/ Preliminary.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month.

b/ Preliminary.

c/ In 2021, the southern boundary of the KMZ was officially moved five nautical miles north from Horse Mountain to latitude 40°10' N.

d/ Recreational estimates for California do not include May and June due to restrictions on sampling caused by the COVID-19 pandemic.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month.

b/ Preliminary.

c/ In 2021, the southern boundary of the KMZ was officially moved five nautical miles north from Horse Mountain to latitude 40°10' N.

d/ Recreational estimates for California do not include May and June due to restrictions on sampling caused by the COVID-19 pandemic.

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.

b/ Preliminary.

c/ Treaty troll effort in number of landings, which closely approximates days fished because treaty Indian fishers do not usually make multi-day trips. Season totals do not include January-April, October, or November-December treaty troll effort.

a/ In 2004, CDFW reviewed and updated 1971-2003 escapement estimates to reflect final project reports.

b/ Chinook spawning during the fall; may include spring run fish in some survey areas.

c/ Most natural area estimates based on carcass surveys with a jack length cut-off.

d/ Upper Sacramento mainstem estimates generally based on carcass surveys with a jack length cut-off, however, jack estimates from Red Bluff Diversion Dam (RBDD) reports have occasionally been used. Early (pre-2001) mainstem Sacramento River adult and jack estimates based on RBDD passage.

e/ Upper Sacramento River escapement includes Sacramento River mainstem; Battle, Clear, Mill, Deer, Butte, Cottonwood, and Cow creeks; and other small tributaries when surveys were conducted. Specific escapement estimates by tributary can be found at www.calfish.org.

f/ American River adult and jack escapement estimates include fish taken at Nimbus Weir, 1979-current. In previous versions of this table, fish taken at Nimbus Weir were included in the Nimbus Fish Hatchery counts.

g/ Total adults in Sacramento hatcheries include Tehama-Colusa Fish Facility escapements, 1971-1985.

h/ Survey methodology was variable for 1998-99; may not be comparable to other surveys.

i/ Change in 2002 estimation methodology due to extremely high Battle Creek escapement.

j/ Nimbus Fish Hatchery opened three weeks early to collect anticipated stray Chinook originating from Coleman National Fish Hatchery. During this time, 2,886 fish were collected.

k/ Preliminary.

l/ Current hatchery-specific goals, not PFMC goals.

m/ Sacramento River fall Chinook S_{MSY} .

GOALS ^{f/}	-	-	-	-	-	-	-	-	-	-	-	-	3,000 ^{g/}	-	1,000	-	4,000	-

a/ In 2004, CDFW review ed and updated 1971-2003 escapement estimates to reflect final project reports.

b/ Most natural area estimates based on carcass surveys with a jack length cut-off.

c/ Other San Joaquin tributary escapement includes Cosumnes and Calaveras Rivers when surveys were conducted. In some years no survey was conducted due to logistical or environmental limitations.

d/ Calculating jack proportions was not possible in some years due to sampling and/or environmental limitations. In those years jacks are included in the adult escapement values.

e/ Preliminary.

f/ Current hatchery-specific goals, not PFMC goals.

g/ Due to modernization of the hatchery facility and improved efficiencies, the Mokelumne Hatchery escapement goal was reduced from 5,000 to 3,000 adults in 2010.

a/ Jacks and adults based on sampling at Red Bluff Diversion Dam (RBDD) from unpublished CDFW data. Beginning in 1987 for late-fall and winter run, estimates based on historical run patterns and partial counts at RBDD due to raising of dam gates during the last part of the late-fall run and first part of the winter run.

b/ Since 1998, late-fall adult and jack estimates are based on carcass counts of natural spawners plus fish spawned at Coleman National Fish Hatchery.

c/ Estimates of late-fall and winter run include Chinook trapped at Keswick Dam for use as broodstock at Coleman or Livingston Stone National Fish hatcheries. Beginning in 2019, winter run estimates also include Chinook that returned to Battle Creek as part of the Coleman National Fish Hatchery captive broodstock "jumpstart" reintroduction effort.

d/ RBDD and carcass survey estimates represent alternative methods for determining winter run Chinook escapement.

e/ Natural spawning spring run which are isolated from fall run; primarily Mill Creek, Deer Creek, and Butte Creek escapement.

f/ Sacramento River spring run estimates are the total RBDD counts minus the spring run numbers in the upper Sacramento tributaries. If this number is less than or equal to zero, the upper Sacramento River spring run estimates are zero.

g/ Feather River spring run estimates are primarily fish returning to Feather River Hatchery. Spring run are not distinguished from fall run in the natural spawning surveys and are reported in the fall run natural escapement numbers.

h/ Jack proportion could not be determined in 2001.

i/ Primarily number of spawners at Coleman National Fish Hatchery 1991-97. No data available for natural spawners, RBDD gates were raised during time coinciding with the late-fall run.

j/ Methodology change from using snorkel survey to carcass survey for Butte Creek spring run estimates.

k/ Methodology change for distinguishing spring run Chinook at Feather River Hatchery in 2005. Fish arriving prior to the spring Chinook spawning period were tagged and returned to the river. Spring Chinook escapement estimate is the number of these tagged fish that subsequently returned during the spring Chinook spawning period.

l/ RBDD did not go into operation until June 15, a month later than normal; thus RBDD winter and spring run estimates are unavailable.

m/ RBDD gates were permanently removed on September 1, 2012; thus RBDD winter and spring run estimates are no longer available.

n/ Includes 47 adults that were transferred from the Colusa Basin Drain to Livingston Stone National Fish Hatchery for use as

o/ Preliminary.

p/ Estimates from Butte Creek and Big Chico Creek were unavailable at time of printing.

TABLE B-4. Summary of Klamath River fall Chinook salmon estimates in numbers of adults and jacks.

GOAL	Adults													≥40,700 ^{d/e/}	

a/ Total inriver run includes an estimated 30,550 fish that died prior to spawning in September 2002.

b/ Total inriver run includes fish collected from the Klamath and Trinity rivers by the Yurok and Hoopa Valley tribes, respectively, to test for the presence of the parasite *Ichthyophthirius multifiliis* during the following years: 2014 - 282 fish; 2015 - 124 fish; 2016 - 113 fish; 2019 - 9 fish; 2021 - 113 adults and 6 jacks; 2022 - 159 adults.

c/ Preliminary.

d/ In December 2011, Amendment 16 to the Salmon Fishery Management Plan was approved, which replaced the 35,000 spawning escapement floor with an S_{MSY} management objective of 40,700 natural area adult spawners. The 35,000 spawner floor was in effect from 1989-2007 and in 2011. In 2008-2010, fisheries were managed for a natural area spawning escapement of 40,700 adults under requirements of a rebuilding plan.

e/ Annual escapement goals may be more or less than S_{MSY} in some years due to meeting SACL requirements and *de minimis* fishing provisions.

a/ Estimates are made from a combination of weir counts, carcass surveys, and redd counts. The methodology can change annually based on environmental conditions, logistical constraints, and/or the expert opinion of regional biologists.

b/ Commercial fishing in lower Klamath River closed by the state after the 1933 season.

c/ Gillnetting resumed in lower 20 miles of Klamath River by Hoopa Valley Indian Reservation fishers in 1976.

d/ Shasta adults include 276 females taken to Iron Gate Hatchery in 1981.

e/ Low water conditions appeared to hinder entry into the Shasta River in 1988.

f/ Preliminary.

TABLE B-7. Summary of California North Coast salmon spawning stock surveys in numbers of fish (adults and jacks combined) or redd counts.
(Page 2 of 2)

-
- a/ Escapement estimates from expanded sonar fish counts.
 - b/ Previous versions of this table reported Chinook and coho counts for Cañon, Tomki (Chinook only), and Sprowl creeks, tributaries to the Mad, mainstem Eel, and South Fork Eel rivers, respectively. See the *Review of 2018 Ocean Salmon Fisheries* for these estimates.
 - c/ Expanded redd counts from design-based sample of reaches.
 - d/ Video counts of combined adults and jacks made at Mirabel Dam. These are minimum counts and are not comparable between years. Accuracy of counts may be affected by environmental conditions.
 - e/ No data available.
 - f/ Minimum count; sonar installed mid-season.
 - g/ Mirabel Dam video counts were unavailable due to construction of a new counting facility. The number recorded is the sum of minimum counts made at two facilities upstream of Mirabel Dam.
 - h/ Minimum abundance due to unexpanded, missing data.
 - i/ Monitoring at Mirabel Dam was complicated by operational challenges associated with the implementation of a new counting facility.
 - j/ Available estimates are incomplete and preliminary; surveys are still in progress at time of publication.
 - k/ Estimates not yet available; data analysis in progress.
 - l/ Redd surveys conducted in the four largest tributaries to Humboldt Bay: Jacoby Creek, Freshwater Creek, Elk River, and Salmon Creek.
 - m/ Escapement estimates from mark-recapture experiments.
 - n/ Escapement estimates derived by multiplying expanded redd counts from design-based sample of reaches by annual fish/redd ratios.
 - o/ Olema Creek is excluded.

a/ Pistol River was subject to several "slope failures" in 1986 resulting in severe short-term alterations in gravel bars and spawning index areas. Considerable debris and siltation severely limited Chinook surveys resulting in "0" counts in Deep Creek index areas through December.

b/ Preliminary.

a/ Jacks included in natural, hatchery, and total counts.

b/ Gold Ray Dam removed October, 2010. Natural estimate derived using relationship of 2004-2010 spawning ground surveys to Gold Ray Dam passage. Estimate includes an unknown number of jacks.

c/ Jacks include all Chinook less than 20 inches prior to 1978 and all Chinook less than 24 inches beginning in 1978.

d/ Preliminary.

a/ Includes some upriver origin spring Chinook through 1980. Beginning in 1981, the lower river catch of lower river spring Chinook is based on mark recoveries rather than the timing of the catch, as in previous years. Since 1986, GSI and VSI techniques have been used for stock composition analysis. Commercial catch includes Select Area fisheries. Sport catch is mainstem Columbia River, does not include tributaries. Catch may include small numbers of jacks. Sport fishery closed in 1995 to 1997.

b/ Prior to 1988, the escapement goal at Willamette Falls was 30,000 to 35,000. Beginning in 1988, the goal was dependent on run size under the Willamette Basin Fish Management Plan. Since 2001, hatchery escapement targets are set in the Fisheries Management and Evaluation Plan developed by ODFW. Lower Willamette sport catch may include small numbers of jacks.

c/ Includes hatchery escapement, tributary recreational catch, and natural spawning escapement for 1975 to present. The years 1971-1973 are based on using the 1975-1976 Cow litz River recreational fishery adult harvest rates.

d/ Includes hatcheries operated by all agencies. Values are included in the totals for the tributary runs.

e/ Preliminary.

a/ Chinook formerly managed separately as Snake River summer Chinook are now grouped with all upriver spring Chinook because of overlap in run timing.

b/ Includes adult upriver spring chinook and Snake River summer Chinook.

c/ Includes some lower river origin spring Chinook through 1980. Beginning in 1981, the lower river catch of upriver spring Chinook is based on mark recoveries rather than timing of the catch as in previous years. Since 1986, GSI techniques have been used for stock composition analysis. Commercial catch is from estimated miscellaneous fishery-related impacts from commercial shad and test fisheries, Select Area fisheries beginning in 1979, and catch and release mortalities from selective fisheries beginning in 2001. Sport catch, including any release mortalities, is from mainstem and Select Area fisheries downstream of

d/ Spring counting period is January 1-June 15.

e/ Includes mainstem Columbia R. fisheries in Zone 6 (BON-MCN), McNary to Hwy I-395, Ringold sport (2001-2011), plus the Washington lower Snake River sport fishery.

f/ Includes ticketed commercial, over-the-bank sales, and ceremonial and subsistence catch. Spring season commercial fishery closed in 1975, 1976, and from 1978 to 2000. Spring Chinook landed during those years were from the winter season fishery and limited spring Ceremonial & Subsistence harvest. Includes below Bonneville Dam C&S starting in 2008 along with fish taken for tribal use from lower river test fishing.

g/ Mainstem catch. Wanapum tribal fishery.

h/ Escapement estimated at Lower Granite Dam.

i/ Preliminary.

a/ Summer Chinook accounting begins on June 16. Chinook managed as Snake River summer Chinook prior to 2004 are now grouped with all upriver spring Chinook because of overlap in run timing. As of 2004, Snake River summer Chinook have been moved from this table to Table B-13.

b/ Mainstem and Select Area Fisheries. Includes estimated miscellaneous fishery-related impacts from mainstem recreational fisheries, test fisheries, commercial shad fisheries, and terminal area commercial gillnet fisheries beginning in 1979. Includes release mortality in selective fisheries beginning in 2002.

c/ Includes estimated catch and release mortalities from mainstem and Select Area recreational fisheries.

d/ Counting period June 16-July 31.

e/ Mainstem catch from Bonneville Dam upstream to Priest Rapids Dam.

f/ Mainstem catch. Includes ticketed commercial, over-the-bank sales, and ceremonial and subsistence catch. No directed commercial summer Chinook fishery from 1965 to 2003. Landings during those years are bycatch from commercial sockeye fishery. Includes commercial and C&S catch. Includes catch downstream of Bonneville since 2010.

g/ Mainstem catch. Wanapum and Colville tribal fisheries.

h/ Summer counting period June 18 to August 17.

i/ Preliminary.

j/ Comanager goal established in 2004 associated with regrouping Snake River summer Chinook with Snake River spring Chinook.

k/ MSY spawning escapement objective adopted in 2011 under Amendment 16 based on Chinook Technical Committee Report 99-3.

GOAL								7,000 ^{j/}

a/ Based on Columbia River fall Chinook database (Preliminary Big Sheets), WDFW, unpublished. Adult Aged fish. This stock may also be referred to as Bonneville Pool Hatchery (BPH).

b/ Includes Select Area fisheries.

c/ Includes Bouy 10, Mainstem, and tributary catch downstream of Bonneville Dam. Includes estimates for release mortalities. 1970-1988 catch includes upriver catch.

d/ Fall counting period begins August 1.

e/ Includes mainstem and Zone 6 tributary catch. 1970-1988 catch included in lower river sport fisheries.

f/ Includes mainstem commercial, ands ceremonial and subsistence catch.

g/ Includes White Salmon, Klickitat, and Little White Salmon rivers.

h/ Does not include strays to hatcheries below Bonneville Dam. Includes fall Chinook tules trapped at Bonneville Dam, 1986-1994 and 1998.

i/ Preliminary estimates based on in-season run updates.

j/ Escapement goal was changed from 8,200 fish to 7,000 fish, or 4,000 females, in 1994.

TABLE B-18. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult mid-Columbia bright (MCB) stock fall Chinook destined for areas below McNary Dam, not including the Deschutes River^{a/}

a/ Based on Columbia River fall Chinook database (Preliminary Big Sheets), WDFW, unpublished. Adult Aged fish. The MCB stock includes Bonneville upriver brights (BUBs) and Pool upriver brights (PUBs). A portion of the BUB stock includes low er river brights (LRBs) that spawn naturally downstream of Bonneville Dam. In 2013, hatchery production of BUBs was discontinued and production shifted to PUB. Since 2018, the MCB stock has consisted of PUB stock and the minor LCB component.

b/ Mainstem and Select Areas downstream of Bonneville Dam.

c/ Mainstem and tributary downstream of Bonneville Dam. 1982-88 includes catch from upriver sport.

d/ Mainstem and tributary between Bonneville and McNary dam (Zone 6). 1982-88 catch from upriver sport included in low e river sport catch.

e/ Mainstem and tributary between Bonneville and McNary dam (Zone 6). Includes commercial, ceremonial, and subsistence catch.

f/ Includes Little White Salmon, Klickitat, and Umatilla rivers.

g/ Includes Little White Salmon, Bonneville, Umatilla, and Klickitat hatcheries.

h/ Preliminary estimates based on in-season run updates.

GOAL								60,000 ^{k/}	39,625 ^{l/}		

a/ Based on Columbia River fall Chinook database (Preliminary Big Sheets), WDFW, unpublished. Does not include hatchery URB Chinook reared and released below McNary Dam. Adult Aged fish except for McNary, Ice Harbor and Total Lower Granite Dam Counts which are based on adult-sized passage.

b/ Includes, Mainstem, Select Areas, and test fishing.

c/ Includes Bouy 10, Mainstem, and Select Areas. 1971-1988 includes above Bonneville sport catch.

d/ Includes tributary and mainstem catch between Bonneville and Priest Rapids dams and Hanford Reach. Does not include Snake Basin sport harvest. 1971-1988 above Bonneville sport catch included in Lower River sport catch.

e/ Includes Mainstem Commercial and C&S, plus Deschutes Subsistence.

f/ Deschutes esc. time series revised in 2010 to match Deschutes R. Chinook Spawner Esc. Goal using U.S. v. OR Tech. Advisory Comm. Data (Sharma et al. 2009).

g/ Counting period August 9-December 31. Data from Fish Passage Center. Does not separate out any MCB fish that stray above McNary.

h/ Upper Columbia escapement only: Yakima River, Hanford Reach, and Priest Rapids Dam count.

i/ Snake River wild; adjusted for stray hatchery fish. Includes wild fish hauled to Lyons Ferry Hatchery.

j/ Preliminary estimates based on in-season run update.

k/ The U.S. v. Oregon parties managed for a McNary Dam esc. of 60,000 beginning in 2008. Starting in 1994, inriver fisheries were managed for ESA consultation standards.

l/ MSY spawning escapement objective adopted in FMP Amendment 16 in 2011.

TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River^{a/}. (Page 3 of 3)

a/ As reported in Appendix B tables. Spring Chinook data in tables B-12 and B-13, Summer Chinook data in B-14, Fall Chinook data in Tables B-15-19.

b/ Includes lower river, Willamette, and upriver spring Chinook, which also includes Snake River summer Chinook. Excludes Select Area spring Chinook.

c/ Upper Columbia Summer Chinook destined for areas upstream of the Snake River.

d/ Includes LRH,LRW,SCH,MCB and URB stocks. Excludes Select Area Brights (SAB).

e/ Preliminary.

TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River^{a/}. (Page 3 of 3)

a/ As reported in Appendix B tables. Spring Chinook data in tables B-12 and B-13, Summer Chinook data in B-14, Fall Chinook data in Tables B-15-19.

b/ Includes low er river, Willamette, and upriver spring Chinook, w hich also includes Snake River summer Chinook. Excludes Select Area spring Chinook.

c/ Upper Columbia Summer Chinook destined for areas upstream of the Snake River.

d/ Includes LRH,LRW,SCH,MCB and URB stocks. Excludes Select Area Brights (SAB).

e/ Preliminary.

TABLE B-21. Estimates of minimum inriver run size, catch, and escapement in thousands of adult coho entering the Columbia River.^{a/}

GOAL					Hatchery Production				

a/ These numbers match OPI databases. Adjustments were made to the escapement figures and catches.

b/ Mainstem recreational catches listed in this table include tributary catches and catches in the Chinook/Hammond area of 3,195 in 1989, 28 in 1990, and 1,151 in 1991.

c/ Includes hatcheries operated by all agencies.

d/ Willamette Falls, Clackamas River (North Fork Dam) and Sandy River (Marmot Dam).

e/ Includes additional small adults counted as jacks for 1983-1984 and 1986-1989.

f/ Bonneville Dam count minus Zone 6 mainstem commercial treaty Indian harvest.

g/ Preliminary.

2023 ^{f/}	78,179	18,136	9,832	0.36

a/ Prior to 1982, Buoy 10 area catches were not estimated separately and are included in the Columbia River marine area (Cape Falcon to Leadbetter Pt.) recreational catches. Estimates include bank anglers fishing from Clatsop Spit in Oregon and from the North Jetty in Washington. Effort and catch for the North Jetty fishery applied to the ocean quota for the Columbia River area until the ocean fishery closed. Beginning in 2000, includes catch and effort from the Astoria-Megler Bridge upstream to the new boundary from Tongue Point, Oregon to Rocky Point, Washington.

b/ Includes adults and jacks as determined by CWT analysis.

c/ 1989 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 32 and 33. A total of 7,922 angler trips produced catches of 492 Chinook, 3,195 coho, and a catch rate of 0.47 fish per trip. Catches in this fishery were counted against the Buoy 10 quota.

d/ 1990 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32. A total of 3,225 angler trips produced catches of 54 Chinook, 28 coho, and a catch rate of 0.03 fish per trip.

e/ 1991 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32. A total of 2,759 angler trips produced catches of 39 Chinook, 1,151 coho, and a catch rate of 0.43 fish per trip.

f/ Preliminary.

2023 ^{e/f/}	225	1,474	NA	NA	NA	NA
GOAL				3,393 ^{g/}	9,800 ^{h/}	

a/ Non-local gillnet is catch prior to Aug. 16. In 2010-13, 42% were considered non-local. In 2014, 28% were non-local based on genetic data samples. Since 2015, non-local stock contribution based on genetic sampling throughout the duration of the commercial fishery.

b/ Adults. Sport catch since 1991 includes marine areas within Willapa Bay (e.g., Washaway Beach).

c/ Escapement estimates after 1984 are based on revised spawning habitat estimates. Natural = adult returns assumed to be from natural origin parents.

d/ Does not include catch of non-local stocks.

e/ To calculate total gillnet catch, combine Non-local Stocks Gillnet Catch (column 1) and Terminal Catch Gillnet (column 2).

f/ Preliminary.

g/ MSY spawning escapement objective established in FMP Amendment 16; WDFW goal is 4,350.

h/ WDFW goal; not an FMP goal.

2023 ^{e/}	16,638	NA	NA	NA	NA
GOAL			17,200 ^{f/}	6,100 ^{f/}	

a/ Adults. Sport catch since 1991 includes marine areas within Willapa Bay (e.g., Washaway Beach).

b/ Natural spawning escapement estimates were not made in 1984-1994; estimates in 1996, 1997, and 1998 do not include adult fish released upstream of hatchery racks. Estimates from 1996 to present include both wild and naturally spawning hatchery fish.

c/ Hatchery rack number includes fish released upstream until 2009.

d/ Does not include natural spawning escapement between 1984 and 1994.

e/ Preliminary.

f/ Willapa Bay coho were added to the FMP in 2011; the STT finalized the new FMP goal for use beginning in 2016.

GOAL						13,326 ^{i/}		

a/ Age-3 and older.

b/ Age-3 and older, including hatchery fish spawning naturally.

c/ Includes fish taken from the spawning grounds for broodstock.

d/ Minimum estimate due to incomplete estimates of river recreational catch. Does not include non-local catch.

e/ Fewer than 50 fish.

f/ In 1996 and 1997 WDFW not able to differentiate spawning time and believes this includes fall Chinook.

g/ Preliminary.

h/ Rec. catch estimates by WDFW reflect a catch record card bias correction factor of 0.833. Quinault Indian Nation does not believe this factor is appropriate. Unadjusted catch estimates are 1,000 for 1987; 2,400 for 1988; 2,500 for 1989; 2,400 for 1990; 4,500 for 1991; 2,600 for 1992; 4,200 for 1993; 4,300 for 1994; 6,500 for 1995; 6,800 for 1996; 3,400 for 1997; 3,500 for 1998; and 100 for 1999; terminal run sizes would be adjusted accordingly.

i/ November 2014: Council adopted new spawning escapement objective. The SMSY estimate of 13,326 was accepted as an escapement goal by the Pacific Salmon Commission, PFMC and the co-managers. Previous objectives used for preseason planning

j/ Includes non-harvest mortalities.

TABLE B-26. Grays Harbor coho terminal catch, spawning escapement, and run size estimates in numbers of fish.

GOAL					35,400 ^{f/}				

a/ Beginning in 1987, estimates provided by WDFW for recreational catch reflect punch card bias correction factor.

b/ "Natural" includes hatchery fish spawning in wild. "Hatchery" includes wild fish taken for brood stock.

c/ Terminal run size numbers from 1981 to present are under co-manager review .

d/ The combined natural and hatchery run size total may not add to the sum of the catch and escapements due to hatchery total run size including on-station and off-station escapements.

e/ Preliminary.

f/ The Pacific Fisheries Management Council adopted a new SMSY of 24,426 under FMP Amendment 16 as a biological reference point used to develop status determination criteria consistent with the Magnuson-Stevens Act. Previously, the conservation objective of 35,400 listed in the Pacific Coast Salmon FMP was used to assess overfished status. The natural spawning escapement goal remains 35,400.

GOAL				2,500 ^{f/}			

a/ River sport catch of age-3 and older fish. The 2000 sport fishery was closed to retention of unmarked Chinook. The 2002 sport fishery was closed to Chinook retention on October 18 due to unusually low water conditions. The 2008 sport fishery was closed to the retention of Chinook. The 2009 sport fishery was closed to retention of unmarked Chinook in Queets and Salmon Rivers within Olympic National Park.

b/ Includes fish of natural origin and hatchery origin (indicator stock) on the spawning grounds. Estimates for years prior to 2001 assume a broodstock take of 150 as a placeholder until individual run reconstructions are complete.

c/ Includes from 100 to 200 wild Chinook captured each season near spawning grounds to be used as Indicator broodstock.

d/ This is an integrated wild/hatchery program. Brood stock are unmarked wild fish collected from river.

e/ Preliminary.

f/ Minimum. Terminal run managed at 40 percent exploitation rate of terminal run size.

TABLE B-31. Estimated terminal run size, catch, and escapement for Queets River coho in numbers of fish.

GOAL				5,800-14,500						

a/ Includes dip-in fish from other river systems.

b/ Recreational catch of adults (coho over 20 inches).

c/ Natural escapement and run size estimates include fish taken for hatchery brood stock.

d/ Queets stock only; does not include non-local, dip-in fish.

e/ 1991 and 1997 supplemental was included in natural escapement and run size.

f/ In 2004, 2005 and 2006 escapement estimates are from non-standard methods due to poor survey conditions during the coho spawning season.

g/ Preliminary.

GOAL	900 ^{d/}											

a/ Beginning in 1981, catch breakouts recalculated to account for Solduc hatchery yearling release dip-in fish.

b/ Recreational catch of adults (at least 24 inches total length); beginning in 2008, all Chinook must be marked with a healed adipose fin clip. Sport fishery closed to retention of wild adult spring/summer Chinook through August 31 in 2001, 2002, and every year since 2008.

c/ Preliminary.

d/ Minimum. Terminal run managed at 31 percent harvest rate of inriver run size.

TABLE B-33. Estimated inriver run size, catch, and escapement for Hoh River fall Chinook in numbers of fish.

GOAL	2,000 to 5,000							

a/ Includes dip-in fish from other river systems.

b/ Recreational catch of adults (coho over 20 inches).

c/ Natural escapement and run sizes estimate include fish taken for hatchery brood stock.

d/ In 1997: Recreational fishermen were limited to Chinook only. Release of adult coho required. Tribal net fishery used large mesh to minimize coho impacts.

e/ In 2002: Sport and tribal gillnet seasons reduced inseason in response to delayed upriver movement of coho caused by extreme low water conditions in October and early November. Closures were for two weeks.

f/ Preliminary.

GOAL				1,200 ^{f/}				

a/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch. Catch during designated ceremonial and subsistence fisheries is listed separately.

b/ Recreational catch of adults; mark selective for adipose fin clipped coho beginning in 2003.

c/ Natural escapement includes hatchery strays and broodstock fish.

d/ Hatchery escapement and terminal run size exclude hatchery strays.

e/ Preliminary.

f/ FMP goal is adults; WDFW goal of 1,200 includes age-3 males (jacks).

a/ WDFW Statistical Areas 5 through 13, which include the Strait of Juan de Fuca, San Juan Islands, and inner Puget Sound. 1981-1987: Adjusted all Puget Sound and freshwater estimates by 0.833, due to previous estimates being 20% too high. 1988: Area 5, no adjustment. Areas 6-13 adjusted by 0.633, due to estimates being 58% too high. 1989-Present: Area 5, no adjustment. Areas 6-13 adjusted by 0.685, due to estimates being 46% too high. 1991, 1992, and 1993 catch record card estimates adjusted for results of 1987-1990 WDFW/tribal sports emphasis study.

b/ Odd-year averages for pink salmon.

c/ Preliminary.

TABLE B-41. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound Chinook stocks.^{a/}
(Page 4 of 4)

-
- a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
- b/ Includes estimated off-station returns.
- c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by troll and recreational fisheries inside Puget Sound.
- d/ Natural escapement includes NORs and supplementation origin fish in the Mid Hood Canal management unit streams. Escapement management objectives in the Skokomish River are for total river spawners (HOR & NOR) and are not comparable to the natural escapement column in this table. NOR/HOR breakout of Skokomish R spawners from prior to mass adipose clipping (pre-2010) are based on the average pHOS from after mass adipose clipping (2010-2017) .
- e/ Since 1999, numbers include Tulalip hatchery returns, which are not added into escapement since no broodstock is taken at the hatchery.
- f/ Preliminary.
- g/ Includes the following stock groups: miscellaneous Area 10 - Seattle, Lake Washington, Green-Duwamish, miscellaneous Area 10E - Port Orchard, Puyallup, miscellaneous Area 13 - south Puget Sound, Chambers Creek, Nisqually, miscellaneous Area 13A - Minter Creek, Deschutes, miscellaneous Area 13B streams.

GOAL	52,000								

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.

b/ Includes estimated off-station returns and secondary wild stocks.

c/ Terminal run size is defined as the run to terminal marine areas; spawning escapement plus commercial net and sport catch (inriver and terminal fishery catch). Prior to 1997, estimates are Puget Sound run size, which is defined as the run available to Puget Sound net fisheries; spawning escapement plus commercial net catch (inriver, terminal, and pre-terminal Puget Sound net fishery catch), but not including fish caught in Puget Sound troll and recreational fisheries.

d/ Preliminary.

e/ Hood Canal terminal run size is defined as the run to terminal marine areas; spawning escapement plus commercial net and sport catch (inriver and terminal fishery catch). Prior to 1997, estimates are Puget Sound run size, which is defined as the run available to Puget Sound net fisheries; spawning escapement plus commercial net catch (inriver, terminal, and pre-terminal Puget Sound net fishery catch), including fish caught in Puget Sound troll and recreational fisheries.

f/ Area 10, 10e and 11 escapements are preliminary estimates pending final Co-Manager agreement. These preliminary estimates were used in the 2022 run reconstruction.

TABLE B-43. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks.^{a/} (Page 4 of 4)

a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.

b/ Includes estimated off-station returns.

c/ Puget Sound run size is defined as the run available to Puget Sound fisheries; spawning escapement plus Puget Sound fishery catch. Includes fish caught by treaty net fisheries and non-Indian commercial and recreational fisheries inside Puget Sound.

d/ State-Tribal comanager goal; the only Council goal is for a total Puget Sound pink salmon spawning escapement of 900,000 natural spawners.

e/ Nisqually escapement estimate incomplete.

f/ Green river returns included in run reconstruction.

g/ Preliminary.

GOAL		2,000						

a/ Beginning in 2019, data were available to independently account for hatchery and natural spawning escapement. Prior to 2019, natural and hatchery spawning escapement are combined.

b/ Hatchery escapement estimates include all rack returns (retained and released).

c/ Natural escapement estimates based on carcass counts expanded by a 3.48 multiplier developed from 5 years of redd count-based estimates. Most natural spawners are hatchery fish spawning in the wild.

d/ Nooksack basin co-managers updated spawning ground escapements to report "Total Basin Escapement" for each Spring Chinook stock starting with Run Year 2016.

e/ The 2021 SF Nooksack "natural" spawning ground escapement includes an estimated 2,333 pre-spawn mortalities from a mass mortality event in the SF Nooksack River.

f/ Estimate includes adult returns to Hupp Springs, White R. Hatchery, and Buckley Trap. Data from 1999 - 2017 were updated using new "agreed-to" methodology for estimating unsampled portions of Spring Chinook back to Buckley Trap with Fall/Unknown origin fish removed from the estimate.

g/ Program discontinued.

h/ Preliminary.

					Chinook	Coho ^{b/}	
2021^{d/}	WA/OR Border to Cape Falcon	June 19-Aug. 29	72	2	22	16	7,200 Chinook guideline, 42,400 coho quota. Daily limit through June 26 includes only one salmon and no coho. Daily limit beginning June 27 includes two salmon per day and only one Chinook.
	Cape Falcon to Humbug Mt.	Mar. 15-June 11, Aug. 29-31,	92	2	24	-	
		Sept. 1-9, 13-16	13	2	24	-	
		Oct. 1-31	31	2	24	-	
	Cape Falcon to Humbug Mt.	June 12-Aug. 28	78	2	24	16	120,000 marked coho quota shared with the Humbug Mt to OR/CA border fishery.
	Cape Falcon to Humbug Mt.	Sept.10-12, 17-30	17	2	24	16	20,230 non-mark-selective coho quota.
	Humbug Mt. to OR/CA Border (Oregon KMZ)	June 12-18	7	2	-	16	120,000 marked coho quota shared with the Humbug Mt to OR/CA border fishery.
		June 19- Aug. 15	58	2	24	16	
		Aug. 16-28	13	2	-	16	
2022^{d/}	WA/OR Border to Cape Falcon	June 25-Sept. 30	98	2	22	16	8,090 Chinook guideline (adjusted inseason from 7,700), 84,000 coho quota. Daily limit includes two salmon; only one Chinook. No Chinook retention beginning Aug. 23. The subarea North of 46° 15' N and East of 124° 08' 40" W, which is north of the Columbia River mouth and falls within the Columbia River Ocean Salmon Management Area (Leadbetter Point, Washington to Cape Falcon, Oregon) closed beginning July 16. Chinook transferred from the Neah Bay area guideline to add 390 Chinook to the Columbia River area guideline on Sept. 12.
	Cape Falcon to Humbug Mt.	Mar. 15-June 17	95	2	24	-	
		Aug. 22-Sept. 2	12	2	24	-	
		Oct. 1-31	31	2	24	-	
	Cape Falcon to Humbug Mt.	June 18-Aug. 21	65	2	24	16	100,000 marked coho quota shared with the Humbug Mt to OR/CA border fishery
	Cape Falcon to Humbug Mt.	Sept. 3-30	28	2	24	16	26,800 non-mark-selective coho quota. Quota was adjusted inseason (Aug. 30) from 17,000 based on an impact neutral rollover of coho remaining on the marked coho fishery.
	Humbug Mt. to OR/CA Border (Oregon KMZ)	June 18-24	7	2	-	16	100,000 marked coho quota shared with the Cape
		June 25- Aug. 21	58	2	24	-	

TABLE C-4. Summary of actual Oregon recreational ocean salmon regulations. (Page 5 of 5)

Year	Area	Season	Days	Bag Limit	Minimum Size Limit (in.)		Other Restrictions ^{c/}
					Chinook	Coho ^{b/}	
2023 ^{d/}	WA/OR Border to Cape Falcon	June 24-Sept. 30	99	2	22	16	11,490 Chinook guideline 79,800 marked coho quota. Quota was adjusted inseason (Aug. 26) on an impact-neutral basis to allow for non-selective retention. Daily limit includes two salmon; only one Chinook.
	Cape Falcon to OR/CA Border.	June 17-Aug. 31	76	2	-	16	All salmon except Chinook. All retained coho must be marked with a healed adipose fin clip. 110,000 marked coho.
	Cape Falcon to Humbug Mt.	Sept. 1-17, 21-30	27	2	24	16	Inseason non-mark-selective coho quota was 42,500. Quota was adjusted inseason twice based on an impact neutral rollover of coho remaining on the marked coho fishery. Preseason non-mark-selective coho quota was 25,000.
		Oct. 1-31	31	1	24	-	Open for all salmon except coho and only open shoreward of the 40 fathom management line.
	Cape Blanco to Humbug Mt. (Elk River Area) ^{a/}	Nov. 1-30	30	1	24	-	Redfish Rocks Marine Reserve closed to all fishing.

a/ Elk River area is inside a line from Cape Blanco to Black Rock to Best Rock to 42.40'30" N. Lat. 124.29'00" W. Long. to Humbug Mt.

b/ Mark-selective coho fishery unless otherwise noted; all retained coho must be marked with a healed adipose fin clip.

c/ All seasons are seven days per week unless otherwise indicated.

d/ For detailed regulations and inseason adjustments, see Tables I-3 and C-9.

					Chinook	Coho ^{a/}	
2022 ^{b/}	U.S./Canada Border to Cape Alava WA (Neah Bay subarea)	June 18-July 5, July 25-Sept. 30	86	2	24	16	5,510 Chinook guideline, 17,470 coho quota. Chinook guideline adjusted inseason (Sept. 14) Daily limit includes two salmon; only one Chinook beginning June 24. Area east of Bonilla-Tatoosh line closed beginning July 2. Entire area closed July 5-24. Area west of Bonilla-Tatoosh line opened beginning July 25. Area east of Bonilla-Tatoosh line opened beginning Aug. 1. Balance of Chinook guideline (600 Chinook) transferred to the Columbia River area guideline on an impact neutral basis on Sept. 14.
	Cape Alava to Queets R. (La Push subarea)	June 18-Sept. 30	105	2	24	16	995 Chinook guideline, 4,370 coho quota. Daily limit includes two salmon; only one Chinook July 4-15 and July 25-Sept. 30. No Chinook retention allowed July 16-24.
	48°00' N. Lat. to 47°50' N. Lat.	Oct. 5-8	4	2	24	-	125 Chinook quota. Chinook only.
	Queets R. to Leadbetter Pt. WA (Westport subarea)	July 2-Sept. 30	91	2	22	16	12,070 Chinook guideline, 62,160 coho quota. Coho quota adjusted inseason (Aug. 27) to 14,000 non-mark selective coho. Daily limit includes two salmon; only one Chinook <u>except</u> no Chinook retention on Fridays and Saturdays July 22- August 22. No Chinook retention beginning Aug. 23. Non-marked coho retention allowed beginning Aug. 27.
	Leadbetter Pt. WA to Cape Falcon OR (Columbia River subarea)	June 25-Sept. 30	98	2	22	16	8,090 Chinook guideline (adjusted inseason from 7,700), 84,000 coho quota. Daily limit includes two salmon; only one Chinook. No Chinook retention beginning Aug. 23. The subarea North of 46° 15' N and East of 124° 08' 40" W within the Columbia River area closed beginning July 16. Chinook transferred from the Neah Bay area guideline to add 390 Chinook to the Columbia River area guideline on Sept. 14.
2023 ^{b/}	U.S./Canada Border to Cape Alava WA (Neah Bay subarea)	June 17-Sept. 30	106	2	24	16	8,710 Chinook guideline, 16,600 coho quota. Quota adjusted inseason (Aug. 26) on an impact-neutral basis to 4,800 non-mark selective coho. Daily limit includes two salmon beginning July 8. Non-marked coho retention allowed beginning Aug. 26.
	Cape Alava to Queets R. (La Push subarea)	June 17-Sept. 30	106	2	24	16	1,440 Chinook guideline, 4,150 coho quota. Quota adjusted inseason (Aug. 26) on an impact-neutral basis to 1,210 non-mark selective coho. Daily limit includes two salmon beginning July 8. Non-marked coho
	48°00' N. Lat. to 47°50' N. Lat.	Oct. 3-7	5	1	24	-	150 Chinook quota. Chinook only.
	Queets R. to Leadbetter Pt. WA (Westport subarea)	June 24-Sept. 30	99	2	22	16	17,210 Chinook guideline, 59,050 coho quota. Quota adjusted inseason (Aug. 26) on an impact-neutral basis to 16,010 non-mark selective coho. Daily limit includes two salmon; only one Chinook <u>except</u> no Chinook retention on Fridays and Saturdays July 28 - August 12. Non-marked coho retention allowed beginning Aug. 26.
	Leadbetter Pt. WA to Cape Falcon OR (Columbia River subarea)	June 24-Sept. 30	99	2	22	16	11,490 Chinook guideline, 79,600 coho quota. Quota adjusted inseason (Aug. 26) on an impact-neutral basis to 21,740 non-mark selective coho. Daily limit includes two salmon; only one Chinook. Non-marked coho retention allowed beginning Aug. 26.

a/ Mark-selective coho fishery unless otherwise noted; all retained coho must be marked with a healed adipose fin clip.

b/ For detailed regulations and inseason adjustments, see Tables I-1 and C-9.

a/ Although the Skagit River escapement goal would not be achieved, management was based on meeting WDFW's escapement goal for Hoh River coho and allocation based on aggregation to Washington coastal tribes.

b/ The Council management regime was not expected to meet equitable adjustment requirements for Skagit River coho.

c/ Plus 7,430 hooking mortality for pink fishery.

d/ Plus 3,250 hooking mortality for pink fishery.

e/ Hooking mortality of 2,800 coho for June 1-15 fishery not included.

f/ Plus 1,200 hook-and-release mortality for the Neah Bay all-salmon-except-coho fishery.

g/ Marked hatchery coho only (healed adipose fin clip).

h/ Sharing of impacts on ESA listed Puget Sound Chinook also affected the shaping of ocean and inside fisheries.

i/ For 2002, the Council elected to constrain fishing so that the OCN exploitation rate would not exceed 12.5 percent per ODFW's recommendation to provide additional protection for lower Columbia River natural coho, which are listed as endangered under the Oregon State-ESA. The FMP objective for OCN coho was 15 percent.

j/ Includes mark-selective fishery quotas of: 12,000 (5,000 non-mark selective quota) in 2010, 4,800 (2,000 non-mark selective quota) in 2011, 8,000 in 2012 and 2013 (4,000 non-mark selective quota), 9,000 (4,500 non-mark selective) in 2014, and 10,000 in 2015 (4,000 non-mark selective).

GENERAL MANAGEMENT ACTIONS FOR TRIBAL COMMERCIAL FISHERIES

- January 1: The all-salmon treaty troll fisheries open in Area 4B for the Makah and S'Klallam Tribes through April 15.
- May 1: The all-salmon-except-coho treaty troll fisheries open through the earlier of June 30 or attainment of the seasonal sub-quota of 22,500 Chinook. Tribal fisheries for the Quinault, Quileute, Hoh, Makah, and S'Klallam Tribes operate within their respective usual and accustomed areas within Marine Areas 2, 3, 4 and 4B.
- July 1: The all-salmon treaty troll fisheries open through the earlier of September 15 or attainment of the 57,000 coho quota or the seasonal sub-quota of 38,400 Chinook (includes 16,500 Chinook remaining from the spring quota). Tribal fisheries for the Quinault, Quileute, Makah, Hoh, and S'Klallam Tribes operate within their respective usual and accustomed areas within Marine Areas 2, 3, 4 and 4B.
- September 15: Quileute, Quinault, Hoh, Makah, and S'Klallam treaty troll salmon fisheries close as scheduled.
- November 1: The all-salmon treaty troll fisheries open in Area 4B for the S'Klallam Tribes through December 31.
- November 2: The Chinook winter troll fisheries open in Area 4B, 5, and 6 for the Makah Tribe through April 15.

GENERAL MANAGEMENT ACTIONS FOR NON-TRIBAL FISHERIES

- March 5-10: Pacific Fishery Management Council meeting in Seattle, WA.
- March 3: National Marine Fisheries Service (NMFS) provides the Council with a [letter](#) outlining the 2023 management guidance for stocks listed under the Endangered Species Act (ESA) and stocks of concern. Supplemental guidance was also provided to the Council.
- March 15: North of Cape Falcon Salmon Forum meets online to initiate consideration of recommendations for treaty Indian and non-Indian salmon management alternatives.
- March 20-21: Council holds public hearings on proposed management alternatives; one for each of the three coastal states (WA, OR, and CA).
- March 21: North of Cape Falcon (NOF) Salmon, Puget Sound Forum meets to further consider recommendations for treaty Indian and non-Indian salmon management alternatives.
- March 29: North of Cape Falcon (NOF) Salmon, Columbia River Forum meets to further consider recommendations for treaty Indian and non-Indian salmon management alternatives.
- April 2-7: Pacific Fishery Management Council meeting in Foster City, CA.
- May 11: Final Rule for the 2023 annual salmon management measure is published on the Federal Register ([88 FR 30235](#))

INSEASON ACTIONS FOR NON-TRIBAL FISHERIES

48. Decision date: March 9, 2023. Effective: March 15, 2023. Inseason action #48 modifies the SOF ocean salmon recreational fishery from Cape Falcon, OR, the Heceta Bank Line (lat. 43°58'00" N), OR; Heceta Bank Line (lat. 43°58'00" N), OR, to Humbug Mountain, OR; and Humbug Mountain, OR, to the Oregon/California border, previously scheduled to open on March 15, 2023. This fishery is closed through May 15, 2023.

49. Decision date: March 9, 2023. Effective: March 15, 2023. Inseason action #49 modifies the SOF ocean salmon recreational fishery from Cape Falcon, OR, to Humbug Mountain, OR, previously scheduled to open on March 15, 2023. This fishery is closed through May 15,

50. Decision date: March 9, 2023. Inseason action #50 modifies the ocean salmon recreational fishery and the salmon troll commercial fishery from the Oregon/California border to the U.S./Mexico border. These fisheries are closed through May 15, 2023.

- Effective May 1, 2023 at 12:01 a.m. for the salmon troll commercial fishery from the Oregon/California border to Humboldt South Jetty (California Klamath Management Zone).
- Effective April 16, 2023 at 12:01 a.m. for the salmon troll commercial fishery from lat. 40° 10N to Point Arena, CA (Fort Bragg management area).
- Effective May 1, 2023 at 12:01 a.m. for the salmon troll commercial fishery from Point Arena, CA, to Pigeon Point, CA (San Francisco management area).
- Effective May 1, 2023 at 12:01 a.m. for the salmon troll commercial fishery from Pigeon Point, CA, to the U.S./Mexico border (Monterey management area).
- Effective May 1, 2023 at 12:01 a.m. for the ocean salmon recreational fishery from the Oregon/California border to lat. 40° 10N (California Klamath Management Zone management area).
- Effective April 1, 2023 at 12:01 a.m. for the ocean salmon recreational fishery from lat. 40° 10N to Point Arena, CA (Fort Bragg management area).
- Effective April 1, 2023 at 12:01 a.m. for the ocean salmon recreational fishery from Point Arena, CA, to Pigeon Point, CA (San Francisco management area).
- Effective April 1, 2023 at 12:01 a.m. for the ocean salmon recreational fishery from Pigeon Point, CA to the U.S./Mexico border (Monterey management area).

51. Decision date: May 18, 2023. Inseason action #51 modifies the ocean salmon troll commercial fishery from the U.S./Canada border to Cape Falcon, OR.

- Effective May 1, 2023, at 12:01 a.m. the quota for the May-June fishery is modified to 26,000 Chinook salmon, no more than 6,890 of which may be caught in the area between the U.S./Canada border and the Queets River and no more than 6,040 of which may be caught in the area between Leadbetter Point and Cape Falcon.
- Effective May 1, 2023, at 12:01 a.m. the landing and possession limit for the entire area between the U.S./Canada border and Cape Falcon is 200 Chinook salmon per vessel for the period May 1, 2023, through May 10, 2023, and 150 Chinook salmon per vessel per landing week (Thursday – Wednesday) beginning May 11, 2023, at 12:01 a.m.
- Effective May 1, 2023, at 12:01 a.m. the landing and possession limit in the area between the U.S./Canada border and the Queets River is 105 Chinook per vessel for the period May 1, 2023, through May 10, 2023, and 70 Chinook salmon per vessel per landing week (Thursday – Wednesday) beginning May 11, 2023, at 12:01 a.m.
- Effective May 1, 2023, at 12:01 a.m. the landing and possession limit in the area between the Queets River and Leadbetter Point is 200 Chinook salmon per vessel for the period May 1, 2023, through May 10, 2023, and 150 Chinook salmon per vessel per landing week (Thursday – Wednesday) beginning May 11, 2023, at 12:01 a.m.
- Effective May 1, 2023, at 12:01 a.m. the landing and possession limit in the area between Leadbetter Point and Cape Falcon is 90 Chinook per vessel for the period May 1, 2023, through May 10, 2023, and 60 Chinook salmon per vessel per landing week (Thursday – Wednesday) beginning May 11, 2023, at 12:01 a.m.
- Effective May 1, 2023, at 12:01 a.m. vessels may not land fish east of the Sekiu River or east of Tongue Point, Oregon.

TABLE C-9. 2023 General Management and Inseason Actions ^{a/b/} (Page 3 of 5)

52. Decision date: May 9, 2023. Effective May 11, 2023, at 12:01 am, inseason action #52 modified the commercial salmon troll fishery. The area between the U.S./Canada border and the Queets River (La Push and Neah Bay subareas) is closed.

1. Decision date: May 16, 2023. Effective May 17, 2023, at 12:01 am, Inseason action #1 modifies the NOF ocean salmon troll commercial fishery. The area between the U.S./Canada border and the Queets River (La Push and Neah Bay subareas) is closed.

2. Decision date: May 16, 2023. Effective May 17, 2023, at 12:01 am. Inseason action #2 modifies the NOF ocean salmon troll commercial fishery. The landing and possession limit in the area between the U.S./Canada border and Cape Falcon is 150 Chinook salmon per vessel per landing week (Thursday – Wednesday) May 17, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

3. Decision date: May 16, 2023. Effective May 18, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason action #3 modifies the NOF ocean salmon troll commercial fishery. The area between the U.S./Canada border and the Queets River (La Push and Neah Bay subareas) is open. For the area between the U.S./Canada border and the Queets River, the landing and possession limit is 35 Chinook salmon per vessel per landing week (Thursday – Wednesday) May 18, 2023, through June 21, 2023, and for the period June 22, 2023 – through June 29, 2023.

4. Decision date: May 24, 2023. Effective May 25, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason #4 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between the Queets River and Leadbetter Point (Westport subarea) is 200 Chinook salmon per vessel per landing week (Thursday – Wednesday) May 15, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

5. Decision date: May 24, 2023. Effective May 25, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason #5 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between Leadbetter Point and Cape Falcon (Columbia River subarea) is 80 Chinook salmon per vessel per landing week (Thursday – Wednesday) May 25, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

6. Decision date: May 24, 2023. Effective May 25, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason #6 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between the U.S./Canada border and Cape Falcon is 200 Chinook salmon per vessel per landing week (Thursday – Wednesday) May 25, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

7. Decision date: June 8, 2023. Effective June 8, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason #7 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between Leadbetter Point and Cape Falcon (Columbia River subarea), is 100 Chinook salmon per vessel per landing week (Thursday – Wednesday) June 8, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

8. Decision date: June 8, 2023. Effective June 8, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason action #8 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between the Queets River and Leadbetter Point (Westport subarea), is 250 Chinook salmon per vessel per landing week (Thursday – Wednesday) June 8, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

9. Decision date: June 8, 2023. Effective June 8, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason action #9 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between the Queets River and the U.S./Canada border (La Push and Neah Bay subareas) is 40 Chinook salmon per vessel per landing week (Thursday – Wednesday) June 9, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

10. Decision date: June 8, 2023. Effective June 8, 2023, at 12:01 a.m. and remains in effect until June 29, 2023, at 11:59 p.m. Inseason action #10 modifies the NOF commercial salmon troll fishery. The landing and possession limit in the area between the U.S./Canada border and Cape Falcon is 250 Chinook salmon per vessel per landing week (Thursday – Wednesday) June 8, 2023, through June 21, 2023, and for the period June 22, 2023, through June 29, 2023.

TABLE C-9. 2023 General Management and Inseason Actions ^{a/b/} (Page 4 of 5)

11. Decision date: June 21, 2023. Effective June 21, 2023, at 11:59 p.m. and remains in effect until June 30, 2023, at 11:59 p.m. Inseason action #11 modifies the NOF ocean salmon troll commercial fishery. The area between the U.S./Canada border and Cape Falcon is closed.
12. Decision date: June 24, 2023. Effective on June 24, 2023, at 12:01 a.m., and remains in effect until June 29, 2023, at 11:59 p.m. Inseason action #12 modifies the NOF ocean salmon troll commercial fishery in the area between the U.S./Canada border and Cape Falcon. The landing and possession limit is 11 Chinook salmon per vessel for the period June 24, 2023, through June 29, 2023.
13. Decision date: June 30, 2023. Effective July 1, 2023 at 12:01 a.m., and remains in effect until superseded. Inseason action #13 modifies the NOF ocean salmon troll commercial fishery in the area between the U.S./Canada border and Cape Falcon. The landing and possession limit is 50 Chinook salmon per vessel per landing week (Thursday-Wednesday).
14. Decision date: June 30, 2023. Effective July 1, 2023, at 12:01 a.m. and remains in effect until superseded. Retention of halibut caught incidental to the commercial salmon troll fishery (U.S./Canada border to the U.S./Mexico border) is extended past June 30, 2023, and remains in effect until superseded.
15. Decision date: July 6, 2023. Effective Saturday, July 8, 2023, at 12:01 a.m., through September 30, 2023, at 11:59 p.m. Inseason action #15 modifies the NOF recreational salmon fishery between the U.S./ Canada border and the Queets River (Neah Bay and La Push subareas), daily limit of two salmon per day.
16. Decision date: July 11, 2023. Effective Thursday, July 13, 2023, at 12:01 a.m., through September 30, 2023, 11:59 p.m., for the commercial troll fishery in the area between the U.S./Canada border and Cape Falcon, landing and possession limit of 35 Chinook salmon per vessel per landing week (Thursday - Wednesday).
17. Decision date: July 1, 2023. Effective Thursday, July 1, 2023, at 12:01 a.m., Inseason action modifies the July-September subquota for the treaty Indian salmon fishery north of Cape Falcon that was set preseason at 22,500 Chinook salmon, to 38,265 Chinook salmon through an impact-neutral rollover of unused May-June subquota.
18. Decision date: July 19, 2023. The following modifications to the area north of Cape Falcon have been made:
 - Effective Thursday, July 20, 2023, at 12:01 a.m., through Wednesday, July 26, 2023, at 11:59 p.m., for the commercial troll fishery in the area between the U.S./Canada border and Cape Falcon, landing and possession limit of 30 Chinook salmon and 150 adipose marked coho salmon per vessel per landing week (Thursday - Wednesday).
 - Effective Thursday, July 27, 2023, at 12:01 a.m., through Wednesday, August 2, 2023, at 11:59 p.m., for the commercial troll fishery in the area between the U.S./Canada border and Cape Falcon, landing and possession limit of 20 Chinook salmon and 150 adipose marked coho salmon per vessel per landing week (Thursday - Wednesday).
 - Effective Thursday, August 3, 2023, at 12:01 a.m., the commercial salmon troll fishery in the area between the U.S./Canada border and Cape Falcon is closed. All preseason regulations remain in place.
19. Decision date: July 26, 2023. Effective Friday, July 28, 2023, at 12:01 a.m. for the recreational salmon fishery from the Queets River to Leadbetter Point (Marine Area 2 - Westport subarea), retention of Chinook salmon is prohibited on Fridays and Saturdays. Possession of Chinook salmon is illegal when retention is prohibited in the area.
20. Decision date: August 15, 2023. Effective Thursday, August 17, 2023, at 12:01 a.m., through Saturday, September 30, 2023, at 11:59 p.m. the commercial salmon troll fishery in the area between the U.S./Canada border and Cape Falcon is open, with landing and possession limits of 7 Chinook salmon and 100 adipose marked coho salmon per vessel per landing week (Thursday-Wednesday).
21. Decision date: August 17, 2023. Effective 12:01 a.m. Friday, August 18, 2023, through 11:59 PM, Saturday, September 30, 2023, the recreational salmon fishery from the Queets River to Leadbetter Point (Marine Area 2 - Westport subarea) is open with a daily limit of two salmon, only one of which may be a Chinook salmon. All coho salmon must be marked with a healed adipose fin clip.
22. Decision date: August 25, 2023. Effective Saturday, August 26, 2023, at 12:01 a.m., for the commercial salmon troll fishery from the U.S./Canada border to Cape Falcon, the remaining coho salmon quota is adjusted, on an impact neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho salmon quota is 9,070. The landing and possession limit for coho salmon is modified to 100 coho salmon (marked or unmarked) per vessel per landing week (Thursday through Wednesday). The landing and possession limit for Chinook salmon remains 7 Chinook salmon per vessel per landing week (Thursday through Wednesday).

TABLE C-9. 2023 General Management and Inseason Actions ^{a/b/} (Page 5 of 5)

23. Decision date: August 25, 2023. Effective Saturday, August 26, 2023, at 12:01 a.m., for the recreational salmon fishery from Cape Falcon to Leadbetter Point (Marine Area 1 - Columbia River subarea), the remaining coho salmon quota is adjusted, on an impact neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho salmon quota is 21,740. The daily limit is modified to 2 salmon per day, only one of which may be a Chinook salmon.

24. Decision date: August 25, 2023. Effective Saturday, August 26, 2023, at 12:01 a.m., for the recreational salmon fishery from Leadbetter Point to the Queets River (Marine Area 2 - Westport subarea), the remaining coho salmon quota is adjusted, on an impact neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho salmon quota is 16,010. The daily limit is modified to 2 salmon per day, only one of which may be a Chinook salmon.

25. Decision date: August 25, 2023. Effective Saturday, August 26, 2023, at 12:01 a.m., for the recreational salmon fishery from Queets River to Cape Alava (Marine Area 3 - LaPush subarea), the remaining coho salmon quota is adjusted, on an impact neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho salmon quota is 1,210. The daily limit is modified to 2 salmon per day; retention of chum salmon is prohibited.

26. Decision date: August 25, 2023. Effective Saturday, August 26, 2023, at 12:01 a.m., for the recreational salmon fishery from Cape Alava to the U.S./Canada border (Marine Area 4 - Neah Bay subarea), the remaining coho salmon quota is adjusted, on an impact neutral basis, from mark-selective to non-mark-selective. The adjusted non-mark-selective coho salmon quota is 4,800. The daily limit is modified to 2 salmon per day; retention of chum salmon is prohibited. The portion of the subarea east of the Bonilla-Tatoosh line is closed to fishing for salmon.

27. Decision date: September 6, 2023. Effective Thursday, September 7, 2023, at 12:01 a.m. through Saturday, September 30, 2023, at 11:59 p.m., for the commercial salmon troll fishery in the area between the U.S./Canada border and Cape Falcon, landing and possession limit of 15 Chinook salmon and 100 coho salmon per vessel per landing week (Thursday-Wednesday).

a/ Unless stated otherwise, season openings or modifications of restrictions are effective at 00:01 hours of the listed date. Closures are effective at 23:59 hours of the listed date. NMFS inseason actions are results of conference calls between state, federal and tribal fishery managers.

b/ Preseason fishing structure are in Preseason report III, Tables 1-3 found on the Council's website (pcouncil.org). Updated regulations reflecting inseason actions are also published on the NOAA fisheries.noaa.gov Westcoast webpage.

c/ A summary of actual fishing seasons are provided in Chapter I, Tables 1-3 and a more detailed summary is provided in Appendix C, Table C1-C7.

a/ All values in this table are based on preliminary information available at the start of each year's review. Treaty Indian statistics include landings from

b/ Season totals include additional winter treaty Indian troll.

c/ In 1994-1996 the non-Indian fishery for Chinook was closed north of Cape Falcon; however, Chinook were caught off Oregon and landed in Washington.

TABLE D-4. California troll combined Chinook and coho salmon landings in dressed weight, value of landings, and number of registered vessels making commercial salmon landings.^{a/}

a/ Derived from vessel registrations and fish landing tickets.

b/ In 1980, the establishment of a restricted vessel permit system drew a number of historically active vessels back into the

c/ In 1984, vessels were not required to land at least one salmon to be eligible for a permit in 1985. The Oregon Fish and Wildlife Commission waived this requirement because of the elimination of the coho fishery south of Cape Falcon.

d/ In 1985, vessels traditionally landing salmon south of Cape Blanco and north of Cape Falcon were not required to land at least one salmon to be eligible for a permit in 1986. The Oregon Fish and Wildlife Commission waived this requirement

because of the complete closure of the coho season south of Cape Blanco and a limited one-day coho season between the

e/ During the 1991 session of the Oregon Legislature, legislation passed waiving the requirement that troll permit holders must buy a 1991 permit to be able to renew for 1992. This was a one-time exemption for 1991 only.

f/ Permits were reissued in a lottery, because the total number of permits had fallen below 1,200.

g/ Preliminary.

2023	429	3,358	93	151	36,108	36,108

a/ Derived from vessel registrations and fish landing tickets. All values in this table are based on preliminary information available at the start of each year's salmon review.

b/ 312 licenses and delivery permits purchased by buyback program in 1984.

c/ 118 licenses and delivery permits purchased by buyback program in 1985.

d/ The 1994 season was closed north of Cape Falcon, but Chinook were caught off Oregon and landed in Puget

e/ Value information in 1994 is not provided in order to preserve confidentiality.

f/ Vessels were not required to purchase a permit in 1994 to maintain their eligibility for a permit in 1995.

g/ 190 licenses and delivery permits purchased by buyback program in 1995.

h/ 72 licenses and delivery permits purchased by buyback program at the end of 1996 and early 1997.

i/ 100 licenses and delivery permits purchased by buyback program at the end of 1997 and early 1998.

j/ 41 licenses purchased by buyback program at the end of 2000.

a/ "Home state" refers to the declared state of residence of vessel skipper, who, in most cases, is also the vessel owner.

b/ Includes vessels with home states other than California, Oregon, and Washington.

c/ Includes vessels of unknown lengths.

d/ Length category for 1982 is ≥36.

TABLE D-17. Percentages of vessels landing troll salmon in Oregon by license holder's state of residence.

a/ Legislation that created the license requirement expired in 1987. Annual license fees were between \$25 and \$100 from 1980-1987. The license requirement was reinstituted by rule in 1988 and 1989 with a \$10 fee.

b/ Beginning in 1990, responsibility for licensing of charter vessels was transferred to the Marine Board, and fees for Oregon residents were increased from \$10 to between \$50 and \$100.
