Introduction

The primary objective of this report is to determine total fishing mortality for groundfish species in U.S. west coast fisheries in 2009 in order to evaluate their status relative to Acceptable Biological Catch (ABC) and Optimum Yield (OY) harvest management goals. The ABC is a biologically based estimate of the amount of fish that may be harvested by the fishery each year without jeopardizing the resource and is used to set the upper limit of the annual total allowable catch. An OY is defined as the amount of fish that will provide the greatest overall benefit to the Nation, particularly with respect to food production and recreational opportunities, and taking into the account the protection of marine ecosystems. Both of these management goals are published in the federal groundfish regulations each year for selected groundfish species (50 CFR 660 Subpart G). This report summarizes estimates of 2009 discarded catch, retained landings, and total fishing mortality of the species published in federal regulations and compares mortality estimates to OY and ABC harvest management goals for 2009.

Our inventory of 2009 total fishing mortality includes summaries from the following groundfish fishery sectors (*Sectors with observer program data used for analyses and discard estimation in this report.):

- Commercial limited entry (LE) non-midwater trawl*
- Commercial limited entry non-midwater trawl - targeting California halibut*
- Commercial open access (OA) non-midwater trawl - targeting California halibut*
- Commercial fixed gear state-permitted nearshore (Oregon/California)*
- Commercial fixed gear limited entry sablefish primary (tier endorsed)*
- Commercial fixed gear limited entry non-primary sablefish (non-endorsed and daily trip limit sectors)*
- Commercial fixed gear open access daily trip limit*
- At-sea Pacific hake/whiting catcher-processor*
- At-sea Pacific hake/whiting mothership*
- At-sea Pacific hake/whiting tribal*
- Exempted fishing permit
- Commercial limited entry midwater trawl (shoreside hake)
- Tribal (shoreside fisheries)
- Recreational (Washington/Oregon/California)
- Research

Other non-groundfish fisheries included with incidental catch of groundfish species:

Commercial shrimp trawl – north of 40° 10' N latitude*

Commercial shrimp trawl – south of 40° 10' N latitude

Commercial open access midwater trawl

Commercial open access non-midwater trawl – not targeting California halibut

Commercial other gear groups - not trawl, shrimp trawl, or fixed-gear

Commercial OA and LE fixed gear non-nearshore, non-sablefish –

LE only north of 36° N latitude (see methods section)

Other exempted fishing permits

Data Sources

This report includes an inventory of groundfish fishing mortality from all available sources, as well as results from discard estimation analyses. Data sources used in this report include landing receipt data (referred to as fish tickets), trawl logbook data, onboard observer data, recreational data provided by state agencies, research catch data provided by NOAA's Northwest Regional Office (NWR), and additional information from the Pacific Fishery Management Council's (PFMC) Groundfish Management Team (GMT).

Records of fleet-wide landings are the cornerstone of retained catch information for all sectors of the commercial groundfish fishery on the west coast. Landing receipts are completed by fish-buyers in each port for each delivery of fish by a vessel. Fish tickets are trip-aggregated sales receipts by market categories. They are issued to fish-buyers by a state agency and must be returned to the agency for processing. Fish tickets are designed by the individual states, and Washington, Oregon, and California each have a slightly different format of receipt. In addition, each state conducts species-composition sampling for numerous market categories that are reported on fish tickets. Market categories represent either a single species or a mixture of species. Fish ticket and species-composition data are submitted by state agencies to the Pacific Coast Fisheries Information Network (PacFIN) regional database, which is maintained by the Pacific States Marine Fisheries Commission (PSMFC). Percentages for the species composition within market categories were applied to the fish ticket data used in our analyses. As such, landed weights from sampled market categories were distributed to individual species whenever possible.

Fish ticket landings data for the calendar year of 2009 were retrieved from the PacFIN database and subsequently divided into various sectors of the groundfish fishery as indicated in Figure 1. All additional data processing steps that were applied during the discard estimation process are described in the methods section below.

Logbook record-keeping is a state-mandated requirement for the LE groundfish trawl sector in Washington, Oregon, and California. A common-format logbook is used by all three states and completed logbook information is entered into state agency databases. The electronic logbook data are then submitted by state agencies to the PacFIN regional database.

Trawl logbook data for the calendar year 2009 were retrieved from the PacFIN database and divided into various sectors of the groundfish fishery as indicated in Figure 1. All additional data processing steps that were applied during the discard estimation process are described in the methods section below. Logbook data from the open-access groundfish trawl sector were not included in our analyses.

Discard estimation analyses focused on commercial groundfish fishery sectors in which the Northwest Fishery Science Center (NWFSC) Fishery Resource Analysis and Monitoring Division (FRAM) has conducted scientific at-sea observation of discards. The West Coast Groundfish Observer Program (WCGOP) and the At-Sea Hake Observer Program (A-SHOP) observe distinct sectors of the groundfish fishery. The WCGOP observes a number of different sectors of the groundfish fishery, including the limited entry (LE) groundfish bottom trawl, limited entry and open access (OA) fixed gear, and state-permitted nearshore fixed gear sectors. The WCGOP also observes several fisheries that incidentally catch groundfish, including the California halibut trawl and pink shrimp trawl fisheries. WCGOP data from each of these groundfish sectors and fisheries were used for the purposes of discard estimation. Observations

by the A-SHOP from the catcher-processor, mothership, and tribal components of the at-sea Pacific hake/whiting fishery were also used for mortality estimates in this report.

The WCGOP was established in 2001 by NOAA Fisheries (National Marine Fisheries Service, NMFS) (66 FR 20609). All commercial vessels that land groundfish caught in the United States Exclusive Economic Zone (EEZ) from 3-200 miles offshore are required to carry an observer when notified to do so by NMFS or its designated agent. Subsequent state rule-making also requires vessels that fish for groundfish within 3 miles of shore or participate in other state-managed fisheries to carry WCGOP observers when notified. The WCGOP's goal is to improve total catch estimates by collecting information on the discarded catch (fish returned overboard at-sea) of west coast groundfish species. The WCGOP coverage plan details program goals, vessel selection, observer coverage, and basic data collection (NWFSC 2006). A list of fisheries in order of coverage priority and detailed information on data collection methods employed in each observed fishery can be found in the WCGOP manual (NWFSC 2009).

The sampling protocol employed by the WCGOP is primarily focused on the discarded portion of catch. In order to ensure that the recorded weights for the retained portion of the observed catch are accurate, haul-level retained catch recorded by WCGOP observers are reconciled with trip-level fish ticket records. The WCGOP data are linked to fish tickets by fish ticket number(s) obtained by the observer and are adjusted so that the total trip pounds of retained fish equals the total trip pounds on the fish ticket. This is done because the fish ticket weight is more accurate and fish tickets are legally binding documents. These steps are described in further detail in annual reports produced by the WCGOP (<http://www.nwfsc.noaa.gov/research/divisions/fram/observer/datareport/index.cfm>) and were conducted prior to the analyses presented in this report. All additional data processing steps that were applied to the WCGOP data during the discard estimation process are described in the methods section below.

The At-Sea Hake Observer Program (A-SHOP) has conducted observations of the west coast at-sea Pacific hake/whiting fishery since 2001. Prior observations were conducted by the North Pacific Groundfish Observer Program. A-SHOP program information and documentation on data collection methods can be found in the observer manual (AFSC 2009). The at-sea hake/whiting fishery has 100% mandatory observer coverage, with each processor over 125' carrying two observers.

Each year, a certain portion the OY and ABC for groundfish species is harvested through various research activities. In 2009, research programs that caught groundfish included the NWFSC's groundfish bottom trawl, pre-recruit, hook and line surveys, and the International Pacific Halibut Commission's (IPHC) longline survey, as well as other programs or scientific research permits. All groundfish research catch information was provided to NOAA's Northwest Regional Office (NWR). These data were then summarized by the NWR and included in this report.

In addition to these data sources, further information provided by the GMT was also used in the total mortality estimation process. The GMT is an advisory body to the PFMC that is comprised of representatives from federal, state, and Tribal agencies and is involved in evaluating management performance and alternatives for groundfish fisheries between the U.S. borders with Canada and Mexico. The GMT analyzes catch-related information from all sectors of the groundfish fishery to assist in groundfish management. For the purposes of this analysis, the GMT provided mortality rates, which are assumptions regarding the survival of discards, for sablefish and lingcod in the trawl and fixed gear sectors and for the major species groupings reported in the state-permitted fixed gear nearshore sector.

Methods

Discard Estimation Methods

We used a deterministic approach to estimate discard mortality for all sectors of the groundfish fishery for which WCGOP observer data were available. Through this approach, observed discard rates for each species were directly expanded to the fleet-wide level. First, discard ratios were computed from observer data as the discarded weight of a particular species/species group divided by the weight of retained catch of either all groundfish (excluding Pacific hake), sablefish, or other targeted species. Denominators differed for each sector of the fishery based on the targeting behavior of that sector. Discard ratios were then multiplied by the total fleet-wide landed weight of groundfish, sablefish or other species (depending on the denominator used to compute observed discard ratios). This provided an expanded estimate of fleet-wide discard weight for each species. Because of differences in data availability and management structure among the various sectors of the groundfish fishery, this approach was applied with slight modifications for each sector. In order to outline each of these modifications explicitly, more detailed methodology of discard estimation is presented for each sector below.

Limited Entry Bottom Trawl Sector

Fleet-wide discard estimates for the LE bottom (non-midwater) trawl sector were derived from WCGOP observer data, fish ticket landings data, and trawl logbook data. Fish ticket and logbook data were isolated for this sector based on processing steps outlined in Figure 1. A summary of observer data for the 2009 LE bottom (non-midwater) trawl sector is presented in the WCGOP data report and summary analyses of the U.S. west coast limited entry groundfish bottom trawl fishery published in October 2010 (NWFSC 2010a).

LE bottom trawl vessels can hold a California halibut bottom trawl permit and participate in the state-permitted California halibut fishery. California halibut tows can occur on the same trip as tows targeting groundfish and were identified in logbook and observer data based on the following criteria: 1) the tow target was California halibut or 2) the tow target was nearshore mix, sand sole, or other flatfish, and the tow took place in less than 30 fathoms and south of 40°10' N. latitude. All tows in the observer and logbook data that met at least one of the above requirements were removed from the LE bottom trawl data sets and included as data for the California halibut fishery (see below). Whether in observer or logbook data, the tow target was typically determined by the vessel captain.

Several additional filtering steps were then applied to the data in order to ensure that we had distinguished data for the LE bottom trawl sector appropriately. First, we investigated fish ticket data for landings of more than 2 mt of Pacific hake on a given day, in order to remove them and thus exclude effort that was targeted exclusively towards this species. A similar check was performed on the observer and logbook data, such that tows with more than 2 mt of retained Pacific hake were flagged for removal. On the basis of the Pacific hake catch criterion, five observed tows and one logbook tow met the criterion and all were removed from the 2009 data before analyses.

Next, trawl logbook and observer data were filtered to ensure that all spatial and temporal information was complete. Any tows lacking a recorded depth or latitude were removed. None of the tows in the 2009 observer data met these criteria. However, 13 tows were removed from the 2009 logbook data set due to a lack of depth information.

Observer data and trawl logbook data were then stratified by management area, depth, and season (Table 1). Records were separated into two groundfish management areas, north and south of 40° 10' N. latitude. Each management area was divided into three depth strata (0-125, 126-250, >250 fathoms). Two-month cumulative trip limit periods were combined to form two seasonal strata: winter (November-April) and summer (May-October). In some cases, if the numbers of observations in particular strata were too limited, data were aggregated across depth strata. In the south during the winter, data were combined across the two shallowest depth strata (0-125 and 126-250 fathoms). Aggregated strata are shown in Table 1, which presents the spatial and temporal distribution of tows and retained FMP groundfish (excluding Pacific hake) weight in the 2009 observer and trawl logbook data.

A similar table for the 2008 LE bottom trawl fishery was provided in the previous groundfish total mortality report (Bellman et al. 2009, Table 1). It is unclear how the process of combining strata may influence discard and bycatch ratios. The validity of stratification in terms of isolating variance in discard has not yet been objectively tested. Until more work can be completed to evaluate which strata (area/depth/season) are most appropriate for this discard analysis, broader stratification is warranted. The broader depth strata used in the present analysis continue to highlight the areas shoreward and seaward of RCA closures relevant in the fishery management framework. Broader depth stratification also provides consistency when evaluating discard or bycatch over time, as depth-based spatial closures change on a yearly basis. The depth strata utilized in this report were also used in analyses which evaluated discard and total mortality estimates over time, using all available years of WCGOP data from 2002-2008 (Bellman and Heery In Preparation).

It should be noted that this stratification scheme is inconsistent with the sampling design employed by the WCGOP. The authors recognize this fact, but used this method in order to provide estimates that were relevant within the spatial and temporal structure of groundfish management. Measures of uncertainty are not provided within this context, as they would be biased by post-stratification.

Once data had been stratified, discard ratios were computed from the observer data and multiplied by logbook catch weights in each stratum (Figure 2). This was done according to the following equation:

$$\hat{D}_{sxab} = \frac{\sum_t d_{sxt}}{\sum_t r_{xt}} \times \sum_t R_{xabt}$$

where:

- s : species or species group
- x : index strata (area, depth, season)
- a : state of landing (Washington, Oregon or California)
- b : bimonthly period (Jan-Feb, Mar-Apr, ... , Nov-Dec)
- t : tows d : observed discard weight of species s
- r : observed retained weight of all FMP groundfish excluding Pacific hake
- R : weight of retained FMP groundfish (excluding Pacific hake) recorded in logbooks
- \hat{D} : initial discard estimate for species s in stratum x , state a and bimonthly period b

Note that the denominator of observed discard ratios and the logbook expansion factor differed from those used in total mortality analyses of data prior to calendar year 2007, in that the present rates include all FMP

groundfish retained weight excluding Pacific hake. Prior to analysis of 2007 data, discard ratio denominators and logbook expansion factors included either the retained weights of individual species or the retained weight of a group of target species. The current approach was favored after an internal examination of the methodology revealed that discard estimates computed using retained weights from individual target species were more susceptible to errors caused by inconsistent species codes in the observer, logbook and fish ticket data sets. We chose to include all groundfish excluding Pacific hake in the denominator rather than a group of target species because of differences in targeting behavior on a coast-wide and temporal basis. Pacific hake was excluded when using the retained FMP groundfish denominator because vessels that target or land large amounts of this species are considered to be part of Pacific hake sectors, which are distinct from the groundfish bottom trawl sector. A complete listing of groundfish species included in the Groundfish Fishery Management Plan and used to compute and expand discard ratios is provided in Appendix A.

In all cases where a FMP groundfish species grouping was used to compute discard ratios, any retained weights that were recorded by the observer but that did not appear on fish tickets were excluded from the denominator. This was necessary to prevent double-counting associated with differences in the species codes used by observers and processors. For instance, while observers may record rockfish catch at the species level, various species of rockfish are often grouped, weighed, and recorded together on the fish ticket under a grouped species code such as NUSP - northern unspecified slope rockfish. In some cases, this difference in species coding prevents observer and fish ticket weights from matching and adjusting properly. Species coding on fish tickets varies considerably between processors and over time, and it is not possible to make assumptions regarding which individual observer-recorded species likely coincide with species grouping codes on fish tickets. Instead, by using only the retained groundfish weight from fish tickets in discard ratio denominators, we prevent double-counting of retained weights. This is not a factor when using a single species in the denominator, such as sablefish in the fixed gear fisheries (see below), as any retained weights in observer and fish ticket data that share the same species code will match and adjust properly.

Discard ratios and standard errors for the LE bottom trawl fishery are presented in Tables 2a-2b by area, season, and depth. Species were grouped according to Appendix B. Groundfish species that are currently being managed under rebuilding plans are presented separately from non-rebuilding species.

Although retained logbook weights of FMP groundfish (excluding Pacific hake) were initially used to expand observed discard ratios to the fleet-wide level in this sector, logbooks are not submitted for 100% of trawl trips and therefore do not capture all groundfish bottom trawl fishing effort. As a result, it was necessary to adjust initial fleet level discard estimates to reflect the level of effort indicated by fish ticket landings. To do this, both the fish ticket and logbook data were aggregated by state and bimonthly periods (Figure 2), which are associated with cumulative trip limits. An adjustment ratio was then computed for each state and bimonthly period as the weight of FMP groundfish (excluding Pacific hake) recorded on fish tickets divided by that recorded in logbooks. Each adjustment ratio was multiplied by coinciding discard estimates and then summed across bimonthly periods, states, and spatial-temporal strata to produce coast-wide adjusted discard estimates for each species:

$$adj(\hat{D}_s) = \sum_x \sum_a \sum_b \hat{D}_{sxab} \times \frac{F_{ab}}{R_{ab}}$$

where:

F : weight of retained FMP groundfish (excluding Pacific hake) recorded on fish tickets

$adj(\hat{D}_s)$: adjusted discard estimate for species s

Adjustment ratios were computed separately for each state and bimonthly period in order to account for differences between individual states' logbook submission rates and fish ticket recording methods. An adjustment ratio value less than 1 indicated that more FMP groundfish weight was recorded in logbooks than on fish tickets. Conversely, adjustment ratios greater than 1 occurred when fish ticket FMP groundfish weights were larger than logbook weights. In 2009, the value of the adjustment ratios computed for the LE bottom trawl sector ranged between 0.959 and 1.331, with a mean of 1.062. Only two state-bimonthly period strata had ratios less than 1, which occurred from January through February, in Washington and Oregon. The largest adjustment ratio occurred in Washington from November through December. The majority of adjustment ratios for state and bimonthly periods were slightly larger than 1.

Coast-wide landings, final discard estimates, and total fishing mortality in the 2009 LE groundfish bottom trawl sector are reported in Table 3. A 50% rate of mortality was applied to discarded sablefish and lingcod weight, as assumed by the GMT. It should also be noted that total estimated fishing mortality is now individually reported for big skate, California skate, longnose skate, and unspecified skate. In the past, a single combined estimate was provided because skates were landed as 'unspecified skate' rather than under individual species names. As such, it was not possible to accurately summarize the mortality associated with landings for individual skate species. In March 2009, a new federal sorting requirement was enacted to specify longnose skate landings (74 FR 9874). Additional state requirements ensured that skates were landed whole (with wings on), which allowed for more accurate speciation of skate landings. Estimated discard and landings for several non-groundfish species of interest as bycatch in this fishery are also reported (i.e. Dungeness crab, etc.).

California Halibut Bottom Trawl Fishery

Fleet-wide discard estimates in the California halibut bottom trawl fishery were derived from WCGOP observer data and fish ticket landings data. Although all California halibut vessels are permitted by the state of California, we considered this fishery to consist of both a limited entry and an open access component (vessels that do not have federal limited entry groundfish permits). The WCGOP provides observer coverage for both of these components. Observer data for the LE component of the California halibut fishery were collected as part of the LE groundfish bottom trawl sector. Observer data for the California halibut fishery were then subsequently isolated based on the following criteria: 1) the tow target was California halibut or 2) the tow target was nearshore mix, sand sole or other flatfish, and the tow took place in less than 30 fathoms, south of 40°10' N. latitude. All tows in the observer data that met at least one of the above requirements were included in the LE California halibut bottom trawl dataset. The WCGOP randomly samples the OA California halibut sector separately. This is described further in the WCGOP data report and summary analyses of limited entry and open access trawl vessels targeting California halibut, published in October 2010 (NWFSC 2010b). These two components of the California halibut trawl fishery remained separate in this analysis.

Discard ratios were computed for this fishery using the retained weight of California halibut in the denominator. The total landed weight of California halibut was then used as a multiplier to expand observed discard ratios to the fleet-wide level. Just as discard ratios were computed separately for the LE and OA observed components of the California halibut fishery, total fleet-wide landings had to be identified separately for each sector as well. For both the LE and OA sectors, landed California halibut weight was compiled

from “non-midwater” trawl fish tickets (see Figure 1) for those vessels that had a state-issued California halibut bottom trawl permit.

Table 4 presents the total LE and OA landed weights of California halibut that were used as multipliers to expand observer discard ratios to the fleet-wide level. Also summarized in this table is the number of observed vessels, trips, and tows, as well as discard ratios. Discard ratios were calculated by dividing the observed discard weight of each species or species group by the observed retained weight of California halibut. Discard estimates were computed for each sector based on the following equation:

$$\hat{D}_s = \frac{\sum_t d_{st}}{\sum_t r_t} \times F$$

where:

- s : species or species group
- t : observed tows
- d : observed discard weight of species s
- r : observed retained weight of California halibut
- F : weight of retained California halibut recorded on fish tickets
- \hat{D}_s : discard estimate for species s

Any species groups used are grouped according to Appendix B. Groundfish species that are being managed under rebuilding plans are presented separately from non-rebuilding species (Table 4).

Although FMP groundfish and California halibut weights from the same fish tickets were used to adjust initial LE groundfish bottom trawl estimates and to expand discard ratios for the LE California halibut fleet, this is not anticipated to be a major source of bias in our analysis, as the primary species retained on observed California halibut tows were non-groundfish (NWFSC 2010b). However, since some flatfish species were retained on these tows, it is possible that estimates for the shallowest strata in California for the LE groundfish bottom trawl sector could have been positively biased due to slightly larger adjustment ratios (caused by the inclusion of landed flatfish weight that was in fact caught on California halibut tows). Examination of the species composition on fish tickets in the areas where California halibut is typically landed suggests that the impact of this is minor. Given that groundfish are regularly discarded by the LE California halibut fishery, we felt that it was more appropriate to estimate discard for this fishery than to exclude LE California halibut discard estimates altogether from this report.

The product of discard ratios for each species and the total fish ticket landed weight of California halibut produced expanded fleet-level discard estimates for each fishery component (LE and OA). These estimates are presented in Table 5, along with total open access landings and estimated mortalities of species caught in the 2009 California halibut trawl fishery. A 50% rate of mortality was applied for discarded lingcod, as assumed by the GMT in the limited entry bottom trawl sector. Estimated discard and landings for several non-groundfish species of interest as bycatch in this fishery are also reported (i.e. Dungeness crab, eulachon, and Pacific halibut). Since limited entry vessels participating in the California halibut fishery often land catch at the same time as catch from bottom trawl tows targeting groundfish, it was not possible to split out landed weights for groundfish species from those reported in the LE bottom trawl sector. Joint groundfish landings for the LE bottom trawl sector and for LE vessels targeting California halibut are presented in Table 3.

Pink Shrimp Trawl Fishery

Fleet-wide discard estimates for the pink shrimp trawl fishery were derived from WCGOP observer data and fish ticket landings data. Fish ticket data were assigned to this fishery using the classification system outlined in Figure 1. A summary of the observer data for the 2009 pink shrimp trawl fishery can be found in the WCGOP data report and summary analyses of open access trawl vessels targeting pink shrimp, published in October 2010 (NWFSC 2010c).

Discard ratios were computed for this fishery using the retained weight of pink shrimp in the denominator (Table 6). The total landed weight of pink shrimp was then used as a multiplier to expand observed discard ratios for this fishery to the fleet-wide level. Since observer data in 2009 were only available north of 40°10' N. latitude, only pink shrimp fish tickets in the north were compiled for the expansion. We assumed the same discard rates for all pink shrimp fleets in the north. Pink shrimp landings from south of 40°10' N. latitude are summarized as part of the remaining incidental fisheries landings in Table 18. The number of observed vessels, trips, and tows are also summarized in Table 6. Discard ratios for this fishery were calculated by dividing the observed discard weight of each species or species group by the observed retained weight of pink shrimp. The equation for the expansion of pink shrimp discard ratios is identical to that presented for the California halibut fishery, but where r represents the retained weight of pink shrimp and F represents the weight of retained pink shrimp recorded on fish tickets. Any species groups used were grouped according to Appendix B. Groundfish species that are being managed under rebuilding plans are presented separately from non-rebuilding species. Table 7 presents landings, final discard estimates, and total fishing mortality in the 2009 pink shrimp trawl fishery. Estimated discard and landings for several non-groundfish species of interest as bycatch in this fishery are also reported (i.e. Dungeness crab, eulachon, etc.).

Non-Nearshore Fixed Gear Sector

Fleet-wide discard estimates for the LE and OA non-nearshore fixed gear sector of the groundfish fishery were derived from WCGOP observer data and fish ticket landings data. A mortality rate provided by the GMT for sablefish was also employed in the analyses for this sector once discard had been estimated. Fish ticket data were assigned to this sector using the classification system outlined in Figure 1. Fish tickets for fixed gear that did not have recorded sablefish or nearshore species, were included in the non-nearshore fixed gear sector only if total groundfish landings were greater than non-groundfish landings based on a unique vessel and landing date. If non-groundfish landings were greater than groundfish landings, those fixed gear fish tickets (which also did not have recorded sablefish or nearshore species) were included in incidental landings. The commercial fixed gear fish tickets with recorded nearshore species weight were not used in this portion of the fixed gear analysis, regardless of whether they included recorded weights for sablefish. These fish tickets were instead included in the nearshore fixed gear groundfish sector (see next section).

Fish tickets were partitioned into three commercial fixed gear subsectors: LE sablefish primary, LE sablefish non-endorsed, and OA fixed-gear sablefish. Commercial fixed gear fish tickets were first divided out by whether the vessel had a federal groundfish permit (limited entry) or no federal groundfish permit (open access). OA fish tickets were placed in the OA fixed gear sablefish subsector. Next, LE fish tickets were separated based on whether the vessel's federal groundfish permit(s) had a sablefish endorsement (sablefish-endorsed) with tier quota for the primary season subsector or whether it was not endorsed (also referred to as '0' tier permits). The LE sablefish primary season takes place from April through the end of October. Fish tickets for all LE sablefish vessels with tier endorsements that were operating within this period and within

their allotted tier quota were placed in the LE sablefish primary subsector. If LE sablefish-endorsed vessels fished outside of the primary season (November through March) or made trips within the season after they had reached their tier poundage, the fish tickets were placed in the sablefish non-primary subsector. In addition, fish tickets from non-endorsed LE vessels were also placed in the sablefish non-primary subsector.

The WCGOP observes the following fixed gear subsectors in order of priority: LE sablefish-endorsed primary season fixed gear, LE '0' tier (non-endorsed) and OA fixed gear (non-nearshore). LE sablefish-endorsed vessels that were fishing outside of the primary season subsector or that had reached their quota in the primary season were not observed in 2009. Data used in our analyses were collected from these three observed fisheries, and are summarized in the WCGOP data report and summary analyses of the U.S. west coast non-nearshore fixed gear fishery, published in October 2010 (NWFSC 2010d).

WCGOP observer data were stratified according to subsector, area, and gear group (where applicable) (Table 8). Records were separated into three areas; north of the groundfish management line at 40° 10' N. latitude, from 40° 10' to 36° N. latitude, and south of 36° N. latitude. Area stratification was structured in accordance with PFMC management of sablefish trip limits. Data were summarized separately for longline and pot/trap gear groups. Because logbook data are not available for the non-nearshore fixed gear sector, data associated with the depth of fishing for the entire fleet were not available. However, 2009 fishery management restricted fixed gear fishing to depths greater than 100 fathoms in the area north of 40° 10' N. latitude, with the exception of fishing greater than 125 fathoms from 45° 3.83' to 43° N. latitude, and to depths greater than 150 fathoms in the area south of 40° 10' N. latitude. These depth zones are therefore tied to area strata, but no further depth stratification of fixed-gear fishing effort is possible.

The number of observed vessels, trips, and sets are summarized for each subsector in Tables 9-11, along with the weight of sablefish and FMP groundfish (excluding Pacific hake) landings used as a measure for expanding discard from observed trips to the entire fleet. Discard ratios were calculated by area stratum, as well as by gear group when an adequate sample size was available. Any species groups used were grouped according to Appendix B. Groundfish species that are being managed under rebuilding plans are presented separately from non-rebuilding species.

In all cases where a FMP groundfish species grouping was used to compute discard ratios, any retained weights that were recorded by the observer but that did not appear on fish tickets were excluded from the denominator. This was necessary to prevent double-counting associated with differences in the species codes used by observers and processors. For instance, while observers may record rockfish catch at the species level, various species of rockfish are often grouped, weighed, and recorded together on the fish ticket by the processor under a grouped species code such as NUSP - northern unspecified slope rockfish. In some cases, this difference in species coding prevents observer and fish ticket weights from matching and adjusting properly. Species coding on fish tickets varies considerably between processors and over time, and it is not possible to make assumptions regarding which individual observer-recorded species likely coincide with species grouping codes on fish tickets. Instead, by using only the retained groundfish weight from fish tickets in discard ratio denominators, we prevent double-counting of retained weights. This is not a factor when using a single species in the denominator, such as sablefish in the area north of 36° N. latitude, as any retained weights in observer and fish ticket data that share the same species code will match and adjust properly.

Discard ratios in the two areas north of 36° N. latitude were calculated by dividing the stratum discard weight of each species by the retained catch weight of sablefish. Discard ratios for all species in the area south of 36° N. latitude were calculated by dividing the stratum discard weight of each species by the retained catch weight of all groundfish species listed in the Pacific Coast Groundfish FMP, excluding Pacific hake (Appendix B). Retained groundfish was used as the denominator in this area rather than sablefish weight alone because fixed gear fisheries south of 36° N. latitude have a wider range of target species. A broader denominator was therefore necessary in order to effectively capture their level of fishing effort.

Next, for each subsector in each area/gear stratum, the observed discard ratio (Tables 9-11) was multiplied by the fish ticket retained weight of sablefish or all FMP groundfish species (excluding Pacific hake) as indicated in Table 8. This provided an expanded fleet level discard estimate for each subsector in the stratum. If landings were made by a fixed gear subsector for which there were no or very few WCGOP observations, the most appropriate observed discard ratios were selected and applied to these landings based on similarities in the fishery management structure, fishing and discard behavior, and the gear fished. Observations in the LE sablefish primary sector were all pooled north of 36° N. latitude by individual gear type, and not divided into the small area stratum between 36° and 40° 10' N. latitude. For another example, the LE sablefish non-primary subsector landed 192 mt of sablefish north of 40° 10' N. latitude with longline gear in 2009 but only a small portion of the fleet was observed by the WCGOP program. Given similarities in gear type and catch composition, OA fixed gear data were selected as the most appropriate source of information to supplement observer data from LE non-endorsed sablefish vessels. Observer data from both sources were combined to compute a discard ratio, which was then applied to the LE sablefish non-primary longline landings in this area.

The stratum discard amounts for all subsectors were then summed for each area and totaled coast-wide. Coast-wide landings, final discard estimates, and total fishing mortality in the 2009 LE and OA non-nearshore fixed gear sector are reported in Table 12. A 20% rate of mortality is applied for discarded sablefish, as assumed by the GMT. Estimated discard and landings for several non-groundfish species of interest as bycatch in this fishery are also reported (i.e. Dungeness crab, etc.).

Nearshore Fixed Gear Sector

Fleet-wide discard estimates for the commercial nearshore fixed gear groundfish sector of the groundfish fishery were derived from WCGOP data, fish ticket landings data, and mortality rates provided by the GMT. Fish ticket data were assigned to this sector using the classification system outlined in Figure 1 and included only those fish tickets with recorded nearshore species weight. A list of nearshore species and associated species groups used in this analysis is provided in Appendix C.

The WCGOP provides coverage for the commercial nearshore fisheries in California and Oregon based on a selection process of state-issued nearshore permits/licenses. State regulations have extended the authority of the WCGOP to require observers be carried by vessels participating in these state nearshore fisheries. Summaries of observer data for the 2009 nearshore fixed gear groundfish sector are available in the WCGOP data report and summary analyses of U.S. west coast nearshore fixed gear groundfish fishery, published in October 2010 (NWFSC 2010e). Although California and Oregon nearshore fisheries are sampled separately for observer coverage, fleet-wide discard estimates are provided for the areas north and south of the groundfish management line at 40° 10' N. latitude, in accordance with 2009 federal groundfish management specifications.

The mortality rates provided by the GMT differ for each species according to depth, and it was therefore necessary to generate discard estimates in each of the three depth strata employed by the GMT. In order to compute separate estimates by depth, 2009 fleet-wide nearshore landings had to be distributed among the three depth intervals (0-10, 11-20, >20 fathoms). The percentage of catch for each species or species group by depth was calculated based on summarized observer data from 2003-2009 (Table 13). Total landings of each nearshore species or species group in 2009 were then distributed among depth intervals using the percentages computed in the previous step. For example, 5.9 mt of landed blue rockfish were observed in the commercial nearshore fishery north of 40° 10' N. latitude from 2003-2009. Of the total observed catch (landed + discarded) of blue rockfish, 23.0% were observed in 0-10 fm, 67.2% in 11-20 fm, and 9.8% in >20 fm. Using these percentages, of the 5.9 mt of blue rockfish landed north of 40° 10' N. latitude by the nearshore fleet in 2009, 1.4 mt were distributed to the 0-10 fm depth interval, 4.0 mt to the 11-20 fm interval, and 0.6 mt to the >20 fm interval. Finally, the factors used to expand observed discard were derived by summing the distributed weights of all nearshore groundfish species within each depth stratum.

Prior to the calculation of discard ratios in this sector, WCGOP observer data were stratified by area and depth (Table 14). Area stratification was structured in accordance with federal groundfish management and depth stratification (0-10, 11-20, >20 fathoms) was structured in accordance with mortality rates provided by the GMT. In both areas, data were combined in the two deepest depth strata (11-20 and >20 fathoms) to ensure an adequate sample size. The number of observed nearshore fixed gear vessels, trips, and sets are summarized in Table 14. Discard ratios were calculated by dividing the stratum discard weight of each species or species group by the retained weight of nearshore species. All species groups used in reporting nearshore results reflect the species assignments in Appendix B. Groundfish species that are being managed under rebuilding plans are presented separately from non-rebuilding species.

Observed discard ratios (Table 14) were multiplied by the retained weight of all nearshore groundfish species within each depth stratum (Table 13). These fleet-level estimates of gross discard within each stratum were then multiplied by depth-specific discard mortality rates (provided by the GMT) to estimate the amounts of discard mortality in each stratum (Table 15a-b). In December 2007, the GMT provided a slightly revised suite of depth-specific discard survival assumptions for nearshore species. Final discard estimates for each area were obtained by summing amounts of discard mortality across depth strata. Gross discard estimates, discard mortality rates, estimated discard mortality, and total fishing mortality in the 2009 nearshore fixed gear sectors north and south of 40° 10' N. latitude are reported in Tables 15a-15b. Estimated discard and landings for several non-groundfish species of interest as bycatch in this fishery are also reported (Dungeness crab, California sheephead, etc.).

Discard Estimation Summary

The estimated fishing mortalities of major U.S. west coast groundfish species are reported by sector/fishery in Table 16. This table includes only the sectors/fisheries for which WCGOP observer data were available and for which discard estimation analyses were conducted by the authors of this report. These include the following fisheries: LE bottom trawl, California halibut trawl, pink shrimp trawl (north of 40° 10' N latitude), non-nearshore fixed gear (LE primary, LE non-primary, OA fixed gear), and nearshore fixed gear (Oregon and California). Major U.S. west coast groundfish species are presented by specific area or species group to be consistent with ABC and OY guidelines.

Discard estimation and summaries for several additional non-groundfish species observed by the WCGOP are available in separate reports; Pacific halibut is provided in Heery et al. 2010, salmon species are provided in Bellman et al. 2010a, and green sturgeon is provided in Bellman et al. 2010b.

Other Commercial Data Summaries

The midwater trawl fishery for Pacific hake/whiting is comprised of several at-sea processing fleets. The three at-sea processing sectors include: catcher-processors, motherships (with non-tribal catcher boats), and a tribal fleet delivering to motherships. Observer data were obtained from the At-Sea Hake Observer Program (ASHOP), which observes all of these at-sea sectors. The objective of observation in this program is to produce estimates of total catch in the fishery. Observers do not estimate or report amounts of discard separately. However, they provide visual estimates of the proportions of catch that are discarded. These proportions form the basis of the retained and discarded catch amounts summarized in Table 17. Fishing mortalities from all at-sea sectors of the Pacific hake fisheries are summarized in Table 19 as 'All at-sea hake fisheries'. The summary of this fishery is based exclusively on A-SHOP observer data.

In addition, there is also a Pacific hake fleet which delivers to shoreside processors. The shoreside fishery has been conducted under an Exempted Fishing Permit (EFP). Under this EFP, participants place all of their catch directly into refrigerated tanks, rather than sorting the catch on deck, in order to preserve fish quality. They are allowed to avoid penalties for catch weights which go over their allotted trip-limits at the time of landing. This is described as a "maximum" retention fishery. Summaries of catch in the shoreside hake midwater trawl fleet are included in Table 17. The summary is also included in Table 19 as 'Shoreside hake mid-water trawl'.

The summary of this fishery is based exclusively on fish ticket data assigned to this fishery using the classification system outlined in Figure 1, and then combining any commercial trawl midwater gear and any EFP midwater trawl gear fish tickets.

Landings of groundfish species from the WA tribal shoreside fisheries, which may directly target Pacific hake or other groundfish, are summarized in Table 19. The summary of this fishery is based exclusively on fish ticket data assigned to this fishery using the classification system outlined in Figure 1. Landings of several non-groundfish species of interest are also included. Discard estimates for WA tribal shoreside fisheries were not provided.

Total catch of groundfish species from the recreational fisheries are summarized in Table 19. The summary of these fisheries is based exclusively on data provided by the state agencies: the Washington Department of Fish and Wildlife, the Oregon Department of Fish and Wildlife, and the California Department of Fish and Game. Several non-groundfish species of interest are also included if data were provided.

Research catch of groundfish species is summarized in Table 19, based on data provided by the NOAA Northwest Regional Office. Total catch weight (discarded + retained) was summarized from reporting based on scientific research permits that directly or indirectly caught groundfish off the U.S. west coast.

Landings of groundfish species from other non-groundfish fisheries operating under federal open access landing limits, which are mostly state-managed and incidentally catch groundfish, are also summarized in Table 19 as 'Remaining incidental fisheries'. The fisheries included in this summary are listed in the Introduction section. A more detailed breakdown of incidental landings is provided in Table 18. The

summary of these fisheries was based exclusively on fish ticket data assigned to each fishery using the classification system outlined in Figure 1. It was not possible to provide discard estimates for the remaining incidental fisheries.

In Table 20, total fishing mortality estimates are evaluated in terms of 2009 OY and ABC harvest specifications from federal groundfish regulations (50 CFR 660 Subpart G). Major U.S. west coast groundfish species are summarized by area or species group to be consistent with ABC and OY harvest specifications.

Results

The primary objective of this report is to determine total annual fishing mortality in the 2009 U.S. west coast groundfish fishery to evaluate the status of groundfish species in terms of ABC and OY harvest specifications. Table 20 provides the basis for these determinations.

The results of this analysis indicate that only one of the rebuilding groundfish species exceeded OY in 2009 (Table 20). However, the ABCs for rebuilding groundfish species were not exceeded in 2009. OY specifications for rebuilding species in 2009 relative to 2008 increased except for darkblotched and yelloweye rockfish (74 FR 9874). The darkblotched rockfish OY decreased by 45 mt and the yelloweye rockfish OY decreased by 3 mt relative to 2008. However, total mortality of darkblotched rockfish increased in 2009 relative to 2008 (301 mt in 2009; 253 mt at 77% of OY in 2008), and exceeded the 2009 OY (285 mt) by 6% (Bellman et al. 2009). However, the 2009 darkblotched rockfish ABC (437 mt) was not exceeded. The highest prior proportion of darkblotched rockfish total mortality in relation to OY occurred in 2007 at 98% (Bellman et al. 2008). One potential source of darkblotched rockfish mortality not accounted for in our total mortality reports is catch discarded at-sea in the shoreside hake fishery (<http://www.nwr.noaa.gov/Groundfish-Halibut/Groundfish-Fishery-Management/Whiting-Management/2009/index.cfm>).

Total mortality estimates of darkblotched rockfish and Pacific Ocean Perch were highest in the LE bottom trawl sector (Table 19). Total mortality of canary rockfish in 2009 was the lowest value (38 mt) and lowest proportion of OY (36%; Table 20) for this species since estimates began in 2005. In addition, the 2009 canary rockfish OY and ABC were higher than any values set for this species since 2005.

Among other rebuilding species, the largest percentage of estimated mortality in relation to OY was 96% for Pacific ocean perch, with an estimated total fishing mortality of 181 mt and an OY of 189 mt in 2009. In 2008, Pacific ocean perch total mortality was at 87% of the 150 mt OY. In 2007, Pacific ocean perch mortality was estimated to exceed the same OY by approximately 7 mt (4%) (Bellman et al. 2008). Pacific ocean perch is managed under the slope rockfish category when caught south of 40° 10' N. latitude, so species-specific estimates are reported only in the area north of this line. Thus, additional mortality of Pacific ocean perch at the population level can occur south of 40° 10' N. latitude, but it is not evaluated in groundfish management on an individual species-specific basis.

For other groundfish, only the total mortality estimate for longnose skate (1455 mt) was above the OY (1,349 mt) by 8%. This was still within the ABC harvest management goal of 3,428 mt (Table 20). Longnose skate

was fully assessed in 2006 and an assessment update was completed in 2007. Total mortality of longnose skate was highest in the LE bottom trawl sector, followed by non-nearshore fixed gear sectors (Table 19).

Prior to 2009, longnose skate was managed as part of the ‘Other Fish’ complex and were recorded in previous total mortality reports under “skates.” In March 2009, a new federal sorting requirement was enacted which requires longnose skates to be sorted and recorded as an individual species on landing receipts (74 FR 9874). Additional state requirements ensured that skates were landed whole (with wings on), which allowed for more accurate speciation of skate landings. Since sorting requirements for longnose skate did not begin until March 2009, the total mortality value presented here is likely an underestimate.

Fishing mortality values for three additional groundfish species were estimated to be within 10% of their OYs (Table 20). These were shortspine thornyhead (north of 34° 27’ N. latitude) (97% of OY), sablefish (north of 36° N. latitude) (94% of OY), and Pacific hake (90% of OY). Petrale sole total mortality decreased from the prior year (1978 mt; 2260 in 2008) to 81% of its OY in 2009. Pacific hake total mortality also decreased from the prior year (122165 mt; 250,205 mt in 2008), and had lower OY and ABC guidelines in 2009.

It should be noted that several sources of uncertainty were not accounted for in this analysis and may influence total mortality estimates. These include uncertainty in sampling of landings for species composition, logbook spatial and depth information, observed retained weights, discard mortality rates, as well as others. Currently, it is not possible to quantify uncertainty for total mortality estimates presented in this report, as measures of the variability associated with various data source are not available. As with all point estimates, total mortality values presented in Tables 19 and 20 should be considered with caution.

Summary and Conclusions

In this analysis, total mortality estimates were derived for the 2009 U.S. west coast groundfish fishery. These estimates were then compared with OY and ABC harvest management goals (Table 20) in order to determine whether overfishing was occurring for west coast groundfish species.

- Total estimated mortality for darkblotched rockfish exceeded the 2009 OY specification by 6% (301 mt versus OY of 285 mt). The darkblotched rockfish 2009 ABC (437 mt) was not exceeded.
- Total estimated mortality for longnose skate exceeded the 2009 OY specification by 8% (1455 mt versus OY of 1349 mt). The longnose skate 2009 ABC (3428 mt) was not exceeded. This was the first year that longnose skate was evaluated individually, as in prior years it was managed under the ‘Other Fish’ complex. Sorting requirements for longnose skate began in March 2009 thus the total mortality value presented here is likely an underestimate.
- Three additional groundfish species were estimated to be within 10% of their OYs; shortspine thornyhead (north of 34° 27’ N. latitude) (97% of OY), sablefish (north of 36° N. latitude) (94% of OY), and Pacific hake (90% of OY).
- Although the total mortality estimate for petrale sole decreased, it remained within 20% of the 2009 OY guideline, at 81%.
- Total estimated mortality of canary rockfish in 2009 was the lowest value (38 mt) and lowest proportion of OY (36%) since estimates for this species began in 2005.

- Of the 75 groundfish species or species groups for which total fishing mortality estimates are calculated, the majority (72%) of total mortality estimates increased from 2008 to 2009.
- Twenty-six groundfish species or species groups (65%) had total fishing mortality estimates which were less than 50% of 2009 OY harvest specifications.

Acknowledgements

The authors gratefully acknowledge the hard work and dedication of the observers from the West Coast Groundfish and At-Sea Hake Observer Programs, contributions from all the staff of the West Coast Groundfish Observer Program, as well as Vanessa Tuttle of the At-Sea Hake Observer Program, in the development of this report. Heather Reed (WDFW), Linda ZumBrunnen and Lynn Mattes (ODFW), and Jayna A. Schaaf-Da Silva (CDFG) provided recreational catch amounts on behalf of Washington, Oregon, and California. Gretchen Arentzen provided summarized research catch from the NOAA NWR. John Devore and Kelly Ames provided discard mortality rates on behalf of the GMT and Jason Cope facilitated communications with the GMT as a whole.

Figures

Figure 1. Fish ticket and logbook data processing for division into groundfish fishery sectors after retrieval of a full calendar year data set from the Pacific Coast Fisheries Information Network (PacFIN) database. Grey highlight indicates sectors for which federal observer data is available.

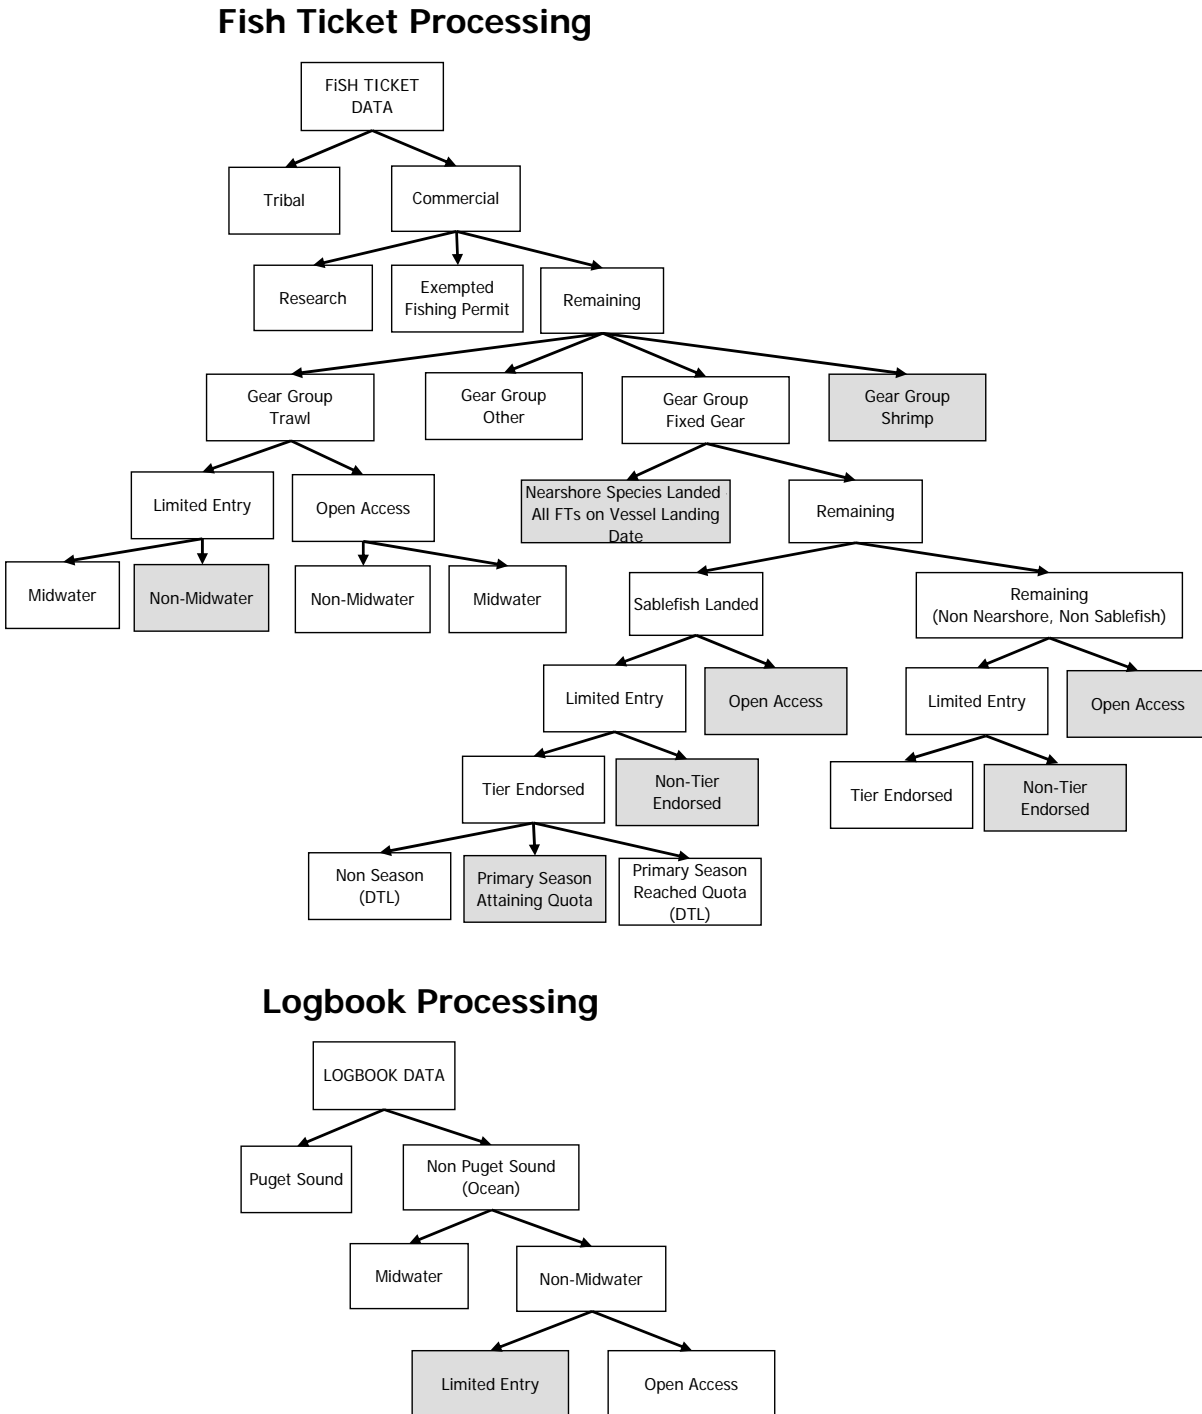

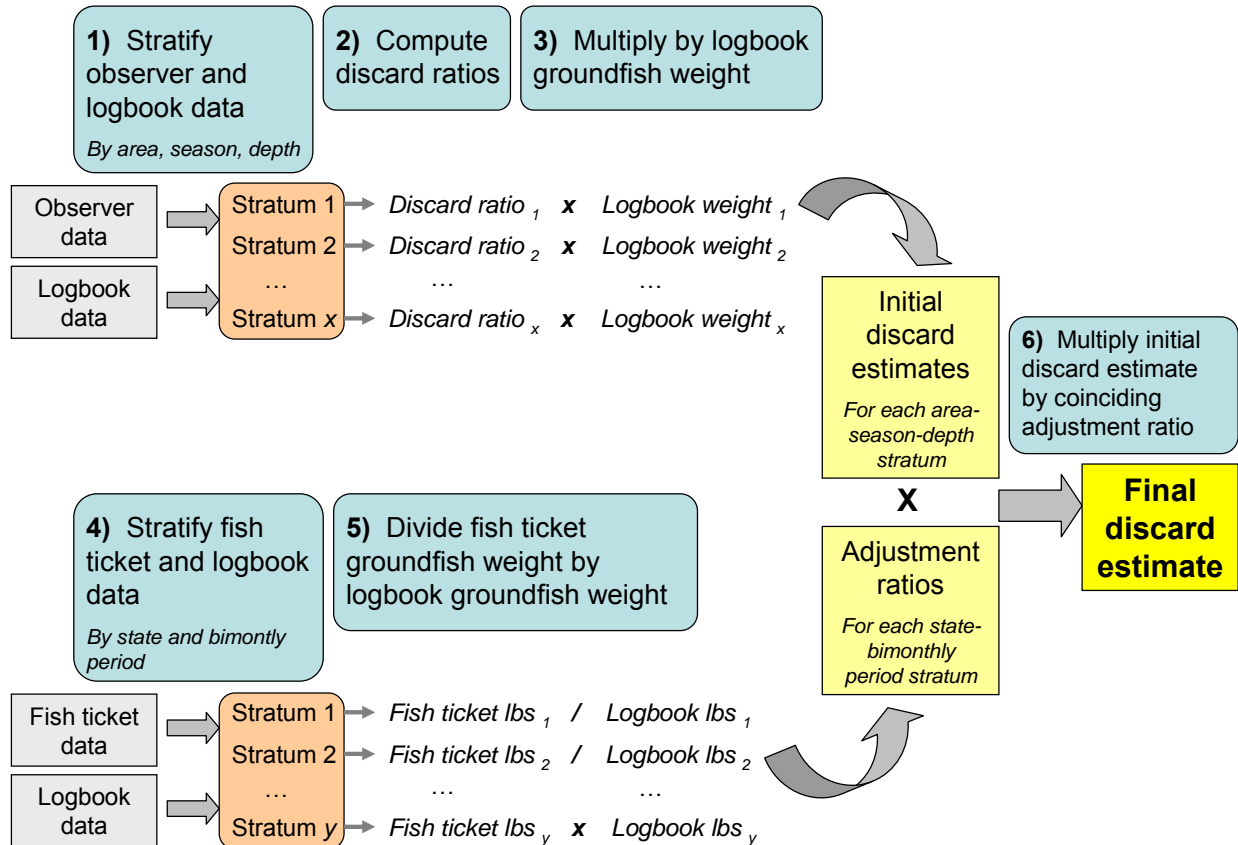

Figure 2. Flow chart illustrating the process by which WCGOP observer data from the limited entry bottom trawl sector are expanded to the fleet-wide level. Retained weights in the observer data are adjusted based on coinciding fish ticket weights for each observed trip. Observer data are then assigned to spatial/temporal strata based on latitude, depth, and season. Observed discard ratios are then computed and applied to the coinciding logbook weight for each stratum. Finally, an adjustment ratio of the proportion of logbook groundfish weight to fish ticket groundfish weight is multiplied by the initial expanded estimate to produce a final discard mortality estimate for each species. See the limited entry bottom trawl section in the methods for further details.

Tables

Note: In all tables, (-) was used when there is no actual numeric value (i.e. the species was neither caught nor discarded). Values appear as 0.0 when a value exists but is smaller than the decimal places allotted. A value of NA represents that the calculation is not applicable for a particular species or strata, or that the calculation did not produce a result (e.g. very small values might result in NA from a standard error calculation).

Table 1. Number of tows and retained weight (mt) of FMP groundfish species (excluding Pacific hake) from observer and logbook data for the 2009 limited entry bottom trawl fishery by management area, depth, and season. Data are combined across depth categories as needed to ensure adequate sample size. Tows targeting California halibut have been removed from both observer and logbook data. Winter season is January-April and November-December and summer season is May-October.

Table 2b. Discard ratios and standard errors from observed trips south of 40°10' N. latitude in the 2009 limited entry bottom trawl fishery by season and depth. Ratios are computed as the observed discard weight divided by the observed weight (adjusted to fish tickets) of retained FMP groundfish species (excluding Pacific hake). Winter season is January-April and November-December and summer season is May-October. Species are grouped according to Appendix B. **Columns with darker shading signify that data were combined across more than one depth interval.**

Table 3. Landings (mt), estimated discard (mt), and total catch (mt) of major west coast groundfish species from non-hake, commercial limited entry groundfish bottom trawls in 2009. Discard ratios (Table 2) were multiplied by stratified (area, depth, season) total FMP groundfish landings (excluding Pacific hake) and subsequently summed across strata to generate discard estimates. Species are grouped according to Appendix B. Total catch weight may not appear as the sum of landed and discard values due to rounding.

Table 5. Landings (mt), estimated discard (mt), total catch (mt), and total fishing mortality (mt) from the federal limited entry and open access participants in the state-licensed California halibut trawl fishery in 2009. Discard ratios (Table 4) were multiplied by total landings of California halibut to generate estimated discard for each sector. Since limited entry vessels participating in the California halibut fishery often land catch from this fishery at the same time as catch from bottom trawl tows targeting groundfish, it was not possible to split out groundfish landed weights for the limited entry bottom trawl and limited entry California halibut sectors. Joint landings for these two sectors are presented in Table 3. Total catch weight may not appear as the sum of landed and discard values due to rounding.

Table 18. Incidental landings (mt) of groundfish by shoreside commercial fisheries in 2009 by sector and gear group. Gear group abbreviations are those used in the PacFIN database; HKL is hook-and-line gear, MSC is miscellaneous gear, NET is net gear POT is pot gear, TLS is troll gear, TWL is trawl gear, and TWS is shrimp trawl gear. Pacific halibut (PHLB) derby fishing is managed under the IPHC and fished with hook-and-line gear. Trawl exempted fishing permit (EFP) fishing is under groundfish management.

Appendix A

Common and scientific names of species included in the Pacific Coast Groundfish Fishery Management Plan, as amended through Amendment 19 (PFMC 2008).

Sharks

Big skate, *Raja binoculata*
California skate, *R. inornata*
Leopard shark, *Triakis semifasciata*
Longnose skate, *R. rhina*
Soupfin shark, *Galeorhinus zyopterus*
Spiny dogfish, *Squalus acanthias*

Ratfish

Ratfish, *Hydrolagus colliei*

Morids

Finescale codling, *Antimora microlepis*

Grenadiers

Pacific rattail, *Coryphaenoides acrolepis*

Roundfish

Cabezon, *Scorpaenichthys marmoratus*
Kelp greenling, *Hexagrammos decagrammus*
Lingcod, *Ophiodon elongatus*
Pacific cod, *Gadus macrocephalus*
Pacific whiting, (hake) *Merluccius productus*
Sablefish, *Anoplopoma fimbria*

Flatfish

Arrowtooth flounder, (turbot) *Atheresthes stomias*
Butter sole, *Isopsetta isolepis*
Curlfin sole, *Pleuronichthys decurrens*
Dover sole, *Microstomus pacificus*
English sole, *Parophrys vetulus*
Flathead sole, *Hippoglossoides elassodon*
Pacific sanddab, *Citharichthys sordidus*
Petrale sole, *Eopsetta jordani*
Rex sole, *Glyptocephalus zachirus*
Rock sole, *Lepidopsetta bilineata*
Sand sole, *Psettichthys melanostictus*
Starry flounder, *Platichthys stellatus*

Rockfish

Includes all genera and species of the family Scorpaenidae, even if not listed, that occur in the Washington, Oregon, and California area. The Scorpaenidae genera are *Sebastes*, *Scorpaena*, *Sebastolobus*, and *Scorpaenodes*.

Aurora, *Sebastes. aurora*
Bank, *S. rufus*
Black, *S. melanops*

Black-and-yellow, *S. chrysolmelas*.
 Blackgill, *S. melanostomus*
 Blue, *S. mystinus*
 Bocaccio, *S. paucispinis*
 Bronzespotted, *S. gilli*
 Brown, *S. auriculatus*
 Calico, *S. dalli*
 California scorpionfish, *Scorpaena guttata*
 Canary, *Sebastes pinniger*
 Chameleon, *S. phillipsi*
 Chilipepper, *S. goodei*
 China, *S. nebulosus*
 Copper, *S. caurinus*
 Cowcod, *S. levis*
 Darkblotched, *S. crameri*
 Dusky, *S. ciliatus*
 Dwarf-red, *S. rufianus*
 Flag, *S. rubrivinctus*
 Freckled, *S. lentiginosus*
 Gopher, *S. carnatus*
 Grass, *S. rastrelliger*
 Greenblotched, *S. rosenblatti*
 Greenspotted, *S. chlorostictus*
 Greenstriped, *S. elongatus*
 Halfbanded, *S. semicinctus*
 Harlequin, *S. variegatus*
 Honeycomb, *S. umbrosus*
 Kelp, *S. atrovirens*
 Longspine thornyhead, *Sebastolobus altivelis*
 Mexican, *Sebastes macdonaldi*
 Olive, *S. serranoides*
 Pink, *S. eos*
 Pinkrose, *S. simulator*
 Pygmy, *S. wilsoni*
 Pacific ocean perch, *S. alutus*
 Quillback, *S. maliger*
 Redbanded, *S. babcocki*
 Redstripe, *S. proriger*
 Rosethorn, *S. helvomaculatus*
 Rosy, *S. rosaceus*
 Rougheye, *S. alentianus*
 Sharpchin, *S. zacentrus*
 Shortbelly, *S. jordani*
 Shortraker, *S. borealis*
 Shortspine thornyhead, *Sebastolobus alascanus*
 Silvergray, *Sebastes brevispinus*
 Speckled, *S. ovalis*
 Splitnose rockfish, *S. diploproa*
 Squarespot, *S. hopkinsi*
 Starry, *S. constellatus*
 Stripetail, *S. saxicola*
 Swordspine, *S. ensifer*

Tiger, *S. nigrocinctus*
Treefish, *S. serriceps*
Vermilion, *S. miniatus*
Widow, *S. entomelas*
Yelloweye, *S. ruberrimus*
Yellowmouth, *S. reedi*
Yellowtail, *S. flavidus*

Appendix B

Species identification codes used in the Pacific Coast Fisheries Information Network (PacFIN) database and assigned to WCGOP observer data, with aggregated species groups used in this report for the non-nearshore sectors of the groundfish fishery.

PacFIN Species ID	PacFIN Common Name	Species Group - North of 40° 10' N latitude	Species Group - South of 40° 10' N latitude	FMP
ALBC	ALBACORE	Other nongroundfish	Other nongroundfish	
AKSK	ALASKA SKATE	Other non-FMP skate	Other non-FMP skate
